Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

U.S. Government Rights

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the US government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to US government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at

<http://www.keysight.com/find/sweula>. The license set forth in the EULA represents the exclusive authority by which the US government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the US government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED "AS IS," AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR OF ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT SHALL CONTROL.

Safety Information

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

1 Documentation Roadmap

This section describes the Keysight products covered by this document, and provides links to related documentation.

- ["Products Covered by this Document" on page 85](#)
- ["Additional Documentation" on page 86](#)

- 1 Documentation Roadmap
- 1.1 Products Covered by this Document

1.1 Products Covered by this Document

For the full list of instrument models covered by this documentation, see the title page: "[Vector Modulation Analyzer Mode User's & Programmer's Reference](#)" on page [1](#).

1.2 Additional Documentation

If your instrument or computer has an internet connection, then you can access the latest editions of all relevant X-Series documentation via the links below.

This document is available in 3 formats:

- **Embedded Help**, in the instrument
- **Online Help**, at Keysight's web site

For information on this Mode, browse to:

<http://rfmw.em.keysight.com/wireless/helpfiles/VMAMode/FlexUI.htm>

- **Users & Programmers Reference**, in downloadable PDF format

For information on this Mode, download from:

<http://literature.cdn.keysight.com/litweb/pdf/N9054-90001.pdf>

The following documents are available online at keysight.com:

[X-Series Messages Guide](#)

2 User Interface

Here are the basic elements of the Multitouch User Interface. For more information, tap a topic.

Included in this section are also topics for several front panel keys not described in other topics. Tap one of these topics for more information.

"Cancel key" on
page 133

"Onscreen Keyboard key" on
page 134

"Touch On/Off Key" on
page 135

"Tab key" on
page 136

2.1 Screen Tabs

In the X-Series Multitouch User Interface (or Multitouch UI), you can run many different Measurement Applications, or “Modes”. Examples are Spectrum Analyzer Mode, LTE-A FDD Mode, IQ Analyzer Mode, and Real Time Spectrum Analyzer Mode. Each Mode has its own set of controls, windows and SCPI commands.

Each Mode runs within a “Screen”. The Multitouch UI supports multiple “Screens” (see ["Multiscreen" on page 177](#) for more information). Each screen displays one Measurement in one Mode. The set of configured screens is shown across the top of the display as a set of Screen Tabs, with a + tab at the right for adding new Screens:

You can see up to six tabs at a time on the UXA, and 4 at a time on the CXA, EXA, MXA and PXA. If there are more Screens configured than this, arrows appear to the left and right of the Screen Tabs; pressing the arrows scrolls the Screen Tabs to the left or right. A scroll bar also appears at the bottom of the Screen Tabs, indicating that you can scroll the tabs by dragging them with your finger; you can also scroll them by dragging the scroll bar.

Pressing a Screen Tab selects that screen for operation. Pressing the blue (selected) Screen Tab is the same as pressing the Mode/Meas front panel key.

Both actions open the ["Mode/Meas/View Dialog" on page 90](#). In addition, if you have a PC keyboard plugged in, the sequence CTL-SHIFT-M will open up this dialog.

The + tab at the right of the Screen Tabs bar adds a new Screen by cloning the current screen. The new Screen has the identical setup and settings as the current Screen. You can then change the Mode, Measurement and/or settings of the new Screen.

You can define up to 16 screens at once.

Example Multiscreen View

The example below shows a four-screen display in Multiscreen view.

The Screen called “Real-Time SA 2” is selected, as indicated by its blue tab. Touching any other screen or tab selects the screen for that tab and brings it to the foreground.

The following topics provide more information:

- "Mode/Meas/View Dialog" on page 90
- "Add Screen" on page 107
- "Multiscreen" on page 177

2.1.1 Mode/Meas/View Dialog

The Mode/Meas/View dialog opens when you press the selected (blue) Screen tab (see "Screen Tabs" on page 89) or the **Mode/Meas** front panel key.

This dialog displays lists of available Modes, Measurements and Views, as well as the "Sequencer" on page 101 control for configuring Screens.

2 User Interface

2.1 Screen Tabs

2.1.1.1 Mode

The first column in the Mode/Meas/View dialog allows you to select the desired Mode from those currently licensed in your instrument.

Modes, also known as “measurement applications”, are collections of measurement capabilities packaged together to provide you with an instrument personality specific to your measurement needs. Each Mode is ordered separately by Model Number and must be licensed in order for it to be available in the instrument.

You select the Mode you want to run using the Mode/Meas/View dialog. Once a Mode is selected, only the commands that are valid for that mode can be executed

For more information on Modes, preloading Modes, and memory requirements for Modes, see ["More Information" on page 94](#)

The `:INSTRUMENT[:SElect]` command is used to remotely select a Mode by sending the instrument a parameter which represents the name of the desired Mode. The Mode Names may be found in the table under ["Index to Modes" on page 93](#).

The `:INSTRUMENT:NSElect` command is used to remotely select a Mode by sending the Mode Number of the desired Mode. See ["Instrument Number Select" on page 92](#). The Mode Numbers may be found in the table under ["Index to Modes" on page 93](#).

The `:INSTRUMENT:CONFigure` command causes a Mode and Measurement switch at the same time. This generally results in faster overall switching than sending the

`:INSTRument:SElect` and `CONFigure` commands separately. See "Mode and Measurement Select" on page 92.

Remote Command	<code>:INSTRument[:SElect] <mode_id></code> where <code><mode_id></code> is one of the values listed in "Index to Modes" on page 93 below <code>:INSTRument[:SElect]?</code>
Example	<code>:INST SA</code>
Notes	A list of the valid mode choices is returned by the <code>:INST:CAT?</code> query
Preset	The default Mode is set to <code>SA</code> on Restore System Defaults->All , unless noted below: For N8973B, N8974B, N8975B, or N8976B: <code>NFIG</code>
State Saved	Saved in instrument state
Annunciation	Application Title is in the Screen Tab

Instrument Number Select

Remote Command	<code>:INSTRument:NSElect <integer></code> <code>:INSTRument:NSElect?</code>
Example	<code>:INST:NSEL 1</code>
Notes	The Mode Numbers may be found in the table under "Index to Modes" on page 93 SA mode is number 1 The command is sequential: that is, continued parsing of commands cannot proceed until the instrument select is complete and the resultant SCPI trees are available
Preset	The default Mode is set to <code>1</code> by Restore System Defaults->All , unless noted in the table above
State Saved	Saved in instrument state

Mode and Measurement Select

Remote Command	<code>:INSTRument:CONFigure:<mode_id>:<meas></code> where <code><mode_id></code> is a valid parameter for the <code>:INST:SEL</code> command and <code><meas></code> is a valid parameter for the <code>:CONF</code> command in the Mode specified by <code><mode></code>
Example	<code>:INST:CONF:SA:SAN</code> selects the Spectrum Analyzer mode and the Swept SA measurement <code>:INST:CONF:WCDMA:RHO</code> selects the WCDMA mode and the Mod Accuracy measurement
Notes	The available parameters for <code><mode_id></code> are dependent upon installed and licensed applications resident in the instrument. The available parameters for <code><meas></code> are dependent on the <code><mode_id></code> parameter and the valid measurements available for that mode, which can depend on model numbers and installed options In general this command will execute more quickly than sending the equivalent separate <code>:INST:SEL</code>

and **:CONF** commands

Index to Modes

The Mode Number in the table below is the parameter for use with the **:INSTrument:NSElect** command. The Mode Parameter is the parameter for use with the **:INSTrument[:SElect]** command. Your actual choices will depend upon which applications are installed in your instrument.

Mode	Mode Number	Mode Parameter <mode_id>
5G NR	109	NR5G
89601 VSA	101	VSA89601
Analog Demod	234	ADEM0D
Avionics	232	AVIONIC
Bluetooth	228	BT00th
Channel Quality / Group Delay	161	CQM
EMI Receiver	141	EMI
GSM/EDGE/EDGE Evo	13	EDGE GSM
I/Q Analyzer (Basic)	8	BASIC
LTE FDD & LTE-A FDD	107	LTEAFDD
LTE TDD & LTE-A TDD	108	LTEATDD
Measuring Receiver	233	MRECEIVE
MSR	106	MSR
Noise Figure	219	NFIGure
Phase Noise	14	PNOISE
Power Amplifier	81	PA
Pulse	151	PULSEX
Radio Test	300	RTS
Real Time Spectrum Analyzer	2	RTSA
Remote Language Compatibility	266	RLC
SCPI Language Compatibility	270	SCPILC
Sequence Analyzer	123	SEQAN
Short Range Comms	218	SRCOMMS
Spectrum Analyzer	1	SA
Vector Modulation Analyzer	200	VMA
WCDMA with HSPA+	9	WCDMA
WLAN	217	WLAN

More Information

The Mode name appears on the Screen Tab, followed by a number identifying which instance of the Mode appears on that screen. Each Screen contains one Mode. For example, in the image below, there is one Real-Time Spectrum Analyzer screen, and two Spectrum Analyzer screens. The current Screen contains **Real-Time SA 1**.

It is possible to specify the order in which the Modes appear in the Mode menu, using the **Configure Applications** utility on the Desktop. Using the same utility, it is also possible to specify a subset of the available applications to load into memory at startup time, which can decrease the startup time of the instrument and the amount of memory consumed.

Each application (Mode) that runs in an X-Series instrument consumes virtual memory. The various applications consume varying amounts of virtual memory, and as more applications run, the memory consumption increases. Keysight characterizes each Mode and assigns a memory usage quantity based on a conservative estimate. The **Configure Applications** utility shows an estimate for how much memory each Mode will consume.

You can still run a Mode even if it is not preloaded into memory – during runtime, the first time an application that is not loaded into memory is selected (either by pressing that application's **Mode** key or by sending that application's **:INST:SEL** command), the Application will be loaded, but this takes a few seconds. The instrument will pause while loading the application while displaying a message box that says “Loading application, please wait...” Preloading the application eliminates this wait time *but* consumes additional memory.

2.1.1.2 Application Mode Remote Commands

This section contains a number of remote commands that are provided for programming convenience and remote compatibility.

Application Mode Catalog Query (Remote Command Only)

Returns a string containing a comma-separated list of names of all the installed and licensed measurement modes (applications). These names can only be used with **:INSTrument[:SElect]**.

Remote Command	:INSTrument:CATalog?
----------------	-----------------------------

Example	<code>:INST:CAT?</code>
Notes	Query returns a quoted string of the installed and licensed modes separated with a comma. Example: <code>"SA,PNOISE,WCDMA"</code>
Backwards Compatibility Notes	VSA (E4406A): <code>:INSTrument:CATalog?</code> returned a list of installed <code>INSTrument:SELECT</code> items as a comma separated list of string values, for example: <code>"BASIC", "GSM", "EDGEgSM", "CDMA", "SERVICE"</code> X-Series uses the ESA/PSA compatible query of a string contain comma separated values: <code>"SA,PNOISE,NFIG,BASIC"</code>

Current Application Model (Remote Command Only)

Returns a string that is the Model Number of the currently selected application (mode). This information is also displayed in the **Show System** screen.

Remote Command	<code>:SYSTem:APPLication[:CURRent][:NAME]?</code>
Example	<code>:SYST:APPL?</code>
Notes	Query returns a quoted string that is the Model Number of the currently selected application (Mode). Example: <code>"N9060A"</code> String length between 6 to 9 characters.
Preset	Not affected by Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Revision (Remote Command Only)

Returns a string that is the Revision of the currently selected application (mode). This information is also displayed in the Show System screen

Remote Command	<code>:SYSTem:APPLication[:CURREnt]:REVIision?</code>
Example	<code>:SYST:APPL:REV?</code>
Notes	Query returns a quoted string that is the Revision of the currently selected application (Mode). Example: <code>"1.0.0.0"</code> String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points) The format is Major.Minor.Build.Compile, where Major must correspond to the Integer portion of the Version in the license file for the application.
Preset	Not affected by a Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Options (Remote Command Only)

Returns a string that is the Options list of the currently selected application (Mode). This information is also displayed in the Show System screen

Remote Command	<code>:SYSTem:APPLication[:CURRent]:OPTion?</code>
Example	<code>:SYST:APPL:OPT?</code>
Notes	Query returns a quoted string that is the Option list of the currently selected application (Mode). The format is the name as the *OPT? or SYSTem:OPTion command: a comma separated list of option identifiers. Example: "1FP,2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in state per se, the value will be the selected application when a Save is invoked.

Application Catalog Number of Entries (Remote Command Only)

Returns the number of installed and licensed applications (Modes).

Remote Command	<code>:SYSTem:APPLication:CATalog[:NAME]:COUNT?</code>
Example	<code>:SYST:APPL:CAT:COUN?</code>
Preset	Not affected by Preset
State Saved	Not saved in instrument state.

Application Catalog Model Numbers (Remote Command Only)

Returns a list of Model Numbers for the installed and licensed applications (Modes).

Remote Command	<code>:SYSTem:APPLication:CATalog[:NAME]?</code>
Example	<code>:SYST:APPL:CAT?</code>
Notes	Returned value is a quoted string of a comma separated list of Model Numbers. Example, if SAMS and Phase Noise are installed and licensed: "N9060A,N9068A" String length varies based on licenses. Licenses are between 6 and 9 characters. So the string length will be between $COUNT * 7 - 1$ and $COUNT * 10 - 1$. (7 & 10 = Model Number length + 1 for comma. -1 = no comma for the 1st entry.)
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

Application Catalog Revision (Remote Command Only)

Returns the Revision of the provided Model Number.

Remote Command	<code>:SYSTem:APPLication:CATalog:REVision? <model></code>
Example	<code>:SYST:APPL:CAT:REV? 'N9060A'</code>
Notes	Returned value is a quoted string of revision for the provided Model Number. The revision will be a null-string ("") if the provided Model Number is not installed, licensed, and loaded. Example, if SAMS is installed and licensed: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points)
Preset	Not affected by a Preset.
State Saved	Not saved in instrument state.

Application Catalog Options (Remote Command Only)

Returns a list of Options for the provided Model Number

Remote Command	<code>:SYSTem:APPLication:CATalog:OPTion? <model></code>
Example	<code>:SYST:APPL:CAT:OPT? 'N9060A'</code>
Notes	Returned value is a quoted string of a comma separated list of Options, in the same format as *OPT? or :SYSTem:OPTion?. If the provided Model Number is not installed and licensed a null-string ("") will be returned. Example, if SAMS is installed and licensed: "2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

ESA SA compatibility command (Remote Command only)

Provided for backwards compatibility with ESA. When this command is received, the analyzer aliases it to the appropriate Mode.

Remote Command	<code>:INSTrument[:SElect] 'SA' 'PNOISE' 'EDGE' 'GSM' 'BASIC'</code>
Example	<code>:INST 'SA'</code>
Notes	The query is not a quoted string. It is an enumeration as indicated in the Instrument Select table above

GSM Mode compatibility command (Remote Command only)

Provided for backwards compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EDGE GSM
```

Remote Command :INSTrument[:SElect] GSM

Example :INST GSM

SA compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL SCPI LC
```

This results in the analyzer being placed in SCPI Language Compatibility Mode, in order to emulate the ESU Spectrum Analyzer Mode.

Remote Command :INSTrument[:SElect] SANalyzer

Example :INST SAN

Receiver compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the instrument aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF FSC
```

This results in the instrument being placed in the EMI Receiver Mode, running the Frequency Scan measurement, in order to emulate the ESU Receiver Mode.

Remote Command :INSTrument[:SElect] REceiver

Example :INST REC

APD compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF APD
```

2 User Interface
2.1 Screen Tabs

This results in the analyzer being placed in the EMI Receiver Mode, running the APD measurement, in order to emulate the ESU APD Mode.

Remote Command	<code>:INSTrument[:SElect] APDistribution</code>
----------------	--

Example	<code>:INST APD</code>
---------	------------------------

IF Mode compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF MON`

This results in the analyzer being placed in the EMI Receiver Mode, running the Monitor Spectrum measurement, in order to emulate the ESU IF Mode.

Remote Command	<code>:INSTrument[:SElect] IFANalyzer</code>
----------------	--

Example	<code>:INST IFAN</code>
---------	-------------------------

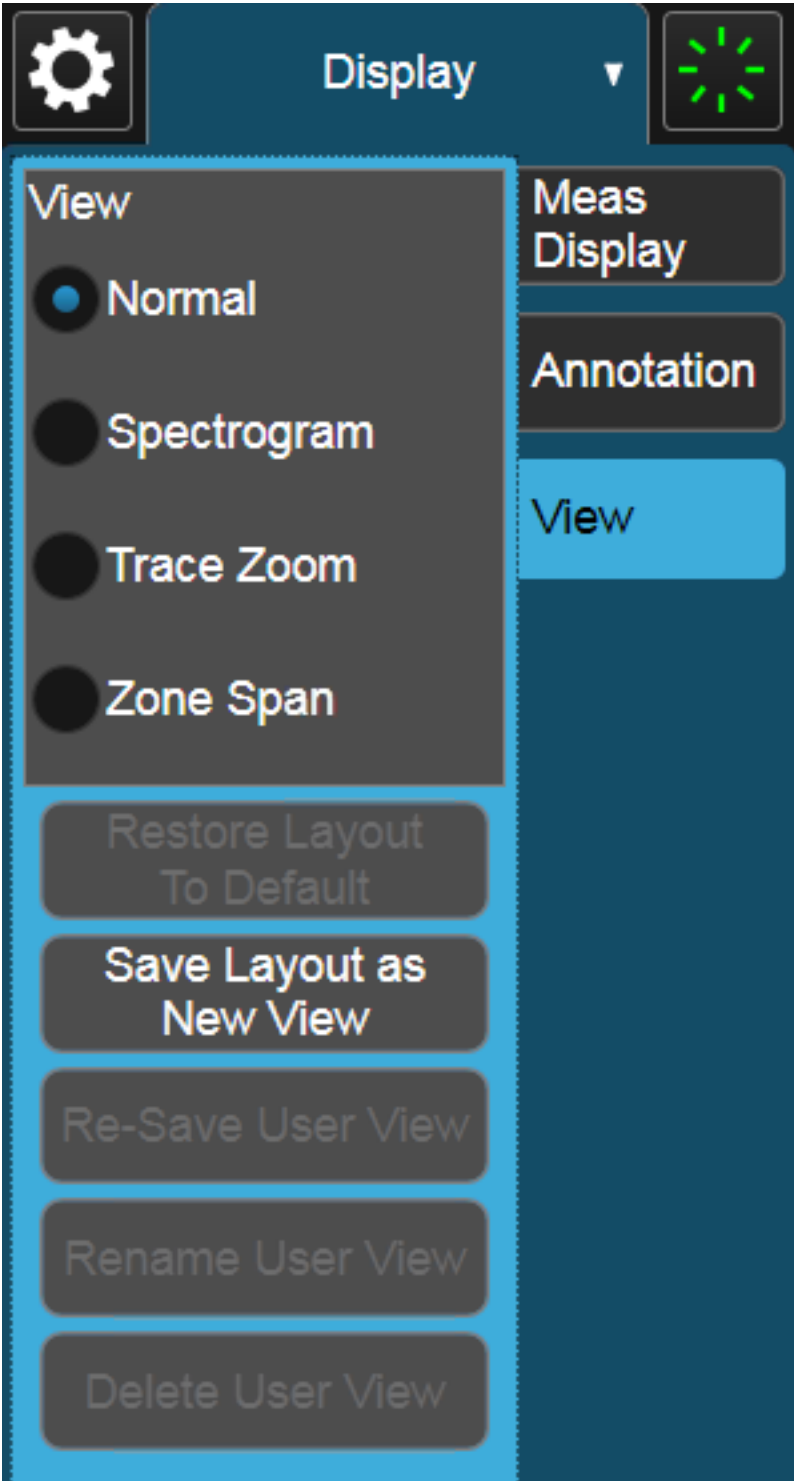

2.1.1.3 Measurement

The Measurement column of the Mode/Meas/View dialog shows all the Measurements available for the Mode which is selected in the first column. Select a Measurement in the second column and the View column will show all the Views available for that measurement. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

2.1.1.4 View

A View is a collection of Result Windows. The View column of the "Mode/Meas/View Dialog" on page 90 shows all the Views available for the Measurement which is selected in the second column. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

The View may also be set by using the View tab on the Display menu. The View tab is the last tab on the Display menu for every measurement. The Views are the same as those listed in the "Mode/Meas/View Dialog" on page 90.

2.1.1.5 Sequencer

Allows multiple Screens to update sequentially while in "Multiscreen" on page 177 display mode. Each Screen updates in sequence, and when all have updated, the sequence will start again.

To start the Sequencer, you must have more than one Screen defined, and you must have Multiscreen selected (see "Screen Tabs" on page 89).

If you want each Screen to use a different input, you must turn off **All Screens Use Same Input** under **Input/Output**, **Input**.

CAUTION

Differences in hardware settings between the Screens may cause switches and/or attenuators to cycle as you go from one Screen to another. This could potentially reduce the life of these components. To avoid this, make sure **Attenuation**, **µW Path Control** and other switch settings are the same in each Screen.

NOTE

When the Sequencer is running, the destination of remote commands is unpredictable, so you should stop the Sequencer before sending any measurement-related commands. Once the Sequencer has stopped, select a specific Screen using `:INSTrument:SCREen:SElect`, before sending any further commands. See "Select Screen" on page 179

NOTE

When the Sequencer is running, Auto alignment is temporarily disabled. A pending auto alignment might be executed when the sequencer is stopped.

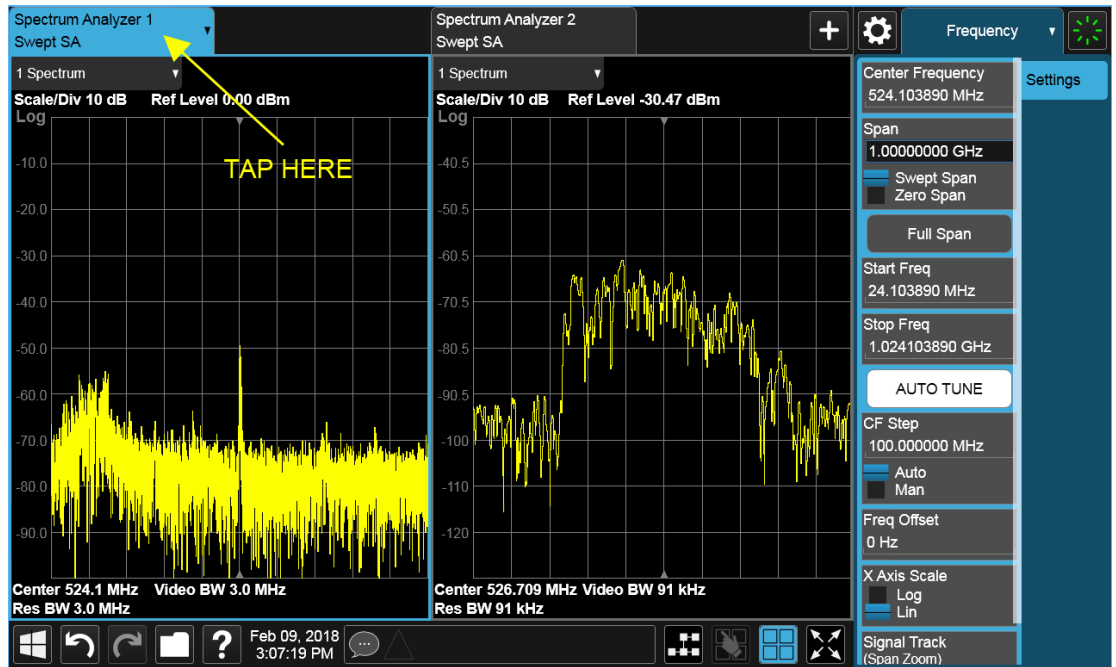

See "More Information" on page 101

Remote Command	<code>:SYSTem:SEQuencer ON OFF 1 0</code> <code>:SYSTem:SEQuencer?</code>
Example	<code>:SYST:SEQ ON</code>
Notes	If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated
Dependencies	To start the Sequencer, you must have more than one Screen defined and you must have Multiscreen selected
Preset	<code>OFF</code>

More Information

To start the Sequencer, tap the current (blue) Screen tab to go into the Mode/Meas/View Dialog:

2 User Interface
2.1 Screen Tabs

In the Sequencer block in the upper left hand corner, tap the Sequencing switch to turn it On:

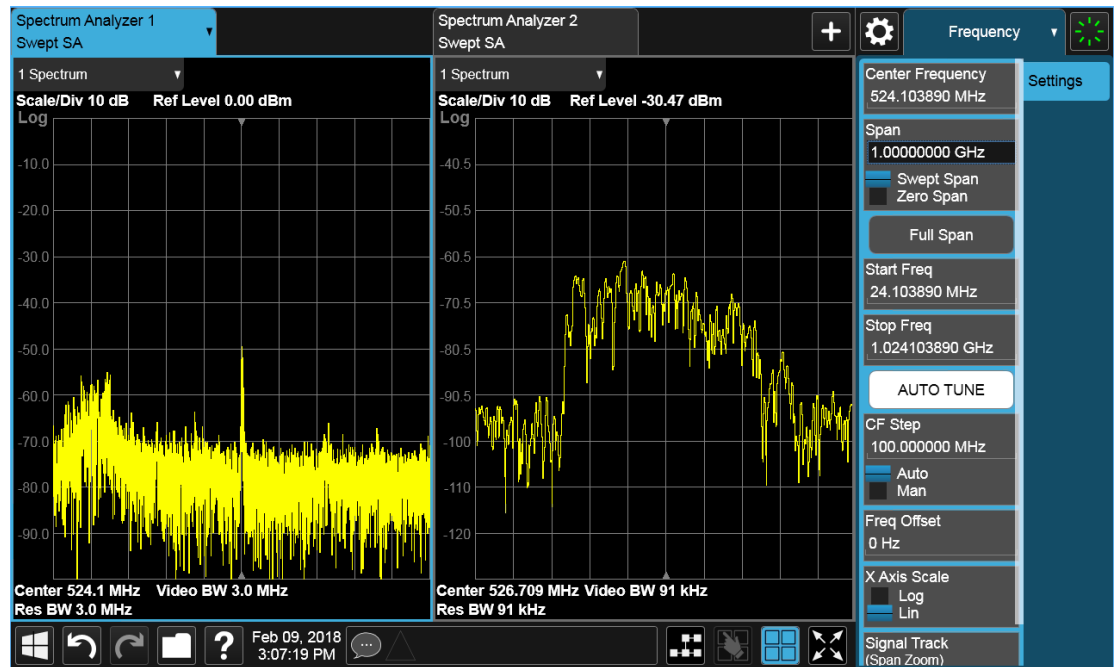

The screenshot shows the 'Mode / Measurement / View Selector' dialog box. In the top left corner, there is a 'Sequencer' section with a 'Sequencing' switch. The switch is currently set to 'Off'. A yellow arrow points to the switch with the text 'TAP HERE'. A text box next to the switch explains: 'When Sequencing is On and there are multiple Screens, all Screens update in sequence. When Sequencing is Off, only the selected Screen updates.' Below this, there is a 'Launch VSA' button. The main part of the dialog is a table with three columns: Mode, Measurement, and View.

Mode	Measurement	View
Spectrum Analyzer	Swept SA	Normal
EMI Receiver	Channel Power	Spectrogram
IQ Analyzer (Basic)	Occupied BW	Trace Zoom
W-CDMA with HSPA+	ACP	Zone Span
GSM/EDGE /EDGE Evo	Power Stat CCDF	User View
Phase Noise	Burst Power	Normal 1
Noise Figure	Spurious Emissions	Normal 2
Analog Demod	SEM	
Bluetooth	TOI	
LTE FDD & LTE-A FDD	Harmonics	
LTE TDD & LTE-A TDD	List Sweep	
WLAN		

2 User Interface
2.1 Screen Tabs

The instrument will immediately exit the Mode/Meas/View Dialog and begin making measurements in each of the screens, one after the other. When a measurement is being made in a particular Screen, that Screen's tab will be blue.

Measurement being made in Screen 1:

Measurement being made in Screen 2:

Touching any key or control on the display will cause the Sequencer to stop, so that you can make desired changes. When this happens, the message “Sequencer stopped” is displayed.

When the Sequencer is running, the screens update in the order in which they were created.

Each Screen takes one measurement then passes control to the next Screen. Each Screen updates as though it were in Single Sweep or Single Measurement mode. Thus, if Averaging is on, a Screen may take multiple sweeps before moving on to the next Screen.

2.1.1.6 Screen Name

By default, the screen name is the Mode (Application) name followed by a number indicating the instance of the application.

You may change the name displayed on the Screen Tab of any screen. The control to do this appears in the ["Mode/Meas/View Dialog" on page 90](#):

When you touch this control an onscreen keyboard appears, allowing you to change the name. Whatever you change it to appears on the Tab, even if you subsequently change the screen to a different Mode.

To reset the name, delete the screen name entirely.

Each Screen Name must be unique; you cannot give the same name to more than one screen.

Remote Command	<code>:INSTrument:SCReen:REName <alphanumeric></code>
Example	<code>:INST:SCR:REN "Baseband"</code>
Notes	<p>The currently active screen is renamed.</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of screen names, the error message “-224, Illegal parameter value; New name <name> already exists” appears</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears</p>

2.1.1.7 Delete This Screen

Pressing this button deletes the current Screen (the one with the blue tab). Deleting a screen removes it from view and selects the next lower screen in the list of screens. If only one screen is configured, it cannot be deleted.

If you press the **Delete This Screen** button, a prompt appears:

“This function will delete the current screen and its settings. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or **ESC** does not.

Remote Command	<code>:INSTrument:SCReen:DELeTe</code>
Example	<code>:INST:SCR:DEL</code>
Notes	<p>The currently active screen is deleted</p> <p>If the screen you are attempting to delete is the only configured screen, the error message “-221, Settings conflict; Last screen cannot be deleted” is displayed</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated</p>

2.1.1.8 Delete All But This Screen

Pressing this control deletes all the Screens except the current Screen (the one with the blue tab).

If you press the **Delete All But This Screen** button, a prompt appears:

“This function will delete all defined screens and their settings, except for the current screen. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or ESC does not.

Remote Command	<code>:INSTrument:SCReen:DELeTe:ALL</code>
Example	<code>:INST:SCR:DEL:ALL</code>
Notes	<p>You can reset the instrument to the power-on configuration by invoking <code>:INST:SCR:DEL:ALL</code> followed by <code>:SYSTem:DEFault ALL</code></p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears</p>

2.1.1.9 89600 VSA

Pressing this button launches the 89600 VSA software. The 89600 VSA software is powerful, PC-based software, offering the industry's most sophisticated general purpose and standards specific signal evaluation and troubleshooting tools for R&D engineers. Even for proprietary and non-standard signals in SATCOM or MILCOM applications, you can make signal quality measurements with customized IQ constellation.

The 89600 VSA software offers the following features:

- Over 35 general-purpose analog and digital demodulators ranging from 2FSK to 4096QAM
- Flexible and custom IQ and OFDM signal analysis for single carrier
- Standards specific modulation analysis including:
 - Cellular: GSM/EDGE, cdma2000, W-CDMA, TD-SCDMA, LTE(FDD/TDD),
 - LTE-Advanced and more
 - Wireless networking: 802.11a/b/g, 802.11n, 802.ac, 802.16 WiMAX (fixed/mobile), WiSUN (MR-FSK PHY)
 - RFID
 - Digital satellite video and other satellite signals, radar, LMDS
- Up to 400K bin FFT, for the highest resolution spectrum analysis
- A full suite of time domain analysis tools, including signal capture and playback, time gating, and CCDF measurements
- 20 simultaneous trace displays and the industry's most complete set of marker

functions

- Easy-to-use Microsoft Windows graphical user interface

For more information see the Keysight 89600 Series VSA web site at www.keysight.com/find/89600vsa

To learn more about how to use the 89600 VSA in the instrument, start the 89600 VSA software, then open the 89600 VSA Help and navigate to the topic "About Keysight X-Series Signal Analyzer with 89600 VSA Software".

Example `:INST:SEL VSA89601`
 `:INST:NSEL 101`

2.1.2 Add Screen

On X-Series analyzers you can configure up to 16 different Screens at one time. Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows.

You can add screens by pressing the “+” icon in the "Screen Tabs" on page 89 panel. The icon is shown below:

Every time you add a Screen, the instrument “clones” or “copies” the current Screen into the new Screen. If desired, you can then use the "Mode/Meas/View Dialog" on page 90 to change the Mode, Measurement and/or View of the new Screen, or simply operate a second copy of your previous Screen, thus preserving the settings of your previous Screen.

When you have defined the maximum number of Screens (16), the “+” icon disappears.

For more information about operating the instrument with multiple screens configured, see "Multiscreen" on page 177.

Remote Command `:INSTrument:SCReen:CREate`

Example `:INST:SCR:CRE`

Notes The maximum number of screens is 16. If an attempt to add a screen occurs when the maximum have been defined, the error message “-221, Settings conflict; Screen limit reached” appears
When you create a new screen the Screen Name is the current Mode name followed by a number indicating the instance of the Mode.

If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

2.2 Meas Bar

The Meas Bar is used to display annotation for the current measurement. There are three primary uses for the Meas Bar:

1. To show annotation for the most important parameters in the measurement so you can see them at a glance
2. To show the annotation that you will most want to have recorded in a screen dump
3. To give you quick access to settings.

The Meas Bar is made up of a number of annotation panels, each of which, when pressed, opens up a dialog below it which contains controls for those settings.

For example, here is what the display looks like when you touch one of the regions of the Meas Bar:

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function.

Settings that are colored amber are those that you need to be particularly aware of; for example, if Alignments are off, this is shown in amber, so you will know that you may not be meeting spec. Similarly, if DC coupling is on, this is shown amber, to alert you to be careful what voltage you put on the input.

You can turn the Meas Bar on and off with a switch on the Annotation tab of the Display menu.

System Control Panel

The leftmost panel holds the GPIB/Remote annunciators, the Single/Continuous symbol/control, the LXI indicator and the PASS/FAIL indicator. Tapping this panel drops down controls for Single/Continuous, Pause/Resume and restart.

GPIB/Remote annunciators

The GPIB/Remote annunciators are shown as the letters **KRLTS**. Each letter is shown if the state is true and is not shown if the state is false, as follows:

K	Keylock indicator	This is shown when the instrument is in the Keylock state (turned on and off by the SYST:KLOCK command)
R	Remote annunciator	Shown when the instrument is in the remote state, as when being controlled via the IEEE-488 bus (GPIB) or TCP/IP connections
L	GPIB Listen annunciator	Shown when addressed to listen via GPIB or TCP/IP
T	GPIB Talk annunciator	Shown when addressed to talk via GPIB or TCP/IP
S	GPIB SRQ annunciator	Shown when the instrument is asserting SRQ on GPIB. This annunciator is an amber color

Single/Continuous symbol/control

This annunciator shows as an arrow on an oval line when in Continuous, or an arrow on a straight line when in Single.

LXI indicator

This indicator displays in green when LAN is connected, in white when LAN is not connected, and in red when LAN is connected but has a connection problem.

PASS/FAIL indicator

This annunciator displays when Limits are turned on. It is green if all Limits are passing, and a red FAIL if any limit is not passing.

The following command queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

Remote Command `:CALCulate:CLIMits:FAIL?`

Example `:CALC:CLIM:FAIL?`

queries the current measurement to see if it fails the defined limits
Returns a 0 or 1: 0 it passes, 1 it fails

Trace Detector Settings Panel

In the Swept SA and some other measurements, there is a special panel summarizing the settings for the traces in the measurement:

There is one column for each trace. The rows are as follows:

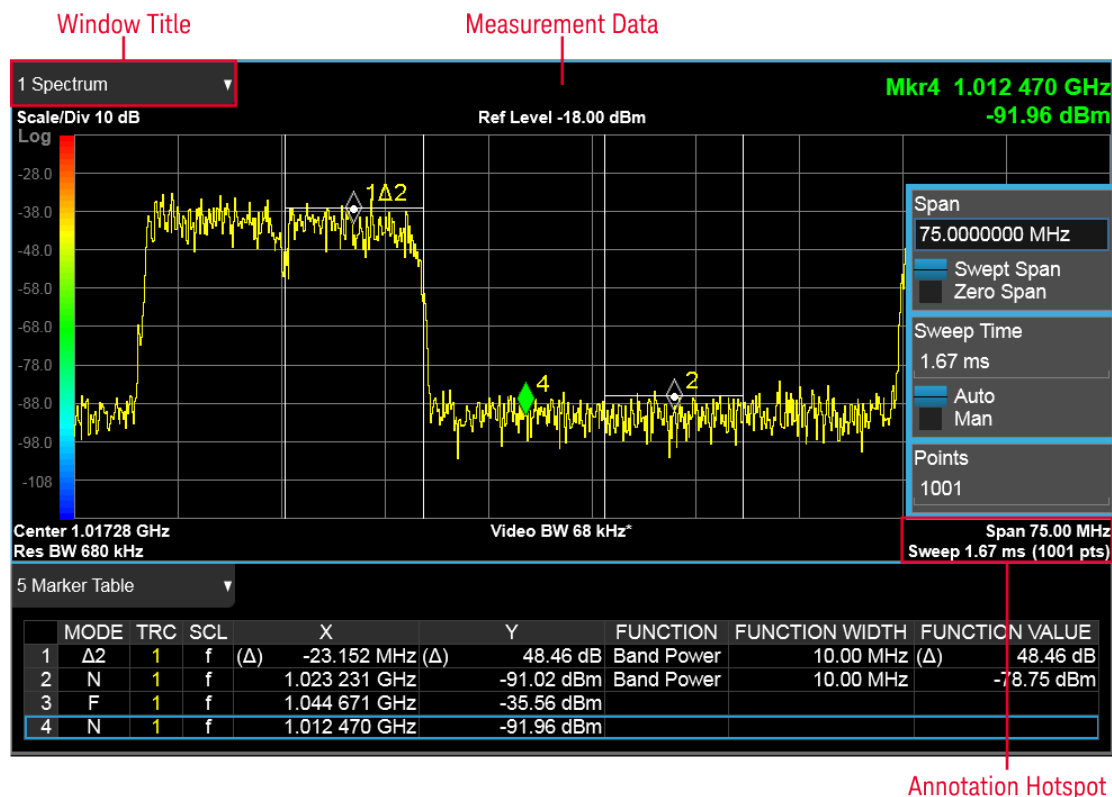

- The top row shows the Trace Number, in the trace color.
- The second row shows the Trace Type for each trace (W=Clear/Write, A=Trace Average, M=Max Hold, m=Min Hold); this letter is in white if the trace is Active, in gray if the trace is inactive; there is a bar through the letter if the trace is not being displayed
- The third row shows the detector for each trace (N=Normal, S=Sample, A=Average, P=peak, p=negative peak, Q=Quasi Peak, E=EMI Average, R=RMS Average, f=math function)

In the example above, trace 1 is active, visible, and in Average using the Sample detector, the other traces are inactive, blanked and in Clear/Write using the Normal detector.

Tapping this panel drops down controls for the Traces.

2.3 Measurement Display

The Measurement Display contains one or more data windows displaying the result of the current measurement. These may be graphical or textual windows.

Annotation Hotspot

Each window in the Measurement display contains a "Window Title" on page 113, "Measurement Data" on page 117, and graphical windows also may contain "Annotation Hotspot" on page 120.

The selected window in the Measurement Display is indicated by a blue border. Window-dependent controls in the menu panel always refer to the selected window.

2.3.1 Window Title

The Window Title appears in the upper left hand corner of the window, and includes a title describing the measurement data currently being displayed in the window. The title may also contain additional information about the data in the window, for example in the LTE measurement supplication, the component carrier being displayed in the window will be indicated (e.g., "CC0").

Measurements that support User Views (see "View Editor" on page 156) also display the Window Number in the Window Title, to enable window addressing from SCPI. The number is the number that will be used in the SCPI command to address that window, for example, in the WCDMA Mod Accuracy measurement, Code Domain Power is assigned window number 6, so you address it with the following SCPI command:

```
:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0
```

Note the arrow pointing down on the right side of the Window Title. This indicates that touching the Window Title will display a dropdown, which enables you to select the Measurement Data to be displayed in the window.

For example, if we wish to assign the results of the upper window in the display below to the Marker Table, we would touch the window title and then the "Data" control that is revealed, as shown:

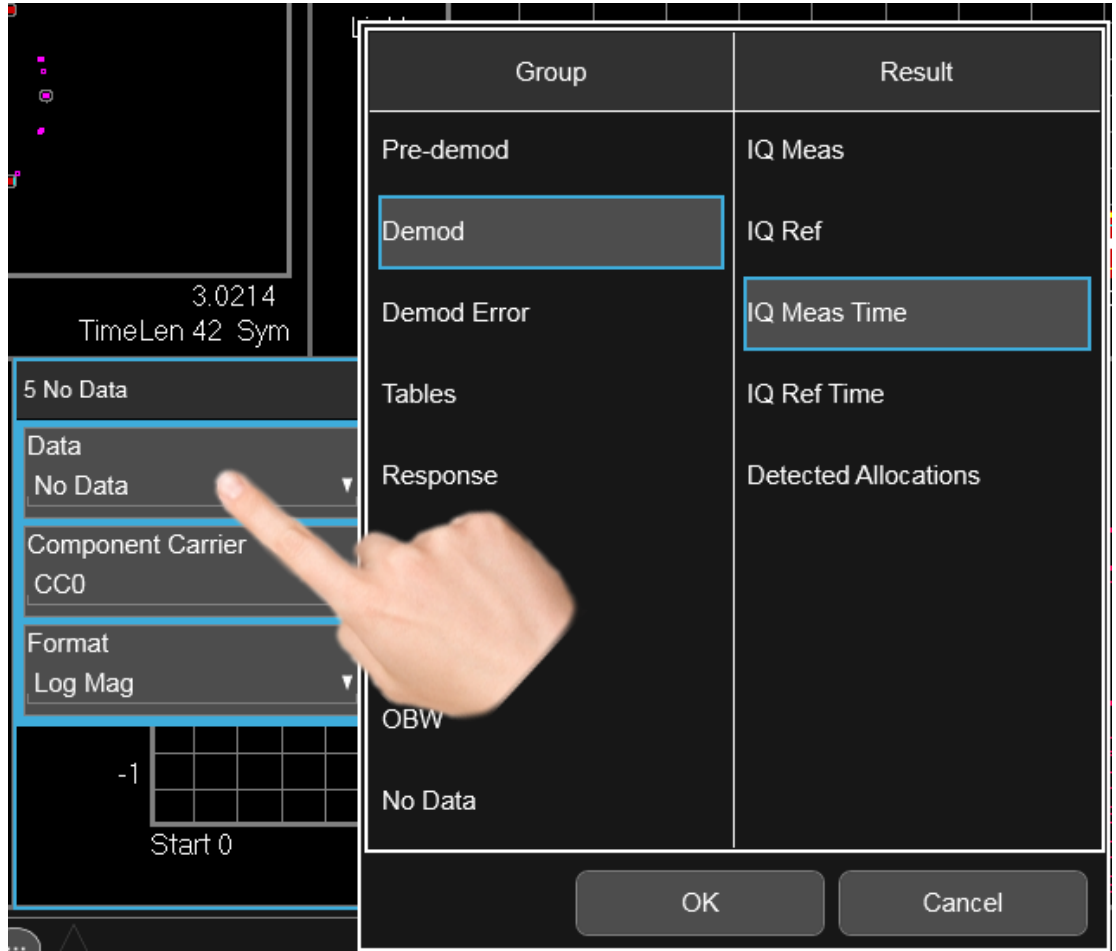

And then select Marker Table, yielding the result below:

2 User Interface
 2.3 Measurement Display

Note also that the Window Data dropdown can be a cascaded list, if the number of available results requires categorization to hold them all:

Note also that the Window Data dropdown sometimes includes controls for further configuring the window, for example, in LTE choosing the desired Component Carrier and Data format.

2 User Interface
 2.3 Measurement Display

Touching a window's title dropdown also selects the window.

2.3.2 Measurement Data

The Measurement Data region shows graphical or textual data for the Data selected in the Window Title Data control. Below you can see examples of both graphical and textual windows in a four-window display.

There are many gestures which you can use to interact with a measurement display window. They are detailed below.

Swipe

There are several swipe actions, as listed below. One of the most important actions is swiping a spectrum window to the left or right, or up or down, to adjust the frequency and level of the spectrum, as shown below.

Swipe actions are summarized in the table below. Not all of these may be available, depending on the measurement.

Object	Action
Spectrum Trace Left/Right	Drag trace (change Center Frequency)
Spectrum Trace up/down	Drag trace (change Ref Level)
Marker Left/Right	Drag marker along trace
Fixed Marker Left/Right/Up/Down	Drag marker in space
Scrollable area	Scroll vertically or horizontally. Scrollable areas include the Menu Panel (if overfull), tables and lists. A scrollable area is indicated by a vertical or horizontal translucent white bar which can also be dragged by a mouse When scrolling a table: <ul style="list-style-type: none"> – Row headers remain in place when the table is scrolled horizontally, and scroll with the table when the table is scrolled vertically – Column headers remain in place when the table is scrolled vertically, and scroll with the table when the table is scrolled horizontally

2 User Interface
 2.3 Measurement Display

Object	Action
Toggle control	Toggle in that direction

Pinch

You can also pinch in or out either horizontally or vertically to zoom in the x-axis or y-axis dimension. For example, a pinch horizontally lets you adjust the Span of the Spectrum window. Also, pinching on the wings of a Band Power or other Band Function allows you to widen or narrow that Band Function.

Pinching may sometimes be easier if you use the index finger of each hand, rather than pinching with one hand.

Touch-and-Hold

You can also touch-and-hold the display, that is, touch it and hold your finger on the display. A circle is drawn, and when the drawing completes, a right-click gesture is performed that depends on the screen feature touched, as listed in the table below.

Right Click on the Background	Lets you select Help
Right Click on a Menu Panel control	Lets you add or remove that control from the User Menu or get Help on that control

Tap

Tapping an object causes the actions defined in the table below:

Object	Action
Marker	Select
Marker (repeated taps on stacked)	Cycle through stacked markers
Trace	Select. In addition if Marker is the active function, move the selected marker to the point where you tapped
Trace (repeated taps on stacked)	Cycle through stacked traces
Window	Select if unselected
Screen	Select if unselected

Double Tap

Double-tapping an object causes the actions defined in the table below:

Object	Action
Window	Zoom/Unzoom

2.3.3 Annotation Hotspot

You can tap on a graticule annotation to modify one of the fields in that annotation. For example if you tap on the region with Center Freq and Res BW in it, a menu panel pops up with just those settings on it.

2 User Interface
2.3 Measurement Display

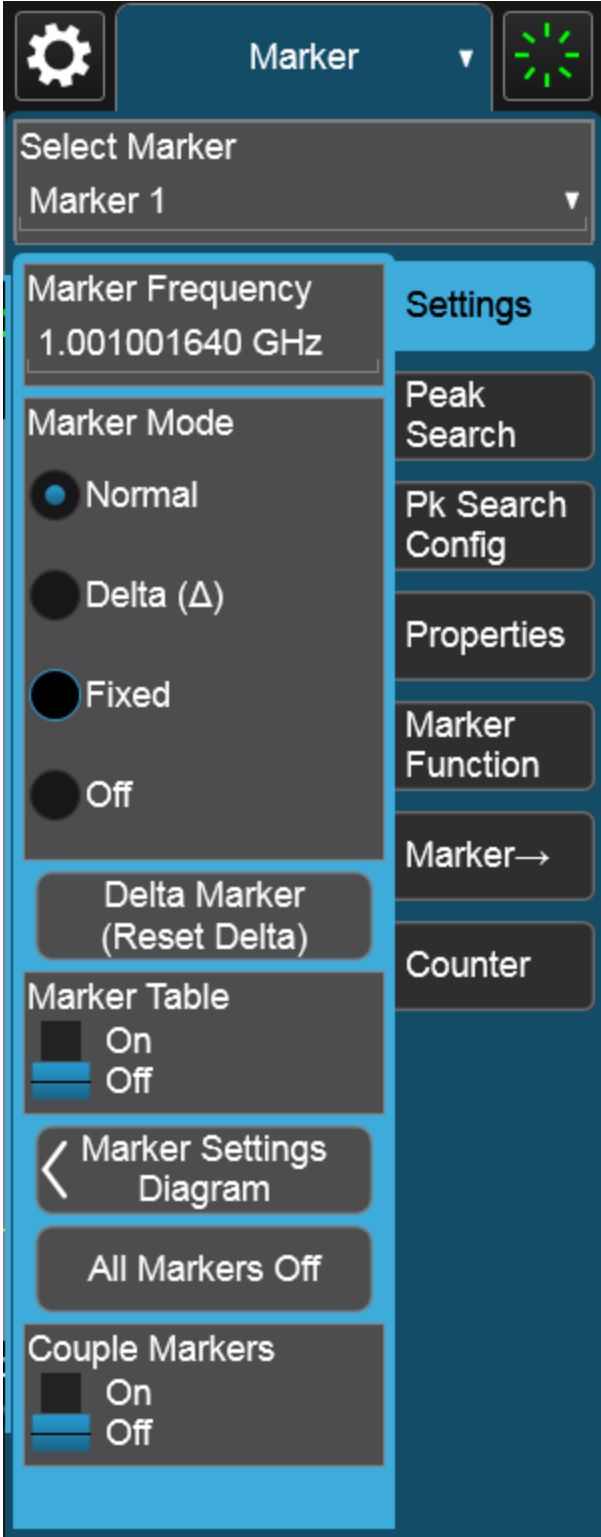

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

Annotation which is not currently able to be adjusted is not grayed out on the display, but the control in the hotspot that drops down or pops up is grayed out.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function

2.4 Menu Panel

The menu panel is the main focus of the X-Series Multitouch user interface. The controls include active functions, dropdowns, action buttons, radio buttons and toggles.

The menu panel normally appears on the right side of the display and consists of a rectangular panel with multiple “sub-panels” lying on top of each other, each sub-panel being accessed by a tab on the right.

You press a front panel key (or “hardkey”) to access a particular menu. On the front panel there are twelve “measurement hardkeys” (the ones in the shaded region in the figures below) – these are the hardkeys that open up menus in the menu panel.

With a menu open, tap a tab to access the controls on its sub-panel. Whenever you press the front panel key associated with a menu, the default (top) tab is selected.

If the number of controls on a panel exceeds the height of the panel, scrolling is enabled, which is indicated by a white bar on the left that fades away after a few seconds. You swipe up or down with your finger to scroll the panel, or you can grab the white bar with a mouse.

If you move to a different menu panel or sub-panel and then come back to a previous panel, the previous panel is always reset to be scrolled all the way back to the top.

Accessing Menus Without Using Front-Panel Keys

You can access the menu panels without using the front panel keys, as you would need to do if you were operating the instrument using Remote Desktop. Touch or click on the menu title, as shown below. A dropdown containing the twelve measurement hardkeys appears. Selecting a hardkey from the dropdown displays the corresponding menu, and the dropdown disappears.

Entering Numeric Values

Many controls on the menu panel allow you to enter numeric values. These are called “active functions.” An active function control displays a number and a suffix,

2 User Interface

2.4 Menu Panel

for example 13.255 GHz, as in the example below:

An active function is “active” if the numeric value is surrounded by a black background with a blue border, as below. In this state, it is ready to receive numeric input from the number pad on the front panel, the knob, or the step keys.

When an active function is in the active state, you can start typing or pressing the number keys on the front panel, which causes the Numeric Entry Panel to appear, as shown below. The Numeric Entry Panel displays the typed value, and the terminators to complete the entry.

Here we see a UXA with an active function control in the active state. Although no Numeric Entry Panel is displayed, you can just touch the “2” key:

This causes the Numeric Entry Panel to pop up to receive the numbers you are typing:

Type in as many digits as required, then touch one of the unit terminator buttons in the Numeric Entry Panel to complete the entry. In this case, 2 GHz was the desired entry, so you just touch the “GHz” terminator:

2 User Interface
2.4 Menu Panel

The Numeric Entry Panel disappears and, in the example, the active function value becomes 2 GHz.

It is important to note that you can always pop up the Numeric Entry Panel by touching an active function control while it is active; for example, if you were to touch it in the figure above, the Numeric Entry Panel would pop up right next to the control:

2 User Interface
2.4 Menu Panel

You can display the Numeric Entry Panel by touching any active function control while it is active, but you don't have to pop up the Numeric Entry Panel first, you can just start typing and it will pop up on its own, thus saving you a keystroke.

You can also adjust a value without displaying the Numeric Entry panel by turning the knob or using the step keys while an active function is active. If you turn the knob or use the step keys while the Numeric Entry Panel is displayed, it disappears, allowing you to see the entire screen while you are making the adjustment.

You can also drag the Numeric Entry Panel to another part of the display if it is covering something that you wish to see while it is on the screen.

2.4.1 Right-Click Menu

If you click with the right mouse button on any of the menus in measurements, a popup menu appears, which includes:

The items in this menu are:

- ["Add to User Menu" on page 132](#)
- ["Help on this setting" on page 132](#)

2.4.1.1 Add to User Menu

For details, see ["User Menu" on page 132](#).

2.4.1.2 Help on this setting

For details, see ["Help" on page 145](#).

2.4.2 User Menu

Lets you create your own menu, to include controls that you frequently use. You can have one **User Menu** for each measurement, and all User Menus survive a power cycle.

You add a control to the User Menu for the current measurement by right-clicking on the control, then selecting ["Add to User Menu" on page 132](#). You can also remove the control from the User Menu using the same right-click menu item.

User Menu appears at the bottom of the menu drop-down panel.

2.5 Cancel key

This front-panel key has the same functions as the Windows **Esc** (Escape) key. It does the following:

- Cancels dialogs
- Cancels active functions (unless there is an entry in progress, in which case it cancels that, and reverts to the previous value)
- Resets input overloads
- Aborts print operations
- Cancels certain other operations (such as alignments)
- Returns you to Local Control (if in Remote)
- If the backlight is off, turns on the backlight, and does nothing else

Most of this functionality is the same as earlier X-Series models and similar to ESA and PSA operation.

When the instrument is in Remote, any hardkey that is pressed on the front panel displays this message:

Analyzer is in Remote. Press ESC to return to Local

The exception is the **Cancel (ESC)** key, which takes the instrument out of Remote.

When the instrument is also in the LLO (local lockout state), the **Local** key is locked out as well. When this is the case, and the **Local** key is pressed, this message is displayed:

Local key is locked out by remote computer. Cancel Local Lockout on computer or release remote control

When you see this message, you should disconnect the remote computer, or use it to take the instrument out of the Local Lockout state.

2.6 Onscreen Keyboard key

This key turns the onscreen alpha keyboard (OSK) on and off.

There are two onscreen keyboards:

- The Multitouch OSK, which pops up automatically if, while using the analyzer application, a text field becomes the active function
- The Windows OSK, which you must open manually when a text field must be entered while interacting with Windows or other apps

2.7 Touch On/Off Key

This front-panel key turns the display touch functionality on and off. If off, you can turn it back on using the front panel **Touch On/Off** key. When the touch functionality is off, you can still use a mouse as a pointer.

When toggled, a dialog box appears midscreen that confirms “Touchscreen On” or “Touchscreen Off”.

This function remains in effect until it is turned off or until the app shuts down. The app always starts up with Touch enabled.

2.8 Tab key

This key has the same function as the **Tab** key on a PC keyboard. You can use this key to display the Windows Taskbar, as follows.

- Alt-Tab to the Desktop
- Touch the desktop
- Touch **TAB**
- The Taskbar appears

2.9 Local Button

Appears in the Menu Panel when the instrument is in remote, and can be brought back to local via the **Local (ESC)** Key. See also "[Cancel key](#)" on page 133.

2.10 Control Bar

The Control Bar contains controls and readouts that let you control instrument functions independent of the current measurement.

2.11 Windows

Pressing the Windows icon on the "Control Bar" on page 138 has the same effect as pressing the Windows icon on the Windows taskbar. It displays the Windows taskbar and Start Menu, which allows you to launch Windows programs and access features such as the Control Panel.

2.12 Undo/Redo

The Undo button in the "Control Bar" on page 138,

and the Undo front panel key,

Ctrl=Redo

are used to undo the most recently executed function.

If you Undo a function, and then decide you should not have done so, you can use the **Redo** button in the "Control Bar" on page 138 to put it back the way it was. The Redo function may also be executed by pressing **Ctrl+Undo** (holding the **Ctrl** key down while pressing the **Undo** front panel key).

Undo allows you to restore a setting, which you had previously set, back to its value before you changed it. When you press the Undo button or front panel key, the last setting you changed is "undone", that is, its previous setting is restored. You are notified of this fact with an advisory pop up message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would show:

UNDO: Center Freq 1 GHz -> 300 MHz

The instrument can store 5 levels of action for Undo.

To truly understand Undo and Redo, it helps to think of two "stacks", an Undo stack and a Redo stack,

UNDO stack

REDO stack

Whenever you perform an action, it is placed on the Undo stack. So for example, if you set the Center Frequency to 1 GHz, then set the RBW to 1 MHz, then set the Detector to Peak, each of these actions gets "pushed" onto the Undo stack:

2 User Interface
2.12 Undo/Redo

UNDO stack	REDO stack
Det = Peak RBW = 1MHz CF = 1 GHz	

When you press **Undo**, the top item on the Undo stack is removed, the action represented by that item is undone, and the item is placed on the Redo stack. So pressing **Undo** once in the above case would undo the setting of the peak detector, and the stacks would look like this:

UNDO stack	REDO stack
RBW = 1MHz CF = 1 GHz	Det = Peak

Now pressing **Undo** again would undo the RBW = 1 MHz action, and the stacks would look like this:

UNDO stack	REDO stack
CF = 1 GHz	RBW = 1MHz Det = Peak

Now pressing Redo would Redo the RBW = 1 MHz action, and the stacks would again look like this:

UNDO stack	REDO stack
RBW = 1MHz CF = 1 GHz	Det = Peak

Also, whenever you set a value, the Redo stack is cleared; you can't redo an action once you have interrupted the original flow of actions. Think of the Undo stack as the past, and the Redo stack as the future; if you have items in both stacks it means you have gone back to a time in the past; if you then *do* something you have changed the future, so the old future (the Redo stack) gets cleared.

For example, in the example above, if you now were to change another setting, such as VBW = 1 kHz, the Redo stack gets cleared, and the stacks would look like this:

UNDO stack	REDO stack
VBW = 1 kHz	
RBW = 1MHz	
CF = 1 GHz	

Undo can undo changes you make with the knob or step keys, however all contiguous events that affect the same parameter are aggregated into one event for the sake of Undo. For example, if CF is the active function and is 1 GHz, and you turn the knob back and forth, then enter a value, then use the step keys, when you press **Undo**, the instrument returns to CF = 1 GHz.

Actions that Cannot be Undone

There are some actions that cannot be undone, because these clear the Undo/Redo stack:

- Restore Mode Defaults clears the stack for that Mode in that Screen
- Sending SCPI commands clears the stack for that Mode in that Screen
- Loading a state file (including User Preset) clears the stack for that Mode in that Screen
- Deleting a Screen clears all the stacks in that screen
- Changing Views

Undo/Redo works within the context of a Mode. Each Mode in each Screen keeps its own record. Settings in the Control Panel or System Settings menus are not undoable.

There are several actions that may change many parameters. Among these are Auto Tune, and Adjust Atten for Min Clipping. After executing such a function, Undo sets all parameters back to their value before the function was selected. Auto Tune appears to be a single action, even though the instrument executes it in several steps.

Redo reverses the effect of the last Undo action, assuming that no other settings have been changed since the last Undo. Changing a setting after an Undo clears memory of all settings after that Undo, that is, it clears the Redo stack, as explained above.

2 User Interface

2.12 Undo/Redo

When you press the **Redo** icon or **Ctl** and the **Undo** hardkey, you are notified with an advisory popup message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would say:

UNDO: Center Freq 1 GHz -> 300 MHz

If you then press **Redo**, the message will say:

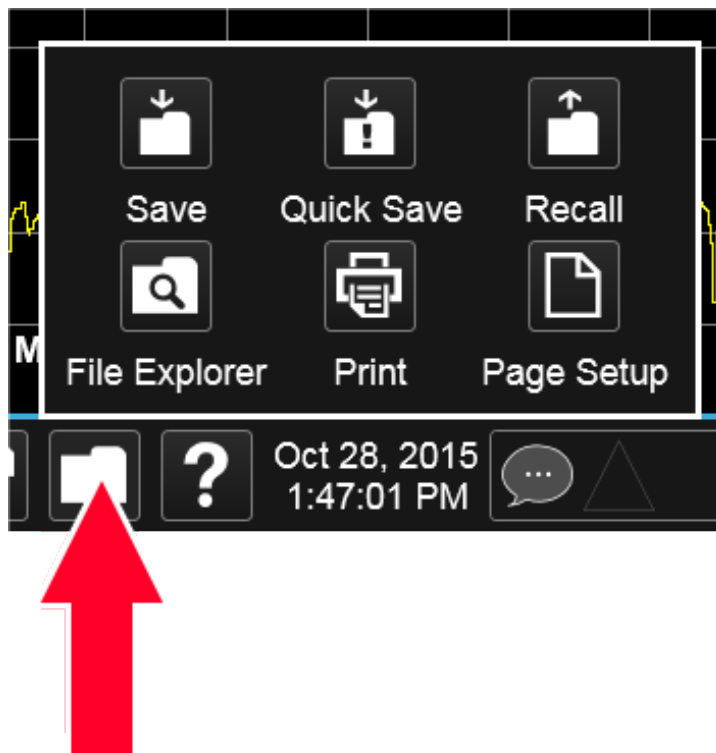

REDO: Center Freq 300 MHz -> 1 GHz

Neither **Undo** nor **Redo** perform any navigation, and have no effect on which menu panel is displayed nor which function is active.

2.13 File Functions

The File Functions popup contains controls for executing Save, Recall, File and Print operations. You display the File Functions popup by tapping the File Functions icon in the "Control Bar" on page 138.

For more information on a control, tap an icon in the image below.

Tapping this folder icon displays the File Functions popup

2.13.1 File Explorer

Pressing the File Explorer button in the "File Functions" on page 144 dialog opens the Windows File Explorer, which allows you to perform operating system file functions such as Move, Copy and Delete.

File Explorer also allows you to map network drives to drive letters on your PC or intranet, in order to more easily save screen images, states and other data, and load them back into the instrument.

2.14 Help

Pressing the **Help** button in the "[Control Bar](#)" on page 138, the **Help** front panel key, or the **F1** key if you have a PC keyboard connected, opens the context-sensitive help system. The **Help** button appears in the "[Control Bar](#)" on page 138 and in the banner of full-screen dialogs

You can also use the Help window's Contents pane to navigate to Help for any function in the instrument

You can also touch-and-hold a specific control to display a "right-click" menu, in which one of the choices is **Help on this setting**

2.15 Status Bar

The Status Panel (or Status Bar) appears at the bottom of the display and contains three fields:

The Message Balloon appears on the left side of the Status Panel and lets you know when there is an unread message in the queue.

No unread messages

Unread messages

The Message Balloon has a gray outline and no fill if there are no unread messages; it has a gray fill and a white outline and displays a white ellipsis in the middle if there are unread messages.

The Condition Indicator appears to the right of the Message Balloon and shows the current number of open conditions. Below are some examples of what the Condition Indicator can look like:

The triangle is unfilled if there are no open conditions, filled with yellow if all open conditions are warnings, and filled with red if at least one open condition is an error. The number displayed is the total number of open conditions.

Touching the Condition Indicator opens up the Show Status dialog (see below) with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

The Condition Message appears to the right of the Condition Indicator. In the example below, the Condition Message is “Align All, Now required”:

Warning condition messages display in yellow, error condition messages display in red.

If there is more than 1 open condition, the Condition Message cycles through the display of all of the open conditions, one at a time. Each message is displayed for 2 seconds, then the next for 2 seconds, and so on.

Show Status Dialog

The Show Status dialog appears if you tap anywhere in the Status Bar. Touching the Condition Indicator (the triangle in the Status Bar) opens up the Show Status dialog with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

Status	History					
	Type	ID	Message	Repeats	Time	
History		1064	Align Now All required - CLEARED		6:37:49 PM 2/24/2015	
Current Conditions		1301	Meas Uncal - CLEARED		6:37:37 PM 2/24/2015	
Settings		64	Align Now All required - DETECTED		6:36:59 PM 2/24/2015	
		301	Meas Uncal - DETECTED		6:33:27 PM 2/24/2015	
		1301	Meas Uncal - CLEARED		6:31:27 PM 2/24/2015	
		301	Meas Uncal - DETECTED		6:33:27 PM 2/24/2015	
		1141	Input Overload - CLEARED,ADC over range	47	1:07:56 PM 2/24/2015	
		141	Input Overload - DETECTED,ADC over range	47	1:07:56 PM 2/24/2015	
		780	No Peak Found		1:03:55 PM 2/24/2015	
			Informational		Warning	

Press any row for more info about that Message

Clear Message Queue

If the display fills up, scrolling is enabled just as in other X-Series Multi-touch UI displays.

The Status dialog automatically refreshes as new messages and conditions occur.

At the bottom of the screen is a Clear Message Queue button. This button clears all errors in all error queues.

Note the following:

- Clear Message Queue does not affect the current status conditions
- Mode Preset does not clear the message queue
- Restore System Defaults (Super Preset) will clear all message queues
- *CLS only clears the queue if it is sent remotely and *RST does not affect any error queue
- Switching Modes does not affect any error queues

See ["More Information" on page 149](#)

Remote Command `:SYSTem:ERRor[:NEXT]?`

Example `:SYST:ERR?`

Notes The return string has the format:

<Error Number>, <Error>

Where <Error Number> and <Error> are those shown on the Show Errors screen

Backwards
Compatibility
Notes

In some legacy analyzers, the Repeat field shows the number of times the message has repeated since the last time the error queue was cleared. In the X-Series, the Repeat field shows the number of times the error has repeated since the last intervening error. So the count may very well be different than in the past even for identical signal conditions

Unlike previous analyzers, in the X-Series all errors are reported through the Message or Status lines and are logged to the event queue. They never appear as text in the graticule area (as they sometimes do in previous analyzers) and they are never displayed in the settings panel at the top of the screen (as they sometimes do, by changing color, in previous analyzers)

As a consequence of the above, the user can only see one status condition (the most recently generated) without looking at the queue. In the past, at least in the Spectrum Analyzer, multiple status conditions might display on the right side of the graticule

In general, there is no backwards compatibility specified or guaranteed between the error numbers in the X-Series and those of earlier products. Error, event, and status processing code in customers' software will probably need to be rewritten to work with X-Series

In the legacy analyzers, some conditions report as errors and others simply turn on status bits. Conditions that report as errors often report over and over as long as the condition exists. In the X-series, all conditions report as start and stop events. Consequently, software that repeatedly queries for a condition error until it stops reporting will have to be rewritten for the X-series

More Information

The Status Dialog has two screens, selectable by the tabs on the right: **History** and **Current Conditions**:

History

History brings up a screen displaying the front panel message queue in chronological order, with the newest event at the top. Remember that the front panel queue contains all of the events generated by front panel actions as well as error events from all of the SCPI queues. A typical History display appears below:

Status	History				
History	Type	ID	Message	Repeats	Time
Current Conditions		301	Meas Uncal - DETECTED		5:36:35 PM 2/24/2015
Settings		1141	Input Overload - CLEARED;ADC over range	49	1:07:56 PM 2/24/2015
		141	Input Overload - DETECTED;ADC over range	49	1:07:56 PM 2/24/2015
		1141	Input Overload - CLEARED;ADC over range		1:07:53 PM 2/24/2015

 Informational
  Warning
  Error

Press any row for more info about that Message

Clear Message Queue

The fields on the History display are:

Type	Displays the icon identifying the event or condition as an error or warning
ID	Displays the error number
Message	Displays the message text
Repeat (RPT)	<p>This field shows the number of consecutive instances of the event, uninterrupted by other events. In other words, if an event occurs 5 times with no other intervening event, the value of repeat will be 5</p> <p>If the value of Repeat is 1 the field does not display. If the value of Repeat is >1, the time and date shown are those of the most recent occurrence. If the value of repeat reaches 999,999 it stops there. The Repeat field can run into some pretty large numbers when apps (like the GSM app) report things like “GSM sync burst not found” as events rather than conditions, which is actually fairly common</p> <p>Note that the repeat count is unavailable over SCPI</p>
Time	Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

To understand the History dialog, and to properly program the instrument's messaging system, remember that there are two types of occurrences, events and conditions:

- An event is an occurrence of zero duration. Events generate messages which are displayed in the center of the display for a period of time and then fade away. These may be of an advisory nature or may represent errors, for example “No

peak found”

- A condition is an occurrence of finite duration, that is, it has a start and an end. Conditions are states of the analyzer characterized by some combination of settings or some kind of failure that the user needs to be told about while it is happening, but then can stop being told once it goes away; for example “Input overload; ADC over range”

The error queue contains error events as well as the DETECTED and CLEARED events for condition errors, as seen in the figure above.

DETECTED events have numbers less than 1000 and CLEARED events have the same number plus 1000. For example,

301, Meas Uncal – DETECTED

and later

1301, Meas Uncal – CLEARED

To detect a condition error over SCPI, you should read the error queue and note any DETECTED error which is not followed eventually by an associated CLEARED error. This means the condition is still in effect. It is not sufficient to simply read the error queue until you get “No Errors” back. You may still have the condition error; the condition may still be in effect, and if that is the case, all you have done by clearing the error queue is to remove the first event (the DETECTED event) from the queue. For a condition error, you have to read the error queue until you see the CLEARED event for that condition. THEN you know that the condition is gone.

Current Conditions

The **Current Conditions** display shows all of the open conditions in the instrument. An open condition is a condition error or warning for which a start (detected) event has occurred but for which no corresponding stop (cleared) event has occurred.

An example of the Current Conditions screen appears below:

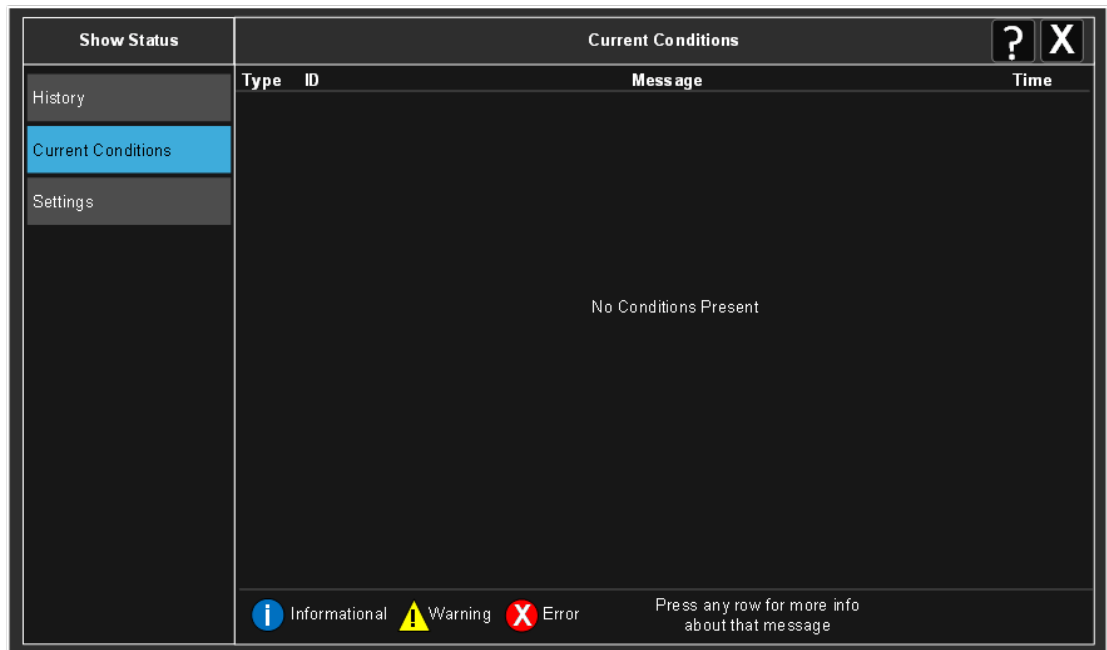

The fields on the Current Conditions display are:

- Type** Displays the icon identifying the event or condition as an error or warning or informational
- ID** Displays the error number
- Message** Displays the message text
- Time** Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

Touching a condition message expands the display of that message. Touching again collapses it. The description is the same as the one that appears on the message dialog. An example of this is shown in the History section, below.

When there are no open conditions, the display is as shown below:

2 User Interface
2.15 Status Bar

2.16 Block Diagram

When you press the Block Diagram button in the "Control Bar" on page 138, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

When you press the Block Diagram button, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

While in the Block Diagram display, the button is blue colored, as:

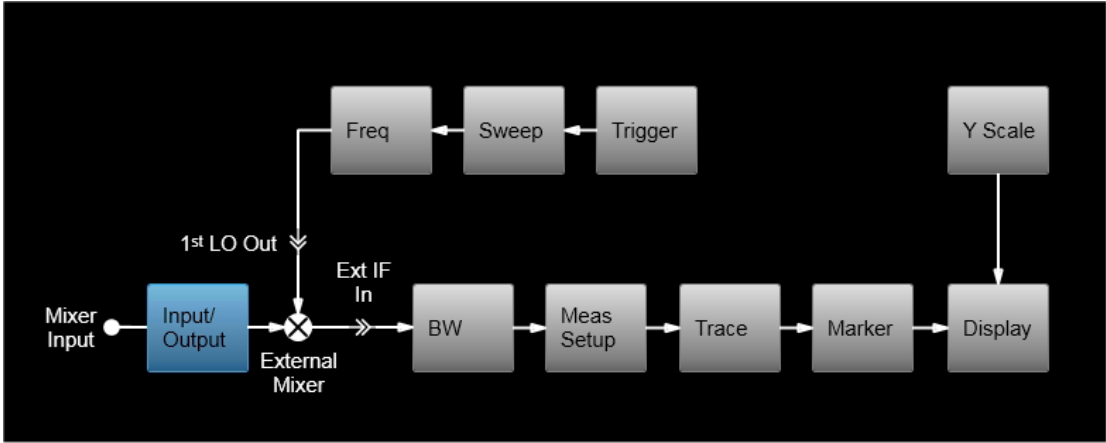

To exit the Block Diagram display, tap the button again.

The Block Diagram display is not meant to be a completely accurate representation, but one which can show differences as you change the hardware setup. For example, here is the basic RF Block Diagram:

And here is the Block Diagram when External Mixing is selected:

2 User Interface
2.16 Block Diagram

And here is the Block Diagram when the I/Q inputs are selected:

2.17 View Editor

This section describes the use of the View Editor, which allows you to:

- Add windows to and delete windows from the current measurement
- Resize and rearrange windows
- Create User Views

User Views are custom Views that you create by adding, deleting, rearranging, resizing, or changing the contents of the windows in an existing View, and then saving the edited View as a new View. The instrument lists the current User Views for a measurement after the Predefined Views, in the Mode/Meas dialog and on the View menu panel under Display:

ent	View
	Basic Meas Summary RB Slot Meas Subcarrier Meas MIMO Summary Cross Carriers Summary
	User View
	My New View

You can save an edited View using the **Save Layout as New View** control in the View menu (see ["To Save a User View" on page 170](#)).

On occasion, the instrument may automatically save an edited View for you. If you have edited a View, so that the * is displaying next to the View name, you must save that View as a User View before you save State or switch measurements. If you forget that you have made changes to a View, then to keep from losing your edited View when you switch measurements, the instrument will save it for you. If you have an edited View that has not been saved and you try to do any of the following:

- Enter the "Save" menu
- Switch Measurements
- Switch Modes
- Switch Screens

the edited view will be saved for you with the name "Autosaved". When this happens, you will receive the following message:

If an Autosaved User View already exists, the User View called "Autosaved" will be overwritten with the currently edited view. If you have multiple edited views, the selected edited view will be Autosaved. If there is not an edited view selected the last selected edited view will be Autosaved.

To Open the View Editor

Pressing the View Editor button (shown above) in the ["Control Bar" on page 138](#), at the bottom right of the screen, opens the View Editor.

While in the View Editor, the icon is blue colored, as:

Pressing the View Editor button again exits the View Editor.

To Close the View Editor

Tap the View Editor button again.

The user chooses the desired View through the use of the Mode/Meas/View dialog (see ["Mode/Meas/View Dialog" on page 90](#)) or the View menu (a tab under the **Display** key). The View menu allows the user to browse the views in the current measurement. The View menu contains a list of Predefined Views for you to use. If you wish to modify a Predefined View or create your own, new View, you use the View Editor.

User Views & Predefined Views

A User View is any View that is not in the list of predefined Views for the current measurement. For example, the Swept SA measurement has four predefined Views: Normal, Spectrogram, Zone Span, and Trace Zoom.

User Views allow you to add, delete, change and rearrange the windows of a predefined View, creating a new custom view.

2.17.1 To Create a User View

Whenever you add or delete a window to/from a predefined View, or change what is being displayed in a Predefined View's window, the Predefined View is marked with an asterisk (*), to show that it has been modified.

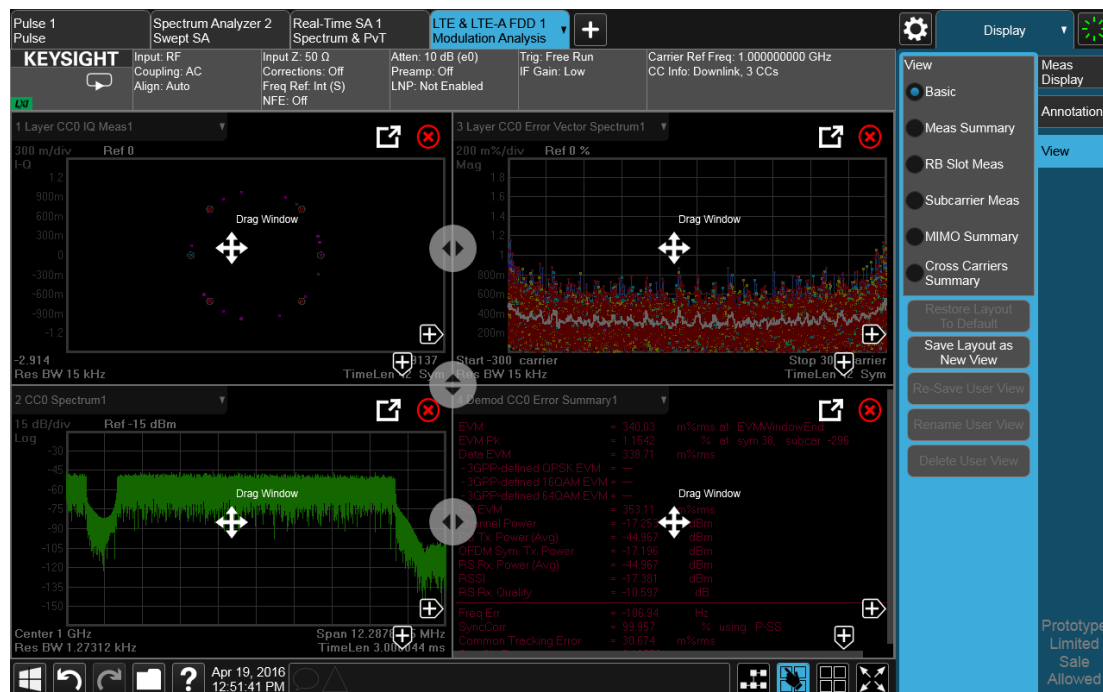

For example, to edit the View shown below, you press the Edit View icon.

2 User Interface

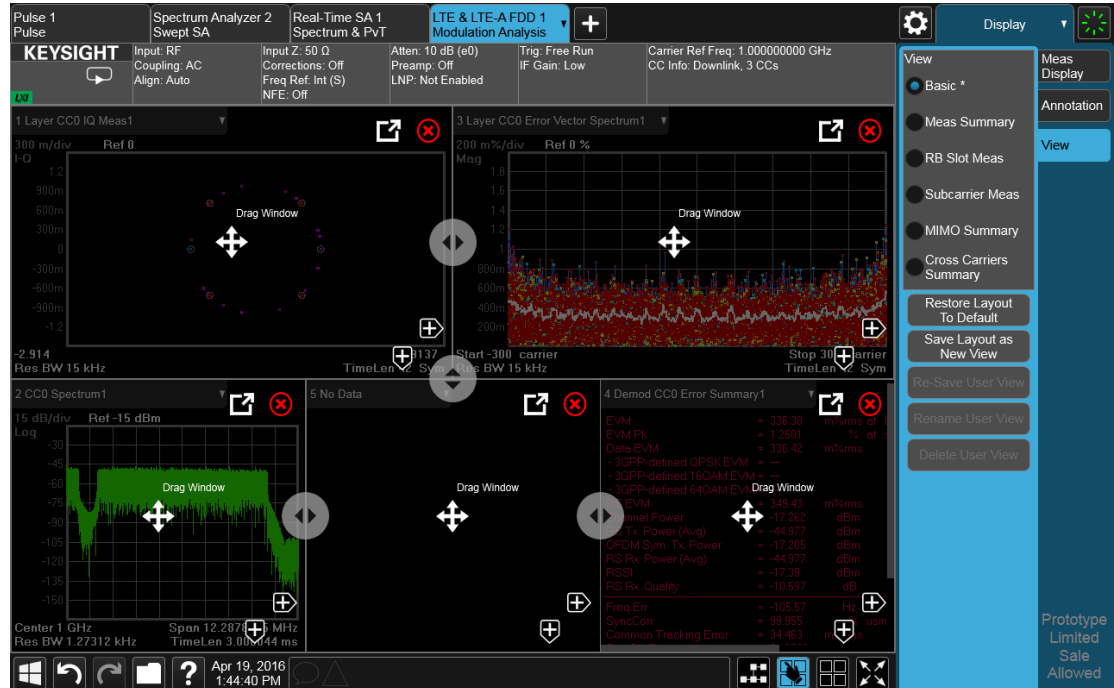

2.17 View Editor

When you do this, you get the View Editor screen, which appears as below. The menu panel switches to the View menu. Here we see that we are in the Predefined View called “Basic”.

Each window has two arrows containing + signs. Pressing either of the “+” symbols adds a new window on that side. For example, let’s say you press the + symbol on the right of the lower left window:

You would then see this:

A fifth window has been added, and is automatically assigned the number 5. (The window number, which is displayed in the Window Title region, is used when sending SCPI commands to that window).

Note the * that now appears next to Basic in the View menu, indicating that you are now in the **modified** Basic View. You see the * if you add, delete or rearrange windows, but simply resizing windows does not display the *. The * means you are in a modified View, which must be saved as a User View before you leave the measurement (if you don't save it, the instrument will save it for you).

Note also that the Restore Layout to Default control is no longer grayed out. If you press this control it restores the Basic View to its default state. Restore Layout to Default becomes available when you add, delete or rearrange windows **and** when you resize them; otherwise it is grayed out.

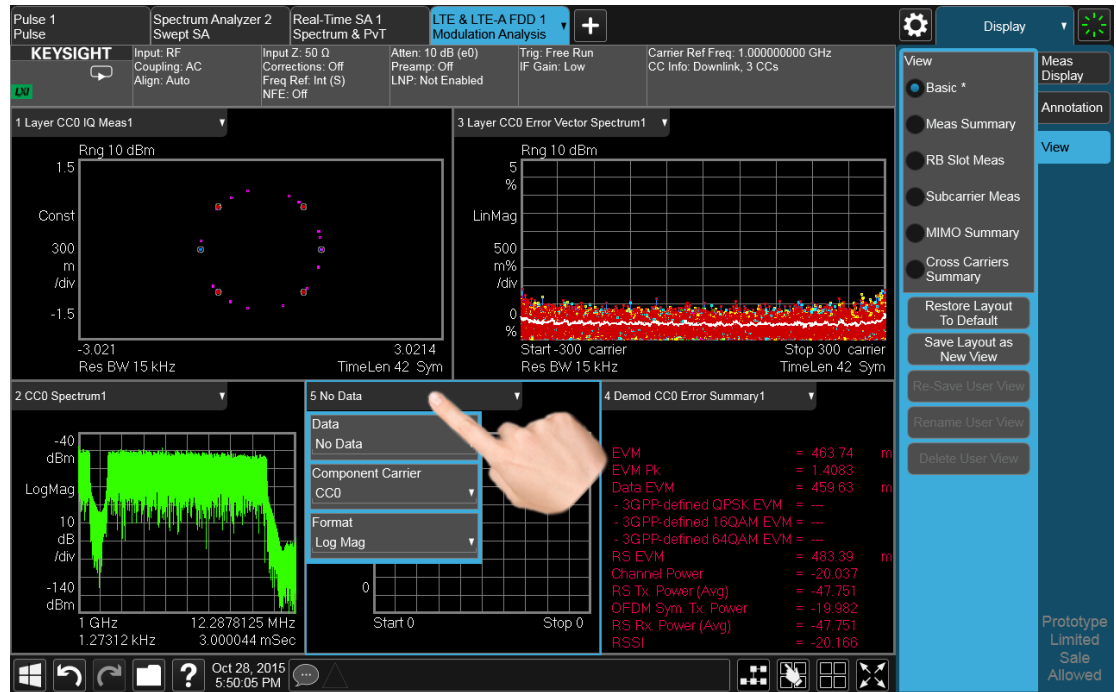

You can add more windows with the “+” arrow symbols. Note that the “+” arrow symbols only appear if the current measurement has more windows available to display. If you are already displaying all the measurement's windows, the “+” symbols disappear.

You can exit the View Editor by again tapping the Edit View icon.

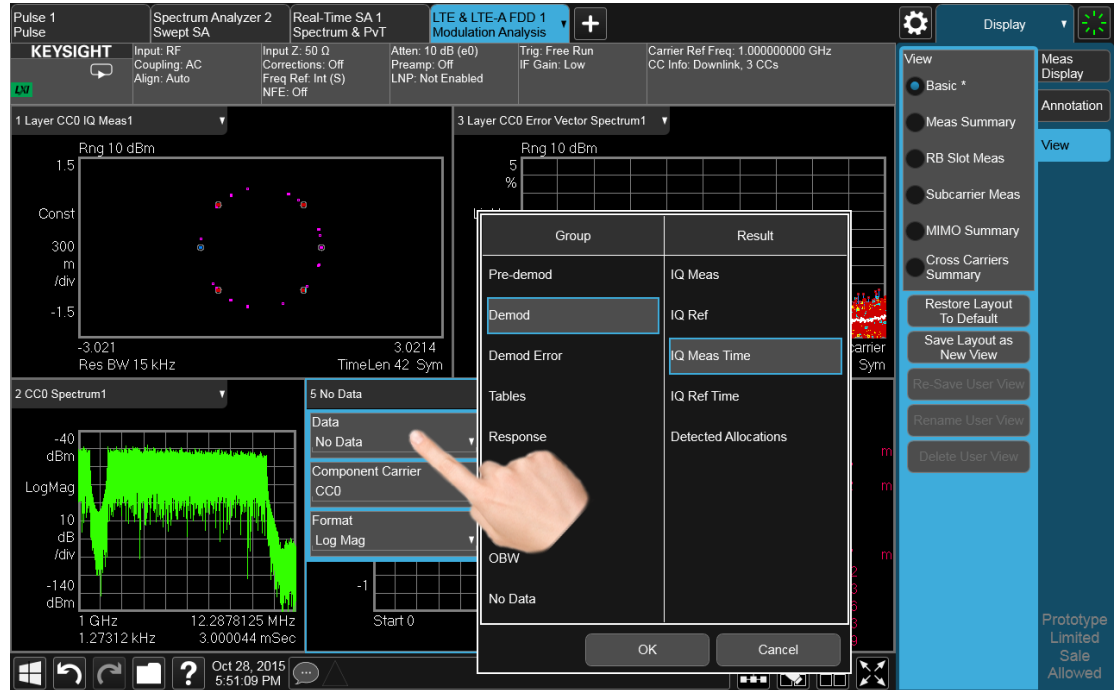

You can specify which result you want to see in the new window by tapping its title region.

2 User Interface

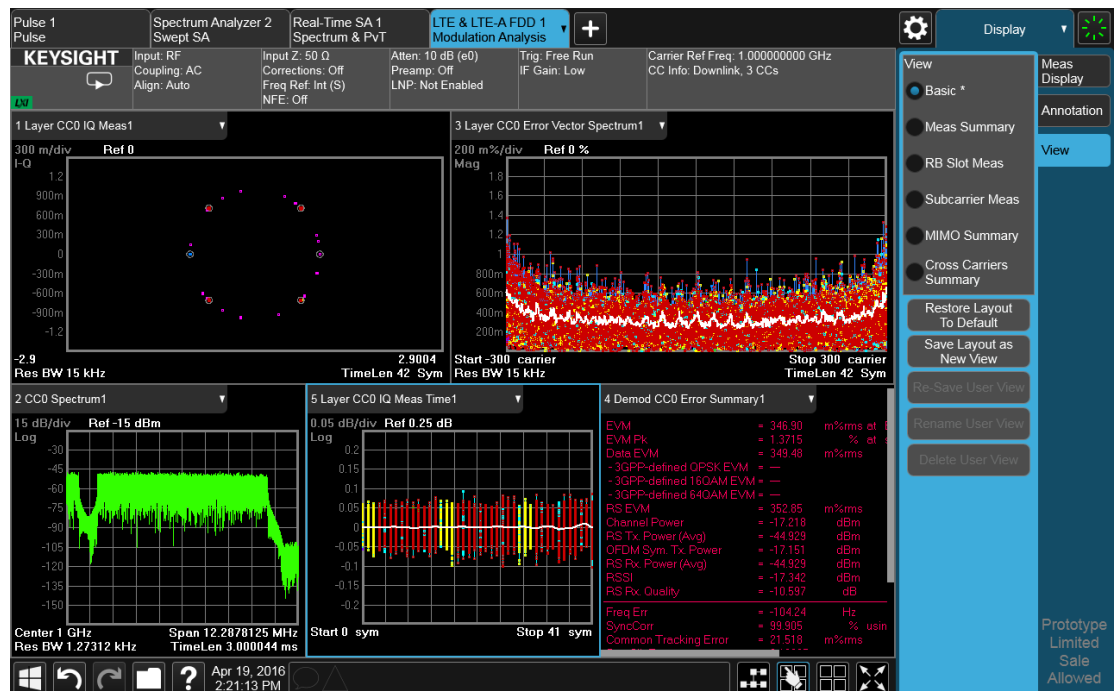

2.17 View Editor

A panel drops down, containing a Data control for specifying window results. Some measurements, such as LTE-A in this example, also provide controls on this dropdown for specifying other window parameters, such as the Component Carrier and Data Format, Tap the Data control and you will see a list of available results for the window. In some cases, as in LTE-A, this will be a cascading list, due to the number of results available:

Choose the result you want and tap OK. Here we have chosen IQ Meas Time from the Demod group:

Your new, edited User View is now ready to use.

2.17.2 To Resize or Rearrange Windows in a View

Sometimes you may wish to resize a window. To do this go back into the View Editor and note the large, translucent white circles along the edges of the draggable borders. These are the “resize handles”. You can resize the windows by dragging these handles. Note that in their quiescent state they are slightly translucent; when you touch one it turns solid white, indicating that it is draggable. If you touch and drag one of them it moves the axis to which it is attached.

Another feature that comes with the View Editor is the ability to move windows around. You do this by dragging the four-arrow objects in the center of the window; the whole window goes along. Actually you can touch and drag anywhere in the window (except on one of the arrows or the delete circle) and it will drag, but the four-arrow objects give you an indication and a convenient finger target.

The outline of the window appears as it is being dragged. When you start to drag a window, target symbols appear in the other windows:

If you drop a window on one of the targets, it swaps positions with the target window. If you drag a window's center into another window, green stripes appear on the edges to show you where the window will go when you release it:

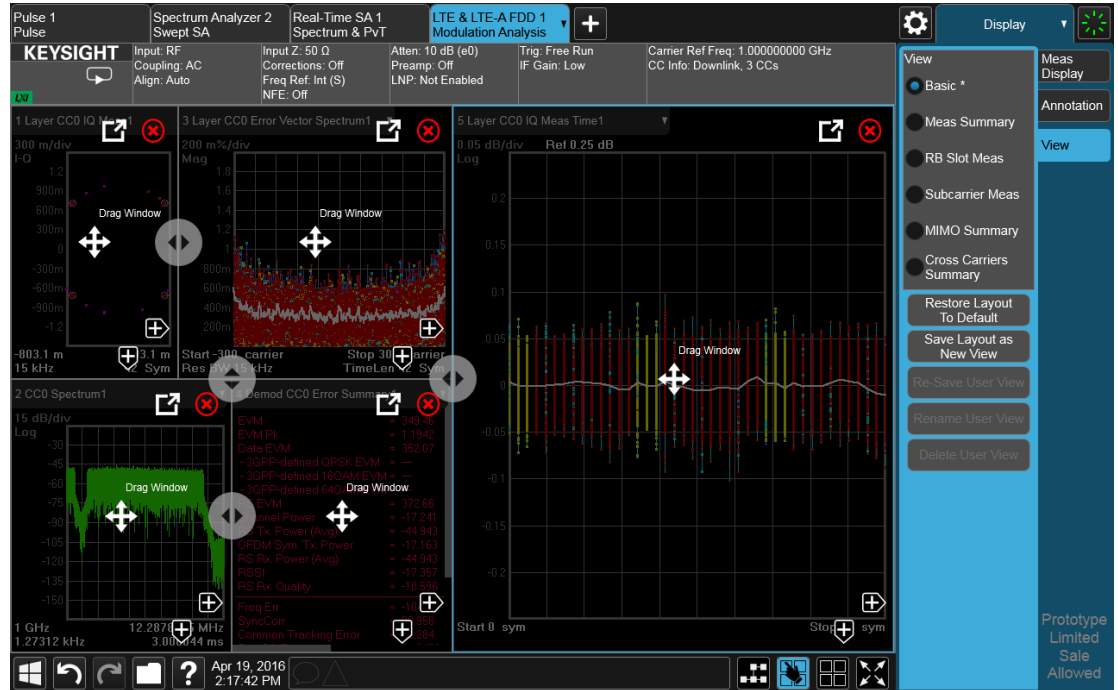

2 User Interface

2.17 View Editor

When you hover over one of the stripes it gets dimmer, to show the position the window being dragged will take on. If you release a window over an inner stripe, the window you are dragging and the window over which you were hovering resize to share the space the target window originally occupied. If you release a window over an outer stripe, as shown below, the window you are dragging takes on a new position outside the array of other windows:

In either case, one or more of the remaining windows resize to occupy the space formerly occupied by the window you were dragging.

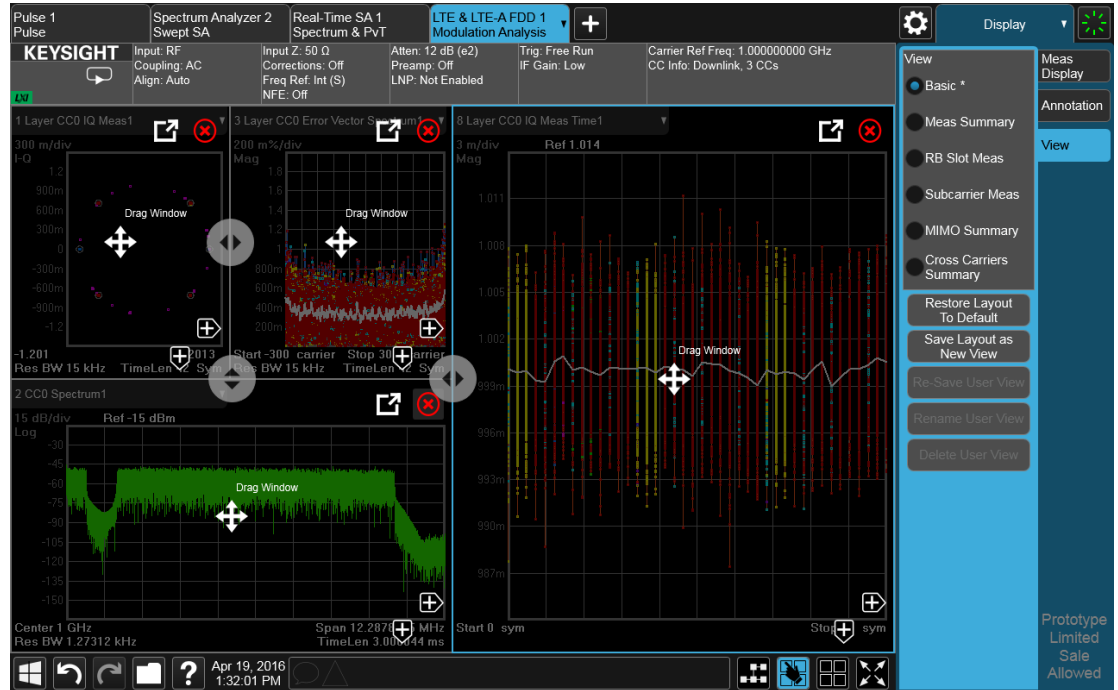

2.17.3 To Delete a Window from a View

The View Editor also lets you delete a window. To do this, tap one of the circled red X's, as shown below.

There has to be more than one window for you to see the circled red Xs.

2 User Interface

2.17 View Editor

Now press the View Editor button (the blue hand) to exit the View Editor. At this point, you have an edited Predefined View, as shown by the * next to Basic:

When you are finished with it, you can restore the Layout to the default for Basic by pressing “Restore Layout to Default”. Or you can save your edited View as a “User

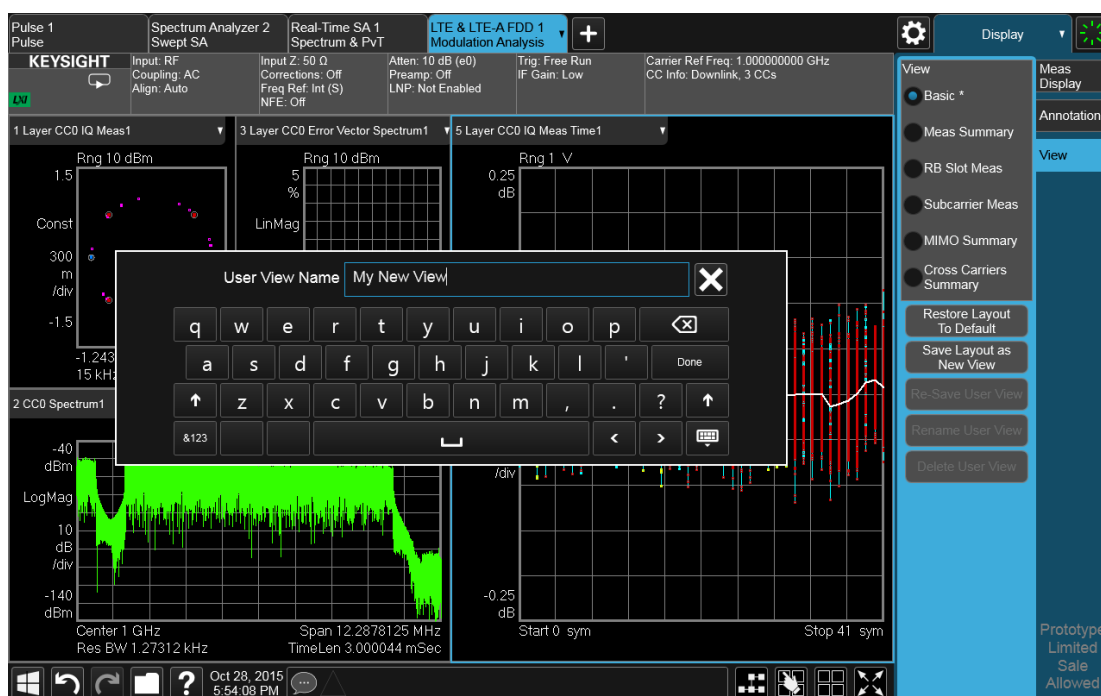

View” (if you exit the measurement without saving the edited View, the instrument will save it for you as a User View called “Autosaved”).

If you clone the current Screen by pressing the “+” tab, the modified Predefined View will be saved as a User View called “Autosaved”, and it will be available in the new Screen.

2.17.4 To Save a User View

See also "[Transferring User Views Between Instruments](#)" on page 172

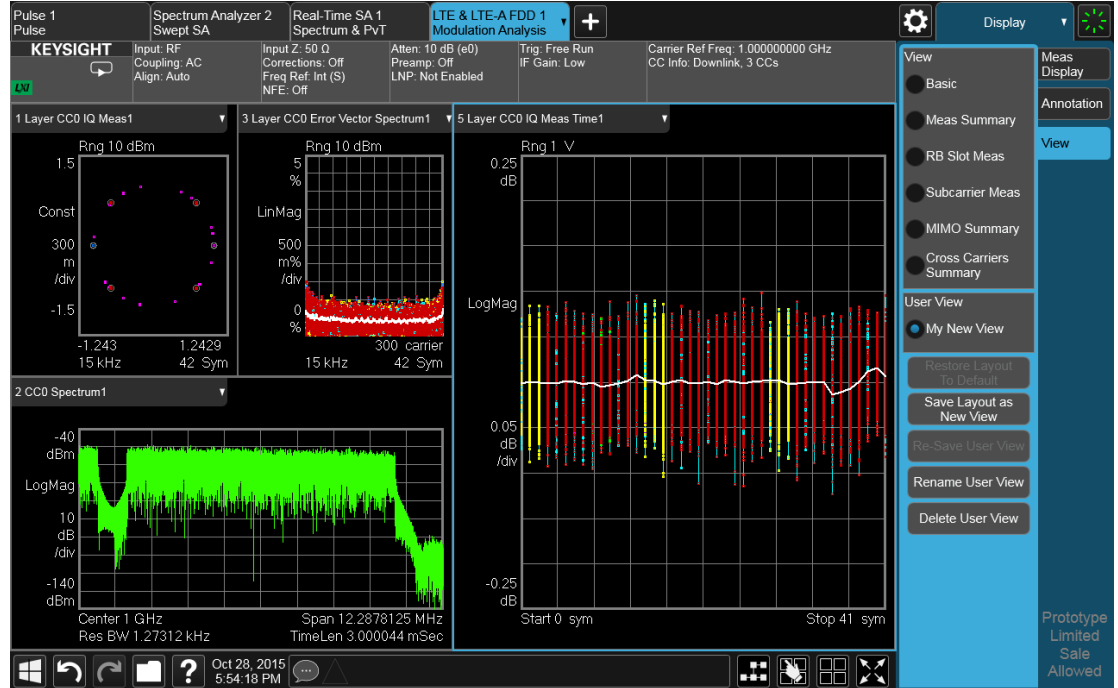

To save your new View as a User View, tap the “Save Layout as New View” control. You will get an alpha keyboard that lets you name your new View; the default is the old View name with a number. Below, we have typed in “My New View”:

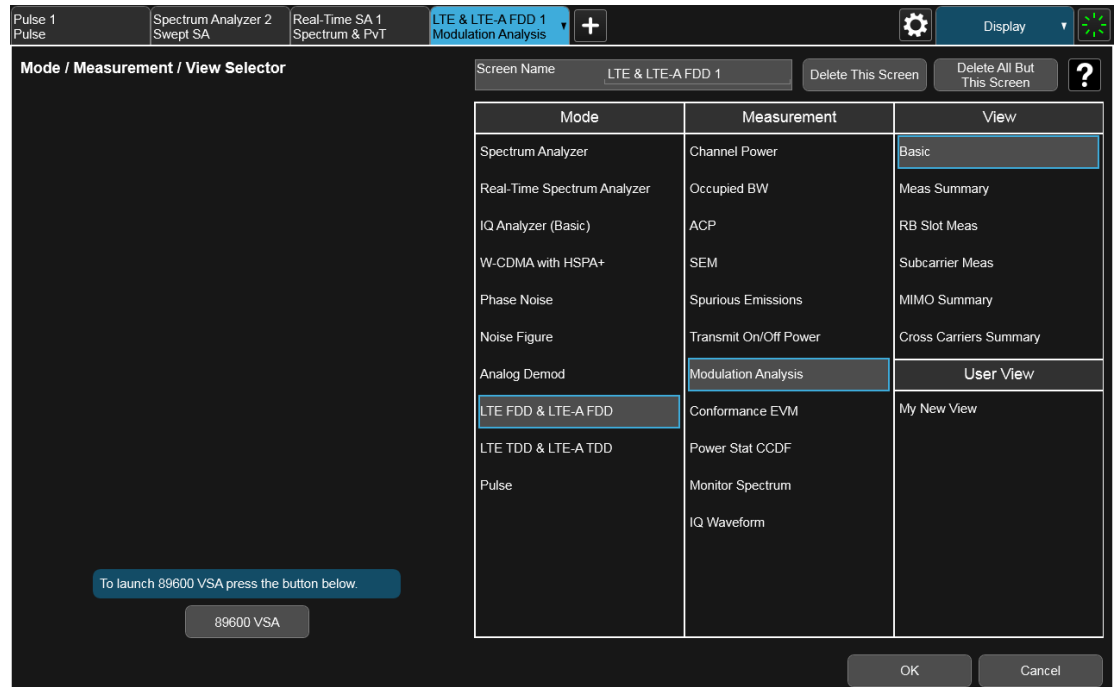

When you tap “Done”, the View is saved:

2 User Interface

2.17 View Editor

Notice the User View region which has appeared on the menu panel above, with the new User View called “My New View. Notice also that “Basic” has returned to its original, unedited state and the * is gone from its name. Note also that “Restore Layout to Default” is grayed out. Note also that if you go to the Mode/Meas dialog, you will see the User View there as well:

When naming a new View, you must choose a name that is not already in use for any User View in any measurement; this is because User Views get written to permanent memory and are available to all instances of the Measurement in any screen. They survive a Mode Preset and also survive shutdown and restart of the application.

Transferring User Views Between Instruments

To transfer a User View to another instrument, you must copy the desired file to a portable drive or to your network and then copy it to the target instrument.

When you save a User View, a file is created (or updated if it already exists) containing all the User Views for the current measurement. All of these files are saved on the D: drive in the instrument, in the folder:

`D:\Users\Instrument\My Documents\UserViews`

(assuming you are logged in as Instrument, which is the default).

Look for the file for your measurement. The file naming convention is:

`ModeName.MeasName.layout`

Where **ModeName** is the long-form SCPI parameter for the `:INST:SEL` command for your Mode, and **MeasName** is the long-form SCPI parameter for the `:CONF` command for your Measurement.

For a full list of all **ModeName** parameters, see **Index to Modes** in "Mode" on page 91.

The following is a full list of all **MeasName** parameters.

Measurement Name	SCPI ID
ACP, Adjacent Channel Power	<code>ACPower</code>
AM	<code>AM</code>
AM Depth	<code>AMD</code>
Amplitude Probability Distribution	<code>APD</code>
Audio Distortion	<code>AUDDist</code>
Audio Frequency	<code>AUDFreq</code>
Audio Level	<code>AUDLevel</code>
Audio SINAD	<code>AUDSinad</code>
Automatic Direction Finder	<code>ADF</code>
Channel Power	<code>CHPower</code>
Code Domain	<code>CDPower</code>
Combined GSM	<code>CGSM</code>
Combined WCDMA	<code>CWCDma</code>
Complex Spectrum	<code>SPECTrum</code>
Conformance EVM	<code>CEVM</code>
Custom OFDM	<code>OFDM</code>

2 User Interface
2.17 View Editor

Measurement Name	SCPI ID
Digital Demod	DDEMod
Disturbance Analyzer	DANalyzer
EDR In-band Spurious Emissions	IBSPurious
EVM	EEVM
Fast Capture	FCAPture
Fast Spectrum	FSPectrum
FM	FM
FM Deviation	FMDeviation
FM Stereo	FMStereo
Frequency Counter	FCOunter
Frequency Scan	FSCan
GMSK Phase & Freq Error	PFERror
Group Delay	GDELay
Harmonics	HARMonics
HRP UWB Demodulation	HUWB
Instrument Landing System	ILS
IQ Waveform	WAVEform
LE In-band Emissions	IBEMissions
List Power Step	LPSTep
List Sequencer	LSEQuencer
List Sweep	LIST
Log Plot	LPLot
LoRa (CSS) Demodulation	LORA
Marker Beacon	MBE
Mod Accuracy	RHO
Modulation Analysis	EVM
Modulation Distortion	MODDist
Modulation Rate	MODRate
Modulation SINAD	MODSinad
Monitor Spectrum	MONitor
Noise Figure	NFIGure
Occupied BW /	OBWidth
Output Spectrum BW	
Output RF Spectrum	EORFspectr
Phase and Amplitude vs Time	PAVTime

Measurement Name	SCPI ID
PM	PM
PM Deviation	PMDeviation
Power Amplifier	PAMplifier
Power Control	PCONtrol
Power Stat CCDF	PStatistic
Power vs Time	EPVTime
Pulse	PULSe
QPSK EVM	EVMQpsk
Real Time Scan	RTSC
RF Power	RFPower
SEM	SEMask
Spectral Flatness	FLATness
Spectrum & PVT	RTSA
Spot Frequency	SFRequency
Spurious Emissions	SPURious
Streaming	STReaming
Strip Chart	SCHart
Swept SA	SANalyzer
TOI	TOI
Transmit Analysis	TX
Transmit On/Off Power	PVTime
Transmit Power (Burst Power)	TXPower
Tuned RF Level	TRFLevel
Tuned RF Level with Tracking	TTRF
Tx Band Spur	ETSPur
VHF Omni-Directional Range	VOR

Examples:

- The User View file for the Swept SA measurement is [SA.SANalyzer.layout](#)
- The User View file for the ACP measurement in the WCDMA mode is [WCDMA.ACPower.layout](#)

Copy the desired file to a thumb drive or to your network. Then go to the target instrument and copy the file into the [D:\Users\Instrument\My Documents\UserViews](#) directory on that instrument (again, assuming you are logged in as Instrument).

Note that copying this file to another instrument will overwrite the file already in that instrument, if any, and will destroy any User Views that might have been created on that instrument.

Note that when you delete the last User View for a measurement, the file is removed.

2.17.5 To Rename a User View

You can rename a User View by selecting that View and tapping “Rename User View.” You can also re-edit a User View; if you do this, an asterisk will appear next to the User View’s name. You can then tap “Re-Save User View to save it back to its existing name, or “Save Layout as New View” to add another, new User View.

2.17.6 To Delete a User View

You can delete a User View by doing the following:

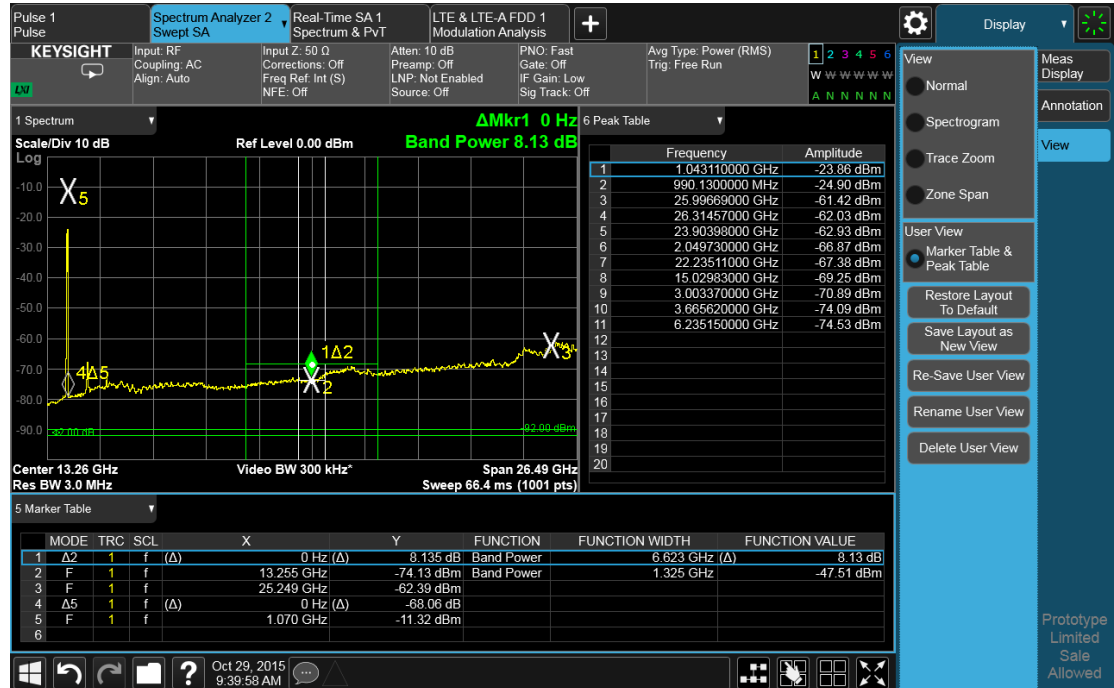

1. From the **"Mode/Meas/View Dialog"** on page 90, or from the **View** menu, select the User View that you want to delete
2. Switch to the **Display** menu
3. Select the **View** tab
4. Tap **Delete User View**

2.17.7 To Delete All User Views

You can delete all User Views by tapping “Delete All User Views.” The default view becomes the current view for the Measurement if a User View was the current view when this control was pressed.

2.17.8 Use Case: Displaying Marker and Peak Tables

One common application for User Views is to create a View that allows the Spectrum Analyzer to display both a Marker Table and a Peak Table at the same time. To do this, simply add a Marker Table Window and a Peak Table window to the Spectrum window of the Swept SA measurement. The result is shown below; note that the new View has been named “Marker Table & Peak Table”:

NOTE: There are legacy displays like Marker Table, Peak Table, Measure at Marker and Gate View, which are not Views but special display modes. These are retained for backwards compatibility, however they are turned on and off with switches and do not use the View system. Turning on one of these switches does not create a modified View, it merely adds the specified window to the current View; turning the switch back off removes the window. While the switch is on, NO View shows as selected in the View menu. These switches are grayed out if you are in a modified View or a User View. Since only one of these switches can be on at a time, and because these switches turn off on a Preset, User Views offer a superior way of adding windows than using the switches.

Some measurements do not support User Views; these do not allow adding, deleting or rearranging windows, however they do allow resizing windows. In these measurements you can get into the View Editor but the Add icons, Delete icons and Move icons will not appear. You can still resize the windows and in some cases (e.g. Noise Figure) you can still change window contents.

2.17.9 View Editor Remote Commands

Remote Commands for User Views can be found in the documentation for the Display, View tab.

2.18 Multiscreen

You can configure up to 16 different Screens at a time. Normally, you only see one Screen, and the set of configured screens is shown across the top of the display in a series of "Screen Tabs" on page 89. Touching any screen's tab brings it to the foreground, makes it the current Screen and starts it updating.

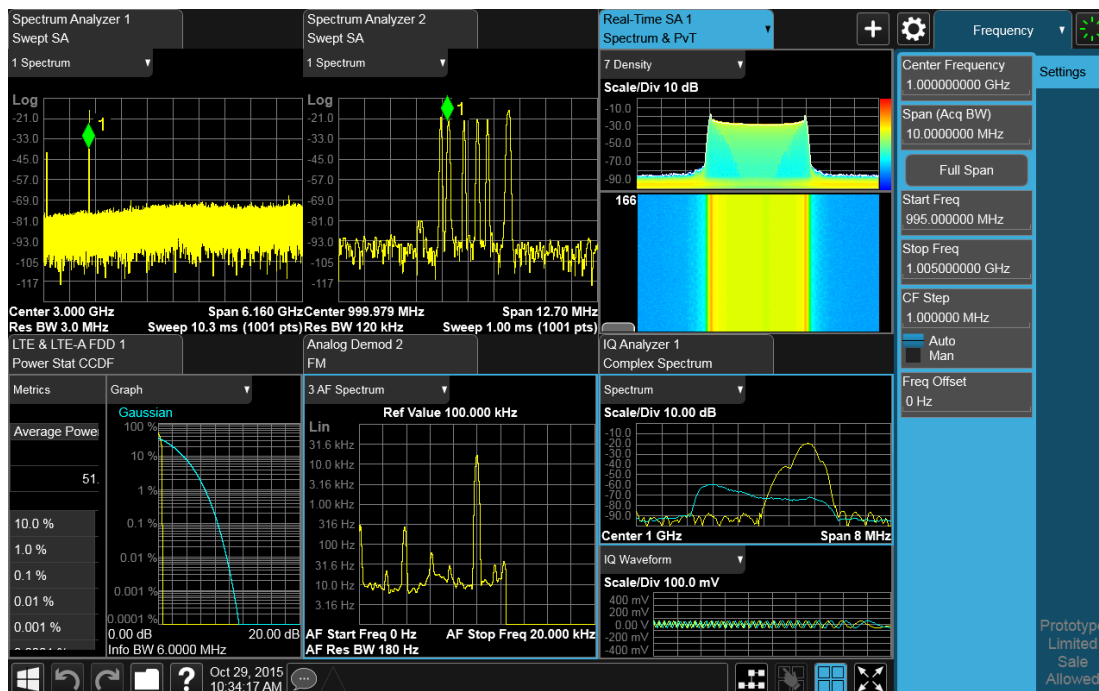

Multiscreen view lets you display all of the configured Screens at once.

You can switch to Multiscreen View by pressing this button in the "Control Bar" on page 138 at the bottom right of the screen:

Multiscreen View looks like this:

While in Multiscreen View, the button changes from a black background to a blue background:

To exit Multiscreen view, tap the button again.

Multiscreen View cannot be activated if only one screen is configured.

Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows arranged in Views. You can configure multiple instances of the same Mode along with any combination of other Modes.

In Multiscreen View, just as in Single Screen View, only one screen is active.

You switch Screens by tapping the Screen Tab you want, or when in Multiscreen View, you can tap the Screen itself. When you switch Screens, the current Screen's state and measurement results are preserved, the new Screen's previous state and data are loaded, and the new Screen starts running its Mode.

In Multiscreen View:

- The Meas Bar does not display
- The Screens are presented in an array of equal size boxes, except where the number of Screens means some have to be different sizes (as when you have 3 Screens, 5 Screens, etc.).

- Each Screen has a tab that contains the name of the Mode and Measurement in the box and a number associated with the instance of that Mode. You can enter a custom Screen name that replaces the Mode name, by going into the Mode/Meas dialog
- There is always one and only one selected Screen. It is indicated by a blue tab. Only the selected Screen is actually running a measurement and updating its display
- The selected window in the selected screen is the context for the current menus. It is the only window on the display with a blue border
- As you go from screen to screen, each screen remembers the last menu that was active in that screen and restores it as the active menu

In Multiscreen View, as in Single Screen View, tapping the blue tab or pressing the Mode/Meas front panel key opens the ["Mode/Meas/View Dialog" on page 90](#) which allows you to change the Mode (or Measurement or View) being displayed in that Screen.

Remote Command	<code>:INSTRument:SCReen:MULTiple[:STATe] OFF ON 0 1</code> <code>:INSTRument:SCReen:MULTiple?</code>
Example	<code>:INST:SCR:MULT ON</code>
Notes	If only one screen is configured, attempting to set Multi-Screen ON generates the error “-221, Settings conflict; Multi-Screen requires >1 screen”
Preset	OFF
	For more information, see the following: <ul style="list-style-type: none"> – "Select Screen" on page 179 – "Screen List (Remote only command)" on page 180

2.18.1 Select Screen

You can select a screen by touching its tab or, in ["Multiscreen" on page 177](#) mode, touching the screen itself. Selecting the Screen activates the screen and suspends the previously selected screen (if any).

Remote Command	<code>:INSTRument:SCReen:SElect <screen name></code> <code>:INSTRument:SCReen:SElect?</code>
Example	<code>:INST:SCR:SEL "Baseband"</code>
Notes	If the <screen name> is specified but not found in the list of Screens, the error message “-224, Illegal parameter value; Screen Name not found” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated

Preset	Returns the name of the active screen
--------	---------------------------------------

2.18.2 Screen List (Remote only command)

You can obtain a list of currently configured Screens. This permits your remote program to manage screens for selection, renaming, or deletion.

Remote Command	<code>:INSTrument:SCReen:CATalog?</code>
----------------	--

Example	<code>:INST:SCR:CAT?</code>
---------	-----------------------------

Notes	<p>The query response is a comma separated list of Screen Names. If only 1 Screen is configured, there is no trailing comma</p> <p>For R&S compatibility, the following query is also available:</p> <p><code>:INSTrument:SCReen:LIST?</code></p>
-------	---

Preset	Returns list of currently configured Screens
--------	--

2.19 Fullscreen

The Fullscreen button is in the "Control Bar" on page 138, at the lower right corner of the display.

When **Full Screen** is pressed the measurement window expands horizontally over the entire instrument display. The screen graticule area expands to fill the available display area.

It turns off the display of the menu panel, however the controls that drop down from the Meas Bar and on-screen annotation are still available, and you can still drag the trace and markers and perform a pinch zoom, so you can still operate the instrument.

Pressing **Full Screen** again while Full Screen is in effect cancels Full Screen.

You can get even more screen area for your data display by turning off the Meas Bar using the Annotation tab of the Display menu)

Full Screen is canceled by the **Preset** key.

Remote Command	<code>:DISPlay:FSCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:FSCReen[:STATe]?</code>
Notes	This was set to Off by :SYST:DEF MISC in MXA1, but not by Preset. It is no longer set Off by :SYST:DEF MISC, since it is now meas global instead of mode global
Preset	Unaffected by Preset but set to Off by Restore Misc Defaults or shutdown and restart
State Saved	Not saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:MENU[:STATe] OFF ON 0 1</code> This emulates ESA full screen functionality, which is the same as the FSCReen command in PSA except that the sense of on/off is reversed (that is, OFF means the menus are OFF, so Fullscreen is ON) and the default is ON (meaning Fullscreen is OFF)
Backwards Compatibility Notes	In ESA/PSA, Full Screen was turned on with a softkey, so pressing any other key turned Full Screen off. In the X-Series, because a hardkey is provided to turn this function on and off, pressing any other key no longer turns off Full Screen

3 VMA Mode

Vector Modulation Analyzer Mode provides flexible modulation analysis capabilities on a broad variety of digital signal formats and standards. These capabilities are primarily accessed through the Digital Demod measurement and Custom OFDM measurement. It provides various analysis techniques for several standard and non-standard digital modulation formats. The Power Suite measurements (Channel Power, Occupied BW, Adjacent Channel Power, CCDF, Monitor Spectrum, IQ Waveform, Spurious Emissions, and Spectrum Emissions Mask, Phase and Amplitude vs Time) are used in this mode to make specific power measurements.

To view this help, VMA must be the current active Mode. If not, exit Help (**Esc** key), select this Mode, and re-open Help.

Example	<code>:INST:SEL VMA</code> <code>:INST:NSEL 200</code>
---------	---

Dependencies	The mode must be installed and licensed in your instrument before it is available for use
--------------	---

Status Bits/OPC dependencies	Changing modes resets all SCPI status registers and mask registers to their power-on defaults. Therefore, event or condition register masks must be re-established after a mode change
------------------------------	--

This mode requires N9054EM0E-1FP and/or N9054EM1E-1FP licenses:

- N9054EM0E-1FP enables the Digital Demod measurement and Power Suite measurements
- N9054EM1E-1FP enables the Custom OFDM measurement and Power Suite measurements
- N9054EM0E-1FP and N9054EM1E-1FP enable all measurements in VMA Mode

3.1 Digital Demod Measurement

This measurement provides flexible modulation analysis capabilities in the N9054C Vector Modulation Analyzer (VMA) Mode. The measurement is based on the acquisition of IQ Pairs from the instrument. It includes flexible demodulation of a wide variety of standard and custom single-carrier modulation formats. You can simultaneously view pre-demod time and spectrum displays, demodulated signal, reconstructed reference signal, recovered symbols and various error traces and summaries.

Measurement Commands

The following measurement commands and queries are used to configure the measurement:

<code>:INITiate:DDEMod</code>	Initiates a trigger cycle for the DDEMod measurement, but does not return any data. You must then use <code>:FETC:DDEM[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings Returns the long form name of current measurement, in this case, DDEMod
<code>:CONFigure:DDEMod</code>	Selects DDEMod measurement with Meas Setup settings in preset state – same as " Meas Preset " on page 306
<code>:CONFigure:DDEMod:NDEFault</code>	Selects DDEMod measurement <i>without</i> affecting settings

The following queries are used to retrieve the results:

<code>:FETCh:DDEMod?</code>	Retrieves the data specified by n
<code>:MEASure:DDEMod [n]?</code>	Switches to DDEMod measurement, restores default values, starts the measurement, then retrieves the data specified by n
<code>:READ:DDEMod[n]?</code>	Starts the measurement, then retrieves the data specified by n

The general functionality of "**CONFigure**" on page 2551, "**INITiate**" on page 2552, "**FETCh**" on page 2552, "**MEASure**" on page 2554, and "**READ**" on page 2553 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Remote Command Results

For the **FETCh**, **MEASure**, and **READ** queries listed above, the results returned depend on the value of **n**. In many cases, the results returned also depend on the selected "**Modulation Format**" on page 335

For this measurement, the value of **n** is derived by concatenating two 2-digit sub-fields: Segment Index (**SI**) and Result Index (**RI**).

For details, see ["Index Sub-Fields" on page 184](#).

For an overview of all available results, see ["Summary of Result Types" on page 185](#). In cases where results depend on **Modulation Format**, details have been moved to separate tables for clarity.

3.1.1 Index Sub-Fields

The general formula for calculating the desired value of **n** is:

$$n = 100 * SI + RI$$

Sub-field	Variable	Definition	
Most Significant 2 Digits	SI	Segment Index	
		00	Segment1 General results not specific to a segment
		01	Segment2
		02	Segment3
		03	Segment4
		04	Segment5
		05	Segment6
Least Significant 2 Digits	RI	Result Index	
		The information returned is for the specified SI :	
		00	Captured IQ data
		01	Metrics
		02	Limit test results
		03	IQ data for Search Time
		04	IQ data for Time (Meas Interval)
		05	Spectrum Trace
		06	IQ Meas Time
		07	IQ Ref Time
		08	IQ Meas Spectrum
		09	IQ Ref Spectrum
		10	Error Vector Time
11	EVM Spectrum		
12	Magnitude Error		

3 VMA Mode
3.1 Digital Demod Measurement

Sub-field	Variable	Definition
		13 Phase Error
		14 Channel Frequency Response (Amplitude)
		15 Channel Frequency Response (Phase)
		16 Channel Frequency Response (Group Delay)
		17 EQ impulse response
		18 Demod Bits
		19 BER Results
		20 IQ Meas Time (Group Delay)
		21 IQ Ref Time (Group Delay)
		22 ccEVM
		23 Frame Summary
		24 ccEVM vs Symbol magnitude

3.1.1.1 Summary of Result Types

RI	Return Value
00	Returns unprocessed I/Q captured trace data, as a series of trace point values. The I values are listed first in each pair, using 0 through even-indexed values. The Q values are the odd-indexed values
01	See "Measurement Results for RI = 01 or Not Specified" on page 186
or no n value	
02	PASS/FAIL results of Segment SI See "Measurement Results for RI = 02" on page 201
03	Search Time Returns I/Q trace data which is used to burst search, as a series of trace point values. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values The length is determined by "Search Length" on page 324
04	Time of Segment SI Returns pre-demodulated I/Q trace data which is used to demodulation, as a series of trace point values. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values The length is determined by "Meas Interval" on page 334
05	Spectrum Returns the spectrum of the pre-demodulated I/Q trace data
06	Meas Time of Segment SI Dependent on Modulation Format. See "Measurement Results for RI = 06" on page 203
07	Dependent on Modulation Format. See "Measurement Results for RI = 07" on page 204
08	Dependent on Modulation Format. See "Measurement Results for RI = 08" on page 205

RI	Return Value
09	Dependent on Modulation Format. See " Measurement Results for RI = 09 " on page 205
10	Dependent on Modulation Format. See " Measurement Results for RI = 10 " on page 206
11	Dependent on Modulation Format. See " Measurement Results for RI = 11 " on page 206
12	Dependent on Modulation Format. See " Measurement Results for RI = 12 " on page 207
13	Dependent on Modulation Format. See " Measurement Results for RI = 13 " on page 207
14	Dependent on Modulation Format. See " Measurement Results for RI = 14 " on page 207
15	Dependent on Modulation Format. See " Measurement Results for RI = 15 " on page 208
16	Dependent on Modulation Format. See " Measurement Results for RI = 16 " on page 208
17	Dependent on Modulation Format. See " Measurement Results for RI = 17 " on page 208
18	Demod bits Returns the demodulation bits
19	BER Results <ul style="list-style-type: none"> - Tx BER (exponential) - Error Bits Number (exponential) - Total Bits Number (exponential)
20	Dependent on Modulation Format. See " Measurement Results for RI = 20 " on page 209
21	Dependent on Modulation Format. See " Measurement Results for RI = 21 " on page 209
22	<ul style="list-style-type: none"> - ccEVM results of segment1 - ccEVM (%) - Valid Points - Total Points - Improvement Factor (dB) <p>Note: The EVM result will be in "dB" if "Report EVM in dB" is set to true</p>
23	Frame Summary Results for each segment <ul style="list-style-type: none"> - Data EVM (%) - Pilot EVM (%) <p>Note: These results are only available for complicated segment including both data and pilot</p>
24	Returns ccEVM per symbol magnitude results

3.1.1.2 Measurement Results for RI = 01 or Not Specified

In the tables below, the value in the A/P column is one of:

3 VMA Mode
3.1 Digital Demod Measurement

A	Average	Averaged value in average cycle
P	Peak Hold	Detected Peak/Maximum value in average cycle
-	n/a	

The [FETCH](#), [MEASure](#), or [READ](#) queries return the following comma-separated scalar results for Segment [SI](#). For values of [SI](#), see "[Index Sub-Fields](#)" on page 184.

For details of available formats, see "[Modulation Format](#)" on page 335.

Modulation Format: QPSK

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	Transmit power Floating point number	dBm
2	RMS EVM	A	EVM over the entire measurement area Floating point number	%
3	Peak EVM	P	Peak EVM in the measurement area Floating point number	%
4	Peak EVM Index	P	Location of the symbol that has the largest EVM	
5	RMS Magnitude Error	A	Average magnitude error over the entire measurement area Floating point number	%
6	Peak Magnitude Error	P	Peak magnitude error in the measurement area Floating point number	%
7	Peak Magnitude Error Index	P	Location of the symbol that has the largest magnitude error	
8	RMS Phase Error	A	Average phase error over the entire measurement area Floating point number	°
9	Peak Phase Error	P	Peak phase error in the measurement area Floating point number	°
10	Peak Phase Error Index	P	Location of the symbol that has the largest phase error	
11	Frequency Error	A	Frequency error in the measured signal Floating point number	Hz
12	Clock Error	A	Symbol clock error Floating point number	Hz
13	I/Q Offset	A	I and Q error (magnitude squared) offset from the origin Floating point number	dB

#	Name	A/P	Description	Unit, if any
14	Rho	A	Rho Floating point number	
15	Quad Error	A	Orthogonal error between the I and Q signals Floating point number	°
16	Gain Imbalance	A	Gain ratio between the I and Q signals Floating point number	dB
17	SNR	A	Signal to noise ratio Floating point number	dB
18	Amplitude Ratio of I Eye	A	Free decision distance in height of I Eye Diagram and calculated as percentage of $2B_I/(A_I+B_I)$. A_I and B_I are the maximum and minimum amplitude difference at the decision point of I Eye Diagram. An ideal signal has a decision height of 100%	%
19	Amplitude Ratio of Q Eye	A	Free decision distance in height of Q Eye Diagram and calculated as percentage of $2B_Q/(A_Q+B_Q)$. A_Q and B_Q are the maximum and minimum amplitude difference at the decision point of Q Eye Diagram. An ideal signal has a decision height of 100%	%
20	Time Ratio of I Eye	A	Free decision distance in width of I Eye Diagram and calculated as percentage of $2B'_I/(A'_I+B'_I)$. A'_I and B'_I is the maximum and minimum zero-cross time width in I Eye Diagram. An ideal signal has a decision width of 100%	%
21	Time Ratio of Q Eye	A	Free decision distance in width of Q Eye Diagram and calculated as percentage of $2B'_Q/(A'_Q+B'_Q)$. A'_Q and B'_Q is the maximum and minimum zero-cross time width in Q Eye Diagram. An ideal signal has a decision width of 100%	%

Modulation Formats: Offset QPSK, Shaped Offset QPSK

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	Transmit power Floating point number	dBm
2	RMS EVM	A	A floating point number of EVM over the entire measurement area	%
3	Peak EVM	P	A floating point number of the peak EVM in the measurement area	%
4	Peak EVM Index	P	Location of the symbol that has the largest EVM	
5	RMS Magnitude Error	A	A floating point number of the average magnitude error over the entire measurement area	%
6	Peak Magnitude Error	P	A floating point number of the peak magnitude error in the measurement area	%

3 VMA Mode
3.1 Digital Demod Measurement

#	Name	A/P	Description	Unit, if any
7	Peak Magnitude Error Index	P	Location of the symbol that has the largest magnitude error	
8	RMS Phase Error	A	A floating point number of the average phase error over the entire measurement area	°
9	Peak Phase Error	P	A floating point number of the peak phase error in the measurement area	°
10	Peak Phase Error Index	P	Location of the symbol that has the largest phase error	
11	Frequency Error	A	A floating point number of the frequency error in the measured signal	ppm
12	I/Q Offset	A	A floating point number of the I and Q error (magnitude squared) offset from the origin	dB
13	RMS Offset EVM	A	A floating point number of Offset EVM over the entire measurement area	%
14	Peak Offset EVM	P	A floating point number of the peak Offset EVM in the measurement area	%
15	Peak Offset EVM Index	P	Location of the symbol that has the largest Offset EVM	
16	Rho	A	A floating point number of Rho	
17	Quad Error	A	A floating point number of orthogonal error between the I and Q signals	°
18	Gain Imbalance	A	A floating point number of the gain ratio between the I and Q signals	dB
19	Clock Error	A	A floating point number of symbol clock error	Hz

Modulation Format: 8-PSK

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	A floating point number of transmit power	dBm
2	RMS EVM	A	A floating point number of EVM over the entire measurement area	%
3	Peak EVM	P	A floating point number of the peak EVM in the measurement area	%
4	Peak EVM Index	P	Location of the symbol that has the largest EVM	
5	RMS Magnitude Error	A	A floating point number of the average magnitude error over the entire measurement area	%

Modulation Format: 2-FSK

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	A floating point number of transmit power	dBm
2	RMS FSK Error	A	A floating point number of the RMS average of the FSK error at all symbol locations	%
3	Peak FSK	P	A floating point number of the largest FSK error at all symbol	%

3 VMA Mode
3.1 Digital Demod Measurement

#	Name	A/P	Description	Unit, if any
	Error		locations	
4	Peak FSK Error Index	P	Location of the symbol that has the largest FSK error	
5	RMS FSK Mag Error	A	A floating point number of the carrier magnitude error over all symbols	%
6	Peak FSK Mag Error	P	A floating point number of the peak carrier magnitude error in all symbols	%
7	Peak FSK Mag Error Index	P	Location of the symbol that has the largest carrier magnitude error	
8	Carrier Offset	A	A floating point number (in ppm) of the carrier frequency error relative to the instrument's center frequency	ppm
9	Deviation	A	A floating point number of the average deviation of all symbols in the measurement area	Hz
10	Deviation Accuracy	-	A floating point number of the measured deviation accuracy, compared to its reference	%
11	Clock Error	A	A floating point number of symbol clock error	Hz
12	RMS Deviation Offset	-	A floating point number of the average deviation of all symbols in the FSK Meas Time trace	%
13	Peak Deviation Offset	-	A floating point number of the peak deviation of all symbols in the FSK Meas Time trace	%
14	RMS Zero Crossing Error	-	A floating point number of the average zero crossing error of all symbols in the FSK Meas Time trace	%
15	Peak Zero Crossing Error	-	A floating point number of the peak zero crossing error of all symbols in the FSK Meas Time trace	%
16	Deviation (Positive)	-	A floating point number of the positive deviation	Hz
17	Deviation (Negative)	-	A floating point number of the negative deviation	Hz
18	Outer Max Peak	-	A floating point number of the maximum peak of outer deviation in eye diagram used for Deviation Tolerance measurement.	%
19	Outer Min Peak	-	A floating point number of the minimum peak of outer deviation in eye diagram used for Deviation Tolerance measurement.	%
20	Inner Max Peak	-	A floating point number of the maximum peak of inner deviation in eye diagram used for Deviation Tolerance measurement.	%
21	Inner Min Peak	-	A floating point number of the minimum peak of inner deviation in eye diagram used for Deviation Tolerance measurement.	%
22	Zero Crossing Offset (Max)	-	A floating point number of the maximum zero crossing offset in eye diagram used for Zero Crossing Offset measurement.	%
23	Zero Crossing Offset (Min)	-	A floating point number of the minimum zero crossing offset in eye diagram used for Zero Crossing Offset measurement.	%

Modulation Formats: 4-FSK, 8-FSK, 16-FSK

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	A floating point number of transmit power	dBm
2	RMS FSK Error	A	A floating point number of the RMS average of the FSK error at all symbol locations	%
3	Peak FSK Error	P	A floating point number of the largest FSK error at all symbol locations	%
4	Peak FSK Error Index	P	Location of the symbol that has the largest FSK error	
5	RMS FSK Mag Error	A	A floating point number of the carrier magnitude error over all symbols	%
6	Peak FSK Mag Error	P	A floating point number of the peak carrier magnitude error in all symbols	%
7	Peak FSK Mag Error Index	P	Location of the symbol that has the largest carrier magnitude error	
8	Carrier Offset	A	A floating point number in ppm) of the carrier frequency error relative to the instrument's center frequency	ppm
9	Deviation	A	A floating point number of the average deviation of all symbols in the measurement area	Hz
10	Deviation Accuracy	A	A floating point number of the measured deviation accuracy, compared to its reference	%
11	Clock Error	A	A floating point number of symbol clock error	Hz

Modulation Formats: VSB 8, VSB 16

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	A floating point number of transmit power	dBm
2	RMS EVM	A	A floating point number of EVM over the entire measurement area	%
3	Peak EVM	P	A floating point number of the peak EVM in the measurement area	%
4	Peak EVM Index	P	Location of the symbol that has the largest EVM	
5	RMS Magnitude Error	A	A floating point number of the average magnitude error over the entire measurement area	%
6	Peak Magnitude Error	P	A floating point number of the peak magnitude error in the measurement area	%
7	Peak Magnitude Error Index	P	Location of the symbol that has the largest magnitude error	
8	RMS Phase Error	A	A floating point number of the average phase error over the entire measurement area	°

3 VMA Mode
3.1 Digital Demod Measurement

#	Name	A/P	Description	Unit, if any
9	Peak Phase Error	P	A floating point number of the peak phase error in the measurement area	°
10	Peak Phase Error Index	P	Location of the symbol that has the largest phase error	
11	Frequency Error	A	A floating point number of the frequency error in the measured signal	Hz
12	SNR	A	A floating point number of signal to noise ratio	dB
13	Pilot Level	A	A floating point number of pilot level	dB

Modulation Format: MSK type 1

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	A floating point number of transmit power	dBm
2	RMS EVM	A	A floating point number of EVM over the entire measurement area	%
3	Peak EVM	P	A floating point number of the peak EVM in the measurement area	%
4	Peak EVM Index	P	Location of the symbol that has the largest EVM	
5	RMS Magnitude Error	A	A floating point number of the average magnitude error over the entire measurement area	%
6	Peak Magnitude Error	P	A floating point number of the peak magnitude error in the measurement area	%
7	Peak Magnitude Error Index	P	Location of the symbol that has the largest magnitude error	
8	RMS Phase Error	A	A floating point number of the average phase error over the entire measurement area	°
9	Peak Phase Error	P	A floating point number of the peak phase error in the measurement area	°
10	Peak Phase Error Index	P	Location of the symbol that has the largest phase error	
11	Frequency Error	A	A floating point number of the frequency error in the measured signal	Hz
12	I/Q Offset	A	A floating point number of the I and Q error (magnitude squared) offset from the origin	dB
13	Quad Error	A	A floating point number of orthogonal error between the I and Q signals	°
14	Gain Imbalance	A	A floating point number of the gain ratio between the I and Q signals	dB

Modulation Format: MSK type 2

#	Name	A/P	Description	Unit, if any

15	Amplitude Droop	A	A floating point number of the change in the magnitude of the signal over the entire measurement	dB/sym
16	95% EVM	A	A floating point number of the EVM below which 95% of the individual symbol EVM occurs	%

Modulation Format: CPM (FM)

#	Name	A/P	Description	Unit, if any
1	Transmit Power	A	A floating point number of transmit power	dBm
2	RMS FSK Error	A	A floating point number of the RMS average of the FSK error at all symbol locations	%
3	Peak FSK Error	P	A floating point number of the largest FSK error at all symbol locations	%
4	Peak FSK Error Index	P	Location of the symbol that has the largest FSK error	
5	RMS FSK Mag Error	A	A floating point number of the carrier magnitude error over all symbols	%
6	Peak FSK Mag Error	P	A floating point number of the peak carrier magnitude error in all symbols	%
7	Peak FSK Mag Error Index	P	Location of the symbol that has the largest carrier magnitude error	
8	Carrier Frequency Offset	A	A floating point number of the carrier frequency error relative to the instrument's center frequency	Hz
9	Deviation	A	A floating point number of the average deviation of all symbols in the measurement area	Hz
10	Deviation Offset	-	a floating point number of the deviation offset	%
11	H1	-	a floating point number of the CPM modulation index H1	
12	H2	-	a floating point number of the CPM modulation index H2	

Modulation Formats: 2-ASK

#	Name	A/P	Description	Unit (if any)
1	Transmit Power	A	Transmit power Floating point number	dBm

#	Name	A/P	Description	Unit (if any)
2	RMS ASK Error	A	RMS average of the ASK error at all symbol locations Floating point number	%
3	Peak ASK Error	P	Largest ASK error at all symbol locations Floating point number	%
4	Peak ASK Error Index	P	Location of the symbol that has the largest ASK error	
5	Carrier Frequency Offset	A	Carrier frequency error relative to the instrument's center frequency Floating point number	Hz
6	Modulation Depth	A	Modulation depth over the entire measurement area Floating point number	%
7	Estimated Carrier Amplitude	A	Estimated carrier amplitude over the entire measurement area Floating point number	V
8	Amplitude Ratio	A	free decision distance in height of I Eye Diagram and calculated as percentage of $2B/(A+B)$ A and B are the maximum and minimum amplitude difference at the decision point of I Eye Diagram. An ideal signal has a decision height of 100%	%
9	Time Ratio	A	free decision distance in width of I Eye Diagram and calculated as percentage of $2B'(A'+B')$ A' and B' are the maximum and minimum zero-cross time width in I Eye Diagram. An ideal signal has a decision width of 100%	%
10	Modulation Index Outer	A	Defined as the measure of extent of outer amplitude variation about an un-modulated carrier Calculated as $(V_{Amax} - V_{Amin}) / (V_{Amax} + V_{Amin})$ V _{Amax} is the largest amplitude at crest. V _{Amin} is the smallest amplitude at bottom. Maximum amplitude difference A is equal to V _{Amax} - V _{Amin}	%
11	Modulation Index Inner	A	Defined as the measure of extent of inner amplitude variation about an un-modulated carrier Calculated as $(V_{Bmax} - V_{Bmin}) / (V_{Bmax} + V_{Bmin})$ V _{Bmax} is the smallest amplitude at crest. V _{Bmin} is the largest amplitude at bottom. Minimum amplitude difference B is equal to V _{Bmax} - V _{Bmin}	%
12	Modulation On/Off Ratio	A	Defined as the ratio of $20\log_{10}(V_{Amax} + V_{Bmax}) / (V_{Amin} + V_{Bmin})$ in dB	

3 VMA Mode
3.1 Digital Demod Measurement

Modulation Format: Custom IQ

#	Name	A/P	Description	Unit (if any)
1	Transmit Power	A	Transmit power Floating point number	dBm
2	RMS EVM	A	A floating point number of EVM over the entire measurement area	%
3	Peak EVM	P	A floating point number of the peak EVM in the measurement area	%
4	Peak EVM Index	P	Peak Hold) is the location of the symbol that has the largest EVM	
5	RMS Magnitude Error	A	A floating point number of the average magnitude error over the entire measurement area	%
6	Peak Magnitude Error	P	A floating point number of the peak magnitude error in the measurement area	%
7	Peak Magnitude Error Index	P	Location of the symbol that has the largest magnitude error	
8	RMS Phase Error	A	A floating point number of the average phase error over the entire measurement area	°
9	Peak Phase Error	P	A floating point number of the peak phase error in the measurement area	°
10	Peak Phase Error Index	P	Location of the symbol that has the largest phase error	
11	Frequency Error	A	A floating point number of the frequency error in the measured signal	Hz
12	SNR	A	A floating point number of signal to noise ratio	dB

Modulation Formats	Result
2-ASK	Reserved
2-FSK, 4-FSK, 8-FSK, 16-FSK	
CPM (FM)	
All others	Equalizer impulse response trace of Segment SI Returns a series of floating point numbers (in dB) that represent each sample in the equalizer's impulse response trace

3.1.1.16 Measurement Results for RI = 20

The [FETCh](#), [MEASure](#), or [READ](#) queries return the following comma-separated scalar results for Segment [SI](#). For values of [SI](#), see "[Index Sub-Fields](#)" on page 184.

For details of available formats, see "[Modulation Format](#)" on page 335.

Modulation Formats	Result
2-FSK, 4-FSK, 8-FSK, 16-FSK	FSK Meas Time (Group Delay) of Segment SI
CPM (FM)	Returns the group delay trace of the FSK IQ Meas Time trace
2-ASK	ASK Meas Time (Group Delay) of Segment SI Returns the group delay trace of the ASK IQ Meas Time trace
All others	IQ Meas Time (Group Delay) of Segment SI Returns the group delay trace of the IQ Meas Time trace

3.1.1.17 Measurement Results for RI = 21

The [FETCh](#), [MEASure](#), or [READ](#) queries return the following comma-separated scalar results for Segment [SI](#). For values of [SI](#), see "[Index Sub-Fields](#)" on page 184.

For details of available formats, see "[Modulation Format](#)" on page 335.

Modulation Formats	Result
2-FSK, 4-FSK, 8-FSK, 16-FSK	FSK Ref Time (Group Delay) of Segment SI
CPM (FM)	Returns the group delay trace of the FSK IQ Ref Time trace
2-ASK	ASK Ref Time (Group Delay) of Segment SI Returns the group delay trace of the ASK IQ Ref Time trace
All others	IQ Ref Time (Group Delay) of Segment SI Returns the group delay trace of the IQ Ref Time trace

3.1.2 Views

There are 5 pre-defined views:

1. "Normal" on page 210
2. "Demod Traces" on page 226
3. "Demod Error" on page 211
4. "Result Summary" on page 211
5. "Eye Diagram" on page 211

Some of these are multiple-window Views. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the View description.

View - Selection by Enum

Remote Command	<code>:DISPlay:DDEMod:VIEW[:SElect] NORMal DTRace DERRor NRESults EDIagram DSEGment FRESults</code> <code>:DISPlay:DDEMod:VIEW[:SElect]?</code>
Example	Set Normal view: <code>:DISP:DDEM:VIEW NORM</code>
Preset	<code>NORM</code>
State Saved	Saved in instrument state

3.1.2.1 Normal

Windows:

3.1.2.2 Demod Traces

Windows:

3 VMA Mode

3.1 Digital Demod Measurement

"IQ Meas Spectrum" on page 216

"FSK Meas Spectrum" on page 218

"IQ Meas Time" on page 215

"FSK Meas Time" on page 217

Dual-window view consists of the above two windows.

Example `:DISP:DDEM:VIEW DTR`

3.1.2.3 Demod Error

Windows:

"Mag Error" on page 221

"Mag Error (Carrier)" on page 222

"Phase Error" on page 221

"FSK Error Spectrum" on page 221

"Error Vector Time" on page 220

"FSK Error Time" on page 221

"Metrics" on page 223

"Metrics" on page 223

Multiple-window view consists of the above four windows.

Example `:DISP:DDEM:VIEW DERR`

3.1.2.4 Result Summary

Windows: "Metrics" on page 223

Single-window view consists of the above window.

Example `:DISP:DDEM:VIEW NRES`

3.1.2.5 Eye Diagram

Windows: "Eye Diagram Metrics" on page 223

Single-window view consists of the above windows.

Example `:DISP:DDEM:VIEW EDI`

3.1.3 Windows

There are at most 6 windows available. Each window has two properties that you can use to select the trace data and trace display format: Data and Format. The **Format** key is hidden if the selected Data does not support any format.

Use the SCPI command:

```
:DISPlay:DDEMod:WINDow[1]|2|...|6:DATA <enum>
```

to configure the trace data. For example, the following command sets the first window data to **Spectrum**.

```
:DISP:DDEM:WIND1:DATA SPEC
```

Use the SCPI command:

```
:DISPlay:DDEMod:WINDow[1]|2|...|6:FORMat <enum>
```

to configure the trace display format. For example, the following command sets the first window trace display format to Constellation.

```
:DISP:DDEM:WIND1:FORM CONS
```

Use the SCPI command:

```
:DISPlay:DDEMod:WINDow[1]|2|...|6:SEGment <enum>
```

to configure the trace data of which segment to be displayed. For example, the following command sets the segment1 trace data to be displayed.

```
:DISP:DDEM:WIND1:SEGM SEGM1
```

3.1.3.1 Data

Provides a menu of trace data choices for the selected window.

Trace data results

Modulation Format FSK

Trace Data	SCPI	Description
FSK Meas Time	MTIME	Demodulated Time Trace
FSK Meas Spectrum	MSpectrum	FFT of FSK Meas Time
FSK Ref Time	RTIME	Reconstructed ideal time waveform to compare FSK Meas Time against
FSK Ref Spectrum	RSpectrum	FFT of FSK Ref Time
FSK Error Time	EVTime	Difference between FSK Meas Time and FSK Ref Time at each point in time
FSK Error Spectrum	EVSpectrum	FFT of FSK Error Spectrum
Mag Error (Carrier)	MERRor	Amplitude error of carrier, relative to average amplitude

Modulation Format ASK

Trace Data	SCPI	Description
ASK Meas Time	MTIME	Demodulated Time Trace
ASK Meas Spectrum	MSpectrum	FFT of ASK Meas Time
ASK Ref Time	RTIME	Reconstructed ideal time waveform to compare ASK Meas Time against
ASK Ref Spectrum	RSpectrum	FFT of ASK Ref Time
ASK Error Time	EVTime	Difference between ASK Meas Time and ASK Ref Time at each point in time
ASK Error Spectrum	EVSpectrum	FFT of ASK Error Spectrum

All Others

Trace Data	SCPI	Description
Raw Main Time	RMTIME	The envelope of the captured data record
Search Time	STIME	The envelope of the captured data used for burst search
Time	TIME	The envelope of the data used for demodulation, it's 20 % longer than the Meas Interval, 10 % of the Meas Interval before the demodulated segment and 10 % after
Spectrum	SPECTrum	Spectrum is the FFT of the Raw Main Time waveform
IQ Meas Time	MTIME	Demodulated Time Trace
IQ Meas Spectrum	MSpectrum	FFT of IQ Meas Time
IQ Ref Time	RTIME	Reconstructed ideal time waveform to compare IQ Meas Time against
IQ Ref Spectrum	RSpectrum	FFT of IQ Ref Time

Trace Data	SCPI	Description
Error Vector Time	EVTime	Vector difference between IQ Meas Time and IQ Ref Time at each point in time
Error Vector Spectrum	EVSpectrum	FFT of Error Vector Time
Mag Error	MERRor	Difference in length of the IQ Meas Time vector and IQ Ref Time vector at each point in time
Phase Error	PERRor	Difference in phase of the IQ Meas Time vector and IQ Ref Time vector at each point in time
EQ Impulse Response	EQIResponse	Impulse response of the adaptive equalizer (no data is available if equalizer is off)
CH Freq Response	CHFResponse	FFT of Equalizer Frequency Response
Metrics	DRESults	Demodulation metrics results
Demod Bits	DBITs	Demodulation bits
Eye Diagram Metrics	ERESults	Eye Diagram metrics results
ccEVM vs Symbol	CESymbol	ccEVM per symbol trace
No Data	NONE	Blank Trace

Pre Demod

Displays the trace data choices that show pre-demodulation results.

Raw Main Time

Raw Main Time is the envelope of the captured raw data. This data is unprocessed and includes additional points acquired for settling of the filters involved in subsequent processing, such as the demodulation filtering.

Example [:DISP:DDEM:WIND2:DATA RMT](#)
Sets the second window data to Raw Main Time

Search Time

Search Time is the envelope of the data which is used to search for the burst or sync pattern. It's generated from the captured raw data according to the Trace Align settings.

Example [:DISP:DDEM:WIND2:DATA STIM](#)

Sets the second window data to Search Time

Time

Time is the envelope of the data which is used to demodulation. It's 20 % longer than the Meas Interval, 10 % of the Meas Interval before the demodulated segment and 10 % after.

Example `:DISP:DDEM:WIND2:DATA TIME`
Sets the second window data to Time

Spectrum

Spectrum shows the FFT of the Raw Main Time waveform.

Example `:DISP:DDEM:WIND3:DATA SPEC`
Sets the third window data to Spectrum

Demod

Displays the general demodulation results.

IQ Meas Time

Available for all modulation formats *except* 2-FSK.

IQ Meas Time is the measured time data results for the input signal. There are 6 available formats for this trace data: I-Q, Constellation, Real, Imaginary, I-Eye, Q-Eye and Group Delay. Normally this trace data is displayed with I-Q format.

Format name	Description
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown
Group Delay	Shows the derivative of phase response with respect to time

Example : `:DISP:DDEM:WIND:DATA MTIM`
 Sets the first window data to IQ Meas Time
 : `:DISP:DDEM:WIND:FORM CONS`
 Selects Constellation as the first window data format

IQ Ref Time

Available for all modulation formats *except* 2-FSK.

IQ Ref Time is the reconstructed ideal time waveform to compare IQ Meas Time against. There are 6 available formats for this trace data: I-Q, Constellation, Real, Imaginary, I-Eye Q-Eye and Group Delay. Normally this trace data is displayed with I-Q format.

Format name	Description
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown
Group Delay	Shows the derivative of phase response with respect to time

Example : `:DISP:DDEM:WIND:DATA RTIM`
 Sets the first window data to IQ Ref Time
 : `:DISP:DDEM:WIND:FORM CONS`
 Selects Constellation as the first window data format

IQ Meas Spectrum

Available for all modulation formats *except* any FSK type.

IQ Meas Spectrum is the frequency spectrum of the IQ Meas Time trace data. The demodulator produces the spectrum by windowing and FFT the IQ measured data. If the measured filter is selected, the spectrum represents the signal after filtering.

Example : `:DISP:DDEM:WIND:DATA MSP`
 Sets the first window data to IQ Meas Spectrum

IQ Ref Spectrum

Available for all modulation formats *except* any FSK type.

IQ Ref Spectrum is the frequency spectrum of the IQ Ref Time trace data. The demodulator produces the spectrum by windowing and FFT the IQ reference data. If the reference filter is selected, the spectrum represents the signal after filtering.

Example **:DISP:DDEM:WIND:DATA RSP**
Sets the first window data to IQ Ref Spectrum

FSK Meas Time

Available only when the demodulation format is any FSK type.

FSK Meas Time is the measured time data results for the input signal. There are 6 available formats for this trace data: I-Q, Constellation, Real, Imaginary, I-Eye and Q-Eye. Normally this trace data is displayed with I-Q format.

Format name	Description
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown

Example **:DISP:DDEM:WIND:DATA MTIM**
Sets the first window data to FSK Meas Time
:DISP:DDEM:WIND:FORM CONS
Selects Constellation as the first window data format

FSK Ref Time

Available only when the demodulation format is any FSK type.

FSK Ref Time is the reconstructed ideal time waveform to compare FSK Meas Time against. There are 6 available formats for this trace data: I-Q, Constellation, Real, Imaginary, I-Eye and Q-Eye. Normally this trace data is displayed with I-Q format.

Format name	Description
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown
Example	<p><code>:DISP:DDEM:WIND:DATA RTIM</code></p> <p>Sets the first window data to FSK Ref Time</p> <p><code>:DISP:DDEM:WIND:FORM CONS</code></p> <p>Selects Constellation as the first window data format</p>

FSK Meas Spectrum

Available only when the demodulation format is any FSK type.

FSK Meas Spectrum is the frequency spectrum of the FSK Meas Time trace data. The demodulator produces the spectrum by windowing and FFT the FSK measured data. If the measured filter is selected, the spectrum represents the signal after filtering.

Example	<code>:DISP:DDEM:WIND:DATA MSP</code>
	Sets the first window data to FSK Meas Spectrum

FSK Ref Spectrum

Available only when the demodulation format is any FSK type.

FSK Ref Spectrum is the frequency spectrum of the FSK Ref Time trace data. The demodulator produces the spectrum by windowing and FFT the FSK reference data. If the reference filter is selected, the spectrum represents the signal after filtering.

Example	<code>:DISP:DDEM:WIND:DATA RSP</code>
	Sets the first window data to FSK Ref Spectrum

ASK Meas Time

Available only when the demodulation format is any ASK type.

3 VMA Mode

3.1 Digital Demod Measurement

ASK Meas Time is the measured time data results for the input signal. There are 6 available formats for this trace data: I-Q, Constellation, Real, Imaginary, I-Eye and Q-Eye. Normally this trace data is displayed with I-Q format.

Format name	Description
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown
Example	<pre>:DISP:DDEM:WIND:DATA MTIM</pre> Sets the first window data to ASK Meas Time <pre>:DISP:DDEM:WIND:FORM CONS</pre> Selects Constellation as the first window data format

ASK Ref Time

Available only when the demodulation format is any ASK type.

ASK Ref Time is the reconstructed ideal time waveform to compare ASK Meas Time against. There are 6 available formats for this trace data: I-Q, Constellation, Real, Imaginary, I-Eye and Q-Eye. Normally this trace data is displayed with I-Q format.

Format name	Description
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown
Example	<pre>:DISP:DDEM:WIND:DATA RTIM</pre> Sets the first window data to ASK Ref Time <pre>:DISP:DDEM:WIND:FORM CONS</pre> Selects Constellation as the first window data format

ASK Meas Spectrum

Available only when the demodulation format is any ASK type.

ASK Meas Spectrum is the frequency spectrum of the ASK Meas Time trace data. The demodulator produces the spectrum by windowing and FFT the ASK measured data. If the measured filter is selected, the spectrum represents the signal after filtering.

Example `:DISP:DDEM:WIND:DATA MSP`
Sets the first window data to ASK Meas Spectrum

ASK Ref Spectrum

Available only when the demodulation format is any ASK type.

ASK Ref Spectrum is the frequency spectrum of the ASK Ref Time trace data. The demodulator produces the spectrum by windowing and FFT the ASK reference data. If the reference filter is selected, the spectrum represents the signal after filtering.

Example `:DISP:DDEM:WIND:DATA RSP`
Sets the first window data to ASK Ref Spectrum

Demod Error

Displays the general demodulation error results.

Error Vector Time

Available for all modulation formats *except* any FSK type.

This trace shows the time domain error vector trace data results. The trace contains the computed error vectors between IQ Meas Time and IQ Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:DDEM:WIND2:DATA EVT`
Sets the second window data to Error Vector Time

Error Vector Spectrum

Available for all modulation formats *except* any FSK type.

3 VMA Mode

3.1 Digital Demod Measurement

Error Vector Spectrum is the frequency spectrum of the Error Vector Time trace data. The demodulator produces the spectrum by windowing and FFT the Error Vector Time data. On this trace, the individual error vectors are plotted vs frequency.

Example `:DISP:DDEM:WIND2:DATA EVSP`
Sets the second window data to Error Vector Spectrum

Mag Error

Available for all modulation formats *except* any FSK type.

This trace shows the magnitude error trace in time domain. This trace is computed by comparing the magnitude, point by points, of the IQ measured signal with the magnitude of the IQ reference signal.

Example `:DISP:DDEM:WIND:DATA MERR`
Sets the first window data to Mag Error

Phase Error

Available for all modulation formats *except* any FSK type.

This trace shows the phase error trace in time domain. This trace is computed by comparing the unwrapped phase, point by points, of the IQ measured signal with the unwrapped phase of the IQ reference signal.

Example `:DISP:DDEM:WIND:DATA PERR`
Sets the first window data to Phase Error

FSK Error Time

Available only when the demodulation format is any FSK type.

This trace shows the time domain error vector trace data results. The trace contains the computed error vectors between FSK Meas Time and FSK Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:DDEM:WIND2:DATA EVT`
Sets the second window data to FSK Error Time

FSK Error Spectrum

Available only when the demodulation format is any FSK type.

This trace is the frequency spectrum of the FSK Vector Time trace data. The demodulator produces the spectrum by windowing and FFT the FSK Error Time data. On this trace, the individual error vectors are plotted vs frequency.

Example `:DISP:DDEM:WIND2:DATA EVSP`
Sets the second window data to FSK Error Spectrum

Mag Error (Carrier)

Available only when the demodulation format is any FSK type.

This trace shows the carrier magnitude error trace in time domain. This trace is computed by comparing the magnitude, point by points, of the FSK measured signal with the averaged magnitude.

Example `:DISP:DDEM:WIND:DATA MERR`
Sets the first window data to Carrier Mag Error

ASK Error Time

Available only when the demodulation format is any ASK type.

This trace shows the time domain error vector trace data results. The trace contains the computed error vectors between ASK Meas Time and ASK Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:DDEM:WIND2:DATA EVT`
Sets the second window data to ASK Error Time

ASK Error Spectrum

Available only when the demodulation format is any ASK type.

This trace is the frequency spectrum of the ASK Vector Time trace data. The demodulator produces the spectrum by windowing and FFT the ASK Error Time data. On this trace, the individual error vectors are plotted vs frequency.

Example `:DISP:DDEM:WIND2:DATA EVSP`
Sets the second window data to ASK Error Spectrum

Response

Displays the trace data choices that show equalizer response results.

CH Freq Response

Displays the channel frequency response for which the equalizer is correcting. It is computed as the inverse of the equalization filter's frequency response.

Example `:DISP:DDEM:WIND2:DATA CHFR`
Sets the second window data to CH Freq Response

EQ Impulse Response

Displays the impulse response of the equalization filter.

Example `:DISP:DDEM:WIND2:DATA EQIR`
Sets the second window data to EQ Impulse Response

Tables

Displays the trace data choices that are in tabular form, including Metrics, Eye Diagram Metrics, and Demod Bits.

Metrics

Displays the measurement numeric results. The available tabular data changes depending on the modulation format chosen.

Example `:DISP:DDEM:WIND4:DATA DRES`
Sets the fourth window data to Metrics

Eye Diagram Metrics

Displays the numeric results calculated from Eye Diagram. The available tabular data changes depending on the modulation format chosen.

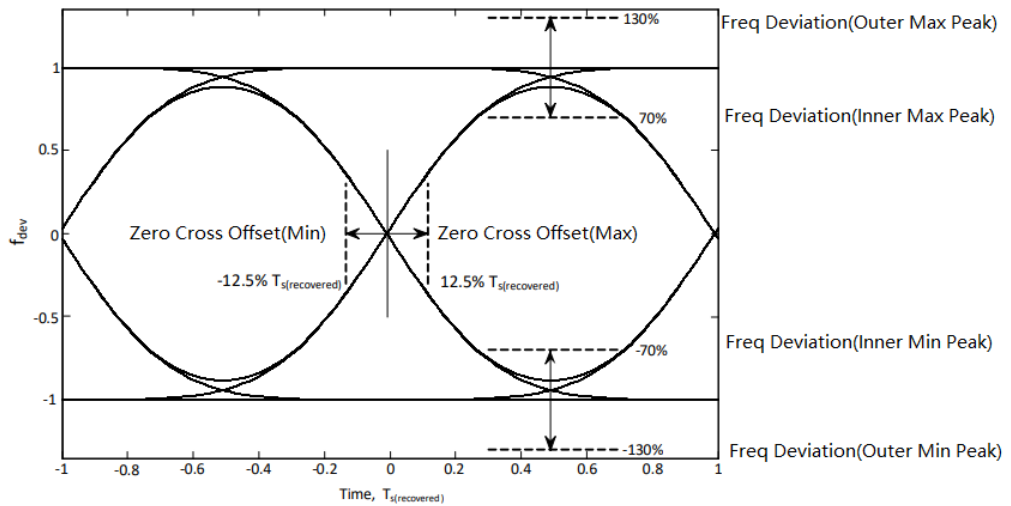

Example `:DISP:DDEM:WIND4:DATA ERES`
Sets the fourth window data to Metrics.

- Amplitude Ratio is the free decision distance in height of a digital signal and is calculated as $2B/(A+B)$. A and B are the maximum and minimum amplitude difference at the decision point. An ideal signal has a decision height of 100%.
- Time Ratio is the free decision distance in width of a digital signal and is calculated as $2B'/(A'+B')$. A' and B' are the maximum and minimum zero-cross time width. An ideal signal has a decision width of 100%.
- Modulation Index Outer (SCPI only) is defined as the measure of extent of outer amplitude variation about an un-modulated carrier. It is calculated as $(V_{Amax} - V_{Amin}) / (V_{Amax} + V_{Amin})$. V_{Amax} is the largest amplitude at crest. V_{Amin} is the smallest amplitude at bottom. Maximum amplitude difference A is equal to $V_{Amax} - V_{Amin}$.
- Modulation Index Inner (SCPI only) is defined as the measure of extent of inner amplitude variation about an un-modulated carrier. It is calculated as $(V_{Bmax} - V_{Bmin}) / (V_{Bmax} + V_{Bmin})$. V_{Bmax} is the smallest amplitude at crest. V_{Bmin} is the largest amplitude at bottom. Minimum amplitude difference B is equal to $V_{Bmax} - V_{Bmin}$.
- Modulation On/Off Ratio (SCPI only) is defined as the ratio of $20\log_{10}((V_{Amax} + V_{Bmax}) / (V_{Amin} + V_{Bmin}))$.

3 VMA Mode

3.1 Digital Demod Measurement

Frequency Deviation Tolerance:

Modulation frequency tolerance is measured as a percentage of the frequency deviation f_{dev} , dictated by the modulation index. In the case of 2-FSK, the measure frequency deviation f at decision point shall be constrained to the range of $70\% f_{dev} < |f| < 130\% f_{dev}$.

- Outer Max Peak is the largest frequency deviation at crest as a percentage of the frequency deviation.
- Inner Max Peak is the smallest frequency deviation at crest as a percentage of the frequency deviation.
- Inner Min Peak is the smallest frequency deviation at bottom as a percentage of the frequency deviation.
- Outer Min Peak is the largest frequency deviation at bottom as a percentage of the frequency deviation.

Zero Crossing Tolerance:

In the case of 2-FSK, the excursions for the zero crossings for all trajectories of the eye diagram shall be constrained to within $\pm 12.5\%$ rms of the symbol time T_s ,

- Zero Crossing Offset(Max) is the maximum zero-crossing offset at the right as the percentage of the symbol time T_s .
- Zero Crossing Offset (Min) is the minimum zero-crossing offset at the left as the percentage of the symbol time T_s .

Demod Bits

Displays the demodulation bits.

Example `:DISP:DDEM:WIND2:DATA DBIT`

Sets the second window data to Demod Bits

When Tx BER is turned on, this table includes BER results:

MS_Demod Bits & BER	
BER	16.17 % (241482 / 1492980)
Index	Demod Bits Data
0	:00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000 :10101010 10101010 10101010 10101010 10101010 10101010 10101010 10101010

Frame Summary

This table shows the frame summary results.

Example `:DISP:DDEM:WIND2:DATA FRAM`

Sets the second window data to Frame Summary

Demod Traces

Windows:

"IQ Meas Spectrum" on page 216

"FSK Meas Spectrum" on page 218

"IQ Meas Time" on page 215

"FSK Meas Time" on page 217

Dual-window view consists of the above two windows.

Example `:DISP:DDEM:VIEW DTR`

3.1.3.2 Selected Segment / Format

These two elements of the window dropdown enable you to select the segment and the format to be used for displaying the demodulated trace.

Selected Segment

Displays a menu of segment choices for the selected window.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:SEGMent?</code>
Example	<code>:DISP:DDEM:WIND2:SEGM SEGM1</code> Select the segment1 data results for window 2 <code>:DISP:DDEM:WIND2:SEGM?</code>
Couplings	Available only for the following trace Data, otherwise hidden <ul style="list-style-type: none"> - IQ Meas Time - IQ Ref Time - IQ Meas Spectrum - IQ Ref Spectrum - Error Vector Time - Error Vector Spectrum - Mag Error - Phase Error - CH Freq Response - EQ Impulse Response - Metrics - Demod Bits
Preset	<code>SEGM1</code>
State Saved	Yes
Range	<code>SEGM1 SEGM2 SEGM3 SEGM4 SEGM5 SEGM6</code>

Format

Enables you to choose the available format of the selected trace.

The formats are:

Format name	Description
Log Mag (dB)	Data is converted to decibel units and shown on a linear Y axis
Linear Mag (Abs Value)	Magnitude of the data is shown on a linear Y axis
Real (I)	Real part of data is shown on a linear Y axis
Imaginary (Q)	Imaginary part of data is shown on linear Y axis
I-Q	Real part of data is shown on horizontal axis, imaginary part is shown on vertical axis, Independent variable (X axis) is normal to display
Constellation	Same as I-Q, but for data with symbols defined, only the symbol points are shown as dots with no connecting lines
Phase	Phase of complex data is shown on Y axis
I-Eye	Real part of data is shown with X axis segmented (generally into 2 symbol segments) and each segment is overlaid to show signal crossings at symbol boundaries
Q-Eye	Same as I-eye but imaginary part of data is shown
Group Delay	Useful for frequency response and IQ Meas Time traces. Shows the derivative of phase response with respect to frequency or time
Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6[:TRACe]:FORMat MLOG MLINear REAL IMAGinary VECTor CONSTln PHASe IEYE QEYE GDELay</code> <code>:DISPlay:DDEMod:WINDow[1] 2 ... 6[:TRACe]:FORMat?</code>
Example	<code>:DISP:DDEM:WIND2:FORM MLOG</code> Sets the second window data format to Log Mag <code>:DISP:DDEM:WIND2:FORM?</code>
Notes	Real, Imaginary, I-Q, Constellation, I-Eye and Q-Eye are available for IQ Meas Time and IQ Ref Time trace Log Mag, Phase and Group Delay are available for Channel Frequency Response trace Log Mag, Real and Imaginary are available for ccEVM vs Symbole trace
Preset	Depends on trace
State Saved	Yes
Range	Log Mag (dB) Linear Mag (Abs Value) Real (I) (Lin) Imaginary (Q) (Lin) I-Q Constellation Phase I-Eye Q-Eye Group Delay

3.1.4 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.1.4.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Auto Scale

Changes the Y reference value and Scale per Division so the full trace is displayed without clipping.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:AUTO:ONCE</code>
Example	<code>:DISP:DDEMod:WIND3:Y:AUTO:ONCE</code> Do the Y auto scale for the third window

Auto Scale at Restart

Enables or disables automatic Y Auto Scale with measurement restart:

- On – Performs automatic Y Auto Scale when measurement restarted, to let you see complete trace
- Off – Does not perform automatic Y Auto Scale when measurement restarted, retaining existing setting for Y scale

Remote Command	<code>:DISPlay:DDEMod:Y[:SCALE]:AUTO:REStart 0 1 OFF ON</code> <code>:DISPlay:DDEMod:Y[:SCALE]:AUTO:REStart?</code>
Example	<code>:DISP:DDEM:Y:AUTO:REST ON</code> <code>:DISP:DDEM:Y:AUTO:REST?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

Ref Value

Specifies the amplitude of a signal displayed on the reference graticule line. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

This setting applies only to the selected window. If a table type window is selected, **Ref Value** is unavailable. The functionality depends on the selected window.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:RLEVel <real></code> <code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:RLEVel?</code>
Example	Set the Y ref value of the third window to 20: <code>:DISP:DDEM:WIND3:Y:RLEV 20</code> Query the Y ref value of the third window: <code>:DISP:DDEM:WIND3:Y:RLEV?</code>
Preset	Depends on trace data
State Saved	Saved in instrument state
Min/Max	-9.9E+37/9.9E+37
Annotation	The reference value is displayed above the graticule with the title "Ref Value"

Scale/Div

Controls the Y scale per division of the selected trace.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:PDIVision <real></code> <code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:PDIVision?</code>
Example	<code>:DISP:DDEM:WIND3:Y:PDIV 10</code> Set the Y scale/div of the third window to 10 <code>:DISP:DDEM:WIND3:Y:PDIV?</code> Query the Y scale/div of the third window
Preset	Depends on trace data
State Saved	Yes
Min/Max	-9.9E+37/9.9E+37
Annotation	Upper left corner of trace grid, same gray as grid

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display.

Changing the reference position does not change the reference level value.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:RPOSition TOP CENTER BOTTom</code> <code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:Y[:SCALE]:RPOSition?</code>
Example	<code>:DISP:DDEM:WIND3:Y:RPOS TOP</code> Set the Y ref position of the third window to TOP <code>:DISP:DDEM:WIND3:Y:RPOS?</code> Query the Y ref position of the third window

Preset	Depends on trace data
State Saved	Saved in instrument state
Range	Top Ctr Bot

3.1.4.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 231](#)
- See ["Single-Attenuator Configuration" on page 232](#)

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1766 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1760 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 236

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1769 See " Attenuator Configurations and Auto/Man " on page 236 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1765 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below</p>

3 VMA Mode

3.1 Digital Demod Measurement

	7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB	
Preset	Auto	The Auto value is 10 dB
State Saved	Saved in instrument state	
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased	
Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
	Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB	
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p>	

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1763, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 234 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1769 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

3 VMA Mode
 3.1 Digital Demod Measurement

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 238](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1788 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1790 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p>
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator

	Transition Rules" on page 239
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description
Auto Function	
Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 240](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1773.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

3 VMA Mode
3.1 Digital Demod Measurement

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 242

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to <code>COMBined</code>
Elec Atten Only	<code>ELECTrical</code>	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	<code>COMBined</code>	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>

Notes	<p>The parameter option ELECTRICAL sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBINED is mapped to ELECTRICAL in Single-Attenuator models. If you send COMBINED, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBINED</p>				
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 1769 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 241 is grayed-out</p> <p>Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>Appears in the Waveform measurement in BASIC and 5G NR Modes</p>				
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC				
State Saved	Saved in instrument state				
Range	<table border="1"> <tr> <td>Dual-Attenuator models:</td> <td>Off Elec Atten Only Mech + Elec Atten</td> </tr> <tr> <td>Single-Attenuator models:</td> <td>Off On</td> </tr> </table>	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten	Single-Attenuator models:	Off On
Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten				
Single-Attenuator models:	Off On				

Backwards Compatibility Command

Notes	<p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p>
Backwards Compatibility SCPI	<pre>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</pre> <pre>[:SENSe]:POWer[:RF]:RANGe:AUTO?</pre>

Adjustment Algorithm

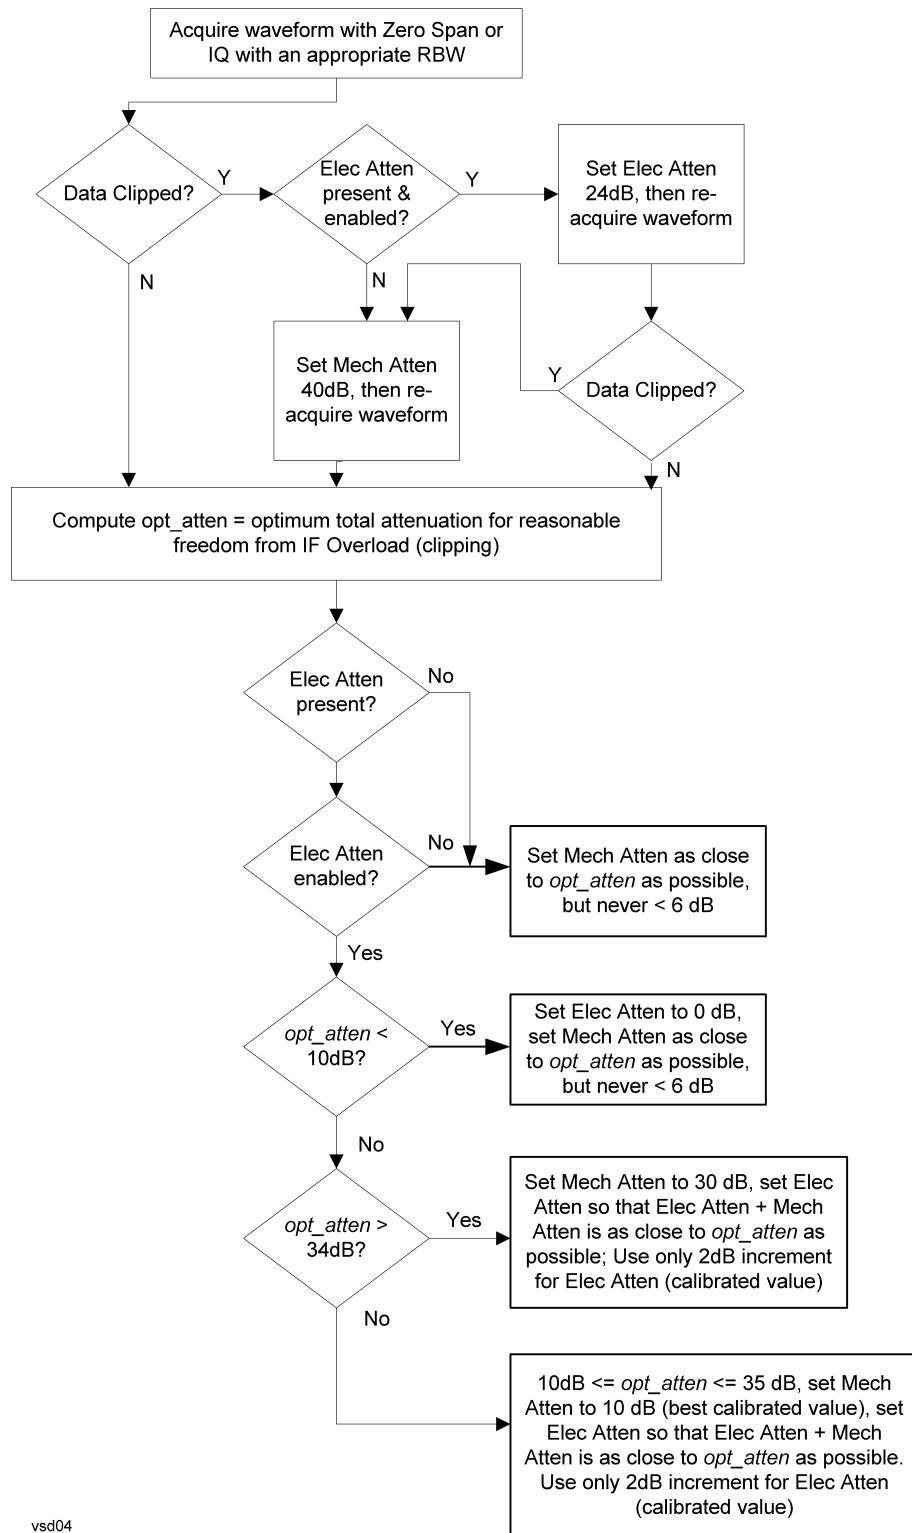

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 241 selection is Mech + Elec Atten:

"Pre-Adjust for Min Clipping" on page 241 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.1.4.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>	
Example	<code>:POW:RANG:PAR 12 dB</code>	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.1.4.4 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe] :VOLTagE :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :VOLTagE :IQ :RANGe :AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT :IQ :RANG :AUTO OFF</code> <code>:VOLT :IQ :RANG :AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to Y_{Max}
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.
Remote Command	<code>[:SENSe] :POWer :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :POWer :IQ :RANGe :AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW :IQ :RANG :AUTO OFF</code> <code>:POW :IQ :RANG :AUTO?</code>
Notes	<code>:POW :IQ :RANG :AUTO</code> is an alternate form of <code>:VOLT :IQ :RANG :AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTagE forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTagE:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTagE:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code> <code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 1782 is On, the I Range value will be copied to " Q Range " on page 1781 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V" the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <amp;l></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWER form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTagE form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTagE form of the command. The power values of the 4 range

	states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "[I Range](#)" on page 1779 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1779 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1782 is On, the " I Range " on page 1779 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak

3 VMA Mode
3.1 Digital Demod Measurement

"Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	<code>[:SENSe] :POWer :IQ :Q :RANGe [:UPPer] <amp;1></code> <code>[:SENSe] :POWer :IQ :Q :RANGe [:UPPer] ?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω , and to 1.0 V Peak when Reference Z is 75 Ω : <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω : 10, 4, -2, -8 75 Ω : 8.2, 2.2, -3.8, -9.8 600 Ω : -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe] :VOLTagE POWer :IQ :MIRROred OFF ON 0 1</code> <code>[:SENSe] :VOLTagE POWer :IQ :MIRROred?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the " I Range " on page 1779 value is mirrored (copied) to the " Q Range " on page 1781
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.1.4.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1801](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1787](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 255](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command

	is sent in these instruments, accepted without error, and the query always returns 0
	- Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1787
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to :READ or :MEASure queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns <code>MWAVE</code>
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTernal</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

3 VMA Mode

3.1 Digital Demod Measurement

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command `[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
`[:SENSe]:POWer[:RF]:GAIN:BAND?`

Example `:POW:GAIN:BAND LOW`
`:POW:GAIN:BAND?`

Dependencies Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown
Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E
If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated

Preset	OFF

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to ["Internal Preamp" on page 1788](#). LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with ["Internal Preamp" on page 1788](#), although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see ["More Information" on page 259](#)

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp’s compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 264
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 266
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 266

Remote Command	<code>[:SENSe] :POWer [:RF] :MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe] :POWer [:RF] :MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> – The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed – The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed – The Full Bypass Enable selection does not appear unless options LNP and MPB are both present

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still

3 VMA Mode
3.1 Digital Demod Measurement

high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around -30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger

amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselect is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and

3 VMA Mode
 3.1 Digital Demod Measurement

- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: :POW:MW:PRES OFF
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB)
Preset	ON
Backwards Compatibility SCPI	[[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See "[μW Path Control](#)" on page 1791.

When this function is **ON**, and "[μW Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Preset	<code>OFF</code>
State Saved	Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The

specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>

Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON

State Saved	Saved in instrument state
-------------	---------------------------

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPreSel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1

State Saved	Saved in instrument state
-------------	---------------------------

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code>

	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: :WAV:PFIL ON
	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: :SAN:PFIL ON
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 273 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.1.5 BW

Opens the **BW** (Bandwidth) menu, which contains "[Info BW](#)" on page 274.

3.1.5.1 Settings

Contains the basic bandwidth functions. It is the only tab under **BW**.

Info BW

Enables you to enter a frequency value to set the channel bandwidth that will be used for data acquisition.

Remote Command	<code>[:SENSe] :DDEMod :BANDwidth [:RESolution] <freq></code> <code>[:SENSe] :DDEMod :BANDwidth [:RESolution] ?</code>											
Example	<code>:DDEM :BAND 8 MHz</code> <code>:DDEM :BAND ?</code>											
Couplings	Changes when Symbol Rate is larger than Info BW x 10											
Preset	5 MHz											
State Saved	Saved in instrument state											
Min/Max	1 kHz / Max Info BW The Max Info BW depends on Data Source and Input Type:											
	<table border="1"> <thead> <tr> <th>Data Source</th> <th>Input Type</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td rowspan="2">Input</td> <td>RF</td> <td>No Option = 10 MHz WB (25 MHz or wider) = Hardware Option Limit</td> </tr> <tr> <td>I/Q (for I+jQ)</td> <td>No Option = 20 MHz Option B25 = 50 MHz</td> </tr> <tr> <td>File</td> <td>n/a</td> <td>100 GHz</td> </tr> </tbody> </table>	Data Source	Input Type	Value	Input	RF	No Option = 10 MHz WB (25 MHz or wider) = Hardware Option Limit	I/Q (for I+jQ)	No Option = 20 MHz Option B25 = 50 MHz	File	n/a	100 GHz
Data Source	Input Type	Value										
Input	RF	No Option = 10 MHz WB (25 MHz or wider) = Hardware Option Limit										
	I/Q (for I+jQ)	No Option = 20 MHz Option B25 = 50 MHz										
File	n/a	100 GHz										
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :BWIDth [:RESolution]</code>											

3.1.6 Display

Enables you to configure display items for the current Mode, Measurement View or Window.

3.1.6.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Demod Bits Format

Selects the display format for demodulation bits.

Remote Command	<code>:DISPlay:DDEMod:BITS:FORMat HEX BINary</code> <code>:DISPlay:DDEMod:BITS:FORMat?</code>
Example	<code>:DISP:DDEM:BITS:FORM HEX</code> <code>:DISP:DDEM:BITS:FORM?</code>
Preset	<code>BIN</code>
State Saved	Yes
Range	Hex Binary

Tx Pattern Display

Turns on/off Tx Pattern display in Demod Bits window.

Remote Command	<code>:DISPlay:DDEMod:TXBit:PATTern OFF ON 0 1</code> <code>:DISPlay:DDEMod:TXBit:PATTern?</code>
Example	<code>:DISP:DDEM:TXB:PATT OFF</code> <code>:DISP:DDEM:TXB:PATT?</code>
Preset	<code>ON</code>
State Saved	Yes
Range	Off On

Ideal State Shape

Enables you to choose between a cross, circle, or none to represent the ideal state on the selected trace. Digital Demodulation shows you the location of all ideal symbol states in an I-Q or constellation diagram.

Remote Command	<code>:DISPlay:DDEMod:SYMBol:SHAPE CIRCle CROSS OFF</code> <code>:DISPlay:DDEMod:SYMBol:SHAPE?</code>
Example	<code>:DISP:DDEM:SYMB:SHAP CIRC</code> <code>:DISP:DDEM:SYMB:SHAP?</code>
Preset	<code>CIRC</code>
State Saved	Yes
Range	Circle Cross None

Ideal State Size

Determines the ideal state size, as a percentage of the maximum ideal state distance from the origin (the same way Error Vector Magnitude is defined). Ideal states are shown as circles or crosses in Vector and constellation diagrams, as determined by the Ideal State Shape setting.

The ideal state is where symbols occur if your signal is without error. Showing the ideal states gives a visual indication of the quality of your signal.

You can use this feature to determine if symbols have an EVM above a specified Value. For example, to see if any symbols have an EVM greater than 10%, set the state size to 10% and select Circle as the shape. Any symbols that fall outside of the circle (other than SYNC or PILOT symbols) have an EVM greater than 10%.

Remote Command	<code>:DISPlay:DDEMod:SYMBol:SIZE <real></code> <code>:DISPlay:DDEMod:SYMBol:SIZE?</code>
Example	<code>:DISP:DDEM:SYMB:SIZE 10</code> <code>:DISP:DDEM:SYMB:SIZE?</code>
Notes	Parameter is interpreted as a percent, for example, if you want the ideal size to be 10% send 10, not 0.1
Preset	5
State Saved	Yes
Min	0.1
Max	50

3.1.6.2 View

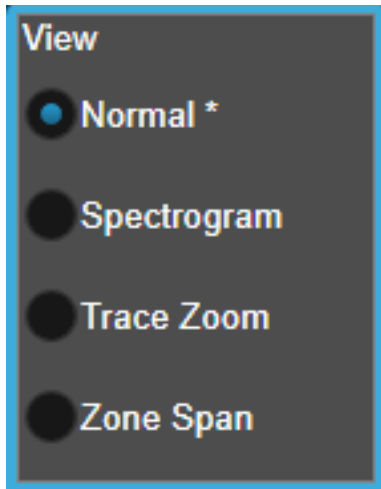

Contains controls for selecting the current **View**, and for editing User Views.

Views

Lets you choose a **View** from the predefined Views for the current measurement. The Views vary from measurement to measurement. See the “Views” section of your measurement’s help for a list of all the Views supported by your measurement.

If you have modified the current View, using the ["View Editor" on page 156](#), an asterisk appears next to that View in the radio button panel. You can save the modified View as a User View (see ["Save Layout as New View" on page 1808](#)).

3 VMA Mode
3.1 Digital Demod Measurement

Example	<code>:DISP:VIEW ZSP</code> sets the zone span view in Swept SA
Preset	<code>NORM</code>
State Saved	Saved in Instrument State

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre><code>:DISP:VIEW:ADV:SEL</code></pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code> <code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></pre>

	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views
------------------------------	--

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
----------------	---

Example	<code>:DISP:VIEW:ADV:NAME “Baseband”</code>
---------	---

Creates a new View named **Baseband** from the current View, and selects it as the current View

Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>
-------	--

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p>

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined</p>

3.1.6.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
----------------	--

3 VMA Mode
3.1 Digital Demod Measurement

Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPLAY:VIEW:ADVANCED:SELECT</code>
Rename User View	<code>:DISPLAY:VIEW:ADVANCED:RENAME</code>
Delete User View	<code>:DISPLAY:VIEW:ADVANCED:DELETE</code>
Create User View	<code>:DISPLAY:VIEW:ADVANCED:NAME</code>
Select Screen	<code>:INSTRUMENT:SCREEN:SELECT</code>
Delete Screen	<code>:INSTRUMENT:SCREEN:DELETE</code>

Name	Command
Delete All But This Screen	:INSTrument:SCReen:DELeTe:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer
Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.1.7 Frequency

Opens the **Frequency** menu, which contains controls that enable you to control the frequency parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**. For example, “**Center Frequency**” on page 284 is the same for all measurements – it does not change as you change measurements.

3.1.7.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

3 VMA Mode

3.1 Digital Demod Measurement

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a Global tab in its Meas Setup menu.

This function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set the center frequency for a specific input.

This setting is remembered as you go from input to input. Thus you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz, and when you go back to the RF Input the **Center Frequency** will revert to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Remote Command	<code>[:SENSE]:FREQuency:CENTer <freq></code> <code>[:SENSE]:FREQuency:CENTer?</code>
Example	<code>:FREQ:CENT 50 MHz</code> Sets Center Frequency to 50 MHz <code>:FREQ:CENT UP</code> Increments the Center Frequency by the value of CF Step <code>:FREQ:CENT?</code> Returns the current value of Center Frequency
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> – For RF input, equivalent to <code>FREQ:RF:CENT</code> – For I/Q input, equivalent to <code>FREQ:IQ:CENT</code> – For External Mixer, equivalent to <code>FREQ:EMIX:CENT</code> Preset and Max values are dependent on Hardware Options (5xx) If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is sent, an invalid suffix error message is generated
Dependencies	Center Frequency can be limited if the Span is such that the range of the instrument is exceeded
Preset	1 GHz See "RF Center Freq" on page 286 , "Ext Mix Center Freq" on page 286 , and "I/Q Center Freq" on page 287
State Saved	Saved in instrumen
Min/Max	Depends on the selected input See "RF Center Freq" on page 286 , and "I/Q Center Freq" on page 287e
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

RF Center Freq

Specifies the RF Center Frequency. Sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent.

Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on Span

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent.

Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer

3 VMA Mode
3.1 Digital Demod Measurement

	setup
Preset	<p>When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies</p> <p>When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz</p>
State Saved	Yes
Min	<p>The minimum frequency in the currently selected mixer band + 5 Hz</p> <p>If the knob or step keys are being used, also depends on Span</p>
Max	<p>The maximum frequency in the currently selected mixer band - 5 Hz</p> <p>If the knob or step keys are being used, also depends on Span</p>

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent.

Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<p><code>[:SENSe] :FREQuency :IQ :CENTer <freq></code></p> <p><code>[:SENSe] :FREQuency :IQ :CENTer ?</code></p>
Example	<code>:FREQ :IQ :CENT 30 MHz</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for the center frequency.

Remote Command	<p><code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code></p> <p><code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code></p>
----------------	--

	<code>[:SENSe] :FREQuency :CENTer :STEP :AUTO OFF ON 0 1</code>
	<code>[:SENSe] :FREQuency :CENTer :STEP :AUTO?</code>
Example	<p><code>:FREQ:CENT:STEP 500 MHz</code></p> <p>Increases the current center frequency value by 500 MHz</p> <p><code>:FREQ:CENT:STEP?</code></p> <p><code>:FREQ:CENT:STEP:AUTO ON</code></p> <p><code>:FREQ:CENT:STEP:AUTO?</code></p>
Notes	Preset and Max values depend on Hardware Options (503, 507, 508, 513, 526)
Dependencies	<p>BW, Center frequency</p> <p>If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning</p>
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	<p>5 MHz</p> <p>ON</p>
State Saved	Saved in instrument state
Min/Max	<p>- /+(Maximum frequency of the instrument)</p> <p>That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band</p>
Status Bits/OPC dependencies	non-overlapped

3.1.8 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed it at the center of the screen on the trace determined by the Marker Window rules.

3.1.8.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. It is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

In any menu in which **Select Marker** appears, the first control is always **Marker X**.

3 VMA Mode
3.1 Digital Demod Measurement

Notes	The selected marker is remembered even when not in the Marker menu and is used if a search is done or a Band Function is turned on, or for Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state

3.1.8.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta**, **Fixed** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker X

Enables you to set or read back the X Axis value of the selected marker in the current X Axis Scale unit. If the marker mode is off, the SCPI command has no affect other than to cause the marker to become selected. Note that the X value can change if the marker is moved to a trace with a different domain.

The Marker X position is absolute if the marker mode is Normal or Fixed. If the mode is Delta, then the X position is relative to the reference marker. The valid X positions are the actual data points in the trace; the marker cannot be located between points. If a SCPI command attempts to place the marker between two points, the X value snaps to the closest point.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:X <real></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:DDEMod:MARK:X 0.325</code> <code>:CALC:DDEMod:MARK:X?</code>
Notes	Does not exceed the bounds of the data unless it is Fixed . If you attempt to set it to a value outside the bounds, it is clipped at the closest limit and Error -222 Data Out of Range is generated If suffix is sent, it must match the X units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated If you try to read or set the position of a Delta marker, remember that the position is in relative units
Couplings	Coupling of Delta and Reference Markers
Preset	None until marker is turned on
State Saved	Yes
Min/Max	Depends on trace data / Depends on trace data

Marker Y

Enables you to set or read back the selected marker's Y Axis value in the current Y Axis Scale unit. Setting the Y value has no effect (other than to cause the marker to become selected) if the marker mode is other than fixed. The query generates an error if the marker mode is **Off**. Note that the Y value can change if the Y-axis units change, either from a change in format of the trace the marker is on or if the marker is moved to a different trace.

If the selected marker is on a trace that is displayed with Vector or Constellation format, this function controls only the real part of the Y value (i.e., the horizontal axis value). Use "[Marker Y Imag](#)" on page 290 to change the imaginary (vertical) value. **Marker Y** and **Marker Y Imag** always set or get the rectangular form of Y, regardless of whether the marker readout is polar or rectangular.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:Y[:REAL] <real></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:Y[:REAL]?</code>
Example	<code>:CALC:DDEM:MARK2:Y 0.325</code> <code>:CALC:DDEM:MARK2:Y?</code>
Notes	You cannot set Y unless the marker type is fixed. If the marker becomes fixed after a marker function is turned on, it is set to whatever the Y value was when the marker became fixed If suffix is sent, it must match the Y units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated
Couplings	Changes if marker is relative to a Delta marker that is turned on
Preset	None until marker is turned on
State Saved	Yes
Min/Max	-9.9E+37 / 9.9E+37

Marker Y Imag

Enables you to set or read back the selected marker's quadrature (imaginary) Y value in the current Y Axis Scale unit. It has no effect (other than to cause the marker to become selected) if the marker mode is other than fixed, or if the current trace format is not complex (Vector or Constellation).

The query generates an error if it is used for a marker that is not on a complex trace. **Marker Y Imag** is not affected by whether the marker readout is polar or rectangular.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:Y:IMAGinary <real></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:Y:IMAGinary?</code>
Example	<code>:CALC:DDEM:MARK1:Y:IMAG 0.435</code> <code>:CALC:DDEM:MARK1:Y:IMAG?</code>

3 VMA Mode

3.1 Digital Demod Measurement

Notes	Grayed-out unless the marker is fixed and on a vector display If suffix is sent, it must match the Y units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated. If query is sent while the marker is on a trace whose format is not vector or constellation, NaN (9.91E+37) is returned
Preset	None until marker is turned on
State Saved	Yes
Min/Max	Depends on trace format / Depends on trace format

Marker Mode

There are four control modes for markers:

Mode	Option	Description
Normal	POSition	A marker that can be moved to any point on the X Axis by specifying its X Axis value, and whose absolute Y Axis value is then the value of the trace point at that X Axis value
Delta	DELTA	A marker that can be moved to any point on the X Axis by specifying its X Axis offset from a reference marker, and whose absolute Y Axis value is then the value of the trace point at that X Axis value
Fixed	FIXed	A marker whose X Axis and Y Axis values may be directly or indirectly specified by you, but whose Y Axis value remains fixed, once specified, and does not follow the trace. Fixed markers are useful as reference markers for Delta markers, as operands in a Peak Search operation, and as arbitrary reference points settable by you. These markers are represented on the display by an "X" rather than a diamond
Off	OFF	A marker that is not in use

The SCPI command in the table below selects the marker and sets the marker control mode as described under **Normal**, **Delta**, **Fixed** and **Off**, below. All interactions and dependencies detailed under the control description are enforced when the remote command is sent.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:MODE POSition DELTA FIXed OFF</code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:MODE?</code>
Example	<code>:CALC:DDEM:MARK2:MODE POS</code> <code>:CALC:DDEM:MARK2:MODE?</code>
Couplings	The marker addressed by this command becomes the selected marker on the front panel
Preset	OFF (all markers)
State Saved	The marker control mode (Normal , Delta , Fixed , Off) and X Axis value are saved in instrument state
Range	Normal Delta Fixed Off

Delta Marker (Reset Delta)

Pressing this control has exactly the same effect as pressing **Delta** in **Marker Mode**. The selected marker becomes a **Delta** Marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Enables you to configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command :CALCulate:DDEMod:MARKer:AOFF

Example :CALC:DDEM:MARK:AOFF

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker that is not **Fixed** or **Off**. By “equal X Axis movement” we mean that we preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

Note that **Fixed** markers do not couple. They stay where they were, while all the other markers move. If a **Fixed** marker is being moved, all the non-fixed markers will move with it.

This may result in markers going off-screen.

Remote Command :CALCulate:DDEMod:MARKer:COUPle[:STATe] ON | OFF | 1 | 0
 :CALCulate:DDEMod:MARKer:COUPle[:STATe]?

Example :CALC:DDEM:MARK:COUP ON
 :CALC:DDEM:MARK:COUP?

Notes In general, when coupling is turned on, then all **Normal** or **Delta** markers with the same (or equivalent) domain as the selected marker move in the same manner as the selected marker

Preset **OFF**, presets on Mode Preset and All Markers Off

State Saved Saved in instrument state

3.1.8.3 Peak Search

The controls on this tab enable you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

Marker X

Sets the X Axis value of the selected marker in the current X Axis Scale unit. This is the same as "[Marker X](#)" on [page 289](#) on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum y-axis value for that trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a **Peak Search**.

Remote Command	:CALCuLate:DDEMod:MARKer[1] 2 ... 12:MAXimum
Example	:CALC:DDEM:MARK2:MAX
Notes	Sending this command selects the subcoded marker

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker's value. Only peaks which meet all enabled peak criteria are considered. If there is no valid peak lower than the current marker position, a "No peak found" message is generated and the marker is not moved.

In Digital Demod measurements, if the format is complex (vector or constellation), then the marker moves to the closest point that has a lower magnitude than the marker's current position.

If the selected marker was off, then it is turned on as a **Normal** marker and a peak search is performed.

Remote Command	:CALCuLate:DDEMod:MARKer[1] 2 ... 12:MAXimum:NEXT
Example	:CALC:DDEM:MARK2:MAX:NEXT
Notes	Sending this command selects the subcoded marker
State Saved	Not part of saved state

Next Higher Amplitude

Moves the marker to the peak next higher in Y value than the peak it is currently on. If the format is complex (vector or constellation) then the marker moves to the closest point that has a higher magnitude than the marker's current position. If this function is invoked via SCPI on a marker that is off, the result is the same as if you sent a Peak Search command.

Remote Command :CALCulate:DDEMod:MARKer[1]|2|...|12:MAXimum:PREVIOUS

Example :CALC:DDEM:MARK2:MAX:PREV

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria. If there is no valid peak to the right of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a **Normal** marker and a peak search is performed.

Remote Command :CALCulate:DDEMod:MARKer[1]|2|...|12:MAXimum:RIGHT

Example :CALC:DDEM:MARK2:MAX:RIGH

Notes Sending this command selects the subopcoded marker

State Saved Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria. If there is no valid peak to the left of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a **Normal** marker and a peak search is performed.

Remote Command :CALCulate:DDEMod:MARKer[1]|2|...|12:MAXimum:LEFT

Example :CALC:DDEM:MARK2:MAX:LEFT

State Saved Not part of saved state

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value.

If the selected marker is Off, it is turned on before the minimum search is performed.

Remote Command	:CALCulate:DDEMod:MARKer[1] 2 ... 12:MINimum
Example	:CALC:DDEM:MARK2:MIN
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time) differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace. And it places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Fixed** or **Normal** if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are exactly the same as for **Peak Search**, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is off, a **Delta** type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	:CALCulate:DDEMod:MARKer[1] 2 ... 12:PTPeak
Example	:CALC:DDEM:MARK:PTP
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this control has exactly the same effect as pressing **Delta** in **Marker Mode** on the **Settings** tab. The selected marker becomes a **Delta** Marker. If the selected

marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here to enable you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.1.8.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker X

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker X](#)" on [page 289](#) on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by **Marker, Properties, Relative To**. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:REference <integer></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:REference?</code>
Example	<code>:CALC:DDEM:MARK2:REF 4</code> <code>:CALC:DDEM:MARK2:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	If the reference marker is off it is turned on in Fixed or Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by Restore Mode Defaults. Not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min/Max	1 / 12

Marker Window

Assigns the specified marker to the designated trace.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:WINDow <int></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:WINDow?</code>
Example	<code>:CALC:DDEM:MARK:WIND 2</code> Sets the first marker's trace to window 2 <code>:CALC:DDEM:MARK:WIND?</code> Query the first marker's trace
Notes	Assigns the specified marker to the designated window
Preset	1
State Saved	Yes
Min/Max	1 / 6

Marker Settings Diagram

Enables you to configure the Marker system using a visual utility. This is the same as "[Marker Settings Diagram](#)" on page 292 on the **Settings** tab.

3.1.8.5 Marker Function

The controls on this tab enable you to control the Marker Functions of the instrument. Marker Functions perform post-processing operations on marker data.

Marker X

Set the X Axis value of the selected marker in the current X Axis Scale unit. This is the same as "[Marker X](#)" on page 289 on the **Settings** tab.

Band Function

Enables you to set the marker control function type to one of the following:

<code>NOISe</code>	Marker Noise
<code>BPOWer</code>	Band Power
<code>BDENsity</code>	Band Density
<code>OFF</code>	Marker Function Off

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNCTION NOISe BPOwer BDENsity OFF</code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNCTION?</code>
Example	<code>:CALC:DDEM:MARK:FUNC BPOW</code> <code>:CALC:DDEM:MARK:FUNC?</code>
Preset	OFF
State Saved	Yes
Range	Marker Noise Band Power Band Density Marker Function Off
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Band Span

Enables you to set the width of the span for the selected marker. This function defines the span of frequencies or time. The marker position does not change when you adjust the span.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNCTION:BAND:SPAN <real></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNCTION:BAND:SPAN?</code>
Example	<code>:CALC:DDEM:MARK2:FUNC:BAND:SPAN 1.23E+06</code> <code>:CALC:DDEM:MARK2:FUNC:BAND:SPAN?</code>
Preset	When marker is turned on, 1/20th of current span or displayed time length
State Saved	Yes
Min/Max	100 / 9.9E+37

Band Left

Enables you to adjust the left side of the band. In order to remain centered in the band, the marker position must also change as you change the left edge. The right edge is unaffected.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNCTION:BAND:LEFT <real></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNCTION:BAND:LEFT?</code>
Example	<code>:CALC:DDEM:MARK2:FUNC:BAND:LEFT 1.23E+06</code> <code>:CALC:DDEM:MARK2:FUNC:BAND:LEFT?</code>
Couplings	Changes marker X to keep the marker centered in the band
Preset	When marker is turned on, 1/40th of current span or displayed time length left of the marker position
State Saved	Yes
Min/Max	-9.9E+37 / 9.9E+37

Band Right

Enables you to adjust the right side of the band. In order to remain centered in the band, the marker position must also change as you change the right edge. The left edge is unaffected.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNction:BAND:RIGHT <real></code> <code>:CALCulate:DDEMod:MARKer[1] 2 ... 12:FUNction:BAND:RIGHT?</code>
Example	<code>:CALC:DDEM:MARK2:FUNC:BAND:RIGHT 1.23E+06</code> <code>:CALC:DDEM:MARK2:FUNC:BAND:RIGHT?</code>
Couplings	Changes marker X to keep the marker centered in the band
Preset	When marker is turned on, 1/40th of current span or displayed time length right of the marker position
State Saved	Yes
Min/Max	-9.9E+37 / 9.9E+37

3.1.8.6 Marker To

The controls on this tab enable you to copy the current marker's value into other instrument parameters (for example, **Center Frequency**). The currently selected marker is made the active function on entry to this menu (if the currently selected marker is not on when you press this control, it will be turned on at the center of the screen as a normal type marker and then made the active function).

Marker X

Sets the X Axis value of the selected marker in the current X Axis Scale unit. This is the same as "**Marker X**" on page 289 on the **Settings** tab.

Mkr -> CF

Enables you to set the **Center Frequency** of the instrument to the frequency of the selected marker. The marker stays at this frequency, so it moves to the center of the display. In delta marker mode, this function sets the center frequency to the x-axis value of the delta marker. When the frequency scale is in log mode, the center frequency is not at the center of the display.

If the currently selected marker is off when this control is pressed, it will be turned on at the center of the screen as a **Normal** type marker.

Remote Command	<code>:CALCulate:DDEMod:MARKer[1] 2 ... 12[:SET]:CENTer</code>
Example	<code>:CALC:DDEM:MARK4:CENT</code>

Notes	Sending this command selects the subopcoded marker
Dependencies	Not available (control is grayed out) when x-axis is the time domain
Couplings	All the usual couplings associated with setting Center Frequency apply

3.1.9 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.1.9.1 Selected Segment

Enables you to select the segment to setup for demodulation. The term “selected segment” is used throughout this document to specify which segment will be affected by changes in the Meas Time and Demod menus.

Selected Segment appears above the menu panel, indicating that it applies to multiple controls in the **Meas Setup** menu. **Selected Segment** is blanked if you select a tab whose controls do *not* depend on the selected segment (for example, **Settings**).

Notes	The selected segment is remembered even when not in the Meas Setup menu
Preset	Segment1
State Saved	Saved in instrument state

3.1.9.2 Settings

Enables you to set measurement parameters.

Avg|Hold Number

Specifies the number of N averages that will be used for the measurement. After the specified number (average counts) have been averaged, the averaging mode (termination control) setting determines the averaging action.

Remote Command	<code>[:SENSe] :DDEMod :AVERAge :COUNT <integer></code> <code>[:SENSe] :DDEMod :AVERAge :COUNT?</code>
Example	<code>:DDEMod :AVER :COUN 1000</code> <code>:DDEMod :AVER :COUN?</code>
Preset	10
State Saved	Yes
Min/Max	1/10000

Averaging On/Off

Turns averaging on or off.

Remote Command	<code>[:SENSe]:DDEMod:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:DDEMod:AVERage[:STATe]?</code>
Example	<code>:DDEM:AVER OFF</code> <code>:DDEM:AVER?</code>
Preset	<code>OFF</code>
State Saved	Yes
Range	Off On

Averaging Mode

Toggles the averaging mode between **EXponential** and **REpeat**. This selection only affects the averaging result after the number of N averages is reached. The N is set using "**Avg|Hold Number**" on page 300.

EXponential	Each successive data acquisition after the average count is reached, is exponentially weighted and then combined with the existing average
REPeat	After reaching the average count, the averaging is reset and a new average is started

Remote Command	<code>[:SENSe]:DDEMod:AVERage:TCONtrol EXponential REPeat</code> <code>[:SENSe]:DDEMod:AVERage:TCONtrol?</code>
Example	<code>:DDEM:AVER:TCON REP</code> <code>:DDEM:AVER:TCON?</code>
Notes	Selects the type of termination control used for averaging. This determines the averaging action after the specified number of frames (average count) is reached
Preset	<code>EXponential</code>
State Saved	Yes
Range	Exponential Repeat

Spur Avoidance

Because VXT models M9410A/11A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The Spur Avoidance function is provided to eliminate this spur, at the expense of some measurement speed.

When Spur Avoidance is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the Info BW \leq maxBW/2.5. See "[More Information](#)" on page 302.

You can disable this function to speed up your measurement by setting Spur Avoidance to "Disabled."

Note that when Spur Avoidance is not in effect, either because you have disabled it or because the Info BW $>$ maxBW/2.5, the following warning message will appear in the status bar: "Settings Alert; Spur Avoidance Off". This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	<code>[:SENSe]:DDEMod:SAVoid[:STATe] ON OFF 0 1</code> <code>[:SENSe]:DDEMod:SAVoid[:STATe]?</code>
Example	<code>:DDEMod:SAVoid ON</code> <code>:DDEMod:SAVoid?</code>
Dependencies	Only appears in VXT models M9410A/11A
Preset	ON
State Saved	Saved in instrument state
Range	On Off

More Information

Option	Frequency Range	MaxBW
Option B40	380 MHz ~ 6000 MHz	40 MHz
Option B3X	380 MHz ~ 550 MHz	100 MHz
	550 MHz ~ 1310 MHz	200 MHz
	1310 MHz ~ 5930 MHz	300 MHz
	5930 MHz ~ 6000 MHz	(6080 MHz- center frequency) * 2
Option B6X	380 MHz ~ 550 MHz	100 MHz
	550 MHz ~ 1310 MHz	200 MHz
	1310 MHz ~ 5780 MHz	600 MHz
	5780 MHz ~ 6000 MHz	(6080 MHz- center frequency) * 2
Option B12	380 MHz ~ 550 MHz	100 MHz
	550 MHz ~ 1310 MHz	200 MHz
	1310 MHz ~ 2000 MHz	600 MHz
	2000 MHz ~ 5480 MHz	1200 MHz
	5480 MHz ~ 6000 MHz	(6080 MHz- center frequency) * 2

Optimize EVM

This is an "immediate action" function to optimize EVM for the current input signal. It is used to set the combination of the preamp, mechanical and electronic attenuation, and IF gain value based on the measured signal peak level. Its purpose is to get better EVM results by improving the SNR and avoid ADC overload at the same time.

After this control is pressed, Pre-Adjust for Min Clipping@50227 changes to **Off** and "IF Gain" on page 362 Auto changes to **Manual**.

NOTE

Before selecting this function, the "EVM Optimization Method" on page 303 should be selected.

Remote Command	<code>[:SENSe]:DDEMod:OPTimize</code>
Example	<code>:DDEM:OPT</code>
Dependencies	Does not appear in VXT Models M9410A/11A/15A/16A/20A

EVM Optimization Method

There are 2 methods for EVM Optimization:

- NORMal** Captures input signal, measures its peak power, then the algorithm will find proper setting combination for attenuation, preamp and IF Gain
- ITERative** Captures input signal multiple times in a iteration process, demodulates the signal and calculates EVM for each iteration, then finds setting combination for attenuation, preamp and IF Gain with minimum EVM

The **Iterative** method is slower than the **Normal** method but it can always get better EVM.

Remote Command	<code>[:SENSe]:DDEMod:OPTMethod NORMal ITERative</code> <code>[:SENSe]:DDEMod:OPTMethod?</code>
Example	<code>:DDEM:OPTM NORM</code> <code>:DDEM:OPTM?</code>
Dependencies	Does not appear in VXT Models M9410A/11A/15A/16A/20A
Couplings	Disabled when Segment Number is greater than one
Preset	NORMal
State Saved	Saved in instrument state
Range	Normal Iterative

Iterative EVM Optimization Target

Specify the segment will be used as iterative EVM optimization target.

Remote Command	<code>[:SENSe]:DDEMod:OPTimize:ITERative:TARGet SEGMENT1 ... SEGMENT6</code> <code>[:SENSe]:DDEMod:OPTimize:ITERative:TARGet?</code>
Example	<code>:DDEM:OPT:ITER:TARG SEG1</code> <code>:DDEM:OPT:ITER:TARG?</code>
Dependencies	This control is invalid when EVM Optimization Method is Normal
Preset	<code>SEGMENT1</code>
State Saved	Saved in instrument state
Range	Segment 1 Segment 2 Segment 3 Segment 4 Segment 5 Segment 6

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 305 below.

Remote Command	<code>:COUPle ALL</code>
Example	<code>:COUP ALL</code>
Backwards Compatibility SCPI	<code>:COUPLE ALL NONE</code>
Backwards Compatibility Notes	<code>:COUP:NONE</code> puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it

3 VMA Mode

3.1 Digital Demod Measurement

would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	:CONFigure:DDEMod
Example	:CONF:DDEM
Notes	Restore all defaults of parameters

3.1.9.3 Meas Standard

Contains controls for setting the radio standard to which the current measurement will be made.

Preset to Std

Displays a menu for selecting preset Digital Demod Setup parameters and BW for measuring a wide variety of standard digital communications formats. Does not prevent you from making adjustments to measurement parameters afterwards.

The following standard presets are available:

Cellular	EDGE, NADC, PDC, PHP (PHS)
Wireless Networking	Wi-SUN FSK & OQPSK, 11ay CB1 MCS12, 11ay CB2 MCS12, 11ay CB3 MCS12, 11ay CB4 MCS 12, 802.15.3d
Video	ATSC 8-VSB, ATSC 16-VSB, DVB-C 16QAM, DVB-C 32QAM, DVB-C 64QAM, DVB128-C 128QAM, DVB-C 256QAM, DVB-S2 QPSK, DVB-S2 8PSK, DVB-S2 16APSK with code rates 2/3, DVB-S2 16APSK with code rates 3/4, DVB-S2 16APSK with code rates 4/5, DVB-S2 16APSK with code rates 5/6, DVB-S2 16APSK with code rates 8/9, DVB-S2 16APSK with code rates 9/10, DVB-S2 32 APSK with code rates 3/4, DVB-S2 32 APSK with code rates 4/5, DVB-S2 32 APSK with code rates 5/6, DVB-S2 32 APSK with code rates 8/9, DVB-S2 32 APSK with code rates 9/10, DVB-S2X 8 APSK with code rate 100/180 (5/9), DVB-S2X 8 APSK with code rate 104/180 (26/45), DVB-S2X 16 APSK with code rate

Sync Search	Off	Off	Off

If the acquisition hardware does not support the default Info BW, then the Info BW will be set to the closest value that the acquisition hardware can support.

3.1.9.4 Frame

Enables you to set frame structure for measurement.

Search Length

Defines the time length that the instrument searches for a burst and/or sync word.

There are two **Search Length** modes:

- Manual: Lets you manually set the Search Length
- Automatic: Sets Search Length automatically according to Meas Interval, Meas Offset and Symbol Rate (longest Segment for multiple Segment case). This is recommended mode for wide band signal (>1GHz) analysis, to avoid unnecessary long Search Length setting leads to slow measurement speed

Remote Command	<code>[:SENSe]:DDEMod:SYNC:SLEngth <time></code> <code>[:SENSe]:DDEMod:SYNC:SLEngth?</code> <code>[:SENSe]:DDEMod:SYNC:SLEngth:AUTO OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SYNC:SLEngth:AUTO?</code>
Example	<code>:DDEMod:SYNC:SLEN 3.0 ms</code> Set the search length to 3 ms <code>:DDEMod:SYNC:SLEN?</code> <code>:DDEMod:SYNC:SLEN:AUTO OFF</code>

3 VMA Mode
3.1 Digital Demod Measurement

:DDEM:SYNC:SLEN:AUTO?

Couplings	Manual: Changing Meas Interval, Meas Offset or Symbol Rate will changes Search Length if Search Length is less than $(1.2 * (\text{Meas Interval} + \text{Meas Offset}) / \text{Symbol Rate})$, no matter what status of the Burst Search or Sync Search is Changing Search Length checks with current allowable minimum value $(1.2 * (\text{Meas Interval} + \text{Meas Offset}) / \text{Symbol Rate})$, if the input value is less than it, the value is clipped to the minimum value, and a data out of range message "Data out of range; Search Length was clipped to the minimum value of xxx ms based on current Meas Interval and Symbol Rate" is displayed Auto: $\text{Search Length} = (3.1 * (\text{Meas Interval} + \text{Meas Offset}) / \text{Symbol Rate})$
Preset	3.0E-3 OFF
State Saved	Yes Yes
Range	Auto Man
Min	1.0E-7
Max	9.9E+37

Segment Number

Specifies the number of segments in one frame.

Remote Command	[:SENSe]:DDEMod:SNUMBER <integer> [:SENSe]:DDEMod:SNUMBER?
Example	:DDEM:SNUM 1 :DDEM:SNUM?
Preset	1
State Saved	Yes
Min	1
Max	6

Capture Time Diagram (Segment Number = 1)

Accesses a menu that enables you to set up time parameters.

Symbol Rate

Enables you to set the symbol rate (symbols per second) for the instrument's digital demodulator. Set this parameter to match the symbol rate of your system.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:SRATe <frequency></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:SRATe?</code>
Example	<code>:DDEM:SEGM1:SRAT 1 MHz</code> <code>:DDEM:SEGM1:SRAT?</code>
Couplings	Changes when Info BW is smaller than Symbol Rate/10
Preset	1.0 MHz
State Saved	Yes
Min	1.0Hz
Max	Max Info BW (hardware dependent)
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:SRATe</code>

Burst Search

Turns burst search on or off.

Remote Command	<code>[:SENSe]:DDEMod:SYNC:BURSt[:STATe] OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SYNC:BURSt[:STATe]?</code>
Example	<code>:DDEM:SYNC:BURS OFF</code> Turn off the burst search <code>:DDEM:SYNC:BURS?</code>
Preset	<code>OFF</code>
State Saved	Yes
Range	<code>Off On</code>
Annotation	PULSE NOT FOUND appears in the corner of demod result traces if burst search fails

Search Length

Defines the time length that the instrument searches for a burst and/or sync word.

There are two **Search Length** modes:

- Manual: Lets you manually set the Search Length
- Automatic: Sets Search Length automatically according to Meas Interval, Meas Offset and Symbol Rate (longest Segment for multiple Segment case). This is recommended mode for wide band signal (>1GHz) analysis, to avoid unnecessary long Search Length setting leads to slow measurement speed

Remote Command	<code>[:SENSe]:DDEMod:SYNC:SLENgth <time></code> <code>[:SENSe]:DDEMod:SYNC:SLENgth?</code>
----------------	--

3 VMA Mode
3.1 Digital Demod Measurement

	<code>[:SENSe]:DDEMod:SYNC:SLENgth:AUTO OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SYNC:SLENgth:AUTO?</code>
Example	<code>:DDEM:SYNC:SLEN 3.0 ms</code> Set the search length to 3 ms <code>:DDEM:SYNC:SLEN?</code> <code>:DDEM:SYNC:SLEN:AUTO OFF</code> <code>:DDEM:SYNC:SLEN:AUTO?</code>
Couplings	Manual: Changing Meas Interval, Meas Offset or Symbol Rate will changes Search Length if Search Length is less than $(1.2 * (\text{Meas Interval} + \text{Meas Offset}) / \text{Symbol Rate})$, no matter what status of the Burst Search or Sync Search is Changing Search Length checks with current allowable minimum value $(1.2 * (\text{Meas Interval} + \text{Meas Offset}) / \text{Symbol Rate})$, if the input value is less than it, the value is clipped to the minimum value, and a data out of range message "Data out of range; Search Length was clipped to the minimum value of xxx ms based on current Meas Interval and Symbol Rate" is displayed Auto: $\text{Search Length} = (3.1 * (\text{Meas Interval} + \text{Meas Offset}) / \text{Symbol Rate})$
Preset	3.0E-3 OFF
State Saved	Yes Yes
Range	Auto Man
Min	1.0E-7
Max	9.9E+37

Meas Interval

Sets the number of symbols that the demodulation will analyze. This and the symbol rate set the overall time record length (in seconds) that is used by the demodulator. It also indirectly sets the resolution bandwidth for the various spectrum results. (ResBW cannot be set independently.)

The resolution bandwidth is annotated below any spectrum trace.

Remote Command	<code>[:SENSe]:DDEMod:SEGMENT1 ... 6:SWEEP:POINTS <integer></code> <code>[:SENSe]:DDEMod:SEGMENT1 ... 6:SWEEP:POINTS?</code>
Example	<code>:DDEM:SEG1:SWE:POIN 100</code> <code>:DDEM:SEG1:SWE:POIN?</code>
Preset	501
State Saved	Yes
Min/Max	10/10000000

Backwards Compatibility [:SENSe]:DDEMod:SWEEP:POINTs
SCPI

Segment Config Diagram (Segment Number >1)

Accesses a menu that enables you to set up segments in frame.

Seg Name

Modify the name of each segment.

Remote Command	[:SENSe]:DDEMod:SEGment1 ... 6:NAME <string> [:SENSe]:DDEMod:SEGment1 ... 6:NAME?
Example	:DDEM:SEG1:NAME 'SYNC' :DDEM:SEG1:NAME?
Preset	SEGmentX X is segment index
State Saved	Yes

Modulation Format

Displays a menu for selecting the digital communication format that is used by the demodulator. Available selections are:

QAM	QAM 16, QAM 32, QAM 64, QAM 128, QAM 256, QAM 512, QAM 1024
PSK	BPSK, DBPSK, QPSK, Offset QPSK, Shaped Offset QPSK, $\pi/4$ DQPSK, DQPSK, 8PSK, $\pi/8$ D8PSK, D8PSK
MSK	Type 1, Type 2

Backwards Compatibility SCPI	[:SENSe] :DDEMod:MODulation

NOTE

DVB QAM formats conform to Digital Video Broadcast standard EN 300 429. The standard defines the bits that represent each state as follows:

The first two bits are differentially encoded so that $\pi/2$ rotations in the QAM constellation do not affect detection of the two MSBs.

The LSBs are positioned to be rotation-invariant as defined in EN 300 429.

Unlike QAM, DVB QAM does not compensate for I/Q offset. When the format is DVB QAM, the measurement reports I/Q offset in the metrics table, but doesn't remove it from the other results calculation. When the format is QAM, the measurement reports I/Q offset in the metrics table AND removes it from the other results calculation. So the EVM result for DVB QAM will be higher than QAM.

Symbol Rate

Enables you to set the symbol rate (symbols per second) for the instrument's digital demodulator. Set this parameter to match the symbol rate of your system.

Remote Command	<p>[:SENSe] :DDEMod:SEGMENT1 ... 6 :SRATe <frequency></p> <p>[:SENSe] :DDEMod:SEGMENT1 ... 6 :SRATe?</p>
Example	<p>:DDEM:SEG1:SRAT 1 MHz</p> <p>:DDEM:SEG1:SRAT?</p>
Couplings	Changes when Info BW is smaller than Symbol Rate/10
Preset	1.0 MHz
State Saved	Yes

Min	1.0Hz
Max	Max Info BW (hardware dependent)
Backwards Compatibility SCPI	[:SENSe] :DDEMod :SRATe

Meas Offset

Specifies the time (in symbols) between the start of segment data and its reference. For segment1, the reference is always the start of the capture data, meas offset is always 0. And for segment2, the reference depends on the selection of Meas Offset Reference, meas offset could be positive or negative. If positive, the segment2 starts after the reference. If negative, the segment2 starts before the reference.

Remote Command	[:SENSe] :DDEMod :SEGMENT1 ... 6 : TIME : OFFSet <integer> [:SENSe] :DDEMod :SEGMENT1 ... 6 : TIME : OFFSet?
Example	:DDEM : SEG1 : TIME : OFFS 10 :DDEM : SEG1 : TIME : OFFS?
Couplings	Max and min constrained by Search Length, Meas Interval, Sync Pattern and Sync Search
Preset	0
State Saved	Yes
Min/Max	For segment1, it is 0 For segment2, it depends on Search Length, Meas Interval and Meas Offset Reference

Meas Interval

Sets the number of symbols that the demodulation will analyze. This and the symbol rate set the overall time record length (in seconds) that is used by the demodulator. It also indirectly sets the resolution bandwidth for the various spectrum results. (ResBW cannot be set independently.)

The resolution bandwidth is annotated below any spectrum trace.

Remote Command	[:SENSe] :DDEMod :SEGMENT1 ... 6 : SWEep : POINTs <integer> [:SENSe] :DDEMod :SEGMENT1 ... 6 : SWEep : POINTs?
Example	:DDEM : SEG1 : SWE : POIN 100 :DDEM : SEG1 : SWE : POIN?
Preset	501
State Saved	Yes
Min/Max	10/10000000
Backwards Compatibility SCPI	[:SENSe] :DDEMod :SWEep : POINTs

Meas Offset Reference

Selects the reference position of segment2 from the following two selections:

- Relative To Capture (Default Setting) - Enables you to specify the segment2 offset from the start of the acquisition data
- Relative To Sync Pattern - Enables you to specify the segment2 offset from the start position of the sync pattern

Remote Command	<code>[:SENSe] :DDEMod:SEGment1 ... 6:TIME:OFFSet:REference RCAPture RSYnc</code> <code>[:SENSe] :DDEMod:SEGment1 ... 6:TIME:OFFSet:REference?</code>
Example	<code>:DDEM:SEGM2:TIME:OFFS:REF RCAP</code> <code>:DDEM:SEGM2:TIME:OFFS:REF?</code>
Notes	Relative To Sync Pattern is only available when sync search is on, otherwise it's grayed out
Dependencies	Only appears when Selected Segment is Segment2
Preset	<code>RCAPture</code>
State Saved	Saved in instrument state
Range	Relative To Capture Relative To Sync Pattern

Equalizer

Turns the adaptive equalization filter on or off. Adaptive equalization uses the measured signal to determine the coefficients of the equalization filter.

When equalization is on, the equalization filter has a unit impulse response. The length of the filter determines the position of the unit impulse response in the filter. The impulse is located in the center of the filter for short filter lengths. As the filter length increases, the impulse moves, proportionally, towards the start of the filter to handle channels with large delay-spread.

If Adaptive is set to run, the instrument uses the results of the current measurement to update the filter coefficients for the next measurement. The instrument chooses coefficients that produce a modulation quality metric that is less impacted by the presence of linear distortion.

If Adaptive is set to hold, the instrument does not update the filter coefficients. Instead, the instrument uses the last updated coefficients before selecting hold.

You can select run or hold at any time to continue or stop updating filter coefficients.

Note that the instrument does not redefine the equalization filter to have a unit impulse response when you select run or when you turn the equalization filter off and then on; instead, the instrument uses the last updated filter coefficients.

Equalization is applied to time-domain data. For best results, make sure you select a frequency span that contains all the energy of your signal. If significant energy from your signal falls outside of the displayed frequency span, equalization will not work on your signal.

You can define the length of the equalization filter (in symbols) and set the convergence (convergence determines the size of the steps used to reshape the equalization filter). For additional details about these parameters, see ["Convergence" on page 343](#) and ["Filter Length" on page 342](#).

The following parameters affect measurement speed when using adaptive equalization:

- meas interval
- filter length (for the equalization filter)
- points/symbol

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQUalization:STATe OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQUalization:STATe?</code>
Example	<code>:DDEM:SEGM1:EQU:STAT ON</code> <code>:DDEM:SEGM1:EQU:STAT?</code>
Preset	OFF
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:EQUalization:STATe</code>

Sync Search

Turns the Sync Word search on or off. **Sync Search** enables you to use a synchronization pattern to isolate a segment of your signal for display and analysis.

NOTE

The sync pattern must be a multiple of the number of bits-per-symbol. For example, if the number of bits-per-symbol is 4 (as with 16 QAM), then the number of bits in the sync pattern must be a multiple of four. Sync search enables you to specify any number of bits for the sync pattern; however, bits that are not a multiple of the bits-per-symbol are truncated.

Remote Command	<code>[:SENSe]:DDEMod:SYNC:SWORd[:STATe] OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SYNC:SWORd[:STATe]?</code>
Example	<code>:DDEM:SYNC:SWOR OFF</code> Turn off the sync word search

3 VMA Mode
3.1 Digital Demod Measurement

	<code>:DDEM:SYNC:SWOR?</code>
Preset	OFF
State Saved	Yes
Annotation	SYNC NOT FOUND appears in the corner of demod result traces if sync search fails

EQ Source

Specify which segment's EQ coefficient will be applied to current segment.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQUalization:SOURce SEGMent1 ... SEGMent6</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQUalization:SOURce?</code>
Example	<code>:DDEM:SEGM1:EQU:SOUR SEGM1</code> <code>:DDEM:SEGM1:EQU:SOUR?</code>
Preset	SEGMentX X is segment index
State Saved	Yes
Range	Segment 1 Segment 2 Segment 3 Segment 4 Segment 5 Segment 6

Burst Search

Turns burst search on or off.

Remote Command	<code>[:SENSe]:DDEMod:SYNC:BURSt[:STATe] OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SYNC:BURSt[:STATe]?</code>
Example	<code>:DDEM:SYNC:BURS OFF</code> Turn off the burst search <code>:DDEM:SYNC:BURS?</code>
Preset	OFF
State Saved	Yes
Range	Off On
Annotation	PULSE NOT FOUND appears in the corner of demod result traces if burst search fails

Burst Search Threshold

Sets the relative power threshold from the peak power, which is used by the burst search algorithm to determine the burst rising edge and falling edge.

Remote Command	<code>[:SENSe]:DDEMod:SYNC:BURSt:THREshold <real></code> <code>[:SENSe]:DDEMod:SYNC:BURSt:THREshold?</code>
----------------	--

Example	<code>:DDEM:SYNC:BURS:THR -10</code> Set the burst search relative power to -10 dB <code>:DDEM:SYNC:BURS:THR?</code>
Preset	-15.00 dB
State Saved	Yes
Min	-200.0
Max	200.0

Sync Search

Turns the Sync Word search on or off. **Sync Search** enables you to use a synchronization pattern to isolate a segment of your signal for display and analysis.

NOTE

The sync pattern must be a multiple of the number of bits-per-symbol. For example, if the number of bits-per-symbol is 4 (as with 16 QAM), then the number of bits in the sync pattern must be a multiple of four. Sync search enables you to specify any number of bits for the sync pattern; however, bits that are not a multiple of the bits-per-symbol are truncated.

Remote Command	<code>[:SENSe] :DDEMod:SYNC:SWORd[:STATe] OFF ON 0 1</code> <code>[:SENSe] :DDEMod:SYNC:SWORd[:STATe] ?</code>
Example	<code>:DDEM:SYNC:SWOR OFF</code> Turn off the sync word search <code>:DDEM:SYNC:SWOR?</code>
Preset	OFF
State Saved	Yes
Annotation	SYNC NOT FOUND appears in the corner of demod result traces if sync search fails

Sync Offset

Specifies the time (in symbols) between the start of the measurement data and the start of the sync word. If positive, the sync word starts after the start of the measurement data. If negative, the sync word starts before the start of the measurement data.

Remote Command	<code>[:SENSe] :DDEMod:SYNC:SWORd:OFFSet <integer></code> <code>[:SENSe] :DDEMod:SYNC:SWORd:OFFSet?</code>
Example	<code>:DDEM:SYNC:SWOR:OFFS -3</code> Set the start of the measurement to the position that is 3 symbols later than the start of the sync word

3 VMA Mode
3.1 Digital Demod Measurement

	<code>:DDEM:SYNC:SWOR:OFFS?</code>
Couplings	Max and min constrained by Search Length, Sync Pattern length
Preset	0
State Saved	Yes
Min	-32768
Max	32767

Sync Pattern

Enables you to define a bit pattern for the sync word search. The maximum length of the pattern is 32 symbols. When you press this control, an editor dialog appears that enables you to define the pattern in binary or hexadecimal.

The instrument can only search for search patterns that are a multiple of the number of bits-per-symbol. The instrument assembles the bits in the search pattern into an integer number of symbols, ignoring any trailing bits that cannot complete a full symbol.

For example, if the number of bits-per-symbol is 4 (as with 16 QAM), and your search pattern contains 18 bits, the instrument only uses the first 16 bits during sync search and ignores the last two bits.

Although the underlying sync pattern is binary, the editor enables you to enter bit patterns in either binary or hexadecimal.

Hexadecimal entries are in symbol table hex format. In this format, each symbol is represented by 1 to 3 hex digits. The least significant bits make up the symbol and any extra bits are ignored. Thus, for 6 bits per symbol, the binary value of 101101 is encoded in hex as 2D. If you enter AD as the symbol value, it is converted to the same binary value as 2D because the upper 2 bits are ignored. 3-bit-wide symbols are represented by 1 hex digit with the most significant bit ignored.

Remote Command	<code>[:SENSe]:DDEMod:SYNC:SWORd:PATtern <string></code> <code>[:SENSe]:DDEMod:SYNC:SWORd:PATtern?</code>
Example	<code>:DDEM:SYNC:SWOR:PATT '1011010'</code> Set the sync pattern to '1011010' <code>:DDEM:SYNC:SWOR:PATT?</code>
Notes	<string> must be a string of 1s and 0s only. The maximum string length is 320 bits. Any string that violates these requirements will return error -224 "Illegal parameter value"
State Saved	Yes

3.1.9.5 Meas Time

Enables you to set measurement time parameters.

Meas Interval

Sets the number of symbols that the demodulation will analyze. This and the symbol rate set the overall time record length (in seconds) that is used by the demodulator. It also indirectly sets the resolution bandwidth for the various spectrum results. (ResBW cannot be set independently.)

The resolution bandwidth is annotated below any spectrum trace.

Remote Command	<code>[:SENSe] :DDEMod:SEGMent1 ... 6:SWEEp:POINTs <integer></code> <code>[:SENSe] :DDEMod:SEGMent1 ... 6:SWEEp:POINTs?</code>
Example	<code>:DDEM:SEGM1:SWE:POIN 100</code> <code>:DDEM:SEGM1:SWE:POIN?</code>
Preset	501
State Saved	Yes
Min/Max	10/10000000
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod:SWEEp:POINTs</code>

Meas Offset

Specifies the time (in symbols) between the start of segment data and its reference. For segment1, the reference is always the start of the capture data, meas offset is always 0. And for segment2, the reference depends on the selection of Meas Offset Reference, meas offset could be positive or negative. If positive, the segment2 starts after the reference. If negative, the segment2 starts before the reference.

Remote Command	<code>[:SENSe] :DDEMod:SEGMent1 ... 6:TIME:OFFSet <integer></code> <code>[:SENSe] :DDEMod:SEGMent1 ... 6:TIME:OFFSet?</code>
Example	<code>:DDEM:SEGM1:TIME:OFFS 10</code> <code>:DDEM:SEGM1:TIME:OFFS?</code>
Couplings	Max and min constrained by Search Length, Meas Interval, Sync Pattern and Sync Search
Preset	0
State Saved	Yes
Min/Max	For segment1, it is 0 For segment2, it depends on Search Length, Meas Interval and Meas Offset Reference

Meas Offset Reference

Selects the reference position of segment2 from the following two selections:

3 VMA Mode
 3.1 Digital Demod Measurement

- Relative To Capture (Default Setting) - Enables you to specify the segment2 offset from the start of the acquisition data
- Relative To Sync Pattern - Enables you to specify the segment2 offset from the start position of the sync pattern

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:TIME:OFFSet:REFeRence RCAPture RSYnc</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:TIME:OFFSet:REFeRence?</code>
Example	<code>:DDEM:SEGM2:TIME:OFFS:REF RCAP</code> <code>:DDEM:SEGM2:TIME:OFFS:REF?</code>
Notes	Relative To Sync Pattern is only available when sync search is on, otherwise it's grayed out
Dependencies	Only appears when Selected Segment is Segment2
Preset	<code>RCAPture</code>
State Saved	Saved in instrument state
Range	Relative To Capture Relative To Sync Pattern

3.1.9.6 Demod

Enables you to set demodulation parameters.

Modulation Format

Displays a menu for selecting the digital communication format that is used by the demodulator. Available selections are:

QAM	QAM 16, QAM 32, QAM 64, QAM 128, QAM 256, QAM 512, QAM 1024

State Saved	Yes
Range	<p>BPSK QPSK Offset QPSK Shaped Offset QPSK $\pi/4$DQPSK DQPSK 8PSK $\pi/8$ DPSK8 D8PSK QAM 16 QAM 32 QAM 64 QAM 128 QAM 256 QAM 512 QAM 1024 FSK 2 FSK 4 FSK 8 FSK 16 FSK 32 FSK 64 MSK Type 1 MSK Type 2 APSK 16 APSK 32 ASK 2 VSB 8 VSB 16 CPM (FM) EDGE DVB QAM 16 DVB QAM 32 DVB QAM 64 DVB QAM 128 DVB QAM 256 DBPSK CUSTOMIQ</p>
Backwards Compatibility SCPI	[:SENSe] :DDEMod :MODulation

NOTE

DVB QAM formats conform to Digital Video Broadcast standard EN 300 429. The standard defines the bits that represent each state as follows:

The first two bits are differentially encoded so that $\pi/2$ rotations in the QAM constellation do not affect detection of the two MSBs.

The LSBs are positioned to be rotation-invariant as defined in EN 300 429.

Unlike QAM, DVB QAM does not compensate for I/Q offset. When the format is DVB QAM, the measurement reports I/Q offset in the metrics table, but doesn't remove it from the other results calculation. When the format is QAM, the measurement reports I/Q offset in the metrics table AND removes it from the other results calculation. So the EVM result for DVB QAM will be higher than QAM.

Symbol Rate

Enables you to set the symbol rate (symbols per second) for the instrument's digital demodulator. Set this parameter to match the symbol rate of your system.

Remote Command	<p>[:SENSe] :DDEMod :SEGMENT1 ... 6 :SRATe <frequency></p> <p>[:SENSe] :DDEMod :SEGMENT1 ... 6 :SRATe ?</p>
Example	<p>:DDEM :SEGM1 :SRAT 1 MHz</p> <p>:DDEM :SEGM1 :SRAT ?</p>
Couplings	Changes when Info BW is smaller than Symbol Rate/10
Preset	1.0 MHz

3 VMA Mode

3.1 Digital Demod Measurement

State Saved	Yes
Min	1.0Hz
Max	Max Info BW (hardware dependent)
Backwards Compatibility SCPI	[:SENSe]:DDEMod:SRATe

Points / Symbol

Enables you to set how many points are displayed per symbol in time displays of demodulated data. The available values are 1, 2, 4, 5, 10 and 20.

Minimum (except OQPSK):	1 point per symbol
Minimum (OQPSK):	2 points per symbol
Maximum:	20 points per symbol

For example, if the value of Points/Symbol is 1, each display point corresponds to a symbol. If the value is 5, the 5th display point corresponds to a symbol—in this case, an IQ diagram would show 4 display points between each symbol.

OQPSK Demodulation: For OQPSK, an even number of Points/Symbol are required due to the offset between I and Q. If you specify an odd value for Points/Symbol, the instrument chooses the next, lower, even value.

Remote Command	[:SENSe]:DDEMod:SEGMENT1 ... 6:PPSYmbol <integer> [:SENSe]:DDEMod:SEGMENT1 ... 6:PPSYmbol?
Example	:DDEM:SEGM1:PPSY 2 :DDEM:SEGM1:PPSY?
Couplings	If Modulation Format is Edge, this value is fixed to 1 and the control is grayed out. If Modulation Format is Offset QPSK or Shaped Offset QPSK, the available values are 2, 4, 10, and 20. Otherwise, the available values are 1, 2, 4, 5, 10 and 20 Numeric entries are rounded to the nearest valid value
Preset	10
State Saved	Yes
Min	1
Max	20
Backwards Compatibility SCPI	[:SENSe]:DDEMod:PPSYmbol

Meas Filter

Accesses a menu for selecting the Meas Filter used by the receiver.

See "More Information" on page 338

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:FILTer:MEASurement NONE RRCosine GAUSSian EDGE RECTangle LPASs USER</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:FILTer:MEASurement?</code>
Example	<code>:DDEM:SEGM1:FILT:MEAS GAUS</code> <code>:DDEM:SEGM1:FILT:MEAS?</code>
Notes	Meas filter types that are not available for a particular selection of modulation format are grayed-out as below: <code>EDGE</code> is only available for EDGE format, grayed-out for other formats
Preset	<code>RRC</code>
State Saved	Yes
Range	No Filter Root Raised Cosine Gaussian EDGE Rectangular Low Pass User Defined
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:FILTer:MEASurement</code>

More Information

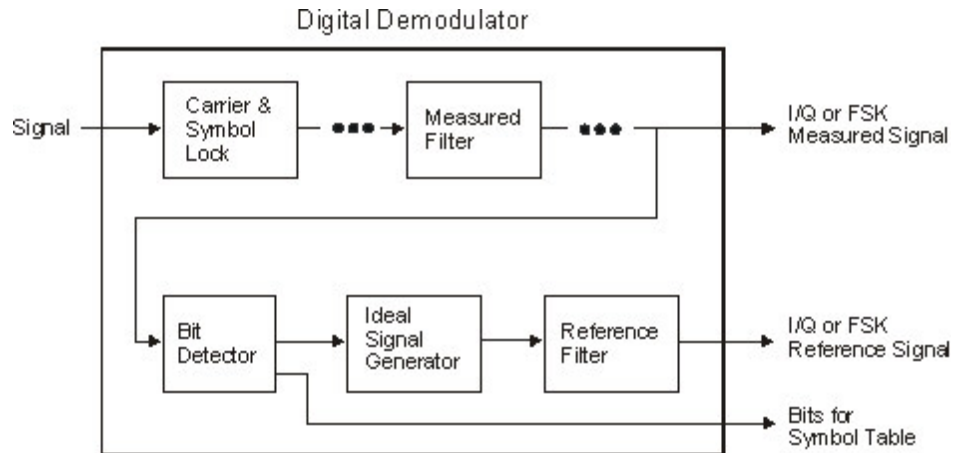

Data filtering is used in digital demodulation to limit bandwidth and reduce inter symbol interference. This instrument includes several commonly used filter types and has the ability to apply user-defined filters. All filters are computed to 20 symbols in length. If the filter alpha is < 0.2, the instrument uses 40 symbols to compute filter length (for most formats).

The shape and width of a filter is defined by the alpha (for cosine filters) or the BT (for Gaussian filters). The alpha or BT indicates the filter roll-off (or excess bandwidth) of the selected filter that occurs due to the practical inability of filter technology to build a perfectly square (brick-wall) filter that would have an alpha of 0 (no excess bandwidth). For example, a typical filter with an alpha of 0.3 has a bandwidth 30% greater than the theoretical minimum.

The instrument's digital demodulator produces two signals: a measured and a reference signal. These signals are called I/Q Measured and I/Q Reference or, for FSK measurements, FSK Measured and FSK Reference.

You can select different filters for the measured and reference signals, as shown in the following generic block diagram.

3 VMA Mode
 3.1 Digital Demod Measurement

Note that for FSK signals, filtering is baseband and occurs after the FM demodulator.

The measured signal is the signal that results after demodulating your waveform. The reference signal is the signal that would result after demodulating your signal if your signal were ideal (contained no errors).

Notice that there are separate filters for the measured and reference signals. You MUST select the correct filter for both signals. Otherwise, a settings conflict message “The Meas/Ref Filter combination is not allowable!” is generated.

Filtering for various communication systems can occur either at the transmitter or the receiver; or the filtering can be distributed between the transmitter and the receiver. This is an important concept that affects your filter selection for the measured and reference signals. The instrument's measured filter represents filtering in the system's receiver while the reference filter represents filtering in the entire system. Both filters share the same alpha/BT. The following table shows some examples of filter selection:

If the transmitter filter is:	The measure filter should be:	The reference filter should be:
root raised cosine	root raised cosine	raised cosine
Raised cosine	none	raised cosine
Gaussian	none	Gaussian
any type	user defined	any type

You can modify the shape and width of Gaussian and Nyquist (cosine) filters. The shape and width is defined by the alpha (for cosine filters) or the BT (for Gaussian filters). All filters are computed to 20 symbols in length. If the filter alpha is < 0.2, the instrument uses 40 symbols to compute filter length (for most formats).

Ref Filter

Selects the Ref Filter that represents the cascaded transmit and receive filter.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:FILTer:REFeRence RCOSine RRCosine GAUSSian EDGE RECTangle HSINe USER F1REC F3RC F4RC SOQPSKTG SOQPSKA SOQPSKB APCOP2RC</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:FILTer:REFeRence?</code>
Example	<code>:DDEM:SEGM1:FILT:REF GAUS</code> <code>:DDEM:SEGM1:FILT:REF?</code>
Notes	Reference filter types that are not available for a particular selection of modulation format are grayed-out as below: <ul style="list-style-type: none"> - EDGE is only available for EDGE format, grayed-out for other formats - 1REC (CPM), 3RC (CPM) and 4RC (CPM) are only available for CPM (FM) format, grayed-out for other formats - SOQPSK-TG (IRIG 106-04), SOQPSKA and SOQPSKB are only available for Shaped OQPSK format, grayed-out for other formats
Preset	RCOS
State Saved	Yes
Range	Raised Cosine Root Raised Cosine Gaussian EDGE Rectangular Half Sine User Defined 1REC (CPM) 3RC (CPM) 4RC (CPM) SOQPSK-TG (IRIG 106-04) SOQPSK-A SOQPSK-B APCO-25 P2 RC
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:FILTer:REFeRence</code>

Alpha

Determines the filter characteristics of the Raised cosine and Root-raised cosine filters used by the instrument's digital demodulator. These characteristics apply to both the Ref filters.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:FILTer:ALPHA <real></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:FILTer:ALPHA?</code>
Example	<code>:DDEM:SEGM1:FILT:ALPH 0.5</code> <code>:DDEM:SEGM1:FILT:ALPH?</code>
Dependencies	Available for Raised Cosine and Root Raised Cosine filter only
Preset	0.5
State Saved	Yes
Min	0.05

3 VMA Mode
3.1 Digital Demod Measurement

Max	1
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :FILTer :ALPHA</code>

BT

Determines the filter characteristics of the Gaussian filters used by the instrument's digital demodulator. These characteristics apply to both the Ref filters.

Remote Command	<code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :FILTer :BT <real></code> <code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :FILTer :BT?</code>
Example	<code>:DDEMod :SEGMENT1 :FILTer :BT 0.5</code> <code>:DDEMod :SEGMENT1 :FILTer :BT?</code>
Dependencies	Available for Gaussian filter only
Preset	0.6
State Saved	Yes
Min	0.05
Max	100
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :FILTer :BT</code>

Advanced Setup

Enables you to access advanced demodulation parameters on one screen.

General

Allows you to configure general advanced parameters for de-modulation algorithm.

Equalizer

Turns the adaptive equalization filter on or off. Adaptive equalization uses the measured signal to determine the coefficients of the equalization filter.

When equalization is on, the equalization filter has a unit impulse response. The length of the filter determines the position of the unit impulse response in the filter. The impulse is located in the center of the filter for short filter lengths. As the filter length increases, the impulse moves, proportionally, towards the start of the filter to handle channels with large delay-spread.

If Adaptive is set to run, the instrument uses the results of the current measurement to update the filter coefficients for the next measurement. The instrument chooses coefficients that produce a modulation quality metric that is less impacted by the presence of linear distortion.

If Adaptive is set to hold, the instrument does not update the filter coefficients. Instead, the instrument uses the last updated coefficients before selecting hold.

You can select run or hold at any time to continue or stop updating filter coefficients.

Note that the instrument does not redefine the equalization filter to have a unit impulse response when you select run or when you turn the equalization filter off and then on; instead, the instrument uses the last updated filter coefficients.

Equalization is applied to time-domain data. For best results, make sure you select a frequency span that contains all the energy of your signal. If significant energy from your signal falls outside of the displayed frequency span, equalization will not work on your signal.

You can define the length of the equalization filter (in symbols) and set the convergence (convergence determines the size of the steps used to reshape the equalization filter). For additional details about these parameters, see ["Convergence" on page 343](#) and ["Filter Length" on page 342](#).

The following parameters affect measurement speed when using adaptive equalization:

- meas interval
- filter length (for the equalization filter)
- points/symbol

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQUalization:STATe OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQUalization:STATe?</code>
Example	<code>:DDEM:SEGM1:EQU:STAT ON</code> <code>:DDEM:SEGM1:EQU:STAT?</code>
Preset	OFF
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:EQUalization:STATe</code>

Filter Length

Sets the length (in symbols) for the instrument's equalization filter.

3 VMA Mode
 3.1 Digital Demod Measurement

In general, the best filter length is the smallest that meets your measurement requirements. For measurements at the transmitter, the filter length may only need to be a few symbols in length. Longer filter lengths may be needed to measure multi-path environments.

The filter length also determines the placement of the impulse response in the equalization filter. For longer filter lengths, the instrument puts the initial, unit impulse response closer to the beginning of the time record to accommodate multi-path measurements, as follows:

Filter Length (symbol)	Unit Impulse Response Position (symbol)
3 to 31	$(\text{length} - 1)/2$
31 to 75	15
75 to 99	$(\text{length})/5$

For example, if the filter length is 11, the unit impulse response is positioned at symbol 5. If the filter length is 35, the unit impulse response is positioned at symbol 15.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQualization:FLEngth <integer></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQualization:FLEngth?</code>
Example	<code>:DDEM:SEGM1:EQU:FLEN 21</code> <code>:DDEM:SEGM1:EQU:FLEN?</code>
Notes	Must be an odd number. If an even number is entered, it is rounded up to the next odd
Preset	21
State Saved	Yes
Min	3
Max	99
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:EQualization:FLEngth</code>

Convergence

Sets the adaptive filter convergence factor higher to converge faster. Note that too high a value can cause the filter to not converge. Set the convergence factor smaller for better accuracy.

This value is normalized, to convert the Convergence value in the VSA to the normalized value, divide the 89600 VSA Convergence value by 1e-07.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQualization:CONvergence <real></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:EQualization:CONvergence?</code>
----------------	--

Example	<code>:DDEM:SEGM1:EQU:CONV 0.5</code> <code>:DDEM:SEGM1:EQU:CONV?</code>
Preset	1
State Saved	Yes
Min	0.000001
Max	10000000
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:EQUalization:CONVergence</code>

Equalizer Hold

Turns the filter coefficient updates on or off. Normally the adaptation algorithm updates the filter coefficients after each scan. When Hold is on, the coefficients of the equalization filter are frozen; that is, the adaptive filter becomes fixed. When you turn Hold off again, the coefficients are again allowed to adapt, starting from where they currently are.

Remote Command	<code>[:SENSe]:DDEMod:SEGMENT1 ... 6:EQUalization:HOLD OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMENT1 ... 6:EQUalization:HOLD?</code>
Example	<code>:DDEM:SEGM1:EQU:HOLD ON</code> <code>:DDEM:SEGM1:EQU:HOLD?</code>
Couplings	Hold will be on automatically after recall Equalizer Coefficients
Preset	OFF
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:EQUalization:HOLD</code>

Equalizer Reset

Resets the adaptive filter coefficients to 1

Remote Command	<code>[:SENSe]:DDEMod:EQUalization:RESet</code>
Example	<code>:DDEM:EQU:RES</code>

FFT Window

Enables you to choose the Window function that is applied to the time data prior to the FFT calculation used for Spectrum, Error Vector Spectrum, IQ Meas Spectrum, and IQ Ref Spectrum results.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:FFT:WINDow:TYPE UNIFORM HANNing GAUSSian FLATtop</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:FFT:WINDow:TYPE?</code>
Example	<code>:DDEM:SEGM1:FFT:WIND:TYPE FLAT</code> <code>:DDEM:SEGM1:FFT:WIND:TYPE?</code>
Preset	<code>FLAT</code>
State Saved	Yes
Range	Uniform Hanning Gaussian Flat top
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:FFT:WINDow:TYPE</code>

Spectrum

Sets a spectrum to either **Normal** or **Inverted** for demodulation related measurements. If set to **INVert**, the upper and lower spectrums are swapped.

The invert function conjugates the spectrum, which is equivalent to taking the negative of the quadrature component in demodulation. The correct setting (**Normal** or **Inverted**) depends on whether the signal at the input of the instrument has a high or a low side mix.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:SPECTrum INVert NORMal</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:SPECTrum?</code>
Example	<code>:DDEM:SEGM1:SPEC INV</code> <code>:DDEM:SEGM1:SPEC?</code>
Preset	<code>NORMal</code>
State Saved	Saved in instrument state
Range	<code>Normal Invert</code>
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:SPECTrum</code>

Gain Imb/Quad Skew Coupling

Controls what measurement data is included in the Quadrature Skew Error and IQ Gain Imbalance error data calculations.

- Off: Calculations use one Point per Symbol
- On: Calculations use the value shown in the Points per Symbol parameter box

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:PPSYmbol:COUPle OFF ON 0 1</code>
Example	<code>:CALC:DDEM:SEGM1:PPSY:COUP ON</code> <code>:CALC:DDEM:SEGM1:PPSY:COUP?</code>
Notes	Available for all IQ formats except Custom IQ format
Preset	OFF
State Saved	Yes
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:PPSYmbol:COUPle</code>

Clock Adjust

Enables you to adjust symbol clock timing in fractions of a symbol. The adjustment is relative to the symbol clock time that is computed by the demodulation algorithm. Some digital communications systems contain nonlinearities that can bias the digital demodulator's estimation of the symbol clock position. You can use clock adjust to compensate for this offset and obtain a lower EVM (Error Vector Magnitude).

Specifying a clock adjust only affects the I/Q measured trace. It does not affect the I/Q reference trace.

Use the eye diagram with an eye length of one (1) to observe the accuracy of the symbol clock timing. You can also monitor the EVM (Error Vector Magnitude) in the metrics table while adjusting clock adjust to obtain the optimum symbol timing.

Clock adjust is reset to 0.0 on power-up or when you select Preset.

Remote Command	<code>[:SENSe] :DDEMod:SEGMent1 ... 6:CADJust <real></code> <code>[:SENSe] :DDEMod:SEGMent1 ... 6:CADJust?</code>
Example	<code>:DDEM:SEGM1:CADJ 0.5</code> <code>:DDEM:SEGM1:CADJ?</code>
Preset	0.0

3 VMA Mode
3.1 Digital Demod Measurement

State Saved	Yes
Min	-0.5
Max	0.5
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :CADJust</code>

IQ Rotation

Rotates the IQ Meas/Ref Time data and corresponding ideal state positions by a user defined amount ranging from -360 degrees to 360 degrees. The Rotation parameter affects the IQ Gain Imbalance and Quadrature Skew error data results.

Remote Command	<code>:CALCulate:DDEMod:SEGMENT1 ... 6:IQRotation <real></code> <code>:CALCulate:DDEMod:SEGMENT1 ... 6:IQRotation?</code>
Example	<code>:CALC:DDEM:SEGM1:IQR 45</code> <code>:CALC:DDEM:SEGM1:IQR?</code>
Preset	0 deg
State Saved	Yes
Min	-360 deg
Max	360 deg
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:IQRotation</code>

IQ Normalize

Turns IQ Normalize on or off. When **IQ Normalize** is on, the Meas Time and Ref Time data is normalized so the extreme points have a value of 1. For quadrature modulation types, the outermost points of the constellation are normalized to 1. For FSK constellations, the deviation is normalized to 1.

When **IQ Normalize** is turned off, the actual data values based on the input signal level are plotted on the constellation.

When normalization is **ON**, the instrument normalizes or scales the demodulated trace data results to a nominal value of 1. Normalization is performed on these traces:

- IQ measured time and IQ measured spectrum
- IQ reference time and IQ reference spectrum
- Error vector time and Error vector spectrum

- Magnitude error
- FSK measured time and FSK measured spectrum (FSK measurements)
- FSK reference time and FSK reference spectrum (FSK measurements)
- FSK error time and FSK error spectrum (FSK measurements)
- Magnitude error (carrier) (FSK measurements)

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:NORMalize OFF ON 0 1</code> <code>:CALCulate:DDEMod:SEGMent1 ... 6:NORMalize?</code>
Example	<code>:CALC:DDEM:SEGM1:NORM ON</code> <code>:CALC:DDEM:SEGM1:NORM?</code>
Preset	ON
State Saved	Yes
Annunciation	When this is on, ideal state positions are identified by graphics on the constellation diagram
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:NORMalize</code>

Low SNR Enhancement

Enhances the ability of the demodulator to lock on to signals with low SNR. This process reduces the frequency lock range and provides additional filtering. This filtering enables the demodulator to lock in the presence of more. To compensate for the smaller frequency lock range, the frequency estimate is tracked from measurement to measurement. An exponential average is used and the output of this average becomes the starting point for the next frequency estimate for the next measurement.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:LSNR OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:LSNR?</code>
Example	<code>:DDEM:SEGM1:LSNR ON</code> <code>:DDEM:SEGM1:LSNR?</code>
Preset	OFF
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:LSNR</code>

EVM Normalization Reference

Sets the normalization value for certain error summary metrics.

3 VMA Mode
3.1 Digital Demod Measurement

EVM Normalization Reference also affects the normalization value used for traces when normalize is turned on. Note that the normalization value used for traces differs from the normalization value used for error summary metrics when EVM Normalization Reference is set to Reference RMS.

These scalar results are normalized by the EVM Normalization Reference:

- EVM
- Mag Err

There are two possible values for EVM Normalization Reference:

Constellation Maximum (Default)	Sets the normalization value to the maximum constellation magnitude For example, the normalization value would be the level of the corner point in a 16QAM constellation. For "cross-QAM" constellations (32QAM, 128QAM, 512QAM), the normalization value would be set to the magnitude of the outer corners of a square that encompasses the constellation, even though the constellation itself does not actually use the outer corners
Reference RMS	Sets the normalization value to the RMS level of the IQ Reference symbol points If the only impairment in the input signal is Additive White Gaussian Noise, using Reference RMS will make the averaged EVM approach the inverse of the Signal-to-Noise ratio of the signal. Using Reference RMS also makes it easier to compare EVM values between signals of different modulation formats

Remote Command	<code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :COMPensate :NREference CMAXimum RRMS</code> <code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :COMPensate :NREference ?</code>
Example	<code>:DDEM :SEG1 :COMP :NREF RRMS</code> <code>:DDEM :SEG1 :COMP :NREF ?</code>
Couplings	Reference RMS is only available for Custom IQ format and I/Q modulation formats with more than one constellation magnitude level (16QAM, 32APSK, etc.)
Preset	<code>CMAX</code>
State Saved	Yes
Range	Constellation Maximum Reference RMS
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :COMPensate :NREference</code>

IQ Offset Compensation

Selects whether to compensate IQ Offset at parameter estimation and compensation time prior to metrics like EVM calculation.

Remote Command	<code>:CALCulate :DDEMod :SEGMENT1 ... 6 :COMPensate :IQOffset [:STATE] OFF ON 0 1</code> <code>:CALCulate :DDEMod :SEGMENT1 ... 6 :COMPensate :IQOffset [:STATE] ?</code>
----------------	---

Example	<code>:CALC:DDEM:SEGM1:COMP:IQOF ON</code> <code>:CALC:DDEM:SEGM1:COMP:IQOF?</code>
Dependencies	Only available for IQ modulation format except FSK, ASK, CPM (FM) and DVB QAMs Turned on automatically if the modulation format is changed to the formats except MSK Type1. For MSK Type1 format, turned off automatically
Preset	ON
State Saved	Yes
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:COMPensate:IQOFset[:STATE]</code>

Report EVM in DB

Remote Command	<code>[:SENSe]:DDEMod:SEGMENT1 ... 6:EVM:REPort:DB OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMENT1 ... 6:EVM:REPort:DB?</code>
Example	<code>:DDEM:SEGM1:EVM:REP:DB ON</code> <code>:DDEM:SEGM1:EVM:REP:DB?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

Multi-Carrier Filter

Specifies whether or not to apply a filter to the acquisition IQ data to filter out adjacent carriers.

When other carriers are expected to be adjacent to the carrier of interest, this multi-carrier filter can be used to filter out the unwanted carrier and minimize leakage into the carrier of interest.

Remote Command	<code>[:SENSe]:DDEMod:SEGMENT1 ... 6:MCFilter:BANDwidth <freq></code> <code>[:SENSe]:DDEMod:SEGMENT1 ... 6:MCFilter:BANDwidth?</code> <code>[:SENSe]:DDEMod:SEGMENT1 2:MCFilter[:STATE] OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMENT1 2:MCFilter[:STATE]?</code>
Example	<code>:DDEM:SEGM1:MCF:BAND 50 kHz</code> <code>:DDEM:SEGM1:MCF:BAND?</code> <code>:DDEM:SEGM1:MCF OFF</code> <code>:DDEM:SEGM1:MCF?</code>
Dependencies	The filter's bandwidth cannot exceed the current information bandwidth
Preset	5 MHz

3 VMA Mode
3.1 Digital Demod Measurement

	OFF
State Saved	Saved in instrument state Yes
Range	On Off
Min	1 kHz
Max	Max Info BW (hardware dependent)
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:MCFilter:BANDwidth</code> <code>[:SENSe]:DDEMod:MCFilter[:STATE]</code>

FSK

Allows you to configure advanced parameters for FSK modulation format.

Tx Frequency Offset

Enables you to set the transmitter frequency offset. It will be subtracted in carrier frequency offset calculation. Set this parameter to match the Tx frequency offset of your system.

Available only when the demodulation format is FSK formats.

Remote Command	<code>[:SENSe]:DDEMod:SEGMENT1 ... 6:FSK:TXFrequency:OFFSet <frequency></code> <code>[:SENSe]:DDEMod:SEGMENT1 ... 6:FSK:TXFrequency:OFFSet?</code>
Example	<code>:DDEMod:SEG1:FSK:TXFR:OFFS 1 kHz</code> <code>:DDEMod:SEG1:FSK:TXFR:OFFS?</code>
Couplings	If the modulation format is not FSK formats, this control is grayed-out
Preset	0.0 Hz
State Saved	Yes
Min	-1 GHz
Max	1 GHz
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:FSK:TXFrequency:OFFSet</code>

FSK Deviation Ref

Sets the value of the FSK deviation reference when the 2-FSK modulation format is selected.

There are two possible FSK Deviation Reference modes:

- Manual: This selection enables the user to manually set the deviation reference
- Automatic: This selection uses an average measured frequency deviation

Available only when the demodulation format is 2-FSK.

Remote Command	<pre>[:SENSe]:DDEMod:SEGMent1 ... 6:FSK:DEViation:REFeRence <freq> [:SENSe]:DDEMod:SEGMent1 ... 6:FSK:DEViation:REFeRence? [:SENSe]:DDEMod:SEGMent1 2:FSK:DEViation:REFeRence:AUTO OFF ON 0 1 [:SENSe]:DDEMod:SEGMent1 2:FSK:DEViation:REFeRence:AUTO?</pre>
Example	<pre>:DDEM:SEGM1:FSK:DEV:REF 50 kHz :DDEM:SEGM1:FSK:DEV:REF? :DDEM:SEGM1:FSK:DEV:REF:AUTO ON :DDEM:SEGM1:FSK:DEV:REF:AUTO?</pre>
Couplings	If the modulation format is not FSK formats, this control is grayed-out When the user manually changes the FSK Deviation Reference, this set automatically goes to 'Man'
Preset	20 kHz ON
State Saved	Saved in instrument state Yes
Range	Auto Man
Min	10 Hz
Max	1 GHz
Backwards Compatibility SCPI	<pre>[:SENSe]:DDEMod:FSK:DEViation:REFeRence [:SENSe]:DDEMod:FSK:DEViation:REFeRence:AUTO</pre>

APSK

Allows you to configure advanced parameters for APSK modulation format.

APSK R2 / R1

Enables you to specify the expected ratio between the two inner rings for APSK modulation formats.

APSK R2 / R1 determines the Ring 2 to Ring 1 ratio for APSK format measurements.

The ring ratio is the ratio of the magnitude of symbol states on a ring (R2) to the magnitude of symbol states on the inner ring (R1). R2 / R1 is a valid parameter for both 16 APSK and 32 APSK format measurements.

3 VMA Mode

3.1 Digital Demod Measurement

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:APSK:R2Ratio <real></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:APSK:R2Ratio?</code>
Example	<code>:DDEM:SEGM1:APSK:R2R 3.0</code> <code>:DDEM:SEGM1:APSK:R2R?</code>
Notes	Affects the position of the ideal state indicators on constellation diagrams
Couplings	If the modulation format is not APSK formats, this control is grayed-out
Preset	2.84
State Saved	Yes
Min	1.25
Max	8
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:APSK:R2Ratio</code>

APSK R3 / R1

Enables you to specify the expected ratio between the outer and inner rings for APSK32 modulation formats.

APSK R3 / R1 determines the Ring 3 to Ring 1 ratio for APSK format measurements.

The ring ratio is the ratio of the magnitude of symbol states on a ring (R3) to the magnitude of symbol states on the inner ring (R1). R3 / R1 is a valid parameter only for 32 APSK format measurements.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:APSK:R3Ratio <real></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:APSK:R3Ratio?</code>
Example	<code>:DDEM:SEGM1:APSK:R3R 5.0</code> <code>:DDEM:SEGM1:APSK:R3R?</code>
Notes	Affects the position of the ideal state indicators on constellation diagrams
Couplings	If the modulation format is not APSK formats, this control is grayed-out
Preset	5.27
State Saved	Yes
Min	1.5625
Max	10
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:APSK:R3Ratio</code>

CPM

Allows you to configure advanced parameters for CPM modulation format.

CPM Auto

Turns modulation indices auto-detected on or off.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CPMindex:AUTO OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CPMindex:AUTO?</code>
Example	<code>:DDEM:SEGM1:CPM:AUTO OFF</code> <code>:DDEM:SEGM1:CPM:AUTO?</code>
Couplings	If the modulation format is not CPM, this control is grayed-out
Preset	OFF
State Saved	Yes
Range	Off On
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:CPMindex:AUTO</code>

CPM Index

Sets the value of the modulation indices, h1 and h2 when the CPM (FM) modulation format is selected. The modulation indices determine the amount of phase change for each symbol.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CPMindex I12I13 I7I10 I6I7 I5I6 I4I5 MSK HCPM</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CPMindex?</code>
Example	<code>:DDEM:MAST:CPM HCPM</code> <code>:DDEM:MAST:CPM?</code>
Couplings	If the modulation format is not CPM, this control is grayed-out
Preset	I4I5
State Saved	Yes
Range	12/16,13/16 7/16,10/16 6/16,7/16 5/16,6/16 4/16,5/16 1/2 (MSK) 1/3 (HCPM)
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:CPMindex</code>

MSK

Allows you to configure advanced parameters for MSK modulation format.

Differential Decoder Anchor State

Specific anchor bit for MSK Type 1 differential decoder.

Remote Command	<code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :MSK :DDECCode :ANCHor 1 0</code>
Example	<code>:DDEM :SEGM1 :MSK :DDEC :ANCH 1</code> <code>:DDEM :SEGM1 :MSK :DDEC :ANCH ?</code>
Couplings	If the modulation format is not MSK Type1, this control is grayed-out
Preset	1
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :MSK :DDECCode :ANCHor</code>

OQPSK

Allows you to configure advanced parameters for OQPSK modulation format.

OQPSK Align I & Q

Selects whether to align I and Q decision points for OQPSK. When this control is turned on, the Q part will be shifted by a half ($\frac{1}{2}$) symbol.

Remote Command	<code>:CALCulate :DDEMod :SEGMENT1 ... 6 :OQPSk :IQALign [:STATe] OFF ON 0 1</code>
Example	<code>:CALC :DDEM :SEGM1 :OQPS :IQAL ON</code> <code>:CALC :DDEM :SEGM1 :OQPS :IQAL ?</code>
Couplings	If the modulation format is not Offset QPSK or Shaped Offset QPSK, this control is grayed-out
Preset	OFF
State Saved	Yes

Custom IQ

Allows you to configure advanced parameters for Custom IQ modulation format.

Sync Persistence Target

Allows you to tune the algorithm for higher frequency lock range (0.0) or higher constellation lock consistency (1.0). Values closer to 0.0 optimize towards higher frequency lock range while values closer to 1 optimize towards higher constellation lock consistency.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CONStIn:PERsistence <real></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CONStIn:PERsistence?</code>
Example	<code>:DDEM:SEGM1:CONS:PERs 0.1</code> <code>:DDEM:SEGM1:CONS:PERs?</code>
Couplings	If the modulation format is not Custom IQ, this control is grayed-out
Preset	0.05
State Saved	Yes
Min	0.0
Max	1.0
Backwards Compatibility SCPI	<code>:SERVice[:PRODUCTION]:DDEMod:CONStIn:PERsistence</code>

Phase Rotation

Sets an additional phase rotation to be applied to the defined constellation.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PHASe:ROTation <real></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PHASe:ROTation?</code>
Example	<code>:DDEM:SEGM1:CIQ:PHAS:ROT 45</code> <code>:DDEM:SEGM1:CIQ:PHAS:ROT?</code>
Preset	0 deg
State Saved	Yes
Min	-360 deg
Max	360 deg

Shift

Enables or disables shift for phase rotation. When enabled, the phase rotation is only applied to the odd symbol, for example pi/2 shift BPSK, pi/4 shift QPSK.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PHASe:ROTation:SODD ON OFF 1 0</code>
----------------	---

3 VMA Mode

3.1 Digital Demod Measurement

	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PHASe:ROTation:SODD?</code>
Example	<code>:DDEM:SEGM1:CIQ:PHAS:ROT:SODD ON</code> <code>:DDEM:SEGM1:CIQ:PHAS:ROT:SODD?</code>
Preset	OFF
State Saved	Yes

Differential

Enables or disables the differential encoding for the segment. This should only be enabled for the BPSK, QPSK and 8PSK constellations.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:DIFFerential:STATe OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:DIFFerential:STATe?</code>
Example	<code>:DDEM:SEGM1:CIQ:DIFF:STAT ON</code> <code>:DDEM:SEGM1:CIQ:DIFF:STAT?</code>
Couplings	When Offset is ON , this control is OFF
Preset	OFF
State Saved	Yes

Offset

Enables or disables an IQ offset by half the symbol time. This should only be enabled for the QPSK constellation.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:OFFSet:STATe OFF ON 0 1</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:OFFSet:STATe?</code>
Example	<code>:DDEM:SEGM1:CIQ:OFFS:STAT ON</code> <code>:DDEM:SEGM1:CIQ:OFFS:STAT?</code>
Couplings	When Differential is ON , this control is OFF
Preset	OFF
State Saved	Yes

Insert Pilot

Enables or disables insertion of pilot (with repeated patten) to data segment.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot ON OFF 1 0</code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot?</code>
Example	<code>:DDEM:SEGM1:CIQ:PIL ON</code>

	<code>:DDEM:SEGM1:CIQ:PIL?</code>
Preset	OFF
State Saved	Yes

Pilot Repeat Cycle

Specifies pilot pattern repeat cycle in data segment.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot:CYCLe <int></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot:CYCLe?</code>
Example	<code>:DDEM:SEGM1:CIQ:PIL:CYCL 100</code> <code>:DDEM:SEGM1:CIQ:PIL:CYCL?</code>
Couplings	If " Modulation Format " on page 335 is not Custom IQ, or " Insert Pilot " on page 357 is not On, this control is grayed-out
Preset	1476
State Saved	Yes
Min	1
Max	10000000

Pilot Start Symbol

Specifies start position of repeated pilot pattern in data segment.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot:STARt <int></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot:STARt?</code>
Example	<code>:DDEM:SEGM1:CIQ:PIL:STAR 10</code> <code>:DDEM:SEGM1:CIQ:PIL:STAR?</code>
Couplings	If Modulation Format is not Custom IQ, or Insert Pilot is not On, this control is grayed-out
Preset	0
State Saved	Yes
Min	0
Max	10000000

Pilot Active Symbols

Specifies a string to specify pilot symbols within one repeat cycle.

Remote Command	<code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot:PATTern <string></code> <code>[:SENSe]:DDEMod:SEGMent1 ... 6:CIQ:PILot:PATTern?</code>
----------------	--

3 VMA Mode
3.1 Digital Demod Measurement

Example	<code>:DDEM:SEGM1:CIQ:PIL:PATT '100:200'</code> <code>:DDEM:SEGM1:CIQ:PIL:PATT?</code>
Couplings	If Modulation Format is not Custom IQ, or Insert Pilot is not On, this control is grayed-out
Preset	"1440:1475"
State Saved	Yes

Pilot Modulation

Specifies modulation type for pilot symbols in data segment.

Remote Command	<code>[[:SENSe]:DDEMod:SEGMENT1 ... 6:CIQ:PILOt:MODulation AUTO BPSK QPSK</code> <code>[[:SENSe]:DDEMod:SEGMENT1 ... 6:CIQ:PILOt:MODulation?</code>
Example	<code>:DDEM:SEGM1:CIQ:PIL:MOD QPSK</code> <code>:DDEM:SEGM1:CIQ:PIL:MOD?</code>
Couplings	If Modulation Format is not Custom IQ, or Insert Pilot is not On, this control is grayed-out
Preset	QPSK
State Saved	Yes
Range	Auto BPSK QPSK

Constellation Settings (Except Custom IQ)

Enables you to edit the constellation state mapping. It's only available for the format except CPM(FM), QAM 256, QAM 512, QAM 1024 and DVB QAM 256.

Constellation Settings (Custom IQ)

Preset To Standard Constellation

Accesses a menu to fill the table by copying one of these typical modulation formats: BPSK\QPSK\8PSK\16PSK\32PSK\64PSK\4QAM\16QAM\64QAM.

Range	BPSK\QPSK\8PSK\16PSK\32PSK\64PSK\4QAM\16QAM\64QAM
-------	---

Axis Type

Selects Constellation Axis between I vs Q and Magnitude vs Phase.

Go to Row

Enables you to move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control. It immediately deletes the currently-selected row regardless of the row is being edited or not. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

This is an immediate action control. It immediately clears the table.

Phase Rotation

Specifies the phase to rotate the constellation.

Couplings	This control is only available when Axis Type is Magnitude vs Phase
Preset	0.0
State Saved	Saved in instrument state, survives Preset
Min	-360
Max	360

Apply Phase Rotation

Updates the phase column and rotates constellation per Phase Rotation value, the Phase Rotation will then be reset to zero.

Couplings	Only available when Axis Type is Magnitude vs Phase
-----------	---

Normalize RMS

Scales the magnitude of the constellation states to have a unitless RMS of 1. This assumes all constellation states have equal probability.

Validate

Checks the current constellation definition for validity and enables the OK button. It will also calculate Mag RMS and Symmetry based on current constellation.

Mag RMS calculation assumes equally probable constellation states.

Symmetry means angle in degrees by which constellation can be rotated to achieve an equivalent constellation.

User-Defined Filter Coefficient

Enables you to edit the user-defined filter's coefficient. Only available when the meas or ref filter is user-defined.

User-Defined Meas Filter Coefficient List Data (Remote Command Only)

Defines a list of coefficient values for a user-defined measure filter. Up to 1000 points may be defined using the following parameters.

Remote Command	<code>:CALCulate:DDEMod:SEGMENT1 ... 6:FILTer:COEFFicient:MEASure[:DATA] <real>, <real>, ...</code> <code>:CALCulate:DDEMod:SEGMENT1 ... 6:FILTer:COEFFicient:MEASure[:DATA]?</code>
Example	<code>:CALC:DDEM:SEG1:FILT:COEF:MEAS -0.1124, -0.1545, -0.2458, -0.325</code> <code>:CALC:DDEM:SEG1:FILT:COEF:MEAS?</code>
Preset	Unaffected by Preset
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:CALCulate:FILTer:COEFFicient:MEASure[:DATA]</code>

User-Defined Ref Filter Coefficient List Data (Remote Command Only)

Defines a list of coefficient values for a user-defined reference filter. Up to 1000 points may be defined using the following parameters.

Remote	<code>:CALCulate:DDEMod:SEGMENT1 ... 6:FILTer:COEFFicient:REFerence[:DATA] <real>, ...</code>
--------	---

Command	<real>, ... :CALCulate:DDEMod:SEGMent1 ... 6:FILTer:COEFficient:REFeRence[:DATA]?
Example	:CALC:DDEM:SEGM1:FILT:COEF:REF -0.1124, -0.1545, -0.2458, -0.325 :CALC:DDEM:SEGM1:FILT:COEF:REF?
Preset	Unaffected by Preset
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:CALCulate:FILTer:COEFficient:REFeRence[:DATA]

3.1.9.7 Advanced

Enables you to configure advanced parameters.

IF Gain

To take full advantage of the RF dynamic range of the instrument, a switched IF amplifier with approximately 10 dB of gain is available. When it can be turned on without an overload, the dynamic range is always better with it on than off. The control “IF Gain” can be used to set the IF Gain function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

Sets the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

This only applies to the RF input. It does not apply to baseband I/Q input.

IF Gain Auto

Activates the auto rules for IF Gain

Remote Command	[:SENSe]:DDEMod:IF:GAIN:AUTO[:STATe] ON OFF 1 0 [:SENSe]:DDEMod:IF:GAIN:AUTO[:STATe]?
Example	:DDEM:IF:GAIN:AUTO OFF :DDEM:IF:GAIN:AUTO?
Dependencies	The IF Gain control has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though IF Gain is set to Low regardless of the setting on the control This control, and the Auto/Man toggle, do not appear in VXT
Preset	OFF
State Saved	Yes
Range	Auto Man

IF Gain Select

Selects the range of IF gain:

- High gain - Set 10 dB IF gain for better noise level measurements
- Low gain - Set 0 dB IF gain for large signals
- Other - enables you to set the arbitrary IF gain value within -12 dB to 12 dB. This selection is not available for the B25 If bandwidth option

When this parameter is changed, IF Gain Auto will become Man.

Remote Command	<code>[:SENSe]:DDEMod:IF:GAIN:SElect LOW HIGH OTHER</code> <code>[:SENSe]:DDEMod:IF:GAIN:SElect?</code>
Example	<code>:DDEMod:IF:GAIN:SEL LOW</code> <code>:DDEMod:IF:GAIN:SEL?</code>
Preset	LOW
State Saved	Yes
Range	LOW HIGH OTHER
Backwards Compatibility SCPI	<code>[:SENSe]:DDEMod:IF:GAIN[:STATE] ON OFF 1 0</code>

Other IF Gain

Specifies the IF gain value. When IF gain is set to Other, this value will be used.

Remote Command	<code>[:SENSe]:DDEMod:IF:GAIN:LEVel <rel_amp1></code> <code>[:SENSe]:DDEMod:IF:GAIN:LEVel?</code>
Example	<code>:DDEMod:IF:GAIN:LEV -10</code> <code>:DDEMod:IF:GAIN:LEV?</code>
Notes	It is not available for B25 IF bandwidth option
Preset	0
State Saved	Saved in instrument state
Min/Max	-12/12

Spur Avoidance

Option H1G has a spur at the -50 MHz offset of the Center Frequency. The Spur Avoidance function is provided to eliminate this spur.

- Auto: move the spur completely out of analysis bandwidth. The tradeoff is that the available analysis bandwidth will be reduced to 400 MHz and EVM could be worse as the edge of the passband is used for analysis
- Manual: move the spur by a specified value, or turn off this feature by setting the value to 0

Remote Command	<code>[:SENSe]:DDEMod:SAVoid:FREQuency <freq ></code> <code>[:SENSe]:DDEMod:SAVoid:FREQuency?</code> <code>[:SENSe]:DDEMod:SAVoid:AUTO ON OFF 1 0</code> <code>[:SENSe]:DDEMod:SAVoid:AUTO?</code>
Example	<code>:DDEM:SAV:FREQ 50MHz</code> <code>:DDEM:SAV:FREQ?</code> <code>:DDEM:SAV:AUTO ON</code> <code>:DDEM:SAV:AUTO?</code>
Couplings	Grayed-out when Mixer Mode is Alternate When Acquisition mode is changed from Sequential to Simultaneous, this control is reset (manual, 0 Hz) for all component carriers
Preset	0 Hz OFF
State Saved	Saved in instrument state Yes
Range	Auto Manual
Min	$-(1\text{GHz} - \text{BW})/2$
Max	$(1\text{GHz} - \text{BW})/2$

LO Dither

When **LO Dither** is turned on, the local oscillator frequency is rapidly changed by small, random amounts. This helps spread the power of spurious signals within the passband, which lowers their level, thus increasing dynamic range. This is only required in very wide passbands, so this feature only appears with option H1G.

Remote Command	<code>[:SENSe]:DDEMod:LO:DITHer[:STATe] ON OFF 1 0</code> <code>[:SENSe]:DDEMod:LO:DITHer[:STATe]?</code>
Example	<code>:DDEM:LO:DITH 1</code> <code>:DDEM:LO:DITH?</code>
Dependencies	Only available when the instrument has Option H1G installed. If you try to turn ON LO Dither in any other case, an error message is generated, -241,"Hardware missing; Option H1G required" Only appears in some Modes (for example, 5GNR, VMA and IQ Analyzer)

3 VMA Mode

3.1 Digital Demod Measurement

	<p>Turned Off and grayed-out when the IF Path is set to a path other than 1 GHz. If you press the grayed-out control, a warning message "LO Dither only available with IF Path 1 GHz" is shown. If you try to set LO Dither to ON remotely while it is grayed-out, a message "-221,Settings conflict; LO Dither only available with IF Path 1 GHz" is returned</p> <p>When LO Dither is turned on, the Phase Noise Optimization control is grayed-out. If you try to change the PNO value via the front panel or SCPI in that case, an error is generated, "LO Dither must be turned off to change this value"</p>
Couplings	<p>As with most parameters with an AUTO state, AUTO COUPLE sets it to Auto, which then selects AUTOorange. Setting any specific value (AUTOorange, LOW or HIGH) will set the AUTO state to false</p> <p>When LO Dither is turned ON, Phase Noise Optimization is set to "Best Close-In". If the Phase Noise Optimization value changes due to turning on LO Dither, a warning message "Phase Noise Optimization changed due to LO Dither activation" is shown</p>
Preset	OFF
State Saved	Saved in instrument state

PhNoise Opt

Selects the LO (local oscillator) phase noise behavior for various desired operating conditions.

For full details, see "[Parameter Options, Installed Options & Auto Rules](#)" on page 365 and "[Ranges](#)" on page 370 below.

Remote Command	<p>[:SENSe] :DDEMod:FREQuency:SYNThesis[:STATe] 1 ... 5</p> <p>For the meaning of each numeric option value, see "Parameter Options, Installed Options & Auto Rules" on page 365 below</p> <p>[:SENSe] :DDEMod:FREQuency:SYNThesis[:STATe]?</p>
Example	<p>:DDEM:FREQ:SYNT 2</p> <p>Selects optimization for best wide offset phase noise</p>
Dependencies	Does not appear in all models. The control is blank in those models, but the SCPI command is accepted for compatibility (although no action is taken)
Preset	2
State Saved	Yes
Range	See " Ranges " on page 370 below

Parameter Options, Installed Options & Auto Rules

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 367	1	<ul style="list-style-type: none"> - In instruments with EPO, balances close-in phase noise with spur avoidance - In instruments without EPO optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 367	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 368	3	Optimizes LO for tuning speed
"Best Close-in" on page 366	4 or 1*	<ul style="list-style-type: none"> - In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance - In instruments without EPO, this setting is accepted but no action is taken
"Best Spurs" on page 367	5	<ul style="list-style-type: none"> - In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance - In instruments without EPO, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EPO installation. See "Best Close-in" on page 366 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 368 is identical in effect to "Best Close-in" on page 366.

Best Close-in

Without option EPO

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

`:FREQ:SYNT 4`

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products

3 VMA Mode

3.1 Digital Demod Measurement

that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 367 setting, parameter 1 selects "Balanced" on page 367 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 366, which is usually not as good a choice as "Balanced" on page 367.

Balanced

:FREQ:SYNT 1

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

:FREQ:SYNT 5

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 367 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 366 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 367 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

:FREQ:SYNT 2

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "[Fast Tuning](#)" on page 368 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EPO, this is the same configuration as "[Best Spurs](#)" on page 367. It is available with the "[Fast Tuning](#)" on page 368 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "[Fast Tuning](#)" on page 368 option, the settings for "[Best Close-in](#)" on page 366 are used if "[Fast Tuning](#)" on page 368 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EPO	Center frequency is < 699.9 kHz	"Balanced" on page 367
Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Span > 114.1 MHz, <i>or</i> RBW > 800 kHz	"Fast Tuning" on page 368
	RBW > 290 kHz, <i>or</i> Span > 4.2 MHz	"Best Wide-offset" on page 367
	Other conditions	"Balanced" on page 367

3 VMA Mode
3.1 Digital Demod Measurement

Models with Option	Conditions	Selection
<p>EP1</p> <p>Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)</p>	<p>Span > 44.44 MHz, <i>or</i></p> <p>RBW > 1.9 MHz, <i>or</i></p> <p>Source Mode is set to "Tracking"</p> <p>Center frequency is < 195 kHz, <i>or</i></p> <p>CF >= 1 MHz <i>and</i> Span <= 1.3 MHz <i>and</i> RBW <= 75 kHz</p> <p>All other conditions</p>	<p>"Fast Tuning" on page 368</p> <p>"Best Close-in" on page 366</p> <p>"Best Wide-offset" on page 367</p>
<p>EP2</p> <p>Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 366; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)</p>	<p>CF < 130 kHz, <i>or</i></p> <p>CF > 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 40 kHz</p> <p>Span > 22 MHz, <i>or</i></p> <p>RBW > 400 kHz, <i>or</i></p> <p>CF ≤ 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 23 kHz</p> <p>All other conditions</p>	<p>"Best Close-in" on page 366</p> <p>"Fast Tuning" on page 368</p> <p>"Best Wide-offset" on page 367</p>
<p>EP4</p> <p>(available in CXA for improved phase noise)</p>	<p>Span > 101 MHz <i>or</i></p> <p>RBW > 1.15 MHz <i>or</i></p> <p>Source Mode is set to "Tracking"</p> <p>CF is < 109 kHz <i>or</i></p> <p>CF >= 4.95 MHz <i>and</i> Span <= 666 kHz <i>and</i> RBW < 28 kHz</p> <p>All other conditions</p>	<p>"Fast Tuning" on page 368</p> <p>"Best Close-in" on page 366</p> <p>"Best Wide-offset" on page 367</p>
<p>All Other Models</p> <p>Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 368 are actually the same as "Best Close-in" on page 366, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning</p>	<p>Span > 12.34 MHz, <i>or</i></p> <p>RBW > 250 kHz, <i>or</i></p> <p>Source Mode is set to "Tracking"</p> <p>Center frequency is < 25 kHz, <i>or</i></p> <p>CF >= 1 MHz <i>and</i> Span <= 141.4 kHz <i>and</i> RBW <= 5 kHz</p> <p>All other conditions</p>	<p>"Fast Tuning" on page 368</p> <p>"Best Close-in" on page 366</p> <p>"Best Wide-offset" on page 367</p>

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
	1	Best Close-in	[offset < 140 kHz]
EP1	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
	1	Best Close-in	[offset < 70 kHz]
EP2, EP3, EP5	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
	1	Best Close-in	[offset < 90 kHz]
EP4	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Mixing Mode

Changing LO mixing from high-side to low-side or vice versa.

Remote Command	<code>[:SENSe]:DDEMod:LO:MIXMode NORMal ALTeRNate</code> <code>[:SENSe]:DDEMod:LO:MIXMode?</code>
Example	<code>:DDEM:LO:MIXM NORM</code> <code>:DDEM:LO:MIXM?</code>
Dependencies	The Mixing Mode, the control is grayed out when the RF Input is set to something other than “RF” (such as External Mixer). If you press the grayed out control, a warning message “Feature only available with Signal Input RF” is shown If you try to set Mixing Mode via SCPI when disabled, a message -221, “Settings conflict; Feature only

3 VMA Mode

3.1 Digital Demod Measurement

	available with signal input RF" is returned
Preset	NORMa1
State Saved	Yes
Range	Normal Alternate

Spectrum Stitching

When Spectrum Stitching is turned on, multiple acquisitions overlapped in frequency domain will be performed and then combined to get wide band IQ data. This enables the instrument to capture and analysis wider signal, it may slow down the measurement speed and it requires the signal to occupy the major part of the analysis bandwidth.

Note: accurate trigger is needed to align multiple acquisitions in time domain, and input signal need to be repeated and aligned with trigger precisely.

Remote Command	[:SENSe]:DDEMod:STITching:SPECTrum[:STATe] ON OFF 1 0 [:SENSe]:DDEMod:STITching:SPECTrum[:STATe]?
Example	:DDEM:STIT:SPEC 1 :DDEM:STIT:SPEC?
Preset	OFF
State Saved	Saved in instrument state

Cross-Correlated EVM

Enables Cross-Corelated EVM.

Remote Command	[:SENSe]:DDEMod:CCEVm[:ENABle] ON OFF 1 0 [:SENSe]:DDEMod:CCEVm[:ENABle]?
Example	:DDEM:CCEV 1 :DDEM:CCEV?
Preset	OFF
State Saved	Saved in instrument state

Multi Channel Config

Lets you perform a detailed configuration of your component carriers, including number of carriers, bandwidth, offset, integration bandwidth, and so on.

Multi Channel Config

This menu is only available for the Modulation Analysis measurement. It enables you to configure multiple channel receiver. Different hardware platforms have different parameters.

Input Channel IP address

Sets instrument IP address for channel configuration, "local" is used for current instrument.

Remote Command	<code>[:SENSe] :DDEMod :MCHannel :IPAddress1 2 <String></code> <code>[:SENSe] :DDEMod :MCHannel :IPAddress1 2 ?</code>
Example	<code>:DDEM :MCH :IPAD1 '192.168.1.2'</code>
Preset	Local
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :MIMO :IPAddress1 2</code>

Input Channel Instrument port

Remote Command	<code>[:SENSe] :DDEMod :MCHannel :IPAddress1 2 <String></code> <code>[:SENSe] :DDEMod :MCHannel :IPAddress1 2 ?</code>
Example	<code>:DDEM :MCH :IPAD1 '192.168.1.2'</code>
Preset	Local
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :MIMO :IPAddress1 2</code>

Lock

Locks instrument and assigns to a channel in sequence.

Remote Command	<code>[:SENSe] :DDEMod :MCHannel :IPAddress1 2 :LOCKed OFF ON 0 1</code> <code>[:SENSe] :DDEMod :MCHannel :IPAddress1 2 :LOCKed ?</code>
Example	<code>:DDEM :MCH :IPAD1 :LOCK 1</code> <code>:DDEM :MCH :IPAD1 :LOCK ?</code>
Preset	0

3 VMA Mode
3.1 Digital Demod Measurement

State Saved	Yes
Backwards Compatibility SCPI	[:SENSe] :DDEMod:MIMO:IPADdress1 2:LOCKed

Channel Configuration Information (Remote Query only)

Reads back channel configuration information.

Remote Command	[:SENSe] :DDEMod:MCHannel:CHANnel:INFO?
Example	:DDEM:MCH:CHAN:INFO?
Backwards Compatibility SCPI	[:SENSe] :DDEMod:MIMO:CHANnel:INFO

3.1.9.8 BER

Enables you to set Tx BER parameters.

BER

Turns Tx BER on or off. When Tx BER is on, the results of BER, Error Bits, and Total Bits are displayed in Demod Bits window.

NOTE

When segment2 is enabled, Tx BER measurement will be only performed on segment2.

Remote Command	[:SENSe] :DDEMod:SEGMENT1 ... 6:BER:STATe OFF ON 0 1 [:SENSe] :DDEMod:SEGMENT1 ... 6:BER:STATe?
Example	:DDEM:SEGM1:BER:STAT ON :DDEM:SEGM1:BER:STAT?
Couplings	Available only when Tx Pattern has been recalled
Preset	OFF
State Saved	Yes
Backwards Compatibility SCPI	[:SENSe] :DDEMod:BER:STATe

Total Bit Num

Determines the maximum total bit number that is used for Tx BER calculation. Once this number is achieved, the BER measurement stops accumulation.

Remote Command	<code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :BER :COUNT :BITS <real></code> <code>[:SENSe] :DDEMod :SEGMENT1 ... 6 :BER :COUNT :BITS ?</code>
Example	<code>:DDEM :SEGM1 :BER :COUN :BITS 1.0E8</code> <code>:DDEM :SEGM1 :BER :COUN :BITS ?</code>
Preset	1.0e8
State Saved	Yes
Min/Max	1.0e2 / 1.0e25
Backwards Compatibility SCPI	<code>[:SENSe] :DDEMod :BER :COUNT :BITS</code>

3.1.9.9 Limits

Accesses a menu that enables you to set the following limits:

- Tx Power
- RMS EVM
- Frequency Error
- Clock Error
- RMS Offset EVM

Limit Test

Selects whether to test the scalar limits and the trace limits. For scalar results that fail the limit, a red F is appended. And for trace results that pass or fail the displayed limit (i.e. those for which Limit On/Off is set to On), a message will be displayed in the upper-left corner of the graticule of the window as below:

- If the trace is at or within the bounds of all applicable limits and margins, the text "Trace Pass" will be displayed in green
- If the trace is at or within the bounds of all applicable limits, but outside the bounds of some applicable margin, the text "Trace Fail Margin" will be displayed in amber

3 VMA Mode
 3.1 Digital Demod Measurement

- If the trace is outside the bounds of some applicable limits, the text “Trace Fail” will be displayed in red
- If the window has no enabled limits, or the trace itself is not displayed, no message is displayed for that trace

`:CALCulate:DDEMod:LLINE[1]|2|3|4|5|6:FAIL?` returns the trace limit testing results.

`:READ|FETCh|MEASure:DDEMod2?` returns the scalar limit testing results.

Remote Command	<code>:CALCulate:DDEMod:LIMit:STATe OFF ON 0 1</code> <code>:CALCulate:DDEMod:LIMit:STATe?</code>
Example	<code>:CALC:DDEM:LIM:STAT OFF</code> <code>:CALC:DDEM:LIM:STAT?</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>On Off</code>

Edit Scalar Limits

Enables you to edit the limit value for the scalar results.

Tx Power

Sets the limit for the transmit power pass/fail test. It fails when the measured power is less than this limit value.

Remote Command	<code>:CALCulate:DDEMod:SEGment1 ... 6:LIMit:POWer <amp></code> <code>:CALCulate:DDEMod:SEGment1 ... 6:LIMit:POWer?</code>
Example	<code>:CALC:DDEM:SEGM1:LIM:POW -30.0 dBm</code> Set the transmit power limit of segment1 to -30 dBm <code>:CALC:DDEM:SEGM1:LIM:POW?</code> query the transmit power limit of segment1
Preset	-50.0
State Saved	Yes
Min	-200.0
Max	200.0
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LIMit:POWer</code>

RMS EVM

Sets the limit for the RMS EVM or FSK Error measurement pass/fail test.

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:EVM:RMS <real></code> <code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:EVM:RMS?</code>
Example	<code>:CALC:DDEM:SEGM1:LIM:EVM:RMS 10.0</code> Set the RMS EVM limit of segment1 to 10 % <code>:CALC:DDEM:SEGM1:LIM:EVM:RMS?</code> query the RMS EVM limit of segment1
Notes	The control label is "RMS EVM" for all modulation format except FSK formats When modulation format is FSK formats, it is "FSK Error"
Preset	35.0
State Saved	Yes
Min	0.00
Max	100.0
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LIMit:EVM:RMS</code>

Frequency Error

Sets the limit for the frequency error measurement pass/fail test.

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:FERRor[:HERTZ] <real></code> <code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:FERRor[:HERTZ]?</code>
Example	<code>:CALC:DDEM:SEGM1:LIM:FERR 40.0</code> Set the frequency error limit of segment1 to 40.0 Hz <code>:CALC:DDEM:SEGM1:LIM:FERR?</code> Query the frequency error limit of segment1
Preset	100.0
State Saved	Yes
Min	0 Hz
Max	500 kHz
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LIMit:FERRor[:HERTZ]</code>

Clock Error

Sets the limit for the symbol clock error measurement pass/fail test.

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:CERRor[:HERTZ] <real></code> <code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:CERRor[:HERTZ]?</code>
Example	<code>:CALC:DDEM:SEGM1:LIM:CERR 40.0</code> Set the clock error limit of segment1 to 40.0 Hz <code>:CALC:DDEM:SEGM1:LIM:CERR?</code> Query the clock error limit of segment1
Preset	100.0
State Saved	Yes
Min	0 Hz
Max	500 kHz
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LIMit:CERRor[:HERTZ]</code>

RMS Offset EVM

Available only when the modulation format is Offset QPSK or Shaped Offset QPSK.

Sets the limit for the RMS Offset EVM measurement pass/fail test.

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:OEVM:RMS <real></code> <code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:OEVM:RMS?</code>
Example	<code>:CALC:DDEM:SEGM1:LIM:OEVM:RMS 10.0</code> Set the RMS Offset EVM limit of segment1 to 10 % <code>:CALC:DDEM:SEGM1:LIM:OEVM:RMS?</code> Query the RMS Offset EVM limit of segment1
Preset	35.0
State Saved	Yes
Min	0.00
Min/Max	0.00/100.0
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LIMit:OEVM:RMS</code>

Deviation Accuracy

Sets the limit for the Deviation Accuracy result pass/fail test.

Remote Command	<code>:CALCulate:DDEMod:SEGMent1 ... 6:LIMit:DEVIation:OFFSet <real></code>
Example	<p><code>:CALC:DDEM:SEGM1:LIM:DEV:OFFS 10.0</code></p> <p>Set the deviation accuracy limit of segment1 to 10 %</p> <p><code>:CALC:DDEM:SEGM1:LIM:DEV:OFFS?</code></p> <p>Query the deviation accuracy limit of segment1</p>
Couplings	<p>Available only when the modulation format is FSK formats or CPM (FM)</p> <p>If FSK Deviation Reference is Auto, this control is grayed-out. Pressing this control in this case generates a message "It's not available while FSK Reference Deviation is Auto"</p>
Preset	20.0
State Saved	Yes
Min/Max	0.00/100.0
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LIMit:DEVIation:OFFSet</code>

Select Limit

Specifies the selected limit. The term "selected limit" is used throughout this document to specify which trace limit will be affected by the functions.

Notes	The selected limit is remembered even when not in the Limit Menu
Preset	Limit 1, not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Limit On/Off

Selects whether the limit is turned on or off. While trying to turn on the trace limit, it will check whether the limit's x/y axis unit and the selected window's x/y axis unit match. If matched, the limit line will be turned on. If not, the limit will be turned off and a settings conflict message "The unit of the limit and the selected window doesn't match." will be displayed.

The limit will be turned off if the data of the selected window is changed and its x/y units do not match those of the current limit.

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:DISPlay OFF ON 0 1</code>
----------------	--

	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:DISPlay?</code>
Example	<code>:CALC:DDEM:LLIN:DISP ON</code> <code>:CALC:DDEM:LLIN:DISP?</code>
Preset	OFF
State Saved	Saved in instrument state

Edit Trace Limit

Enables you to edit the content and the properties of the trace Limit Line.

Limits are turned off by a Preset, but the Limits arrays (data) are only reset (deleted) by Restore Mode Defaults. They survive shutdown and restarting of the instrument application, which means they will survive a power cycle.

When editing a limit, the editor remembers which limit and which element in the limit array you were editing, and returns you to that limit and that element when you return to the editor after leaving it.

Select Limit

Specifies the selected limit. The term “selected limit” is used throughout this document to specify which trace limit will be affected by the functions.

Notes	The selected limit is remembered even when not in the Limit Menu
Preset	Limit 1, not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Go to Row

Enables you to move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

X Axis Unit

Selects how the limit-line x segments are defined. Pressing **X Axis Unit** selects which unit of the selected limit line's x axis will be.

Changing X Axis Unit changes the below control's unit accordingly but doesn't change their values.

- X Offset
- Cells in table's x column

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:X:UNIT HZ SECond SYMBol</code> <code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:X:UNIT?</code>
Example	<code>:CALC:DDEM:LLIN:X:UNIT HZ</code> Sets the selected limit line's x values to be specified in unit of Hz
Couplings	Affects the unit of X Offset and x list of the selected limit line
Preset	<code>HZ</code>
State Saved	Saved in instrument state

Y Axis Unit

Selects how the limit-line y segments are defined. Pressing **Y Axis Unit** selects which unit of the selected limit line's y axis will be.

Changing Y Axis Unit changes the below control's unit accordingly but doesn't change their values.

- Y Offset
- Margin
- Cells in table's y column

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:Y:UNIT DBM DB V HZ PERCent DEGRee</code> <code> SECond NONE</code> <code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:Y:UNIT?</code>
Example	<code>:CALC:DDEM:LLIN:Y:UNIT DB</code> Sets the selected limit line's y values to be specified in unit of dB
Couplings	Affects the unit of Y Offset, Margin and y list of the selected limit line
Preset	<code>DBM</code>
State Saved	Saved in instrument state

X Offset

Offsets the limit trace by some specified frequency (for frequency-based limit lines) or a time (for time-based limit lines).

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:OFFSet:X <real></code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:OFFSet:X?</code>
Example	<code>:CALC:DDEM:LLIN:OFFS:X -50.0</code> Sets the X axis offset to -50 MHz if the limit's X Axis Unit is Hz <code>:CALC:DDEM:LLIN:OFFS:UPD</code> will apply the X axis offset to all points in the limit line, then reset the X axis offset to zero
Couplings	The unit of X Offset depends on the selected X Axis Unit
Preset	0.0
State Saved	Saved in instrument state, survives Preset
Min	-9.9E+37
Max	9.9E+37

Y Offset

Offsets all segments in the limit line by some specified amplitude.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:OFFSet:Y <real></code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:OFFSet:Y?</code>
Example	<code>:CALC:DDEM:LLIN:OFFS:Y 10.0</code> Sets the Y axis offset to -10 dB if the limit's Y Axis Unit is dBm or dB <code>:CALC:DDEM:LLIN:OFFS:Y?</code>
Preset	0.0
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Apply Offset to Limit Table

Adds the X offset and Y offset to each point in the limit table, then resets the X offset and Y offset value to zero. This has no effect on the position of the limit trace. For example, if the Y offset is 1 dB, 1 dB will be added to each Y value in the limit table. The offset value will then be reset to zero.

Remote Command	:CALCulate:DDEMod:LLINe[1] 2 ... 6:OFFSet:UPDate
Example	:CALC:DDEM:LLIN:OFFS:UPD
State Saved	No state

Delete Row

This is an immediate action control. It immediately deletes the currently-selected row regardless of the row is being edited or not. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Delete Limit

Deletes the currently selected limit line. Pressing **Delete Limit** purges the data from the limit line tables.

Limit data – including secondary parameters such as description, margin value, etc. - will be cleared and returned to factory preset settings.

When this control is pressed, a prompt appears on the screen that says “Please press Enter or OK to delete limit. Press ESC or Cancel to close this dialog.” The deletion is only performed if you press **OK** or **Enter**; if so, after the deletion, the informational message “Limit deleted” appears in the MSG line.

Remote Command	:CALCulate:DDEMod:LLINe[1] 2 ... 6:DElete
Example	:CALC:DDEM:LLIN2:DEL
	Deletes all data for limit line 2

Edit Trace Limit Settings

This is the second page of the Edit Trace Limits dialog. You access it by pressing **Settings** on the **Edit Trace Limits** dialog.

Select Limit

Specifies the selected limit. The term “selected limit” is used throughout this document to specify which trace limit will be affected by the functions.

Notes	The selected limit is remembered even when not in the Limit Menu
Preset	Limit 1, not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

X Reference

Chooses whether the limit line x points are fixed, or relative to center frequency when x axis unit is Hz, or relative to trigger when x axis unit is time unit and trigger source is not free run, or relative to sync pattern when x axis unit is time unit and sync search is on.

For example, assume you have a frequency limit line, and the instrument center frequency is at 1 GHz. If Relative to CF is “Off”, entering a limit line segment with a frequency coordinate of 300 MHz displays the limit line segment at 300 MHz, and the limit line segment will not change frequency if the center frequency changes. If Relative to CF is “On”, entering a limit line segment with a frequency coordinate of 300 MHz displays the limit line segment at CF + 300 MHz, or 1.3 GHz. Furthermore, if the center frequency changes to 2 GHz, the limit line segment will be displayed at CF + 300 MHz, or 2.3 GHz.

It is possible to change this setting after a limit line has been entered. When changing from On to Off or vice-versa, the x values in the limit line table change so that the limit line remains in the same position for the current settings of the instrument.

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:X:REference FIXed RCF RTRigger RSYnc</code> <code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:X:REference?</code>
Example	<code>:CALC:DDEM:LLIN:X:REF RTR</code> makes limit line 1 relative to the trigger
Notes	Relative to CF is only available when x axis unit is Hz, otherwise it is grayed-out Relative to Trigger is only available when x axis unit is time unit and trigger source is not free run, otherwise it is grayed-out Relative to Sync is only available when x axis unit is time unit and sync search is on, otherwise it is grayed-out
Preset	FIXed , not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Copy from Limit

Copies an existing limit into the current limit, including all secondary parameters (Description, Comment, Associated Window, X Axis Unit, Y Axis Unit, X Offset, Y Offset, Type, Margin, X Reference). The destination limit is specified as a subcoded LLINe parameter and the source limit is specified as a numeric parameter.

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:COpy 1 ... 6</code>
Example	<code>:CALC:DDEM:LLINE2:COpy 1</code>

copies the data from line 1 into line 2

Copy

Copies a Limit from the Limit specified in Copy From Limit.

Description

Provides a description of up to 60 characters by which the operator can easily identify the limit. Will be stored in the exported file. Can be displayed in the active function area by selecting as the active function, if desired to be in a screen dump.

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:DESCription "Description"</code> <code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:DESCription?</code>
Example	<code>:CALC:DDEM:LLIN:DESC "European Emissions"</code>
Dependencies	60 characters max
Preset	"" (null String), not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Comment

Sets an ASCII comment field, which will be stored in an exported file. Can be displayed in the active function area by selecting as the active function, if desired to be in a screen capture. The Limits CSV file supports this field.

Remote Command	<code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:COMMENT "text"</code> <code>:CALCulate:DDEMod:LLINE[1] 2 ... 6:COMMENT?</code>
Example	<code>:CALC:DDEM:LLIN:COMM "this is a comment"</code>
Dependencies	60 characters max
Preset	"" (null String), not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Apply to Window

Selects the window you want the limit to apply. A limit is applied to one and only one trace in the selected; each trace can have both an upper and a lower limit. When executing Limit Test, the limit is applied only to the specified trace.

A trace in the selected window can have multiple limit lines simultaneously; in that case, only one upper and one lower limit line will affect the color of the trace. Other

3 VMA Mode
3.1 Digital Demod Measurement

limit lines will be displayed, and will affect the pass/fail status, but the trace will not turn red if it crosses a secondary limit line.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:WINDow <int></code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:WINDow?</code>
Example	<code>:CALC:DDEMod:LLIN:WIND 1</code> Selects the 1 st window as the target window that the limit line 1 will be displayed
Preset	1
State Saved	Saved in instrument state
Min	1
Max	6

Margin

Selects a margin for this limit, which will cause a trace to Fail Margin when the trace is between the limit line and the margin line. Portions of the traces which pass the limit but fail the margin will be displayed in an amber color.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:MARGin <real></code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:MARGin?</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:MARGin:STATe OFF ON 0 1</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:MARGin:STATe?</code>
Example	<code>:CALC:DDEM:LLIN1:MARG 2</code> Sets limit line 1's margin to 2 dB when the limit line 1's Y axis unit is dBm or dB <code>:CALC:DDEM:LLIN2:MARG:STAT OFF</code> turns off the margin for limit line 2 and removes any tests associated with that margin line
Notes	The queries "Limit Line Pass/Fail?" (<code>:CALCulate:DDEMod:LLINe[1] 2 3 4 5 6:FAIL?</code>) return 1 if the margin fails
Couplings	The unit of the margin depends on the limit's Y Axis Unit. Changing the Y Axis Unit of the limit changes its Margin's unit, but doesn't change its value
Preset	Not affected by Mode Preset, set to 0.0 for all Limits by Restore Mode Defaults OFF
State Saved	Saved in instrument state Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Type

Selects whether the limit you are editing is an upper or lower limit. An upper limit fails if the trace exceeds the limit. A lower limit fails if the trace falls below the limit.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:TYPE UPPER LOWer</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:TYPE?</code>
Example	<code>:CALC:DDEM:LLIN2:TYPE LOW</code> Sets limit line 2 to act as a lower limit
Couplings	If a margin has already been set for this limit line, and this control is used to change the limit type, then the margin value will reverse sign
Preset	UPPer for Line 1, 3, and 5; LOWer for Line 2, 4, 6 Not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Delete All Limits

Deletes all limit lines. Pressing **Delete All Limits** purges the data from all limit line tables.

All limit data will be cleared and returned to factory preset settings.

When this control is pressed a prompt appears on the screen that says “Please press Enter or OK to delete all limits. Press ESC or Cancel to close this dialog.” The deletion is only performed if you press **OK** or **Enter**; if so, after the deletion, the informational message “All Limits deleted” appears in the MSG line.

Remote Command	<code>:CALCulate:DDEMod:LLINe:ALL:DElete</code>
Example	<code>:CALC:DDEM:LLIN:ALL:DEL</code> Deletes all data for all limit lines

Limit Line Fail? (Remote Command Only)

Tests a limit line against its associated trace window. It performs the test when both Limit and Limit Test are On, returns a 0 if the trace is within the limit, a 1 if the trace exceeds the limit. If either or both Limit and Limit Test is Off, it returns a 0.

Note that this command only tests one limit line – other limit lines are not tested when executing this command. To see whether a trace passed all limits, use `:CALCulate:DDEMod:WINDow[1]|2|3|4|5|6:FAIL?`.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:FAIL?</code>
----------------	---

Command	
Example	<code>:CALC:DDEM:LLIN:FAIL?</code> Returns a zero if limit line 1's associated trace has no failure, 1 if there is a limit failure

Limit Line X List Data (Remote Command Only)

Defines a list of x values for a given limit line. Up to 2000 points may be defined for each limit using the following parameters.

Note that x values may be repeated if a vertical step in the limit line is desired.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:X[:DATA] <real>, <real>, ...</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:X[:DATA]?</code>
Example	<code>:CALC:DDEM:LLIN:X 1000,2000,2000,3000</code> Describes the X values of a stair-stepped limit line
Preset	Limit line data is cleared by Restore Mode Defaults
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:CONTRol[:DATA]</code>

Number of Limit X List Points Query (Remote Query Only)

Returns the number of points in the x list. It should match the number of points in the y list, that is, the number of values for the X axis and for the corresponding Y UPPER and/or Y LOWER limit lines must be identical. If one array is larger than the other, the limit trace is built using only as much data as is contained in the smaller array.

An empty array returns not a number (9.91e+37 to a data query), 0 to a **POINTS** query.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:X:POINTs?</code>
Example	<code>:CALC:DDEM:LLIN:X:POIN?</code> Returns the number of x list points in the limit line
Preset	Limit line X list data/points is cleared by Restore Mode Defaults
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:CONTRol:POINTs</code>

Limit Line Y List Data (Remote Command Only)

Defines a list of y values for a given limit line. Changing the number of elements in the list, the limit line will be automatically turned off. Up to 200 points may be defined for each limit using the following parameters.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y[:DATA] <real>, <real>, ...</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y[:DATA]?</code>
Example	<code>:CALC:DDEM:LLIN:Y -10, -10, -20, -20</code> Describes the y values of an limit line
Preset	Limit line y list data is cleared by Restore Mode Defaults
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:UPPer[:DATA]</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y:UPPer[:DATA]</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:LOWer[:DATA]</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y:LOWer[:DATA]</code>

Number of Limit Y List Points Query (Remote Query Only)

Returns the number of points in the limit y list. It should match the number of points in the control, that is, the number of values for the x axis and for the corresponding y axis must be identical. If one array is larger than the other, the limit trace is built using only as much data as is contained in the smaller array.

An empty array returns the system error message “list is empty” to a data query, 0 to a **POINTS** query.

Remote Command	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y:POINTs?</code>
Example	<code>:CALC:DDEM:LLIN:Y:POIN?</code> Returns the number of y list points in the limit line 1
Preset	Limit line Y list data/points is cleared by Restore Mode Defaults
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:UPPer:POINTs</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y:UPPer:POINTs</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:LOWer:POINTs</code> <code>:CALCulate:DDEMod:LLINe[1] 2 ... 6:Y:LOWer:POINTs?</code>

Trace Fail (Remote Query Only)

Tests the trace in the window against all associated limit lines when Limit Test is On. Returns a 0 if the trace is within all limits and margins, a 1 if the trace exceed either the limit or the margin. If no limits apply to the selected trace, this will automatically return a 0.

Only applies to limits that are turned on, if a Limit is off it will not be tested.

This query ignores limit lines that are assigned to other traces.

Remote Command	<code>:CALCulate:DDEMod:WINDow[1] 2 ... 6:FAIL?</code>
Example	<code>:CALC:DDEM:WIND3:FAIL?</code>

Returns a zero if there is no failure, 1 if the trace exceeds the limit

3.1.9.10 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 1828) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:FREQUENCY:CENTER ALL NONE
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQUENCY:CENTER[:STATE] 1 0 ON OFF :GLOBal:FREQUENCY:CENTER[:STATE]?

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTRUMENT:COUPLE:DEFAULT
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFAULT

3.1.10 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.1.10.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

3 VMA Mode
3.1 Digital Demod Measurement

See "[More Information](#)" on page 391

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold
Single Mode	The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num , then the count stops incrementing, and the instrument stops sweeping See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "[Restart](#)" on page 1832 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 393

3 VMA Mode

3.1 Digital Demod Measurement

Remote Command	:INITiate[:IMMEDIATE]
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUESTionable register bit 9 (INTEGRity sum) is cleared The SWEEPING bit is set The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC: AVER: TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>

Notes	<p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The STATus:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATus:QUEStionable register bit 9 (INTEGRity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p>

3.1.10.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

X Width

Set the width of the X axis which is displayed for the selected trace. The X width can be set less than the span for frequency-domain traces, enabling you to zoom in on just a portion of the measured values. Likewise, it can be less than time span covered by time-domain data. This plus the X Reference Value and X Reference Position control the range of X values that can be displayed on a trace.

Remote Command	<pre>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:WIDTh <real> :DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:WIDTh?</pre>
Example	<pre>:DISP:DDEM:WIND3:X:WIDT 10e6</pre> <p>Set the X width of the third window to 10 MHz</p> <pre>:DISP:DDEM:WIND3:X:WIDT?</pre> <p>Query the X width of the third window</p>
Couplings	If Auto Scaling is On, the X Width is determined by the trace data
Preset	Depends on trace data
State Saved	Yes
Min/Max	-9.9E+37 / 9.9E+37

Ref Value

Controls the X value of the selected trace at the chosen X Reference Position.

Remote Command	<pre>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:RLEVel <real></pre>
----------------	--

3 VMA Mode
3.1 Digital Demod Measurement

	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:RLeV1?</code>
Example	<p><code>:DISP:DDEM:WIND3:X:RLEV 10</code></p> <p>Set the X ref value of the third window to 10</p> <p><code>:DISP:DDEM:WIND3:X:RLEV?</code></p> <p>Query the X ref value of the third window</p>
Couplings	If Auto Scaling is On, the X Reference Value is determined by the trace data
Preset	Depends on trace data
State Saved	Yes
Min/Max	-9.9E+37 / 9.9E+37

Ref Position

Determines the position from which the X scaling is calculated for the selected trace. It can be set to the left side, center, or right side of the grid.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:RPOsition LEFT CENTer RIGHT</code> <code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:RPOsition?</code>
Example	<p><code>:DISP:DDEM:WIND3:X:RPOS CENT</code></p> <p>Set the X ref position of the third window to CENT</p> <p><code>:DISP:DDEM:WIND3:X:RPOS?</code></p> <p>Query the X ref position of the third window</p>
Preset	Depends on trace data
State Saved	Yes
Range	Left Ctr Right

Auto Scaling

Toggles the Auto Scaling function On or Off.

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:COUPle 0 1 OFF ON</code> <code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:COUPle?</code>
Example	<p><code>:DISP:DDEM:WIND3:X:COUP ON</code></p> <p>Do the X auto scale for the third window</p> <p><code>:DISP:DDEM:WIND3:X:COUP?</code></p> <p>Query the X auto scale state of the third window</p>
Couplings	When this parameter is On, pressing the front-panel Restart key activates the scale coupling function, that automatically determines scale per division and reference values based on the measurement results. When you set a value to either X Width or Ref Value manually, Auto Scaling is automatically set to Off

Preset	ON
State Saved	Yes
Range	On Off

Symbol Interval

Controls how many symbols are used to display in eye diagram window.

Remote Command	<code>:DISPlay:DDEMod:EYE:TRACe:INTerval <real></code>
Example	<code>:DISP:DDEM:EYE:TRAC:INT 300</code> <code>:DISP:DDEM:EYE:TRAC:INT?</code>
Preset	1000
State Saved	Yes
Min	1
Max	10000000

Time Unit

Enables you to select the time units that are applied to x-axis annotations and marker readouts for the selected trace, whenever it is assigned data with (demodulation) symbol information. The available measurement units are sym (symbols) or sec (seconds).

Remote Command	<code>:DISPlay:DDEMod:WINDow[1] 2 ... 6:X[:SCALE]:UNIT:TIME SEC SYMBol</code>
Example	<code>:DISP:DDEM:WIND3:X:UNIT:TIME SYMB</code> Set the X scale unit of the third window to symbol <code>:DISP:DDEM:WIND3:X:UNIT:TIME?</code> Query the X scale unit of the third window
Preset	Depend on trace data
State Saved	Yes
Range	symbols seconds

3.1.10.3 Recording

Displays the Sample Rate, Sample Points and Sample Time of the saved IQ data file.

Recording and playback of signal data files is a multi-step process that involves controls in several menus:

3 VMA Mode
3.1 Digital Demod Measurement

- **Save, Recording** (under the **Save** hardkey or the **Save** icon in the **File** panel)
- **Recall, Recording** (under the **Recall** hardkey or the **Recall** icon in the **File** panel)
- **Sweep, Recording** (this tab)
- **Sweep, "Playback"** on page 556
- **Input/Output, "Data Source"** on page 2195

NOTE

A complete tutorial for **Record/Playback** functionality, including how to load and save recording files, can be found in the help for the tab **"Data Source"** on page 2195 under **Input/Output**.

This menu includes the following display-only fields:

Sample Rate

Displays the sample rate of the saved IQ data file. If you have not saved an IQ data file, the value is 0.

Sample Points

Displays the total number of sample points in the saved IQ data file. If you have not saved an IQ data file, the value is 0.

Sampling Time

Displays the total sample time of the saved IQ data file. If you have not saved an IQ data file, the value is 0.

Saved Channels [Mode: 5G NR, VMA, WLAN]

Displays the channel index/number of the saved IQ data file. If you have not saved an IQ data file, no value is displayed.

This control is designed for multi-channel I/Q data recording and playback.

3.1.10.4 Playback

Contains parameters for playback of saved recording files recalled to the instrument.

Recording and playback of signal data files is a multi-step process that involves controls in several menus:

- **Save, Recording** (under the **Save** hardkey or the **Save** icon in the **File** panel)
- **Recall, Recording** (under the **Recall** hardkey or the **Recall** icon in the **File** panel)
- **Sweep, "Recording" on page 555**
- **Sweep, Playback** (this tab)
- **Input/Output, "Data Source" on page 2195**

NOTE

A complete tutorial for **Record/Playback** functionality, including how to load and save recording files, can be found in the help for the tab **"Data Source" on page 2195** under the **Input/Output** menu.

This menu includes the following display-only fields:

Sample Points

Displays the total number of sample points in the recalled IQ data file. If you have not recalled an IQ data file, the value is 0.

Sampling Time

Displays the total sample time of the recalled IQ data file. If you have not recalled an IQ data file, the value is 0.

Input Channels [Mode: 5G NR, VMA, WLAN]

Displays the input channel number of the recalled IQ data file. If you have not recalled an IQ data file, the default value of 1 is displayed.

This control is designed for multi-channel I/Q data recording and playback.

Playback Mode

Specifies the mode of IQ data to be played back and analyzed:

- **Fixed:** Playback Stop value is ignored. Measurement will analyze the first chunk of IQ data start from Playback Start repeatedly

3 VMA Mode
 3.1 Digital Demod Measurement

- Iterative: Measurement will analyze the IQ data chunk by chunk between Playback Start and Playback Stop, if the last chunk is not complete it will be ignored and start from the first chunk again

Remote Command	<code>:CALCulate:<meas>:PLAY:MODE FIXed ITERative</code> <code>:CALCulate:<meas>:PLAY:MODE?</code>
Example	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code> For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:MODE CONT</code> <code>:CALC:EVM:PLAY:MODE?</code>
Preset	<code>FIX</code>
State Saved	Saved in instrument state
Range	Fixed Iterative

Playback Start

Once you have loaded an IQ data file using **Recall**, **Recording**, this control enables you to specify the start position of the IQ data playback range to be analyzed. If its value is less than zero, an additional zero is inserted at the beginning of the IQ data.

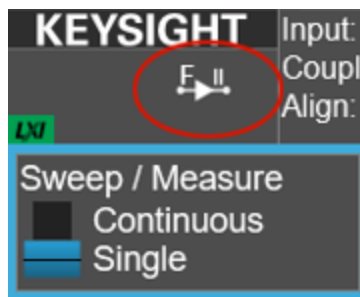

To go to a specific location in the recalled I/Q data, enter the desired **Playback Start** point.

You can use this control to examine the data you recalled from the recording file. How you proceed depends on whether you are in **Continuous** or **Single** mode. To determine which mode you are in, look at the first panel on the left in the **Meas Bar** above the data display.

If the panel looks like this, you are in **Continuous** mode:

If the panel looks like this, you are in **Single** mode:

The **F** indicates that the instrument is using data from a file (if you wish to return to looking at data at the analyzer input, change the **Data Source** control in the **Input/Output, Data Source** menu from **File** back to **Input**.)

To examine the data you loaded:

Continuous mode

In this mode, turn the knob or use the **Up/Down** keys on the front panel to move through records in the recording. You will see **Playback Start** change from 0 to successively higher values as you move deeper into the data.

Single mode

In this mode, you can only look at one record. Set the **Playback Start** time to the desired offset from zero, then press **Restart**. A single record will be displayed. Note that until you press **Restart**, the “invalid data” indicator (yellow asterisk) is displayed in each window. After you press **Restart**, the invalid data indicator disappears.

Remote Command	<code>:CALCulate:<meas>:PLAY:START <time></code> <code>:CALCulate:<meas>:PLAY:START?</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:STAR 0.01 s</code> <code>:CALC:EVM:PLAY:STAR?</code>
Preset	0
State Saved	Saved in instrument state
Min/Max	-/+Sample Points in IQ file / Sample Rate in IQ file

Playback Stop

Specifies the stop position of the IQ data playback range to be analyzed, when “Playback Mode” is iterative.

Remote Command	<code>:CALCulate:<meas>:PLAY:STOP <time></code> <code>:CALCulate:<meas>:PLAY:STOP?</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:STOP 0.01 s</code> <code>:CALC:EVM:PLAY:STOP?</code>
Preset	0
State Saved	No
Min	0
Max	Sample Points in IQ file x Sample Rate

Step Forward

Move to next chunk of IQ data when "Playback Mode" on page 557 is iterative.

Remote Command	<code>:CALCulate:<meas>:PLAY:STEP:FORward</code>
Example	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code> For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:STEP:FORW</code>
State Saved	Saved in instrument state

Sample Rate

Displays the sample rate of the recalled IQ data file if the recalled file format contains sampling rate information (`.csv`, `.sdf`, `.txt`). In this case, the *control* is grayed-out.

`BIN` and `BINX` files do not include sampling rate information inside the file, so after recalling one of these files, you must set **Sample Rate** manually. When you save a file in these formats, you must specify the sample rate, as displayed under **Sweep, Recording**.

Remote Command	<code>:CALCulate:<meas>:PLAY:SRATe <freq></code> <code>:CALCulate:<meas>:PLAY:SRATe?</code>
Example	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code> For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:SRAT 122.88MHz</code> <code>:CALC:EVM:PLAY:SRAT?</code>
Couplings	Displays only after recalling <code>.csv</code> , <code>.sdf</code> , or <code>.txt</code> files Settable after recalling <code>.bin</code> or <code>.binx</code> files
Preset	0
State Saved	No
Min	0

3.1.11 Trace

Contains controls that enable you to control the trace operations, such as trace alignment.

3.1.11.1 Trace Align

Accesses controls that enable you to configure the trace alignment.

Reference

Displays a menu for selecting the reference type that is used to generate the Search Time trace from the Raw Main Time trace. The selection includes:

- Auto – auto select the reference according to Burst Search and Sync Search state
- Burst Rise Edge – select the rise edge of the burst as the reference
- Burst Fall Edge – select the fall edge of the burst as the reference
- Sync Pattern – select the start position of the founded sync pattern as the reference
- Off – doesn't align the trace (Search Time trace = Raw Main Time trace)

Details

Works with Offset and Interval to determine the trace alignment region. If the region is out of the acquisition data range, the trace stops updating, and a trace indicator "DATA?" (which means "Data is questionable relative to current setup.") will be displayed at the top right of the graph.

Remote Command	:CALCulate:DDEMod:TRACe:SEARCh:TIME:REFerence AUTO BRISe BFALl SWOrd OFF :CALCulate:DDEMod:TRACe:SEARCh:TIME:REFerence?
Example	:CALC:DDEM:TRAC:SEAR:TIME:REF AUTO :CALC:DDEM:TRAC:SEAR:TIME:REF?
Notes	The align Reference, Offset and Interval determine the trace alignment region, and if the region is out of

3 VMA Mode

3.1 Digital Demod Measurement

the acquisition data range, the trace will stop updating, and a trace indicator “DATA?” (which means “Data is questionable relative to current setup.”) will be displayed at the top right of the graph

The query returns a name that corresponds to the reference type as follows:

String Returned	Definition
AUTO	Auto
BRIS	Burst Rise Edge
BFAL	Burst Fall Edge
SWOR	Sync Pattern
OFF	Off

Couplings

If the align reference is in Auto, the selected reference depends upon Burst Search state and Sync Search state:

- If the Sync Search is On, the reference is the start time of the founded sync pattern, no matter what state of the Burst Search is; if there is no sync pattern found, the trace stops updating until the sync pattern is found, and a message “Sync Error; Sync Pattern not found” is generated
- If the Sync Search is Off and the Burst Search is On, the reference is the rise edge of the burst; if there is no burst found, the trace stops updating until the burst is found, and a message “Burst Not Found” is generated
- If neither the Sync Search nor the Burst Search are On, the reference is the start time of the acquisition, the Search Time trace is the same as the Raw Main Time trace in this case

If the align reference is in Off, the trace alignment will not apply, the Search Time trace will be the same as the Raw Main Time trace

Preset **AUTO**

State Saved Saved in instrument state

Offset

Specifies the time offset in seconds from the selected reference. It works with Reference and Interval, determine the trace alignment region.

Remote Command	<code>:CALCulate:DDEMod:TRACe:SEARch:TIME:OFFSet <time></code> <code>:CALCulate:DDEMod:TRACe:SEARch:TIME:OFFSet?</code>
Example	<code>:CALC:DDEM:TRAC:SEAR:TIME:OFFS 10 us</code> <code>:CALC:DDEM:TRAC:SEAR:TIME:OFFS?</code>
Notes	The align Reference, Offset and Interval determine the trace alignment region, and if the region is out of the acquisition data range, the trace will stop updating, and a trace indicator "DATA?" (which means "Data is questionable relative to current setup.") will be displayed at the top right of the graph
Preset	0 s
State Saved	Saved in instrument state
Min	-1.0e6 s
Max	1.0e6 s

Interval

Specifies the trace alignment interval. It works with Reference and Offset, determine the trace alignment region.

3 VMA Mode
 3.1 Digital Demod Measurement

Remote Command	<code>:CALCulate:DDEMod:TRACe:SEARch:TIME:LENGth <time></code> <code>:CALCulate:DDEMod:TRACe:SEARch:TIME:LENGth?</code>
Example	<code>:CALC:DDEM:TRAC:SEAR:TIME:LENG 1.0 ms</code> <code>:CALC:DDEM:TRAC:SEAR:TIME:LENG?</code>
Notes	The align Reference, Offset and Interval determine the trace alignment region, and if the region is out of the acquisition data range, the trace will stop updating, and a trace indicator "DATA?" (which means "Data is questionable relative to current setup.") will be displayed at the top right of the graph
Preset	1 ms
State Saved	Saved in instrument state
Min	0.0 s
Max	1.0e6 s

3.2 Custom OFDM Measurement

Custom OFDM modulation analysis is used to analyze a user-defined custom OFDM signal.

Measurement Commands

The following measurement commands and queries are used to configure the measurement:

<code>:INITiate:OFDM</code>	Initiates a trigger cycle for the OFDM measurement, but does not return any data. You must then use <code>:FETC:OFDM[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings Returns the long form name of current measurement, in this case, OFDM
<code>:CONFigure:OFDM</code>	Selects OFDM measurement with Meas Setup settings in preset state – same as " Meas Preset " on page 495
<code>:CONFigure:OFDM:NDEFault</code>	Selects OFDM measurement <i>without</i> affecting settings

The following queries are used to retrieve the results:

<code>:FETCh:OFDM?</code>	Retrieves the data specified by n
<code>:MEASure:OFDM [n]?</code>	Switches to OFDM measurement, restores default values, starts the measurement, then retrieves the data specified by n
<code>:READ:OFDM[n]?</code>	Starts the measurement, then retrieves the data specified by n

The general functionality of "[CONFigure](#)" on page 2551, "[INITiate](#)" on page 2552, "[FETCh](#)" on page 2552, "[MEASure](#)" on page 2554, and "[READ](#)" on page 2553 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Remote Command Results for Custom OFDM

For the FETCh, MEASure, and READ queries listed above, the results returned depend on the value of n. For this measurement, the value of n is derived by concatenating two 2-digit sub-fields: Component Carrier Index (CC) and Result Index (RI).

Index Sub-Fields

The general formula for calculating the desired value of n is:

$$n = 100 * CC + RI$$

3 VMA Mode
3.2 Custom OFDM Measurement

Sub-field	Variable	Definition	
Most Significant 2 Digits	CC	Component Carrier Index , the current valid range is 00-07:	
		00	CC0
		01	CC1
		02	CC2
		03	CC3
		04	CC4
		05	CC5
		06	CC6
Least Significant 2 Digits	RI	Result Index for each CC, the current valid range is 01-03 The information returned is for the specified CC:	
		01	Error Summary (SISO)
		02	Burst Info
		03	Error Summary (MIMO)
		04	ccEVM per symbol magnitude

Index: RI

01
or not specified

Results Returned

Returns the SISO Error Summary results for Component Carrier CC when it is active
All the return values are floating-point
If no result is available, NaN (9.91E+37) is returned

#	Result	Unit, if any
1	RMS EVM	%
2	EVM Pk	%
3	Pilot EVM	%
4	Data EVM	%
5	Preamble EVM	%
6	Frequency Error	Hz
7	Symbol Clock Error	ppm
8	RMS CPE	%
9	Sync Correlation	%
10	IQ Offset	dB
11	IQ Quad Error	deg
12	IQ Gain Imbalance	dB

#	Result	Unit, if any
13	CC Tx Power	dBm
14	All Measured CC Tx Power	dBm
15	SNR (MER)	dB
16	ccEVM	%
17	Valid Points	
18	Total Points	
19	Improvement Factor	dB

If "Report EVM in dB" is set to true, the EVM result is in "dB"

02

Returns the Burst Info results for Component Carrier CC when it is active

#	Result	Value Range	Unit, if any
1	Column Number	5 for current version	
2	Row Index	0 Null 1 All 2 Preamble 3 Pilot 4 Unknown Pilot 5 Data 6 Unspecified	
3	User1 ... User200	1001 ... 1200	
4	EVM		%
5	Power		dB
6	Modulation Format	0 N/A 2 BPSK 3 $\pi/4$ BPSK 4 QPSK 5 $\pi/4$ QPSK 8 8PSK 16 16QAM 32 32QAM 64 64QAM	

3 VMA Mode
 3.2 Custom OFDM Measurement

#	Result	Value Range	Unit, if any
		128	128QAM
		256	256QAM
		512	512QAM
		1024	1024QAM
		2048	2048QAM
		4096	4096QAM

7 RU number

Note: Items 2- 7 repeat for each row of Burst Info table

If "Report EVM in dB" is set to true, the EVM result is in "dB"

03

Returns the MIMO Error Summary results for Component Carrier CC when it is active

All the return values are floating-point

If no result is available, NaN (9.91E+37) is returned

#	Result	Unit, if any
1	Column Number (15 for current version)	
2	RMS EVM	%
3	EVM Pk	%
4	Pilot EVM	%
5	Data EVM	%
6	Preamble EVM	%
7	Frequency Error	Hz
8	Symbol Clock Error	ppm
9	RMS CPE	%
10	Sync Correlation	%
11	IQ Offset	dB
12	IQ Quad Error	deg
13	IQ Gain Imbalance	dB
14	CC Tx Power	dBm
15	All Measured CC Tx Power	dBm
16	SNR (MER)	dB

2- 16 will repeat for each layer

If no result is available, NaN (9.91E+37) is returned.

The EVM result will be in "dB" if "Report EVM in dB" is set to true

04

Return ccEVM per symbol magnitude

3.2.1 Views

The Custom OFDM measurement has four pre-defined views – Normal view, Channel Response view, Demod Error view and Result Summary view.

Some of these are multiple-window Views.

When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View - Selection by Enum

Remote Command	<code>:DISPlay:OFDM:VIEW[:SElect] NORMal CRESponse DERRor NRESults</code> <code>:DISPlay:OFDM:VIEW[:SElect]?</code>
Example	<code>:DISP:OFDM:VIEW NORM</code> Sets the normal view
Preset	NORM
State Saved	Saved in instrument state

Normal

Windows: "IQ Meas Time" on page 415, "Raw Main Time" on page 415, "Spectrum" on page 415, "Demod Results" on page 418

Multiple windows view consists of the above four windows.

Example `:DISP:OFDM:VIEW NORM`

Response

Windows: "CH Freq Response" on page 417, "EQ Impulse Response" on page 417

Dual windows view consists of the above two windows.

Example `:DISP:OFDM:VIEW CRES`

Demod Error

Windows: "Error Vector Time" on page 416, "Error Vector Spectrum" on page 416, "Common Pilot Error" on page 417, "Demod Results" on page 418

Multiple windows view consists of the above four windows.

Example `:DISP:OFDM:VIEW DERR`

Result Summary

Windows: "Demod Results" on page 418, "Burst Info" on page 418

Single window view consists of the above window.

Example :DISP:OFDM:VIEW NRES

3.2.2 Windows

There are 6 window types available. Each window has three properties. The Data and Format properties allow you to select the trace data and trace display format. The Component Carrier property allows you to select the trace data of the CC to be displayed. The Format selection is hidden if the selected Data doesn't support any format.

:DISPlay:OFDM:WINDow[1]|2|3|4|5|6:DATA <enum> is used to configure the trace data. For example, the following command sets the first window data to Spectrum.

```
:DISP:OFDM:WIND1:DATA SPEC
```

:DISPlay:OFDM:WINDow[1]|2|3|4|5|6:FORMat <enum> is used to configure the trace display format. For example, the following command sets the first window trace display format to Constellation.

```
:DISP:OFDM:WIND1:FORM CONS
```

:DISPlay:OFDM:WINDow[1]|2|3|4|5|6:CC <enum> is used to configure the trace data of the CC to be displayed. For example, the following command sets the CC0 trace data to be displayed.

```
:DISP:OFDM:WIND1:CC 0
```

3.2.2.1 Data

Provides a menu of trace data choices for the selected window.

Remote Command	:DISPlay:OFDM:WINDow[1] 2 ... 6[:TRACe]:DATA RMTIME SPECTrum MTIME RTIME ERR3D EVTime EVSpectrum CPERror REVTime REVSpectrum CHFResponse EQIResponse DRESults BINfo CESymbol NONE
	:DISPlay:OFDM:WINDow[1] 2 ... 6[:TRACe]:DATA?

Example	:DISP:OFDM:WIND2:DATA SPEC
	Sets the second window data to Spectrum
	:DISP:OFDM:WIND2:DATA?

Trace Data Results

Trace Data	SCPI	Description
Raw Main Time	RMTIME	The envelope of the captured data record
Spectrum	SPECTRUM	Spectrum is the FFT of the Raw Main Time waveform
IQ Meas	MTIME	IQ Meas trace is the measured IQ symbol values used to calculate the EVM data results. There is one complex value for each subcarrier for each OFDM symbol in the measurement burst
IQ Ref	RTIME	IQ Ref trace is the reference IQ values for computing the signal EVM values. There is one complex value for each subcarrier for each symbol in the measurement burst
Error Vector Time	EVTIME	Error Vector Time trace shows the OFDM symbol and subcarrier Error Vector Magnitude vs. Symbol (time) and Subcarrier (frequency)
Error Vector Spectrum	EVSPSPECTRUM	Error Vector Spectrum trace shows the OFDM symbol and subcarrier Error Vector Magnitude (EVM) vs. subcarrier (frequency) and Symbol (time)
RMS Error Vector Time	REVTIME	RMS Error Vector Time is a plot of the Root Mean Square (RMS) average of multiple "RMS symbol EVM" data results
RMS Error Vector Spectrum	REVSPECTRUM	RMS Error Vector Spectrum is a plot of the Root Mean Square (RMS) average of multiple "RMS subcarrier EVM" data results
Common Pilot Error	CPERROR	Common Pilot Error trace data shows the difference between the measured and ideal pilot subcarrier symbols
EQ Impulse Response	EQIRESPONSE	Eq Impulse Response trace for Custom modulation is the equalizer impulse response
CH Freq Response	CHFRESPONSE	Ch Frequency Response trace for Custom modulation is the channel frequency response
Burst Info	BINFO	OFDM Burst Info trace is a summary table of basic burst information grouped by subcarrier type. Burst information includes EVM, Power, modulation format and resource unit information
ccEVM vs Symbol	CESYMBOL	ccEVM per symbol trace
No Data	NONE	Blank Trace

Pre Demod

Displays the trace data choices that show pre-demodulation results.

Raw Main Time

The envelope of the captured raw data. This data is unprocessed and includes additional points acquired for settling of the filters involved in subsequent processing, such as the demodulation filtering.

Example `:DISP:OFDM:WIND2:DATA RMT`
Sets the second window data to Raw Main Time

Spectrum

Shows the FFT of the Meas Interval part of Raw Main Time waveform, note when synchronization failed Meas Interval part will start from captured IQ data.

Example `:DISP:OFDM:WIND3:DATA SPEC`
Sets the third window data to Spectrum

Demod

Displays the general demodulation results.

IQ Meas Time

The measured time data results for the input signal.

Example `:DISP:OFDM:WIND:DATA MTIM`
Sets the first window data to IQ Meas Time
`:DISP:OFDM:WIND:FORM CONS`
Selects Constellation as the first window data format

IQ Ref Time

The reconstructed ideal time waveform to compare IQ Meas Time against.

Example `:DISP:OFDM:WIND:DATA RTIM`
Sets the first window data to IQ Ref Time
`:DISP:OFDM:WIND:FORM CONS`
Selects Constellation as the first window data format

Demod Error

Displays the general demodulation error results.

Error Vector Time

Shows the time domain error vector trace data results. The trace contains the computed error vectors between IQ Meas Time and IQ Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:OFDM:WIND2:DATA EVT`
Sets the second window data to Error Vector Time

Error Vector Spectrum

The frequency spectrum of the Error Vector Time trace data. The demodulator produces the spectrum by windowing and FFT of the Error Vector Time data. On this trace, the individual error vectors are plotted vs frequency.

Example `:DISP:OFDM:WIND2:DATA EVSP`
Sets the second window data to Error Vector Spectrum

RMS Error Vector Time

Shows the time domain error vector trace data results. The trace contains the computed error vectors between IQ Meas Time and IQ Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:OFDM:WIND2:DATA REVT`
Sets the second window data to RMS Error Vector Time

RMS Error Vector Spectrum

Shows the time domain error vector trace data results. The trace contains the computed error vectors between IQ Meas Time and IQ Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:OFDM:WIND2:DATA REVS`
Sets the second window data to RMS Error Vector Spectrum

Common Pilot Error

Shows the time domain error vector trace data results. The trace contains the computed error vectors between IQ Meas Time and IQ Ref Time at each point in time. The values of the error vectors are usually plotted as a magnitude.

Example `:DISP:OFDM:WIND2:DATA CPER`
Sets the second window data to Common Pilot Error

Error Vector 3D

Shows modulation error for each resource element

Example `:DISP:OFDM:WIND3:DATA ERR3D`
Sets the third window data to Error Vector 3D trace

ccEVM vs Symbol

This trace shows ccEVM result per Symbol.

Example `:DISP:OFDM:WIND2:DATA CES`
Sets the second window data to ccEVM vs Symbol

Response

Displays the trace data choices that show equalizer response results.

CH Freq Response

Shows the channel frequency response for which the equalizer is correcting. It is computed as the inverse of the equalization filter's frequency response.

Example `:DISP:OFDM:WIND2:DATA CHFR`
Sets the second window data to CH Freq Response

EQ Impulse Response

Shows the impulse response of the equalization filter.

Example `:DISP:OFDM:WIND2:DATA EQIR`
Sets the second window data to EQ Impulse Response

Tables

Displays the trace data choices that are in tabular form, including Demod Results, Demod Bits.

Demod Results

Shows the measurement numeric results. The available tabular data changes depending on the modulation format chosen.

Example `:DISP:OFDM:WIND4:DATA DRES`
Sets the fourth window data to Demod Results

Burst Info

Shows the measurement numeric results. The available tabular data changes depending on the modulation format chosen.

Example `:DISP:OFDM:WIND4:DATA DRES`
Sets the fourth window data to Demod Results

3.2.2.2 Format

Enables you to choose the available format of the selected trace.

The formats are:

Format Name	Description
Log Mag (dB)	Data is converted to decibel units and shown on a linear Y axis
Phase	Phase of complex data is shown on Y axis
Group Delay	Useful for frequency response displays. Shows the derivative of phase response with respect to frequency
Real (I)	Real part of ccEVM per symbol
Imaginary (Q)	Imaginary part of ccEVM per symbol
Remote Command	<code>:DISP:OFDM:WINDow[1] 2 ... 6[:TRACe]:FORMat MLOG PHASe GDELay REAL IMAGinary</code> <code>:DISP:OFDM:WINDow[1] 2 ... 6[:TRACe]:FORMat?</code>
Example	<code>:DISP:OFDM:WIND2:FORM MLOG</code> Sets the second window data format to Log Mag <code>:DISP:OFDM:WIND2:FORM?</code>
Notes	Log Mag, Phase and Group Delay are available for Channel Frequency Response trace

	Log Mag, Real and Imaginary are available for ccEVM vs Symbol trace
Preset	Depends on trace
State Saved	Yes
Range	Log Mag (dB) Phase Group Delay Real Imaginary

3.2.2.3 Component Carrier

Provides a menu of component carrier choices for the selected window.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:CCARrier CC0 ... CC7</code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:CCARrier?</code>
Example	<code>:DISP:OFDM:WIND2:CCAR CC0</code> <code>:DISP:OFDM:WIND2:CCAR?</code>
Couplings	Depends on window
Preset	Depends on window
State Saved	Yes
Range	CC0 CC1 CC2 CC3 CC4 CC5 CC6 CC7

3.2.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.2.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Auto Scale

Changes the Y reference value and Scale per Division so the full trace is displayed without clipping.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:AUTO:ONCE</code>
Example	<code>:DISP:OFDM:WIND3:Y:AUTO:ONCE</code> Do the Y auto scale for the third window

Auto Scale at Restart

Enable and disable automatic Y Auto Scale with measurement restart:

- ON – Does automatic Y Auto Scale when measurement is restarted, to let you see the complete trace
- OFF – Does not do automatic Y Auto Scale when measurement is restarted, to retain user setting for Y scale

Remote Command	<code>:DISPlay:OFDM:Y[:SCALE]:AUTO:REStart 0 1 OFF ON</code> <code>:DISPlay:OFDM:Y[:SCALE]:AUTO:REStart?</code>
Example	<code>:DISP:OFDM:Y:AUTO:REST ON</code> <code>:DISP:OFDM:Y:AUTO:REST?</code>
Preset	OFF
State Saved	Yes
Range	On Off

Ref Value

Specifies the amplitude of a signal displayed on the reference graticule line. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 421.

Applies only to the selected window. If the table type window is selected, this control is unavailable. The functionality depends on the selected window.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:RLEVel <real></code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:RLEVel?</code>
Example	<code>:DISP:OFDM:WIND3:Y:RLEV 20</code> Set the Y ref value of the third window to 20 <code>:DISP:OFDM:WIND3:Y:RLEV?</code> Query the Y ref value of the third window
Preset	Depends on trace data
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	The reference value is displayed above the graticule with the title "Ref Value"

Scale/Div

Controls the Y scale per division of the selected trace.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:PDIVision <real></code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:PDIVision?</code>
Example	<code>:DISP:OFDM:WIND3:Y:PDIV 10</code> Set the Y scale/div of the third window to 10 <code>:DISP:OFDM:WIND3:Y:PDIV?</code> Query the Y scale/div of the third window
Preset	Depends on trace data
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37
Annotation	Upper left corner of trace grid, same gray as grid

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change "Ref Value" on page 420.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:RPOsition TOP CeNTER BOTTom</code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:Y[:SCALE]:RPOsition?</code>
Example	<code>:DISP:OFDM:WIND3:Y:RPOS TOP</code> Set the Y ref position of the third window to TOP <code>:DISP:OFDM:WIND3:Y:RPOS?</code> Query the Y ref position of the third window
Preset	Depends on trace data
State Saved	Saved in instrument state
Range	Top Ctr Bot

3.2.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined

mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 422
- See "Single-Attenuator Configuration" on page 423

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command `[:SENSe]:POWer[:RF]:FRATten <rel_amp>`
`[:SENSe]:POWer[:RF]:FRATten?`

Example `:POW:FRAT 14`

: POW: FRAT?	
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1766 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1760 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "**Internal Preamp**" on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "**Attenuator Configurations and Auto/Man**" on page 426

3 VMA Mode
 3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> <p>Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual</p>
Dependencies	<p>Some measurements do not support Auto setting of Mech Atten. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available</p> <p>In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1769</p> <p>See "Attenuator Configurations and Auto/Man" on page 426 for more information on the Auto/Man functionality</p>
Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1765 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>
Preset	Auto The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased

Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
<p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>		
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p> <p>Auto Function</p>	
Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO?</pre>	
Example	<p>Turn Auto Mech Atten ON:</p> <pre>:POW:ATT:AUTO ON</pre>	
Dependencies	<pre>:POW:ATT:AUTO</pre> <p>is only available in measurements that support Auto, such as Swept SA</p>	
Preset	<pre>ON</pre>	

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1763, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 424 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in

the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1769 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 429

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB

Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no “electronic attenuator”; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a “soft” attenuation. The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Attenuation control or :POW:ATT, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1788 is ON (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1790 is ON, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5GNR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p>
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 429
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	<p>Dual-Attenuator configuration: 24 dB</p> <p>Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	<code>OFF</code> (Disabled) for Swept SA measurement <code>ON</code> (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 430](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or

knob, and it behaves as it normally would in manual mode

- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated

than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under ["Pre-Adjust for Min Clipping" on page 1773](#).

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code>

	<code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set `Elec+Mech Atten`, in which case both attenuators participate in the autoranging, or `Elec Atten Only`, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 433

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the <code>ON</code> parameter is supported and mapped to <code>COMBined</code>
Elec Atten Only	<code>ELECTrical</code>	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	<code>COMBined</code>	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>
Notes	The parameter option <code>ELECTrical</code> sets this function to <code>ON</code> in Single-Attenuator models The parameter option <code>COMBined</code> is mapped to <code>ELECTrical</code> in Single-Attenuator models. If you send <code>COMBined</code> , it sets the function to <code>ON</code> and returns <code>ELEC</code> to a query For SCPI compatibility with models that do not have an input attenuator, the <code>ON</code> parameter is honored and mapped to <code>COMBined</code>
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1769 is <code>OFF</code> or grayed-out,

3 VMA Mode
 3.2 Custom OFDM Measurement

	"Pre-Adjust for Min Clipping" on page 432 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off Elec Atten Only Mech + Elec Atten Single-Attenuator models: Off On

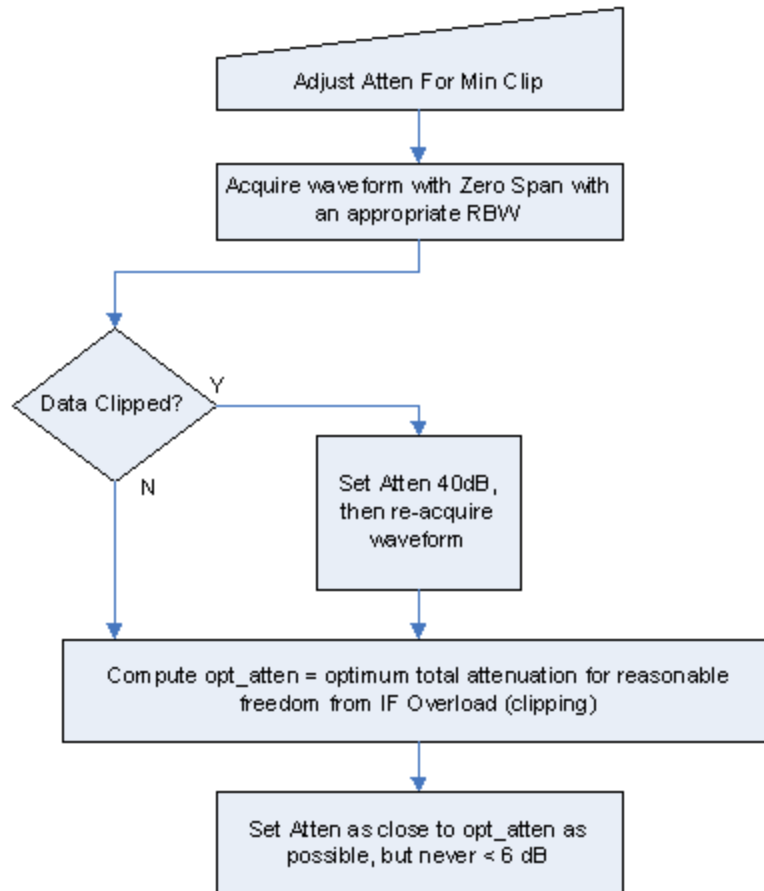

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe] :POWer [:RF] :RANGe :AUTO ON OFF 1 0 [:SENSe] :POWer [:RF] :RANGe :AUTO?

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 432 selection is Mech + Elec Atten:

3 VMA Mode
 3.2 Custom OFDM Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 432 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 VMA Mode
3.2 Custom OFDM Measurement

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.2.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:VOLTage:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT:IQ:RANG:AUTO OFF</code> <code>:VOLT:IQ:RANG:AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to YMax
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.

Remote Command	<code>[:SENSe]:POWer:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code>

3 VMA Mode
3.2 Custom OFDM Measurement

	<code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 1782 is On, the I Range value will be copied to " Q Range " on page 1781 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <amp;pl></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "[I Range](#)" on page 1779 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1779 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1782 is On, the " I Range " on page 1779 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;gt;</code> <code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω , and to 1.0 V Peak when Reference Z is 75 Ω : <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain

3 VMA Mode
 3.2 Custom OFDM Measurement

range parameter as the **VOLTage** form of the command

The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the **VOLTage** form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:

50 Ω: 10, 4, -2, -8

75 Ω: 8.2, 2.2, -3.8, -9.8

600 Ω: -0.8, -6.8, -12.8, -18.9

Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe] :VOLTage POWer:IQ:MIRROred OFF ON 0 1</code> <code>[:SENSe] :VOLTage POWer:IQ:MIRROred?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the " I Range " on page 1779 value is mirrored (copied) to the " Q Range " on page 1781
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.2.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting.
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements.

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBined</code>
----------------	---

	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query

	via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.2.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1801](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1787](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 446](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1787
Status Bits/OPC	When centering the preselector, *OPC does not return true until the process is complete and a

dependencies subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries
The **Measuring** bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when **"Presel Center"** on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	- Does not appear in CXA-m

3 VMA Mode
 3.2 Custom OFDM Measurement

- Does not appear in VXT Models M9410A/11A/15A/16A
- Does not appear in M9410E/11E/15E/16E
- Grayed-out if microwave preselector is off
- Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz
- Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz
- Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0
- Grayed-out in the **Spectrogram View**

Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"

3 VMA Mode
3.2 Custom OFDM Measurement

When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1788. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with "[Internal Preamp](#)" on page 1788, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 450

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	<code>OFF</code>
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and

3 VMA Mode
 3.2 Custom OFDM Measurement

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 455
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 457
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 457

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	Mode	Value
	IQ Analyzer	MPB option present and licensed: MPB
	Pulse	MPB option not present and licensed: STD
	RTSA	
	Avionics	
	All other Modes	STD
	-

Couplings	See " μW Path Control Auto " on page 452 above
Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1791.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command `[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ON | OFF | 1 | 0`
`[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ?`

Example	<code>:POW:MW:PATH:AUTO:FULL ON</code> <code>:POW:MW:PATH:AUTO:FULL?</code>
Dependencies	Only appears if Option FBP is installed, and in the following measurements <ul style="list-style-type: none"> - 5GNRMode: Modulation Analysis and IQ Waveform - WLAN Mode: IQ Waveform - Channel Quality Mode: Group Delay and Noise Power Ratio
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be

3 VMA Mode
 3.2 Custom OFDM Measurement

used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPResel:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPreSel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

3 VMA Mode
 3.2 Custom OFDM Measurement

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)

- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1801 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code>

	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: :SAN:PFIL ON
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 464 below
State Saved	Saved in instrument state

OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.2.4 BW

BW is not supported in this measurement.

3.2.5 Display

Opens the **Display** menu, which enables you to configure display items for the current Mode, Measurement View or Window.

3.2.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Display Null Subcarriers

Enables/disables display of null subcarriers in IQ traces. Null subcarriers have zero amplitude; often this is just the DC subcarrier.

Remote Command	<code>:DISPlay:OFDM:NULL:SUBCarrier OFF ON 0 1</code> <code>:DISPlay:OFDM:NULL:SUBCarrier?</code>
Example	<code>:DISP:OFDM:NULL:SUBC 1</code> <code>:DISP:OFDM:NULL:SUBC?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

Display Data Subcarriers

Enables/disables display of data subcarriers in IQ traces.

Remote Command	<code>:DISPlay:OFDM:DATA:SUBCarrier OFF ON 0 1</code> <code>:DISPlay:OFDM:DATA:SUBCarrier?</code>
Example	<code>:DISP:OFDM:DATA:SUBC 1</code> <code>:DISP:OFDM:DATA:SUBC?</code>
Preset	ON
State Saved	Yes
Range	OFF ON

Display Pilot Subcarriers

Enables/disables display of pilot subcarriers in IQ traces.

Remote Command	<code>:DISPlay:OFDM:PILot:SUBCarrier OFF ON 0 1</code> <code>:DISPlay:OFDM:PILot:SUBCarrier?</code>
Example	<code>:DISP:OFDM:PIL:SUBC 1</code> <code>:DISP:OFDM:PIL:SUBC?</code>
Preset	ON
State Saved	Yes
Range	OFF ON

Display Preamble Subcarriers

Enables/disables display of preamble subcarriers in IQ traces.

Remote Command	<code>:DISPlay:OFDM:PREamble:SUBCarrier OFF ON 0 1</code> <code>:DISPlay:OFDM:PREamble:SUBCarrier?</code>
Example	<code>:DISP:OFDM:PRE:SUBC 1</code> <code>:DISP:OFDM:PRE:SUBC?</code>
Preset	ON
State Saved	Yes
Range	OFF ON

Display Sync Correlation in Percent

Enables/disables display of sync correlation values in percent. When true, sync correlation values are displayed in percent.

Remote Command	<code>:DISPlay:OFDM:SYNC:CORRelation:PERCent OFF ON 0 1</code> <code>:DISPlay:OFDM:SYNC:CORRelation:PERCent?</code>
Example	<code>:DISP:OFDM:SYNC:CORR:PERC 1</code> <code>:DISP:OFDM:SYNC:CORR:PERC?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

Display EVM in Percent (SCPI only)

Enables/disables display of EVM in percent. When false, the EVM values are displayed in dB.

Remote Command	<code>:DISPlay:OFDM:EVM:PERCent OFF ON 0 1</code>
----------------	---

3 VMA Mode
3.2 Custom OFDM Measurement

	<code>:DISPlay:OFDM:EVM:PERCent?</code>
Example	<code>:DISP:OFDM:EVM:PERC ON</code> <code>:DISP:OFDM:EVM:PERC?</code>
Preset	ON
State Saved	Yes
Range	OFF ON

3.2.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 412

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOom</code>) with</p> <pre><code>:DISP:VIEW:ADV:SEL</code></pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code> <code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p>

	If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated
Backwards Compatibility SCPI	The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME “Baseband”</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p>

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined</p>

3.2.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
----------------	--

Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPLAY:VIEW:ADVANCED:SELECT</code>
Rename User View	<code>:DISPLAY:VIEW:ADVANCED:RENAME</code>
Delete User View	<code>:DISPLAY:VIEW:ADVANCED:DELETE</code>
Create User View	<code>:DISPLAY:VIEW:ADVANCED:NAME</code>
Select Screen	<code>:INSTRUMENT:SCREEN:SELECT</code>
Delete Screen	<code>:INSTRUMENT:SCREEN:DELETE</code>

Name	Command
Delete All But This Screen	:INSTrument:SCReen:DELeTe:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer
Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.2.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.2.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

Sets the reference frequency of all the carriers. The center frequencies of carriers are defined as an offset frequency from this value.

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe] :OFDM :CCARrier :REFerence <freq></code> <code>[:SENSe] :OFDM :CCARrier :REFerence ?</code>
Example	<code>:OFDM :CCAR :REF 2GHz</code> <code>:OFDM :CCAR :REF ?</code>
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on the instrument minimum/maximum center frequency. Same as Center Frequency

3.2.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, Marker selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Window rules.

3.2.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

Select Marker appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. It is blanked if you select a tab whose controls do *not* depend on the selected marker (e.g., Counter).

In any menu tab that includes **Select Marker**, the first control is always "**Marker X**" on [page 480](#).

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state

3.2.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta**, **Fixed** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker X

Sets the X Axis value of the selected marker in the current X Axis Scale unit. If the marker mode is off, the SCPI command has no affect other than to cause the marker to become selected. Note that the X value can change if the marker is moved to a trace with a different domain.

The Marker X position is absolute if the marker mode is Normal or Fixed. If the mode is Delta, then the X position is relative to the reference marker. The valid X positions are the actual data points in the trace; the marker cannot be located between points. If a SCPI command attempts to place the marker between two points, the X value snaps to the closest point.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:X <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:OFDM:MARK:X 0.325</code> <code>:CALC:OFDM:MARK:X?</code>
Notes	Cannot be set outside the bounds of the data unless it is Fixed . If you attempt to set it to a value outside the bounds, it is clipped at the closest limit and error -222 Data Out of Range is generated If a suffix is sent, it must match the X units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated If you try to read or set the position of a Delta marker, remember that the position is in relative units
Couplings	Coupling of Delta and Reference Markers
Preset	None until marker is turned on
State Saved	Yes
Min	Depends on trace data
Max	Depends on trace data

Marker Z

Sets the selected markers Z Axis value in the current Z Axis Scale unit for markers on traces with a 2-dimensional domain. In each case the marker that is addressed becomes the selected marker. It has no affect (other than to cause the marker to become selected) if the control mode is Off or if the trace has no Z domain. Note that the Z value can change or become irrelevant if the marker is moved to a trace with a different Z domain or no Z domain.

Note that this Z value is affected if the SCPI command to set marker point position is used.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:Z <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:Z?</code>
----------------	--

3 VMA Mode
3.2 Custom OFDM Measurement

Example	<code>:CALC:OFDM:MARK:Z 0.325</code> <code>:CALC:OFDM:MARK:Z?</code>
Notes	Cannot be set outside the bounds of the data unless it is Fixed . If you attempt to set it to a value outside the bounds it is clipped at the closest limit, and error -222 Data Out of Range is generated If a suffix is sent, it must match the Z units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated
Couplings	Coupling of Delta and Reference Markers
Preset	None until marker is turned on
State Saved	Yes
Min	Depends on trace data
Max	Depends on trace data

Marker Y

Enables you to set or read back the selected marker's Y Axis value in the current Y Axis Scale unit. Setting the Y value has no affect (other than to cause the marker to become selected) if the marker mode is other than fixed. The query form generates an error if the marker mode is Off. Note that the Y value can change if the Y-axis units change, either from a change in format of the trace the marker is on or if the marker is moved to a different trace.

If the selected marker is on a trace that is displayed with Vector or Constellation format, this function controls only the real part of the Y value (i.e., the horizontal axis value). Use the Marker Y (imag) control to change the imaginary (vertical) value. Marker Y and Marker Y Imag always set or get the rectangular form of Y, regardless of whether the marker readout is polar or rectangular.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:Y[:REAL] <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:Y[:REAL]?</code>
Example	<code>:CALC:OFDM:MARK2:Y 0.325</code> <code>:CALC:OFDM:MARK2:Y?</code>
Notes	You cannot set Y unless the marker type is Fixed . If the marker becomes Fixed after a marker function is turned on, it is set to whatever the Y value was when the marker became fixed If a suffix is sent, it must match the Y units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated
Couplings	Changes if marker is relative to a Delta marker that is turned on
Preset	None until marker is turned on
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Marker Y Imag

Enables you to set or read back the selected marker's quadrature (imaginary) Y value in the current Y Axis Scale unit. It has no affect (other than to cause the marker to become selected) if the marker mode is other than fixed or if the current trace format is not complex (Vector or Constellation). The query form generates an error if it is used for a marker that is not on a complex trace. Marker Y Imag is not affected by whether the marker readout is polar or rectangular.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:Y:IMAGinary <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:Y:IMAGinary?</code>
Example	<code>:CALC:OFDM:MARK1:Y:IMAG 0.435</code> <code>:CALC:OFDM:MARK1:Y:IMAG?</code>
Notes	Grayed-out unless the marker is fixed and on a vector display If a suffix is sent, it must match the Y units for the trace the marker is on. Otherwise, an Invalid Suffix error is generated. Otherwise, error -138, "Suffix not allowed" is generated If a query is sent while the marker is on a trace whose format is not vector or constellation, NaN (9.91E+37) is returned
Preset	None until marker is turned on
State Saved	Yes
Min	Depends on trace format
Max	Depends on trace format

Marker Mode

There are four control modes for markers:

Normal (POSition) – A marker that can be moved to any point on the X Axis by specifying its X Axis value, and whose absolute Y Axis value is then the value of the trace point at that X Axis value

Delta (DELTA) – A marker that can be moved to any point on the X Axis by specifying its X Axis offset from a reference marker, and whose absolute Y Axis value is then the value of the trace point at that X Axis value

Fixed (FIXed) – A marker whose X Axis and Y Axis values may be directly or indirectly specified by you, but whose Y Axis value remains fixed, once specified, and does not follow the trace. Fixed markers are useful as reference markers for Delta markers, as operands in a Peak Search operation, and as arbitrary reference points settable by you. These markers are represented on the display by an "X" rather than a diamond

Off (OFF) – A marker which is not in use

3 VMA Mode
3.2 Custom OFDM Measurement

The SCPI command in the table below selects the marker and sets the marker control mode as described under Normal, Delta, Fixed and Off, below. All interactions and dependencies detailed under the control description are enforced when the remote command is sent.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:MODE POSition DELTa FIXed =OFF</code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:MODE?</code>
Example	<code>:CALC:OFDM:MARK2:MODE POS</code> <code>:CALC:OFDM:MARK2:MODE?</code>
Couplings	The marker addressed by this command becomes the selected marker on the front panel
Preset	OFF
State Saved	The marker control mode (Normal, Delta, Fixed, Off) and X Axis value are saved in instrument state
Range	Normal Delta Fixed Off

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing **Delta** in "**Marker Mode**" on page 478. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	<code>:CALCulate:OFDM:MARKer:AOFF</code>
Example	<code>:CALC:OFDM:MARK:AOFF</code>

Couple Markers

When this function is ON, moving any marker causes an equal X Axis movement of every other marker that is not Fixed or Off. By "equal X Axis movement" we mean that we preserve the difference between each marker's X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

Note that **Fixed** markers do not couple. They stay where they were while all the other markers move. Of course, if a **Fixed** marker is being moved, all the non-fixed markers *do* move with it.

This may result in markers going off screen.

Remote Command	:CALCulate:OFDM:MARKer:COUPlE[:STATe] ON OFF 1 0 :CALCulate:OFDM:MARKer:COUPlE[:STATe]?
Example	:CALC:OFDM:MARK:COUP ON :CALC:OFDM:MARK:COUP?
Notes	In general, when coupling is turned on, all Normal or Delta markers with the same (or equivalent) domain as the selected marker move in the same manner as the selected marker
Preset	OFF, presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.2.7.3 Peak Search

The controls on this tab let you move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

Marker X

Sets the X Axis value of the selected marker in the current X Axis Scale unit. This is the same as "[Marker X](#)" on page 476 on the **Settings** tab.

Marker Z

Sets the selected markers Z Axis value in the current Z Axis Scale unit for markers on traces with a 2-dimensional domain. This is the same as "[Marker Z](#)" on page 476 in the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	:CALCulate:OFDM:MARKer[1] 2 ... 12:MAXimum
----------------	--

Example	<code>:CALC:OFDM:MARK2:MAX</code>
Notes	Sending this command selects the subopcoded marker

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker's value. Only peaks that meet all enabled peak criteria are considered. If there is no valid peak lower than the current marker position, a "No peak found" message is generated and the marker is not moved.

In the Digital Demod measurements, if the format is complex (vector or constellation) then the marker moves to the closest point that has a lower magnitude than the marker's current position.

If the selected marker was **Off**, then it is turned on as a **Normal** marker and a peak search is performed.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:MAXimum:NEXT</code>
Example	<code>:CALC:OFDM:MARK2:MAX:NEXT</code>
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Higher Amplitude

Moves the marker to the peak next higher in Y value than the peak it is currently on. If the format is complex (vector or constellation) then the marker moves to the closest point that has a higher magnitude than the marker's current position. If this function is invoked via SCPI on a marker that is **Off**, the result is the same as if you sent a **Peak Search** command.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:MAXimum:PREVious</code>
Example	<code>:CALC:OFDM:MARK2:MAX:PREV</code>

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria. If there is no valid peak to the right of the current marker position, a "No peak found" message is generated and the marker is not moved.

If the selected marker was **Off**, then it is turned on as a **Normal** marker and a peak search is performed.

Remote Command	:CALCulate:OFDM:MARKer[1] 2 ... 12:MAXimum:RIGHT
Example	:CALC:OFDM:MARK2:MAX:RIGH
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria. If there is no valid peak to the left of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was **Off**, then it is turned on as a **Normal** marker and a peak search is performed.

Remote Command	:CALCulate:OFDM:MARKer[1] 2 ... 12:MAXimum:LEFT
Example	:CALC:OFDM:MARK2:MAX:LEFT
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value.

If the selected marker is **Off**, it is turned on before the minimum search is performed.

Remote Command	:CALCulate:OFDM:MARKer[1] 2 ... 12:MINimum
Example	:CALC:OFDM:MARK2:MIN
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time) differences between the highest and lowest y-axis value. Places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Fixed** or **Normal** if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are exactly the same as for Peak Search, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is **Off**, a **Delta** type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to **Delta**, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	:CALCulate:OFDM:MARKer[1] 2 ... 12:PTPeak
Example	:CALC:OFDM:MARK:PTP
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Couplings	The selected marker becomes a Delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this control has exactly the same effect as pressing **Delta** in "**Marker Mode**" on page 478 on the **Settings** tab. The selected marker becomes a **Delta** Marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.2.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker X

This is the fundamental control that you use to move a marker around on the trace. It is the same as "**Marker X**" on page 476 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by **Marker, Properties, Relative To**. The marker must be a **Delta** marker to make this attribute relevant. If it

is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:REFerence <integer></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:REFerence?</code>
Example	<code>:CALC:OFDM:MARK2:REF 4</code> <code>:CALC:OFDM:MARK2:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	If the reference marker is Off , it is turned on in Fixed or Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by Restore Mode Defaults . <i>Not</i> reset by Marker Off , All Markers Off , or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12

Marker Window

Assigns the specified marker to the designated trace.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:WINDow <int></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:WINDow?</code>
Example	<code>:CALC:OFDM:MARK:WIND 2</code> Sets the first marker's trace to window 2 <code>:CALC:OFDM:MARK:WIND?</code> Query the first marker's trace
Notes	Assigns the specified marker to the designated window
Preset	1
State Saved	Yes
Min	1
Max	6

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "[Marker Settings Diagram](#)" on page 479 on the **Settings** tab.

3.2.7.5 Marker Function

The controls on this tab let you control the Marker Functions of the instrument. Marker Functions perform post-processing operations on marker data.

Marker X

Sets the X Axis value of the selected marker in the current X Axis Scale unit. It is the same as "[Marker X](#)" on page 476 on the **Settings** tab.

Marker Function/Interval Function

Sets the marker control function type to one of the following:

NOISe	Marker Noise
BPOWer	Band Power/Interval Power
BDENsity	Band Density/Interval Density
OFF	Marker Function Off

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION NOISe BPOWer BDENsity OFF</code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION?</code>
Example	<code>:CALC:OFDM:MARK:FUNC BPOW</code> <code>:CALC:OFDM:MARK:FUNC?</code>
Preset	OFF
State Saved	Yes
Range	Marker Noise Band Power Band Density Marker Function Off
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Band Span/Interval Span

Band Span

Sets the width of the span for the selected marker. This function defines the span of frequencies. The marker position does not change when you adjust the span.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:BAND:SPAN <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:BAND:SPAN?</code>
Example	<code>:CALC:OFDM:MARK2:FUNC:BAND:SPAN 1.23E+06</code> <code>:CALC:OFDM:MARK2:FUNC:BAND:SPAN?</code>
Preset	When marker is turned on, 1/20 th of current span
State Saved	Yes
Min	100
Max	9.9E+37

Interval Span

Sets the width of the span for the selected marker. This function defines the span of time. The marker position does not change when you adjust the span.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:INTERval:SPAN <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:INTERval:SPAN?</code>
Example	<code>:CALC:OFDM:MARK2:FUNC:INT:SPAN 1.23E+06</code> <code>:CALC:OFDM:MARK2:FUNC:INT:SPAN?</code>
Preset	When marker turned on, 1/20 th of current displayed time length
State Saved	Yes
Min	100
Max	9.9E+37

Band Left/Interval Left

Band Left

Lets you adjust the left side of the band. In order to remain centered in the band, the marker position must also change as you change the left edge. The right edge is unaffected.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:BAND:LEFT <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:BAND:LEFT?</code>
Example	<code>:CALC:OFDM:MARK2:FUNC:BAND:LEFT 1.23E+06</code> <code>:CALC:OFDM:MARK2:FUNC:BAND:LEFT?</code>
Couplings	Changes marker X to keep the marker centered in the band
Preset	When marker turned on, 1/40 th of current span left of the marker position

3 VMA Mode
3.2 Custom OFDM Measurement

State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Interval Left

Lets you adjust the left side of the band. In order to remain centered in the band, the marker position must also change as you change the left edge. The right edge is unaffected.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:INTERval:LEFT <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:INTERval:LEFT?</code>
Example	<code>:CALC:OFDM:MARK2:FUNC:INT:LEFT 1.23E+06</code> <code>:CALC:OFDM:MARK2:FUNC:INT:LEFT?</code>
Couplings	Changes marker X to keep the marker centered in the band
Preset	When marker turned on, 1/40 th of current displayed time length left of the marker position
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Band Right/Interval Right

Band Right

Lets you adjust the right side of the band. In order to remain centered in the band, the marker position must also change as you change the right edge. The left edge is unaffected.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:BAND:RIGHT <real></code> <code>:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCTION:BAND:RIGHT?</code>
Example	<code>:CALC:OFDM:MARK2:FUNC:BAND:RIGHT 1.23E+06</code> <code>:CALC:OFDM:MARK2:FUNC:BAND:RIGHT?</code>
Couplings	Changes marker X to keep the marker centered in the band
Preset	When marker turned on, 1/40 th of current span right of the marker position
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Interval Right

Lets you adjust the right side of the band. In order to remain centered in the band, the marker position must also change as you change the right edge. The left edge is unaffected.

Remote Command	:CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCtion:INTerval:RIGHT <real> :CALCulate:OFDM:MARKer[1] 2 ... 12:FUNCtion:INTerval:RIGHT?
Example	:CALC:OFDM:MARK2:FUNC:INT:RIGHT 1.23E+06 :CALC:OFDM:MARK2:FUNC:INT:RIGHT?
Couplings	Changes marker X to keep the marker centered in the band
Preset	When marker turned on, 1/40 th of current displayed time length right of the marker position
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

3.2.7.6 Marker To

The controls on this tab let you copy the current marker's value into other instrument parameters (for example, **Center Frequency**). The currently selected marker is made the active function on entry to this menu (if the currently selected marker is not on when you press this front panel key, it will be turned on at the center of the screen as a **Normal** marker, then made the active function).

Marker X

Sets the X Axis value of the selected marker in the current X Axis Scale unit. It is the same as "**Marker X**" on page 476 on the **Settings** tab.

Mkr -> CF

Sets the center frequency of the analyzer to the frequency of the selected marker. The marker stays at this frequency, so it moves to the center of the display. In **Delta** marker mode, this function sets the center frequency to the x-axis value of the delta marker. When the frequency scale is in log mode, the center frequency is not at the center of the display.

If the currently selected marker is not on when this control is pressed, it will be turned on at the center of the screen as a **Normal** type marker.

Remote Command	<code>:CALCulate:OFDM:MARKer[1] 2 ... 12[:SET]:CENTer</code>
Example	<code>:CALC:OFDM:MARK4:CENT</code>
Notes	Sending this command selects the subopcoded marker If specified marker is Off , this command turns it on at the center of the screen as a Normal type marker
Dependencies	Not available (grayed-out) when x-axis is the time domain
Couplings	All the usual couplings associated with setting Center Frequency apply

3.2.8 Meas Setup

Contains functions for setting up the measurement parameters, and also contains functions for setting up parameters global to all measurements in the Mode.

3.2.8.1 Component Carrier

Lists the available component carriers.

3.2.8.2 Settings

Lets you set measurement parameters.

Avg|Hold Number

Specifies the number of N averages that will be used for the measurement. After the specified number (average counts) have been averaged, the averaging mode (termination control) setting determines the averaging action.

Remote Command	<code>[:SENSe]:OFDM:AVERage:COUNT <integer></code> <code>[:SENSe]:OFDM:AVERage:COUNT?</code>
Example	<code>:OFDM:AVER:COUN 1000</code> <code>:OFDM:AVER:COUN?</code>
Preset	10
State Saved	Yes
Min	1
Max	10000

Averaging On/Off

Turns averaging on or off.

Remote Command	<code>[:SENSe]:OFDM:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:OFDM:AVERage[:STATe]?</code>
Example	<code>:OFDM:AVER OFF</code> <code>:OFDM:AVER?</code>
Preset	OFF
State Saved	Yes
Range	Off On

Average Mode

Toggles the averaging mode between Exp (exponential) and Repeat. This selection only affects the averaging result after the number of N averages is reached. The value of N is set using the control “Avg|Hold Number.”

- EXPOnential - Each successive data acquisition after the average count is reached, is exponentially weighted and then combined with the existing average
- REPeat - After reaching the average count, averaging is reset and a new average is started

Remote Command	<code>[:SENSe]:OFDM:AVERage:TCONtrol EXPOnential REPeat</code> <code>[:SENSe]:OFDM:AVERage:TCONtrol?</code>
Example	<code>:OFDM:AVER:TCON REP</code> <code>:OFDM:AVER:TCON?</code>
Notes	Selects the type of termination control used for averaging. This determines the averaging action after the specified number of frames (average count) is reached
Preset	EXPOnential
State Saved	Yes
Range	EXPOnential REPeat

Copy CC To

Copies Custom OFDM demodulation parameters from the selected Component Carrier to another Component Carrier (CC0 – CC7), or to all Component Carriers (ALL).

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:COpy CC0 CC1 CC2 CC3 CC4 CC5 CC6 CC7 ALL</code>
Example	<code>:OFDM:CCAR0:COpy ALL</code>
Couplings	Copies the parameters settings of the selected Component Carrier to the target Component Carrier

Preset	ALL
State Saved	Yes
Range	CC0 CC1 CC2 CC3 CC4 CC5 CC6 CC7 ALL

Spur Avoidance

Because VXT models M9410A/11A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the analyzer uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the Component Carriers Bandwidth $\leq \text{maxBW}/2.5$. See ["More Information" on page 491](#).

You can disable this function to speed up your measurement by setting Spur Avoidance to "Disabled."

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because the Component Carriers Bandwidth $> \text{maxBW}/2.5$, the following warning message will appear in the status bar: "Settings Alert; Spur Avoidance Off". This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	<code>[:SENSe]:OFDM:SAVoid[:STATe] ON OFF 0 1</code> <code>[:SENSe]:OFDM:SAVoid[:STATe]?</code>
Example	<code>:OFDM:SAVoid ON</code> <code>:OFDM:SAVoid?</code>
Dependencies	Only appears in VXT models M9410A/11A
Preset	ON
State Saved	Saved in instrument state
Range	ON OFF

More Information

Option	Frequency Range	MaxBW
Option B40	380 MHz ~ 6000 MHz	40 MHz

Option	Frequency Range	MaxBW
Option B3X	380 MHz ~ 550 MHz	100 MHz
	550 MHz ~ 1310 MHz	200 MHz
	1310 MHz ~ 5930 MHz	300 MHz
	5930 MHz ~ 6000 MHz	(6080 MHz- center frequency) * 2
Option B6X	380 MHz ~ 550 MHz	100 MHz
	550 MHz ~ 1310 MHz	200 MHz
	1310 MHz ~ 5780 MHz	600 MHz
	5780 MHz ~ 6000 MHz	(6080 MHz- center frequency) * 2
Option B12	380 MHz ~ 550 MHz	100 MHz
	550 MHz ~ 1310 MHz	200 MHz
	1310 MHz ~ 2000 MHz	600 MHz
	2000 MHz ~ 5480 MHz	1200 MHz
	5480 MHz ~ 6000 MHz	(6080 MHz- center frequency) * 2

Optimize EVM

This is an "immediate action" function to optimize EVM for the current input signal. It is used to set the combination of the preamp, mechanical and electronic attenuation, and IF gain value based on the measured signal peak level. Its purpose is to get better EVM results by improving the SNR and avoid ADC overload at the same time.

After this control is pressed, "Pre-Adjust for Min Clipping" on page 1773 changes to OFF and "IF Gain" on page 535 Auto changes to Manual.

NOTE

Before selecting the **Optimize EVM** function, the "EVM Optimization Method" on page 492 should be selected.

Remote Command `[:SENSe] :OFDM:OPTimize`

Example `:OFDM:OPT`

EVM Optimization Method

There are 2 methods for EVM Optimization:

NORMAL	Adjusts hardware settings to minimize EVM by an algorithm that is dependent on the measured peak power of input signal
ITERative	Adjusts hardware settings to minimize EVM by an algorithm that iterates measured EVM of input signal

3 VMA Mode
3.2 Custom OFDM Measurement

The **Iterative** method is slower than the **Normal** method, but always results in better EVM.

NOTE

"Optimize EVM" on page 492 is an "immediate action" function. Before selecting the function, the **EVM Optimization Method** should be selected.

Remote Command	<code>[:SENSe]:OFDM:OPTMethod NORMal ITERative</code> <code>[:SENSe]:OFDM:OPTMethod?</code>
Example	<code>:OFDM:OPTM NORM</code> <code>:OFDM:OPTM?</code>
Couplings	Disabled when Component Carrier number is greater than one
Preset	NORMal
State Saved	Saved in instrument state
Range	NORMal ITERative

Iterative EVM Optimization Target

Specifies the component carrier that will be used as iterative EVM optimization target.

Remote Command	<code>[:SENSe]:OFDM:OPTimize:ITERative:TARGet CC0 ... CC7</code> <code>[:SENSe]:OFDM:OPTimize:ITERative:TARGet?</code>
Example	<code>:OFDM:OPT:ITER:TARG CC0</code> <code>:OFDM:OPT:ITER:TARG?</code>
Dependencies	Invalid when EVM Optimization Method is Normal
Preset	CC0
State Saved	Saved in instrument state
Range	CC0 CC1 CC2 CC3 CC4 CC5 CC6 CC7

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be "coupled", meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 494 below.

Remote Command	:COUPlE ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth

3 VMA Mode
3.2 Custom OFDM Measurement

- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	:CONFigure:OFDM
Example	:CONF:OFDM
Notes	Restore all defaults of parameters

3.2.8.3 Meas Standard

Contains controls for setting the radio standard to which the current measurement will be made.

Preset to Std

Displays a menu for selecting preset Custom OFDM Setup parameters. Does *not* prevent you from making adjustments to measurement parameters afterwards. The following standard presets are available:

Cellular	V5G	TFPUSCHQPSK TFPUSCH16QAM TFPUSCH64QAM LTEFDDDL5M
Wireless	WLAN, Wi-SUN	WLAN80211A WISUN01I0 WISUN01I1 WISUN02I0 WISUN02I1 WISUN03 WISUN04
Radio	DAB, CDR, DRM	DABMODE1 DABMODE2 DABMODE3 DABMODE4 CDRTX1SPEC2 CDRTX1SPEC9 CDRTX1SPEC10 DRMA9K DRMB9K
Video	DOCSIS, DVB-TH, ISDB-T	DOCSIS31UP DOCSIS31DOWN DVBTH2K ISDBTM03

Remote Command `[:SENSE]:OFDM:RADio:STANdard:PRESet NONE | TFPUSCHQPSK | TFPUSCH16QAM | TFPUSCH64QAM | DABMODE1 | DABMODE2 | DABMODE3 | DABMODE4 | CDRTX1SPEC2 | CDRTX1SPEC9 | CDRTX1SPEC10 | DOCSIS31UP | DOCSIS31DOWN | WLAN80211A | LTEFDDDL5M | WISUN01I0 | WISUN01I1 | WISUN02I0 | WISUN02I1 | WISUN03 | WISUN04 | DRMA9K | DRMB9K | DVBTH2K | ISDBTM03`

Example `:OFDM:RAD:STAN:PRES TFPUSCH64QAM`

Range `NONE | 5GTF PUSCH QPSK | 5GTF PUSCH 16QAM | 5GTF PUSCH 64QAM | DAB MODE 1 | DAB MODE 2 | DAB MODE 3 | DAB MODE 4 | CDR TxMode1 SpectrumMode 2 | CDR TxMode1 Spectrum Mode 9 | CDR TxMode1 SpectrumMode10 | DOCSIS3.1 Upstream | DOCSIS3.1 Downstream | WLAN80211A | LTE FDD DL5M | WISUN Option1 Interleaving0 | WISUN Option1 Interleaving1 | WISUN Option2 Interleaving0 | WISUN Option2 Interleaving1 | WISUN Option3 | WISUN Option4 | DRM ModeA 9K | DRM ModeB 9K | DVB-TH 2K | ISDB-T Mode3`

3.2.8.4 Component Carrier

Lets you set the component carrier parameters.

Measure Carrier

Specifies whether or not to measure this component carrier.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7[:STATe] OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7[:STATe]?</code>
Example	<code>:OFDM:CCAR0 ON</code> <code>:OFDM:CCAR0?</code>
Notes	Used with a sub-op code <n> (default = 0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

Frequency Offset

Sets the component carrier center frequency as the offset from the "Carrier Reference Frequency" on page 474.

Remote Command	<code>[:SENSe]:OFDM:CCARrier<n>:FREQuency:OFFSet <freq></code> <code>[:SENSe]:OFDM:CCARrier<n>:FREQuency:OFFSet?</code>
Example	<code>:OFDM:CCAR4:FREQ:OFFS 10MHz</code> <code>:OFDM:CCAR4:FREQ:OFFS?</code>
Notes	Used with a sub-op code <n> (default = 0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-100 GHz
Max	100 GHz

Bandwidth

Lets you set the bandwidth of each component carrier for the OFDM signal.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:BANDwidth <freq></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:BANDwidth?</code>
Example	<code>:OFDM:CCAR4:BAND 80MHz</code>
Preset	100 MHz

State Saved	Yes
Min	1 kHz
Max	Hardware dependent:
	RF Input
	No Option = 10 MHz
	WB (25 MHz or wider) = Hardware Option Limit
	I/Q Input (for I+jQ)
	No Option = 20 MHz
	Option B25 = 50 MHz

Spectrum

Sets a spectrum to either normal or to inverted for demodulation related measurements. If set to **INVert**, the upper and lower spectrums are swapped.

The invert function conjugates the spectrum, which is equivalent to taking the negative of the quadrature component in demodulation. The correct setting (**Normal** or **Invert**) depends on whether the signal at the input of the instrument has a high or a low side mix.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SPECTrum INVert NORMal</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SPECTrum?</code>
Example	<code>:OFDM:CCAR0:SPEC INV</code> <code>:OFDM:CCAR0:SPEC?</code>
Preset	NORMal
State Saved	Yes
Range	Normal Invert

Configure Comp Carriers

Lets you configure all component carriers, including bandwidth, offset, spectrum and also lets you exclude certain carriers from the measurement.

Configure CCs

Lets you configure bandwidth, frequency offsets, and spectrum type, and also lets you exclude certain carriers from the measurement.

Advanced Acquisition

Lets you configure bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Input Channel (GUI only)

Select the input channel to configure its settings.

State Saved No

Use Advanced Acquisition Table

Specify if the settings in Advanced Acquisition Table will be applied.

Remote Command `[:SENSe]:OFDM:RF:ACQuistion:ATABle OFF | ON | 0 | 1`

Command `[:SENSe]:OFDM:RF:ACQuistion:ATABle?`

Example `:OFDM:RF:ACQ:ATAB 1`

`:OFDM:RF:ACQ:ATAB?`

Preset OFF

State Saved Yes

Range OFF|ON

IF Path Auto

Specify if the IF path in Advanced Acquisition Table will be automatically or manually selected.

Remote Command `[:SENSe]:OFDM:RF:ACQuistion:ATABle:IFPath:AUTO ON | OFF | 1 | 0`

Command `[:SENSe]:OFDM:RF:ACQuistion:ATABle:IFPath:AUTO?`

Example `:OFDM:RF:ACQ:ATAB:IFP:AUTO 1`

`:OFDM:RF:ACQ:ATAB:IFP:AUTO?`

Preset ON

State Saved Yes

Range OFF|ON

Mechanical Attenuation

Set mechanical attenuation for each component carriers.

Remote Command `[:SENSe]:OFDM:CCARrier[0]|1|...|7:RF:CHANne1|...|8:ATTenuation <rel_amp>`

Command `[:SENSe]:OFDM:CCARrier[0]|1|...|7:RF:CHANne1|...|8:ATTenuation?`

Example `:OFDM:CCAR0:RF:CHAN1:ATT 20`

Preset 10 dB

State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. To get to a value below 6 dB it has to be directly entered from the keypad or via SCPI. This protects from adjusting the attenuation to a dangerously small value which can put the instrument at risk of damage to input circuitry. However, if the current mechanical attenuation is below 6 dB it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB

Elec Attenuation

Set electronic attenuation for each component carriers.

Remote Command	<code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne1 ... 8:EATTenuation <rel_amp></code> <code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne1 ... 8:EATTenuation?</code>
Example	<code>:OFDM:CCAR0:RF:CHAN1:EATT 20</code>
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual attenuator configuration: 24 dB Single attenuator configuration: the total of ATT and EATT cannot exceed 50 dB, so if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB

LNA

Turn on/off Low Noise Amplifier (LNA) for each component carriers.

Remote Command	<code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne1 ... 8:GAIN:LNA OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne1 ... 8:GAIN:LNA?</code>
Example	<code>:OFDM:CCAR0:RF:CHAN1:GAIN:LNA ON</code>
Dependencies	Requires option LNA
Preset	OFF
State Saved	Saved in State

Internal Preamp

Turn on/off internal preamp for each component carriers.

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne11 ... 8:GAIN:PREamp OFF LOW FULL</code> <code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne11 ... 8:GAIN:PREamp?</code>
Example	<code>:OFDM:CCAR0:RF:CHAN1:GAIN:PRE LOW</code> <code>:OFDM:CCAR0:RF:CHAN1:GAIN:PRE?</code>
Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown
Preset	OFF
State Saved	Saved in instrument state

uW Path Control

Select uW Path for each component carriers.

Remote Command	<code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne11 ... 8:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne11 ... 8:MW:PATH?</code>
Example	<code>:OFDM:CCAR0:RF:CHAN1:MW:PATH LNP</code> <code>:OFDM:CCAR0:RF:CHAN1:MW:PATH?</code>
Preset	MPB option present and licensed: MPB MPB option not present and licensed: STD
State Saved	Save in instrument state
Range	Standard Path Low Noise Path Enable uW Preset Bypass Full Bypass Enable

IF Gain

Set IF Gain for each component carriers.

Remote Command	<code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne11 ... 8:IF:GAIN:LEVel <rel_amp1></code> <code>[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne11 ... 8:IF:GAIN:LEVel?</code>
Example	<code>:OFDM:CCAR0:RF:CHAN1:IF:GAIN:LEV -10</code> <code>:OFDM:CCAR0:RF:CHAN1:IF:GAIN:LEV?</code>
Notes	Not available for B25 IF bandwidth option
Preset	0
State Saved	Save in instrument state
Min	Depends on CC Bandwidth
Max	Depends on CC Bandwidth

IF Path

Specify IF path manually for each component carriers.

Remote Command	[:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne1 ... 8:IFPath B10M B25M B40M B85M B125M B140M B160M B255M B510M B1G B1500M B2G B4G EXT [:SENSe]:OFDM:CCARrier[0] 1 ... 7:RF:CHANne1 ... 8:IFPath?

3.2.8.5 Meas Time

Lets you set time parameters of the measurement.

Search Length

Specifies the amount or length of the Search Time input data that is included in the measurement pulse search.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:LENGth:SEARCh <time></code> <code>[:SENSe]:OFDM:OFDM:CCARrier0 ... 7:TIME:LENGth:SEARCh?</code>
Example	<code>:OFDM:CCAR0:TIME:LENG:SEAR 1ms</code> <code>:OFDM:CCAR0:TIME:LENG:SEAR?</code>
Preset	4 ms
State Saved	Yes
Min	Depends on Result Length
Max	Depends on System BW

Result Length

Used to specify the amount of acquired time data (in symbols) that is available for measurement analysis.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:LENGth:RESUlt <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:LENGth:RESUlt?</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:LENGth:RESUlt:AUTO OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:LENGth:RESUlt:AUTO?</code>
Example	<code>:OFDM:CCAR0:TIME:LENG:RES 10</code> <code>:OFDM:CCAR0:TIME:LENG:RES?</code> <code>:OFDM:CCAR0:TIME:LENG:RES:AUTO ON</code> <code>:OFDM:CCAR0:TIME:LENG:RES:AUTO?</code>
Preset	60 ON
State Saved	Yes Yes
Range	Auto Man
Min	1
Max	Depends on System BW

Meas Interval

Specifies how much time data (in symbols), within "[Result Length](#)" on page 503, is used for measurement analysis data (computing the trace and symbol table data results). **Meas Interval** is entered as an integer number of symbols.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:INTERval <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:INTERval?</code>
Example	<code>:OFDM:CCAR0:TIME:INT 15</code> <code>:OFDM:CCAR0:TIME:INT?</code>
Preset	60
State Saved	Yes
Min	1
Max	Depends on the Result Length

Meas Offset

Specifies the start position of the "[Meas Interval](#)" on page 504 with respect to the first symbol within "[Result Length](#)" on page 503. **Meas Interval** is entered as an integer number of symbols.

The sum of **Meas Interval** and **Meas Offset** must not exceed **Result Length**.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:OFFSet <integer></code> <code>[:SENSe]:CCARrier0 ... 7:OFDM:TIME:OFFSet?</code>
Example	<code>:OFDM:CCAR0:TIME:OFFS 0</code> <code>:OFDM:CCAR0:TIME:OFFS?</code>
Preset	0
State Saved	Yes
Min	0
Max	Depends on " Result Length " on page 503

Capture Time Diagram

Accesses a menu that lets you set up time parameters.

Burst Search

Used by the pulse search algorithm to detect the start and end of the analyzed burst (or pulse).

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:BURSt[:STATe] OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:BURSt[:STATe]?</code>
Example	<code>:OFDM:CCAR0:TIME:BURS OFF</code> <code>:OFDM:CCAR0:TIME:BURS?</code>
Preset	ON
State Saved	Yes
Range	Off On

Burst Search Threshold

Specifies the burst search threshold level (-dB) used in the pulse search threshold mode.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:BURSt:THReshold <double></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:BURSt:THReshold?</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:BURSt:THReshold:AUTO OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TIME:BURSt:THReshold:AUTO?</code>
Example	<code>:OFDM:CCAR0:TIME:BURS:THR -15dB</code> <code>:OFDM:CCAR0:TIME:BURS:THR?</code> <code>:OFDM:CCAR0:TIME:BURS:THR:AUTO ON</code> <code>:OFDM:CCAR0:TIME:BURS:THR:AUTO?</code>
Preset	-20 ON
State Saved	Yes Yes
Range	Auto Man
Min	-200 dB
Max	0 dB

3.2.8.6 Demod

Lets you set demodulation parameters.

Demod Settings

Accesses a window that lets you format demod parameters.

Format

Lets you configure format parameters.

FFT Length

Specifies the FFT length for the OFDM transmission.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:FFT:LENGth <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:FFT:LENGth?</code>
Example	<code>:OFDM:CCAR0:FFT:LENG 64</code> <code>:OFDM:CCAR0:FFT:LENG?</code>
Preset	64
State Saved	Yes
Min	4
Max	65536

System Sample Frequency

The OFDM **System Sample Frequency** parameter specifies the FFT sample rate (Hz).

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SAMPle:FREQuency <freq></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SAMPle:FREQuency?</code>
Example	<code>:OFDM:CCAR0:SAMP:FREQ 1MHz</code> <code>:OFDM:CCAR0:SAMP:FREQ?</code>
Preset	10 MHz
State Saved	Yes
Min	Depends on System BW
Max	10 GHz

Guard Lower Subcarriers

Specifies the number of lower guard subcarriers. The Guard Lower Subcarriers are not included in any Trace data result.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:LOWer <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:LOWer?</code>
Example	<code>:OFDM:CCAR0:GUAR:LOW 5</code> <code>:OFDM:CCAR0:GUAR:LOW?</code>
Couplings	Total Guard Subcarriers (Guard Lower Subcarriers + Guard Upper Subcarriers) should be less than the FFT Length

3 VMA Mode
3.2 Custom OFDM Measurement

	The Max value of the Guard Lower/Upper Subcarriers is equal to the FFT Length - 1
Preset	6
State Saved	Yes
Min	0
Max	Depends on FFT Length

Guard Upper Subcarriers

Specifies the number of upper guard subcarriers. The Guard Lower Subcarriers are not included in any Trace data result.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:UPPer <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:UPPer?</code>
Example	<code>:OFDM:CCAR0:GUAR:UPP 6</code> <code>:OFDM:CCAR0:GUAR:UPP?</code>

Couplings	Total Guard Subcarriers (Guard Lower Subcarriers + Guard Upper Subcarriers) should be less than the FFT Length The Max value of the Guard Lower/Upper Subcarriers is equal to the FFT Length - 1
Preset	5
State Saved	Yes
Min	0
Max	Depends on the FFT Length

DFT Spread

Enables/Disables DFT spread.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:DFTSspread OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:DFTSspread?</code>
Example	<code>:OFDM:CCAR0:DFTS 1</code> <code>:OFDM:CCAR0:DFTS?</code>

Preset	OFF
State Saved	Yes
Range	Off On

Half Subcarrier Shift

Enables/Disables half subcarrier shift.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:HSCShift OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:HSCShift?</code>
----------------	--

Example	:OFDM:CCAR0:HSCS 1 :OFDM:CCAR0:HSCS?
Preset	OFF
State Saved	Yes
Range	Off On

Edit Guard Interval per Symbol

Specifies the Guard Intervals (also referred to as the cyclic prefix) as an array of values, one value for each symbol in the signal. The array is constrained to always contain at least one value. The default value is an array of length equal to one, with a value equal to 0.25.

Guard Interval is specified as a fraction of the FFT length. The value is unitless (not as percent). Guard intervals are used to ensure that distinct transmissions do not interfere with one another. The purpose of the guard interval is to introduce immunity to propagation delays, echoes and reflections, to which digital data is normally very sensitive.

Go to Row

Enables you to move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control, which deletes the currently-selected row, even if the row is being edited. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

This is an immediate action control, which clears the table.

Repeat Index

If the Guard Interval Per Symbol array is at least as long as the measurement result length, it provides a guard interval value for each symbol. If the array is shorter than the measurement result length, processing loops back and re-uses the array (and keeps looping back every time the end of the array is reached again). The location within the array that is looped back to is determined by the Repeat Index. There are four possible cases:

1	RepeatIndex ≥ 0 and RepeatIndex < ArrayLength	<p>This is the normal case</p> <p>The repeat index specifies which entry in the array to loop back to (the index is zero-based). Each time the end of the array is reached, it loops back to this entry in the array. A value of zero (which is the default) therefore means that it loops back to the start of the array. A value of ArrayLength-1 means that it loops back to the last value in the array, so the last value is used over and over</p>
2	RepeatIndex \geq ArrayLength	<p>The repeat index points beyond the end of the array. It is treated as though RepeatIndex = ArrayLength-1, so the last value in the array is repeated over and over</p>
3	RepeatIndex < 0 and RepeatIndex $\geq -$ ArrayLength	<p>A negative value means the repeat index is an offset from the end of the array. A value of -1 means the last value in the array is repeated over and over. A value of -ArrayLength means that it loops back to the start of the array</p>
4	RepeatIndex < -ArrayLength	<p>The negative value is larger than the array length, so it is too large to be an offset from the end of the array. It is treated as though RepeatIndex = -ArrayLength, so that it loops back to the start of the array</p>

Remote Command	<pre>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:INTerval:RINDEX <integer></pre> <p>See table above for <integer> values</p> <pre>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:INTerval:RINDEX?</pre>
Example	<pre>:OFDM:CCAR0:GUAR:INT:RIND 1</pre>
Preset	1
Min	1
Max	2147483647

Guard Interval Values (Remote Command Only)

Specifies the guard intervals (also called cyclic prefix) separately for each symbol. Each is specified as a fraction of the OFDM FFT length. The values are unitless (*not* percent).

Remote Command	<pre>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:INTerval <real>, <real>, ...</pre> <pre>[:SENSe]:OFDM:CCARrier0 ... 7:GUARd:INTerval?</pre>
----------------	--

Example	:OFDM:CCAR0:GUAR:INT 0.25,0.2
Preset	Guard Interval Values is cleared by Restore Mode Defaults
State Saved	Saved in instrument state
Min	0
Max	1

Edit Time Gaps

Sets an array of gaps between symbols. Some OFDM signal formats may have empty gaps or other non-OFDM signal content between OFDM symbols. Time Gap allows for proper demodulation of these signals.

The Time Gaps property is an array, with one value for each symbol in the signal. Each value specifies the number of samples of the time gap, at the OFDM system sample frequency, at the start of the OFDM symbol.

Go to Row

Lets you move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control, which deletes the currently-selected row, even if the row is being edited. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

This is an immediate action key, which clears the table.

Repeat Index

If the Time Gaps array is at least as long as the measurement result length, it provides a time gap value for each symbol. If the array is shorter than the measurement result length, processing loops back and re-uses the array (and keeps

3 VMA Mode
 3.2 Custom OFDM Measurement

looping back every time the end of the array is reached again). The location within the array that is looped back to is determined by the Time Gaps Repeat Index. There are four possible cases:

- | | | |
|---|--|---|
| 1 | RepeatIndex ≥ 0
and RepeatIndex
< ArrayLength | This is the normal case

The repeat index specifies which entry in the array to loop back to (the index is zero-based). Each time the end of the array is reached, it loops back to this entry in the array. A value of zero (which is the default) therefore means that it loops back to the start of the array. A value of ArrayLength-1 means that it loops back to the last value in the array, so the last value is used over and over |
| 2 | RepeatIndex \geq
ArrayLength | The repeat index points beyond the end of the array. It is treated as though RepeatIndex = ArrayLength-1, so the last value in the array is repeated over and over |
| 3 | RepeatIndex < 0
and RepeatIndex
$\geq -$ ArrayLength | A negative value means the repeat index is an offset from the end of the array. A value of -1 means the last value in the array is repeated over and over. A value of -ArrayLength means that it loops back to the start of the array |
| 4 | RepeatIndex <
-ArrayLength | The negative value is larger than the array length, so it is too large to be an offset from the end of the array. It is treated as though RepeatIndex = -ArrayLength, so that it loops back to the start of the array |

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TGAP:RINdex <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TGAP:RINdex?</code>
Example	<code>:OFDM:CCAR0:TGAP:RIND 1</code>
Preset	1
Min	1
Max	2147483647

Time Gaps Values (Remote Command Only)

Specifies the time gaps before the start of each OFDM symbol. Each is specified as a number of samples at the OFDM system sample frequency.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TGAP <int>, <int>, ...</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TGAP?</code>
Example	<code>:OFDM:CCAR0:TGAP 2,1</code>
Preset	Time Gaps Values is cleared by Restore Mode Defaults
State Saved	Saved in instrument state
Min	1
Max	2147483647

Edit Pilot IQ Values

The Pilot IQ list may contain a very large number of IQ pairs, so it may not be feasible to display all IQ pairs in one table.

The table displays up to 50 IQ pairs for modification. IQ Pair Start is used to specify which part of the Pilot IQ list will be loaded into the table. The table's index column displays the mapping between the table row index and the IQ pair index in the Pilot IQ list.

IQ Pair Start

Specifies the index of the Pilot IQ value list from which to generate the table.

Min	1
Max	Depends on the Pilot IQ list length

Go to Row

Lets you move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action key, which deletes the currently-selected row, even if the row is being edited. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

This is an immediate action control, which clears the table.

Pilot IQ Values (Remote Command Only)

Defines the expected I and Q values for each pilot subcarrier.

Remote Command	<code>[:SENSE]:OFDM:CCARrier0 ... 7:PIlot:IQ <real>, <real>, ...</code> <code>[:SENSE]:OFDM:CCARrier0 ... 7:PIlot:IQ?</code>
----------------	---

Example	:OFDM:CCAR0:PIL:IQ 1,0,1,0
Preset	Pilot IQ Values is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Layer Index

Specifies the layer which Pilot IQ value list is shown in the table.

Couplings	Only valid when MIMO = On
Min	0
Max	7

Edit Preamble IQ Values

The Preamble IQ list may contain a very large number of IQ pairs, so it may not be feasible to display all IQ pairs in one table.

The table displays up to 50 IQ pairs for modification. IQ Pair Start is used to specify which part of the Preamble IQ list will be loaded into the table. This table's index column displays the mapping between the table row index and the IQ pair index in the Preamble IQ list.

IQ Pair Start

Specifies the index of the Pilot IQ value list from which to generate the table.

Min	1
Max	Depends on Pilot IQ list length

Go to Row

Lets you move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control, which deletes the currently-selected row, even if the row is being edited. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

This is an immediate action control, which clears the table.

Preamble IQ values (Remote Command Only)

Defines the expected I and Q values for each preamble subcarrier.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:PREamble:IQ <real>, <real>, ...</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:PREamble:IQ?</code>
Example	<code>:OFDM:CCAR0:PRE:IQ 1.2,-1.2,1.2,-1.2</code>
Preset	Preamble IQ Values is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Layer Index

Specifies the layer which Preamble IQ value list is shown in the table.

Couplings	Only valid when MIMO = On
Min	0
Max	7

Resource Mapping

Defines the function of each subcarrier in each symbol, describing whether it is a preamble, pilot, data or null subcarrier type.

The Resource Map file must contain one value for each active (that is, non-guard) subcarrier, including the "DC" center subcarrier.

Edit User Mapping

Takes you to the logical user mapping page.

Dependencies	Invalid when " MIMO On/Off " on page 531 is ON
--------------	--

Back

Takes you to the resource mapping page.

Add User

Inserts a row into the User Mapping table.

Delete User

Deletes the selected row of the User Mapping table.

Clear Table

Deletes all rows of the User Mapping table.

User Name

Lets you specify the name of one logic user.

Symbol Index

Lets you specify the time range of the resource assigned to one logic user in terms of the OFDM symbol.

Subcarriers Index

Lets you specify the frequency range of the resource assigned to one logic user in terms of the OFDM sub carrier.

Boost Level

Lets you specify the boost level of one logic user.

Add Allocation

Inserts a row into the Resource Mapping table.

Delete Allocation

Deletes the selected row of the Resource Mapping table.

Clear Table

Deletes all rows of the Resource Mapping table.

Apply

Applies all resource mapping settings to the measurement.

Type

Lets you specify the type of one resource allocation: Data, Pilot, Preamble, Unknown Pilot, Zero, Unspecified.

Active Layer

Lets you specify the layer of the resource allocation in MIMO mode.

Symbol Index

Lets you specify the time range of one resource allocation in terms of the OFDM symbol.

Subcarriers Index

Lets you specify the frequency range of one resource allocation in terms of the OFDM sub carrier.

Modulation

Specify the modulation type of one resource allocation: BPSK to 4096QAM.

Boost Level

Lets you specify the boost level of one modulation type. When the resource type is Unknown Pilot, it specifies the boost level for the Unknown Pilot, regardless of the modulation type.

NOTE

If multiple allocations have the same modulation type, the boost level is the same.

If the modulation type is Auto, the boost level is blank.

If the resource type is Pilot or Preamble, the boost level is blank. It can be determined by Pilot or Preamble IQ values.

All Unknown Pilot resources share the same boost level.

Resource Mapping values (Remote Command Only)

Specifies the type of each "resource" (each used subcarrier and symbol time). 0 = Data, 1 = Pilot, 2 = Unknown Pilot, 3 = Preamble, 4 = Null, 5 = Unspecified.

NOTE

The resource map information set through this command is not visible/editable under **Meas Setup, Demod, Demod Settings, Resource Mapping**.

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:RMAP <int>, <int>, ...</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:RMAP?</code>
Example	<code>:OFDM:CCAR0:RMAP 4,3,1,0</code>
Preset	Cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Resource Modulation Values (Remote Command Only)

Specifies the type of each “resource” (each used subcarrier and symbol time). 0 = Auto, 1 = BPSK, 2 = QPSK, 3 = 8PSK, 4 = 16QAM, 5 = 32QAM, 6 = 64QAM,..., 12 = 4096QAM

NOTE

The resource modulation information set through this SCPI is not visible/editable under Meas Setup, Demod, Demod Settings, Resource Mapping.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:RMOdulation <int>, <int>, ...</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:RMOdulation?</code>
Example	<code>:OFDM:CCAR0:RMOD 4,3,1,1</code>
Preset	Cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Equalizer & Tracking

Lets you set the Equalizer and Tracking parameters.

Equalizer Use Data

Lets you specify if the equalizer training includes the Data subcarriers or not.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:DATA OFF ON 0 1</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:DATA?</code>
Example	<code>:OFDM:CCAR0:EQU:USE:DATA 0</code> <code>:OFDM:CCAR0:EQU:USE:DATA?</code>
Preset	OFF
State Saved	Yes

Equalizer Use DC Pilot

Lets you specify whether the equalizer training includes the DC pilot subcarriers or not, when the Equalizer Use Pilot is selected.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:DCPilot OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:DCPilot?</code>
Example	<code>:OFDM:CCAR0:EQU:USE:DCP 1</code> <code>:OFDM:CCAR0:EQU:USE:DCP?</code>
Preset	ON
State Saved	Yes

Equalizer Use Pilot

Lets you specify if the equalizer training includes the pilot subcarriers or not.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:PILOt OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:PILOt?</code>
Example	<code>:OFDM:CCAR0:EQU:USE:PIL 1</code> <code>:OFDM:CCAR0:EQU:USE:PIL?</code>
Preset	OFF
State Saved	Yes

Equalizer Use Preamble

The equalizer uses the Channel Estimation Sequence in the preamble of the burst. After this initialization, the equalizer coefficients are held constant while demodulating the rest of the burst.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:PREAmbLe OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:USE:PREAmbLe?</code>
Example	<code>:OFDM:CCAR0:EQU:USE:PRE 1</code> <code>:OFDM:CCAR0:EQU:USE:PRE?</code>
Preset	ON
State Saved	Yes

Equalizer Averaging Mode

Selects the averaging method used to determine the equalizer filter coefficients across multiple symbols:

Equal Weight	EWEight	Equalizer averaging calculated using the equal weighted least squares method
Least Squares	LSquares	Equalizer training calculated using the Least Squares method

Remote	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:AVERAge:MODE EWEight LSquares</code>
--------	---

3 VMA Mode
3.2 Custom OFDM Measurement

Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:AVERage:MODE?</code>
Example	<code>:OFDM:CCAR0:EQU:AVER:MODE EWEight</code> <code>:OFDM:CCAR0:EQU:AVER:MODE?</code>
Preset	EWE
State Saved	Saved in instrument state

Initial Equalizer Mode

When creating the initial channel equalizer, the measurement tries to use any available information from known pilot and preamble subcarriers. **Initial Equalizer Mode** controls which symbols are included when looking for known pilot and preamble subcarriers. It can be set to either Auto or Manual:

AUTO	Tries to use all symbols that contain known pilot or preamble subcarriers This is the default
MANual	You specify the number of symbols to use. The number of symbols is specified by "Initial Equalizer Symbols" on page 519 This mode may be useful for signals that have no preamble, and have known pilots in many symbols. If there is significant frequency drift, the initial equalizer might be more accurate when constructed using fewer symbols

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:INITial:MODE AUTO MANual</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:INITial:MODE?</code>
Example	<code>:OFDM:CCAR0:EQU:INIT:MODE AUTO</code> <code>:OFDM:CCAR0:EQU:INIT:MODE?</code>
Preset	AUTO
State Saved	Saved in instrument state

Initial Equalizer Symbols

Specifies the number of symbols used when the Initial Equalizer Mode is set to Manual

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:INITial:SYMBols <integer></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:EQUalizer:INITial:SYMBols?</code>
Example	<code>:OFDM:CCAR0:EQU:INIT:SYMB 1</code> <code>:OFDM:CCAR0:EQU:INIT:SYMB?</code>
Preset	1
State Saved	Yes
Min	0
Max	Depends on Meas Interval

Include Data Subcarriers

Enables/disables use of data subcarriers in phase, amplitude and timing tracking.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:DATA OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:DATA?</code>
Example	<code>:OFDM:CCAR0:TRAC:DATA 1</code> <code>:OFDM:CCAR0:TRAC:DATA?</code>
Preset	OFF
State Saved	Yes

Track Amplitude

When **Track Amplitude** is turned on, the measurement applies pilot subcarrier amplitude error correction to the pilot and data subcarriers (default is true).

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:AMPLitude OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:AMPLitude?</code>
Example	<code>:OFDM:CCAR0:TRAC:AMPL 1</code> <code>:OFDM:CCAR0:TRAC:AMPL?</code>
Preset	ON
State Saved	Yes
Range	Hex Binary

Track Phase

When Track Phase is turned on, the measurement applies pilot subcarrier phase error correction to the pilot and data subcarriers (default is true).

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:PHASe OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:PHASe?</code>
Example	<code>:OFDM:CCAR0:TRAC:PHAS 1</code> <code>:OFDM:CCAR0:TRAC:PHAS?</code>
Preset	ON
State Saved	Yes
Range	Hex Binary

Track Timing

When this is on, the measurement applies pilot subcarrier timing error correction (frequency offset correction) to the pilot and data subcarriers (default is true).

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:TIMing OFF ON 0 1</code>
----------------	---

3 VMA Mode
3.2 Custom OFDM Measurement

Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:TRACk:TIMing?</code>
Example	<code>:OFDM:CCAR0:TRAC:TIM 1</code> <code>:OFDM:CCAR0:TRAC:TIM?</code>
Preset	ON
State Saved	Yes
Range	Hex Binary

Filter

In some circumstances, signal energy from outside the bandwidth of the analyzed signal can leak into the analysis, producing artificially high EVM. This may be due to aliasing that is a byproduct of the sampling and filtering done by the analyzer, or it may be due to similar issues in the signal generator, or perhaps something else entirely.

The **Filter** settings are used to configure and apply equalizer multi-carrier filtering to the measurement. The multi-carrier filter is a FIR filter that is applied to the measured signal before synchronization and demodulation.

Filter Type

Lets you specify the characteristics of the multi-carrier signal, by selecting a filter type.

None	NONE	No multi-carrier filter is applied (default)
"Arbitrary" on page 522	ARbitrary	You supply a set of filter coefficients to apply
"Windowed Sinc" on page 523	WSINc	The filter is designed by starting with an ideal sinc filter shape and then applying a window to the time-domain coefficients. You specify the bandwidth, the number of coefficients, and the window type
"Remez" on page 523	REMez	The filter is designed using the Remez-exchange method. You specify the pass-band ripple, pass-band bandwidth, transition bandwidth, and stop-band attenuation

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:TYPE NONE ARbitrary REMez WSINc</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:TYPE?</code>
Example	<code>:OFDM:CCAR0:FILT:TYPE NONE</code> <code>:OFDM:CCAR0:FILT:TYPE?</code>
State Saved	Saved in instrument state
Range	None Arbitrary Remez Windowed Sinc

Arbitrary

The following functions are available when this is the selected filter type.

Edit Filter Coefficients

Enables you to specify an array of floating-point values Arbitrary Coefficients that are used as the FIR filter coefficients, this is only available when Filter Type is Arbitrary.

Go to Row

Enables you to move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control. It immediately deletes the currently-selected row regardless if the row is being edited or not. The row following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

This is an immediate action control. It immediately clears the table.

Sample Ratio

Enables you to specify the sample rate for the coefficients. The sample rate is specified as a ratio from the OFDM System Sample Frequency. The default value is 1 (or 1:1 ratio), meaning that the sample rate of the coefficients matches the OFDM System Sample Frequency.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:SRATio <integer></code>
Example	<code>:OFDM:CCAR0:FILT:SRAT 1</code>
Preset	1
Min	0.0625

Max 65536

Remez

The following functions are available when this is the selected filter type.

Attenuation

Enables you to specify the stop-band attenuation of the filter in dB.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:REMez:ATTenuation <rel_ampl></code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:REMez:ATTenuation?</code>
Example	<code>:OFDM:CCAR0:REM:ATT -20dB</code>
Preset	-60
State Saved	Saved in instrument state
Min	-300 dB
Max	0 dB

Ripple

Enables you to specify the peak-to-peak ripple of the pass-band in dB.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:REMez:RIPple <double></code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:REMez:RIPple?</code>
Example	<code>:OFDM:CCAR0:REM:RIPP 0.1dB</code>
Preset	0.1
State Saved	Saved in instrument state
Min	0.0001 dB
Max	20 dB

Windowed Sinc

The following functions are available when this is the selected filter type.

Length

Enables you to specify the windowed sinc length (number of coefficients).

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:WSINc:LENGth <int></code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:WSINc:LENGth?</code>
----------------	---

	<code>[:SENSe]:OFDM:CCARrier0 ... 7:WSINc:LENGth:AUTO OFF ON 0 1</code>
	<code>[:SENSe]:OFDM:CCARrier0 ... 7:WSINc:LENGth:AUTO?</code>
Example	<code>:OFDM:CCAR0:WSIN:LENG 32</code> <code>:OFDM:CCAR0:WSIN:LENG?</code>
Preset	32 ON
State Saved	Saved in instrument state
Min	1
Max	1000

Window

Enables you to specify the window type for the windowed sinc filter.

UNIFORM	A Uniform window type is applied
HANNing	A Hanning window type is applied (default)
HAMMING	A Hamming window type is applied

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:WSINc:WINDow UNIFORM HANNing HAMMING</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:WSINc:WINDow?</code>
Example	<code>:OFDM:CCAR0:WSIN:WIND HAMM</code> <code>:OFDM:CCAR0:WSIN:WIND?</code>
Preset	HANNing
State Saved	Saved in instrument state
Range	Uniform Hanning Hamming

Remez & Windowed Sinc

The following functions are available when this is the selected filter type.

Passband

Enables you to specify the pass bandwidth for either Remez or Windowed Sinc filtering as a fraction of the OFDM System Sample Frequency.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:PBANd <double></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:PBANd?</code>
Example	<code>:OFDM:CCAR0:FILT:PBAN 0.8</code> <code>:OFDM:CCAR0:FILT:PBAN?</code>

3 VMA Mode
3.2 Custom OFDM Measurement

Preset	0.8
State Saved	Saved in instrument state
Min	0
Max	1

Transition Bandwidth

Enables you to specify the transition bandwidth for either Remez or Windowed Sinc filtering as a fraction of the OFDM System Sample Frequency.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:TBANd <double></code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:FILTer:TBANd?</code>
Example	<code>:OFDM:CCAR0:FILT:TBAN 0.1</code> <code>:OFDM:CCAR0:FILT:TBAN?</code>
Preset	0.1
State Saved	Saved in instrument state
Min	0
Max	1

Advanced

Contains advanced formatting functions.

Symbol Time Adjustment

Shifts the start of the TFFT period earlier in the symbols. You specify the amount of TFFT shift as a percentage of the TFFT length.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:SYMBol:ADJust <percent></code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:SYMBol:ADJust?</code>
Example	<code>:OFDM:CCAR0:SYMB:ADJ -3.125</code> <code>:OFDM:CCAR0:SYMB:ADJ?</code>
Preset	-3.125
State Saved	Saved in instrument state
Min	- The Minimum value of current Guard Interval * 100 %
Max	0

Synchronization Mode

Controls the type of synchronization used to synchronize to the start of an OFDM burst. The two available choices are:

Time Correlation	TCORrelation	The measurement uses Time Correlation between the user-defined preamble and the measured signal to synchronize to the start of the OFDM burst
Cyclic Prefix	CP	Synchronizes the start of the OFDM burst to the Cyclic Prefix

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:MODE TCORrelation CP</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:MODE?</code>
Example	<code>:OFDM:CCAR0:SYNC:MODE CP</code> <code>:OFDM:CCAR0:SYNC:MODE?</code>
Preset	TCORrelation
State Saved	Saved in instrument state
Range	Time Correlation Cyclic Prefix

Synchronization Region Selection

Enables you to set the Synchronization Region selection mode.

AUTO	The measurement utilizes the full resource map to define the reference signal for synchronization, and searches over the acquisition to synchronize the measured signal with the reference signal
MANual	The measurement uses the manual Synchronization Region settings. This mode is for the case when you want to use only a specific part of the resource map for synchronization

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:REGion:SELECTION AUTO MANual</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:REGion:SELECTION?</code>
Example	<code>:OFDM:CCAR0:SYNC:REG:SEL AUTO</code> <code>:OFDM:CCAR0:SYNC:REG:SEL?</code>
Preset	AUTO
State Saved	Saved in instrument state

Synchronization Reference Interval

Sets the interval of the reference signal to use for synchronization.

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:REFerence:INTerval <int></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:REFerence:INTerval?</code>
Example	<code>:OFDM:CCAR0:SYNC:REF:INT 10</code> <code>:OFDM:CCAR0:SYNC:REF:INT?</code>
Preset	10
State Saved	Saved in instrument state
Min	1
Max	Depends on Max Result Length

Synchronization Reference Offset

Sets the offset of the reference signal to use for synchronization.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:REFerence:OFFSet <int></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:REFerence:OFFSet?</code>
Example	<code>:OFDM:CCAR0:SYNC:REF:OFFS 0</code> <code>:OFDM:CCAR0:SYNC:REF:OFFS?</code>
Preset	0
State Saved	Saved in instrument state
Min	0
Max	Depends on Max Result Length

Synchronization Search Interval

Sets the synchronization search interval (in symbols) used when synchronizing to the signal.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:SEARch:INTerval <int></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:SEARch:INTerval?</code>
Example	<code>:OFDM:CCAR0:SYNC:SEAR:INT 10</code> <code>:OFDM:CCAR0:SYNC:SEAR:INT?</code>
Preset	10
State Saved	Saved in instrument state
Min	1
Max	Depends on Max Result Length

Synchronization Search Offset

Sets the synchronization search offset (in symbols) used when synchronizing to the signal.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:SEARch:OFFSet <int></code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:SYNChronize:SEARch:OFFSet?</code>
Example	<code>:OFDM:CCAR0:SYNC:SEAR:OFFS 0</code> <code>:OFDM:CCAR0:SYNC:SEAR:OFFS?</code>
Preset	0
State Saved	Saved in instrument state
Min	0
Max	Depends on Max Result Length

Compensate Symbol Clock Error

Enables or disables the internal adjustment in the timing of the symbol clock.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:SYMBol:COMPensate:CERRor OFF ON 0 1</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:SYMBol:COMPensate:CERRor?</code>
Example	<code>:OFDM:CCAR0:SYMB:COMP:CERR 0</code> <code>:OFDM:CCAR0:SYMB:COMP:CERR?</code>
Preset	OFF
State Saved	Yes
Range	Hex Binary

EVM Normalized by Reference

Specifies EVM normalized to the IQ Reference signal power.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:EVMNorm OFF ON 0 1</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:EVMNorm?</code>
Example	<code>:OFDM:CCAR0:EVMN 1</code> <code>:OFDM:CCAR0:EVMN?</code>
Preset	ON
State Saved	Yes

Report EVM in DB

Enables/disables display of EVM in percent. When OFF (false), the EVM values are displayed in dB.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:EVM:REPort:DB OFF ON 0 1</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:EVM:REPort:DB?</code>
Example	<code>:OFDM:CCAR0:EVM:REP:DB 1</code> <code>:OFDM:CCAR0:EVM:REP:DB?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

Extended Frequency Lock Range

Increases the range in which the demodulator will be able to lock onto the signal. This parameter uses the value of "[Extended Frequency Lock Range Width](#)" on page 529 to specify the extended frequency offset lock range (in subcarriers). Selecting **Extended Frequency Lock Range** increases the frequency offset lock range to \pm the **Extended Frequency Lock Range Width** subcarrier spacing on either side of the center frequency.

Use if the measurement is failing to lock onto the measurement signal.

NOTE

Extending the frequency lock range causes the measurement to take longer, so this feature should be selected only when necessary.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:EFLock:RANGe OFF ON 0 1</code> <code>[[:SENSe]:OFDM:CCARrier0 ... 7:EFLock:RANGe?</code>
Example	<code>:OFDM:CCAR0:EFL:RANG 1</code> <code>:OFDM:CCAR0:EFL:RANG?</code>
Preset	ON
State Saved	Yes

Extended Frequency Lock Range Width

Specifies the number of subcarriers used to extend the VSA frequency lock range when "[Extended Frequency Lock Range](#)" on page 529 is selected.

Remote	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:EFLock:RANGe:WIDTh <int></code>
--------	--

Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:EFLoCK:RANGe:WIDTh?</code>
Example	<code>:OFDM:CCAR0:EFL:RANG:WIDT 10</code> <code>:OFDM:CCAR0:EFL:RANG:WIDT?</code>
Couplings	Max value equals FFT Length
Preset	10
State Saved	Saved in instrument state
Min	1
Max	Depends on FFT Length

Phase Compensation Mode

Set the phase compensation mode on the baseband signal before upconversion.

AUTO	Use the CF of current component carrier for symbol phase compensation
MANual	Use the Phase Compensation Frequency for symbol phase compensation
OFF	No symbol phase compensation

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:PHASe:COMPensation:MODE AUTO MANUal OFF</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:PHASe:COMPensation:MODE?</code>
Example	<code>:OFDM:CCAR0:PHAS:COMP:MODE AUTO</code> <code>:OFDM:CCAR0:PHAS:COMP:MODE?</code>
Preset	OFF
State Saved	Saved in instrument state

Phase Compensation Frequency

Set the phase compensation frequency on the baseband signal before upconversion, when Phase Compensation Mode is MANual.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:PHASe:COMPensation:FREQuency <freq></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:PHASe:COMPensation:FREQuency?</code>
Example	<code>:OFDM:CCAR0:PHAS:COMP:FREQ 1 GHz</code> <code>:OFDM:CCAR0:PHAS:COMP:FREQ?</code>
Preset	1 GHz
State Saved	Saved in instrument state
Min	0
Max	100 GHz

Pilot in Time Domain

Enables or disables the pilot in the time domain for phase tracking purpose. When enabled, a single DFT is performed over all the Pilot and Data subcarriers in any OFDM symbol, where no Preamble type of resource is allocated.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:PITDomain OFF ON 0 1</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:PITDomain?</code>
Example	<code>:OFDM:CCAR0:PITD 1</code> <code>:OFDM:CCAR0:PITD?</code>
Preset	OFF
State Saved	Saved in instrument state

MIMO On/Off

Turns MIMO on or off.

Remote Command	<code>[:SENSe]:OFDM:MIMO[:STATe] OFF ON 0 1</code> <code>[:SENSe]:OFDM:MIMO[:STATe]?</code>
Example	<code>:OFDM:MIMO OFF</code> <code>:OFDM:MIMO?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

MIMO Transmitter Antennas

Specifies the Transmitter Antennas for MIMO signal.

Remote Command	<code>[:SENSe]:OFDM:MIMO:TXANtennas <integer></code> <code>[:SENSe]:OFDM:MIMO:TXANtennas?</code>
Example	<code>:OFDM:MIMO:TXAN 2</code> <code>:OFDM:MIMO:TXAN?</code>
Dependencies	This control only appears when " MIMO On/Off " on page 531 is on
Preset	1
State Saved	Yes
Min	1
Max	8

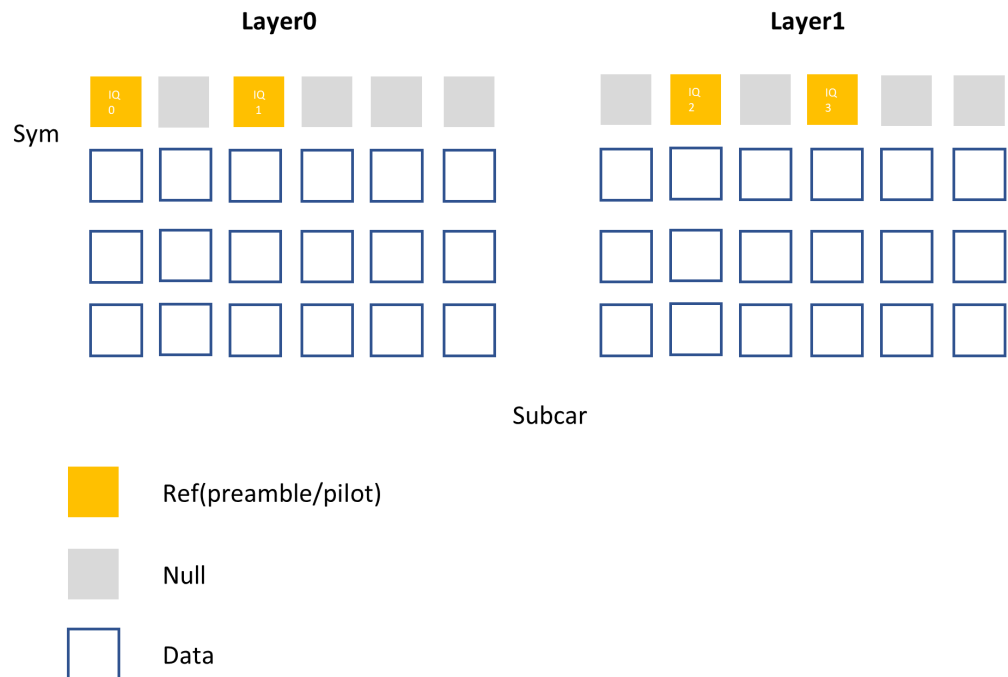

MIMO Scheme

Enables you to specify and configure MIMO scheme.

MIMO Type

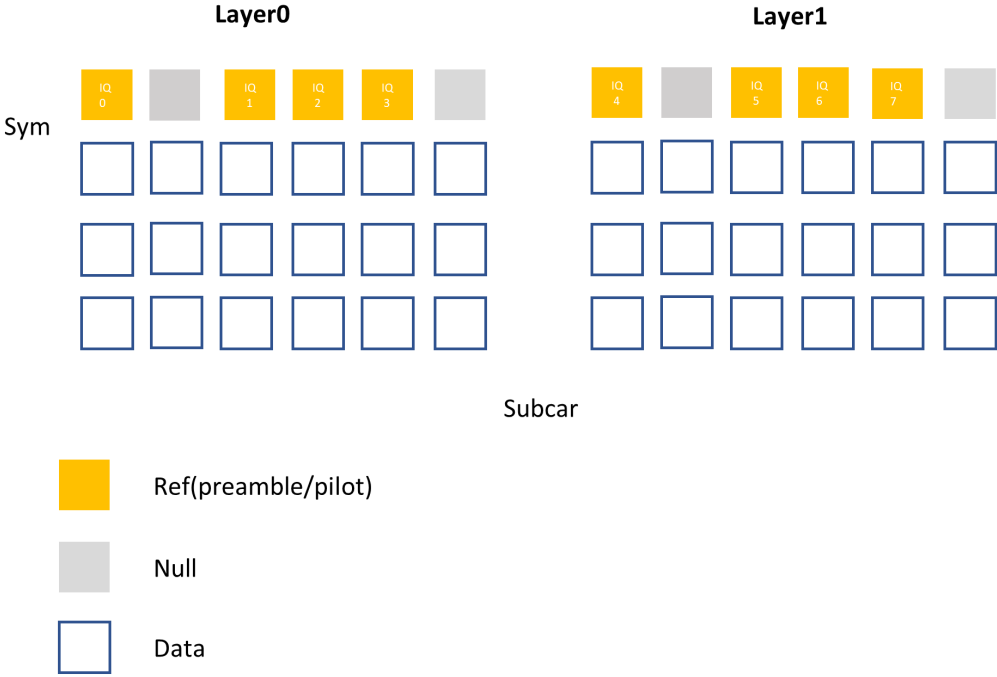

Specify MIMO type according to how reference signal (preamble/pilot) generated. it is assumed that data subcarriers are transmitted simultaneously on all antennas, and have the same modulation format on all antennas.

- Non-overlapping: Any given pilot or preamble subcarrier is transmitted on only one antenna at a time, and is null on all other antennas. (Examples: WiMAX, LTE)

- Overlapping All: All preamble and pilot subcarriers are transmitted on all antennas at all times. (Example: 802.11n)

3 VMA Mode
 3.2 Custom OFDM Measurement

- Partially Overlapping: Preamble and pilot subcarriers are transmitted with specified overlapping pattern on all antennas. (Example: 5GNR CDM group mode)

Remote Command `[:SENSe]:OFDM:MIMO:TYPE NONE | ALL | PARTIALLY`

`[:SENSe]:OFDM:MIMO:TYPE?`

Example `:OFDM:MIMO:TYPE NONE`

`:OFDM:MIMO:TYPE?`

State Saved	Saved in instrument state
Range	Non-Overlapping Overlapping All Partially Overlapping

Subcarrier Count Per Channel Estimation Unit

For partially overlapping mode, specify subcarrier number of channel estimation unit according to reference (preamble/pilot) overlapping pattern.

Remote Command	<code>[:SENSe]:OFDM:MIMO:PARTially:SUBCount <integer></code>
	<code>[:SENSe]:OFDM:MIMO:PARTially:SUBCount?</code>
Example	<code>:OFDM:MIMO:PART:SUBC 4</code> <code>:OFDM:MIMO:PART:SUBC?</code>
Preset	1
State Saved	Yes
Min	1
Max	65536

Symbol Count Per Channel Estimation Unit

For partially overlapping mode, specify symbol number of channel estimation unit according to reference (preamble/pilot) overlapping pattern.

Remote Command	<code>[:SENSe]:OFDM:MIMO:PARTially:SYMCount <integer></code>
	<code>[:SENSe]:OFDM:MIMO:PARTially:SYMCount?</code>
Example	<code>:OFDM:MIMO:PART:SYMC 2</code> <code>:OFDM:MIMO:PART:SYMC?</code>
Preset	1
State Saved	Yes
Min	1

3.2.8.7 Advanced

Enables you to configure advanced parameters.

IF Gain

To take full advantage of the RF dynamic range of the analyzer, a switched IF amplifier with approximately 10 dB of gain is available. When it can be turned on without an overload, the dynamic range is always better with it on than off.

IF Gain can be used to set this function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

Only applies to the RF input. Does not apply to baseband I/Q input.

IF Gain Auto

Activates the auto rules for IF Gain.

Remote Command	<code>[:SENSe]:OFDM:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:OFDM:IF:GAIN:AUTO[:STATe]?</code>
Example	<code>:OFDM:IF:GAIN:AUTO OFF</code> <code>:OFDM:IF:GAIN:AUTO?</code>
Couplings	When either the auto attenuation works (for example, with electrical attenuator), or the optimized mechanical attenuator range is requested, IF Gain is changed as follows: Auto sets IF Gain to ON if the input attenuator is set to 0 dB For other settings, Auto sets IF Gain to OFF
Preset	OFF
State Saved	Yes
Range	Auto Man

IF Gain Select

Selects the range of IF gain.

High gain	HIGH	Set 10dB IF gain for better noise level measurements
Low gain	LOW	Set 0dB IF gain for large signals
Other	OTHer	Enables you to set the arbitrary IF gain value within -12 dB to 12 dB. This selection is not available for the B25 If bandwidth option

When this parameter is changed, IF Gain Auto will become Man.

Remote Command	<code>[:SENSe]:OFDM:IF:GAIN:SElect LOW HIGH OTHer</code> <code>[:SENSe]:OFDM:IF:GAIN:SElect?</code>
Example	<code>:OFDM:IF:GAIN:SEL LOW</code> <code>:OFDM:IF:GAIN:SEL?</code>
Preset	LOW
State Saved	Yes
Range	LOW HIGH OTHer

Other IF Gain

When "**IF Gain**" on page 535 is set to OTHer, specifies the **IF Gain** value.

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe]:OFDM:IF:GAIN:LEVel <rel_amp1></code> <code>[:SENSe]:OFDM:IF:GAIN:LEVel?</code>
Example	<code>:OFDM:IF:GAIN:LEV -10</code> <code>:OFDM:IF:GAIN:LEV?</code>
Notes	Not available for B25 IF bandwidth option
Preset	0
State Saved	Saved in instrument state
Min/Max	-12/12

Adjust IF Gain For

Specifies the reference component carrier for adjustment of "IF Gain" on page 535.

Remote Command	<code>[:SENSe]:OFDM:IF:GAIN:REFerence:CCARrier CC0 ... CC7</code> <code>[:SENSe]:OFDM:IF:GAIN:REFerence:CCARrier?</code>
Example	<code>:OFDM:IF:GAIN:REF:CCAR CC0</code>
Preset	CC0
State Saved	Yes
Range	CC0 CC1 CC2 CC3 CC4 CC5 CC6 CC7

Spur Avoidance

Option H1G has a spur at the -50 MHz offset of the **Center Frequency**, so this Spur Avoidance function is provided to eliminate this spur.

- **Auto**: move the spur completely out of analysis bandwidth, the trade-off is that the available analysis bandwidth will be reduced to 400 MHz. And EVM could be worse as the edge of the passband is used for analysis
- **Manual**: move the spur by a specified value or turn off this feature by setting the value to 0

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7:SAVoid:FREQuency <freq></code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SAVoid:FREQuency?</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SAVoid:AUTO ON OFF 1 0</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7:SAVoid:AUTO?</code>
Example	<code>:OFDM:CCAR0:SAV:FREQ 50MHz</code> <code>:OFDM:CCAR0:SAV:FREQ?</code> <code>:OFDM:CCAR0:SAV:AUTO ON</code> <code>:OFDM:CCAR0:SAV:AUTO?</code>

Couplings	Grayed-out when Mixer Mode is Alternate When the Acquisition mode is changed from Sequential to Simultaneous, this control is reset (manual, 0 Hz) for all component carriers
Preset	0 Hz OFF
State Saved	Saved in instrument state Yes
Range	Auto Manual
Min	-(1GHz – BW)/2
Max	(1GHz – BW)/2

LO Dither

When ON, the local oscillator frequency is rapidly changed by small, random amounts. This helps spread the power of spurious signals within the passband, which lowers their level, thus increasing dynamic range.

This is only required in very wide passbands, so this feature *only* appears with option H1G.

Remote Command	<code>[:SENSe]:OFDM:LO:DITHer[:STATe] ON OFF 1 0</code> <code>[:SENSe]:OFDM:LO:DITHer[:STATe]?</code>
Example	<code>:OFDM:LO:DITH 1</code> <code>:OFDM:LO:DITH?</code>
Dependencies	Only available when the instrument has Option H1G installed. If you try to turn LO Dither ON in any other case, an error message is generated, -241, "Hardware missing; Option H1G required" Appears only in certain Modes (for example, 5GNR, VMA and IQ Analyzer) Turned Off and grayed-out when the IF Path is set to a path other than 1 GHz. If you press the grayed-out control, a warning message "LO Dither only available with IF Path 1 GHz" is shown. If you try to set LO Dither to ON remotely while it is grayed-out, a message "-221,Settings conflict; LO Dither only available with IF Path 1 GHz" is returned When LO Dither is ON, " Phase Noise Optimization " on page 539 is grayed-out. If you try to change the PNO value via the front panel or SCPI in that case, an error is generated, "LO Dither must be turned off to change this value"
Couplings	As with most parameters with an AUTO state, " Auto Couple " on page 1825 sets it to Auto, which then selects AUTOrange, and setting any specific value (AUTOrange, LOW or HIGH) will set the AUTO state to false When LO Dither is ON, Phase Noise Optimization is set to "Best Close-In". If the Phase Noise Optimization value changes due to turning on LO Dither, a warning message "Phase Noise Optimization changed due to LO Dither activation" is shown See also: " Iterative EVM Optimization Target " on page 493

Preset	OFF
State Saved	Saved in instrument state

Phase Noise Optimization

Enables you to select the LO (local oscillator) phase noise behavior for various operating conditions.

Remote Command	<code>[:SENSe]:OFDM:FREQuency:SYNThesis[:STATe] 1 ... 5</code> For the meaning of each numeric option value, see "Parameter Options, Installed Options & Auto Rules" on page 539 below <code>[:SENSe]:OFDM:FREQuency:SYNThesis[:STATe]?</code>
Example	<code>:OFDM:FREQ:SYNT 1</code> <code>:OFDM:FREQ:SYNT?</code>
Preset	2
State Saved	Saved in instrument state

Parameter Options, Installed Options & Auto Rules

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 540	1	<ul style="list-style-type: none"> - In instruments with EPO, balances close-in phase noise with spur avoidance - In instruments without EPO optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 541	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 541	3	Optimizes LO for tuning speed
"Best Close-in" on page 540	4 or 1*	<ul style="list-style-type: none"> - In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance - In instruments without EPO, this setting is accepted but no action is taken

Option	#	Description
"Best Spurs" on page 541	5	<ul style="list-style-type: none"> - In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance - In instruments without EPO, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EPO installation. See "Best Close-in" on page 540 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 541 is identical in effect to "Best Close-in" on page 540.

Best Close-in

Without option EPO

:FREQ:SYNT 1

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

:FREQ:SYNT 4

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 540 setting, parameter 1 selects "Balanced" on page 540 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 540, which is usually not as good a choice as "Balanced" on page 540.

Balanced

:FREQ:SYNT 1

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 541 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 540 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 540 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 541 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 541. It is available with the "Fast Tuning" on page 541 label for convenience,

and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 541 option, the settings for "Best Close-in" on page 540 are used if "Fast Tuning" on page 541 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

:FREQ:SYNT:AUTO ON

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EPO Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz Span > 114.1 MHz, <i>or</i> RBW > 800 kHz RBW > 290 kHz, <i>or</i> Span > 4.2 MHz Other conditions	"Balanced" on page 540 "Fast Tuning" on page 541 "Best Wide-offset" on page 541 "Balanced" on page 540
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 1.3 MHz <i>and</i> RBW <= 75 kHz All other conditions	"Fast Tuning" on page 541 "Best Close-in" on page 540 "Best Wide-offset" on page 541
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise	CF < 130 kHz, <i>or</i> CF > 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 40 kHz	"Best Close-in" on page 540

3 VMA Mode
 3.2 Custom OFDM Measurement

Models with Option	Conditions	Selection
<p>between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 540; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)</p> <p>EP4 (available in CXA for improved phase noise)</p>	<p>Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 23 kHz All other conditions</p>	<p>"Fast Tuning" on page 541</p> <p>"Best Wide-offset" on page 541</p>
<p>All Other Models</p> <p>Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 541 are actually the same as "Best Close-in" on page 540, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning</p>	<p>Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" CF is < 109 kHz <i>or</i> CF ≥ 4.95 MHz <i>and</i> Span ≤ 666 kHz <i>and</i> RBW < 28 kHz All other conditions</p>	<p>"Fast Tuning" on page 541</p> <p>"Best Close-in" on page 540</p> <p>"Best Wide-offset" on page 541</p>
	<p>Span > 12.34 MHz, <i>or</i> RBW > 250 kHz, <i>or</i> Source Mode is set to "Tracking"</p> <p>Center frequency is < 25 kHz, <i>or</i> CF ≥ 1 MHz <i>and</i> Span ≤ 141.4 kHz <i>and</i> RBW ≤ 5 kHz</p> <p>All other conditions</p>	<p>"Fast Tuning" on page 541</p> <p>"Best Close-in" on page 540</p> <p>"Best Wide-offset" on page 541</p>

In all the above cases:

- The RBW to be used in the calculations is the equivalent -3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
EP1	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
	1	Best Close-in	[offset < 140 kHz]
EP2, EP3, EP5	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
	1	Best Close-in	[offset < 70 kHz]
EP4	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Mixing Mode

Changes LO mixing from high-side to low-side or *vice versa*.

Remote Command	<code>[[:SENSe]:OFDM:CCARrier0 ... 7:LO:MIXMode NORMal ALTernate [:SENSe]:OFDM:CCARrier0 ... 7:LO:MIXMode?</code>
Example	<code>:OFDM:CCAR:LO:MIXM NORM :OFDM:CCAR:LO:MIXM?</code>
Dependencies	Grayed-out when the RF Input is set to something other than “RF” (such as External Mixer). If you press the grayed-out control, a warning message “Feature only available with Signal Input RF” appears If you try to set Mixing Mode via SCPI when disabled, a message -221, “Settings conflict; Feature only available with signal input RF” is returned
Preset	NORMal
State Saved	Yes
Range	NORMal ALTernate

Mixing Mode Auto

Activates the auto rules for **Mixing Mode**.

Remote Command	<code>[:SENSe]:OFDM:CCARrier0 ... 7LO:MIXMode:AUTO ON OFF 1 0</code> <code>[:SENSe]:OFDM:CCARrier0 ... 7LO:MIXMode:AUTO?</code>
Example	<code>:OFDM:CARR:LO:MIXM:AUTO OFF</code> <code>:OFDM:CARR:LO:MIXM:AUTO?</code>
Preset	ON
State Saved	Yes
Range	Auto Man

Spectrum Stitching

When ON, multiple acquisitions overlapped in frequency domain will be performed and then combined to get wide band IQ data. This enables the instrument to capture and analyze wider signals, but it may slow down the measurement speed and it requires the signal to occupy the majority of the analysis bandwidth.

NOTE

Accurate trigger is needed to align multiple acquisitions in the time domain, and the input signal must be repeated and aligned with trigger precisely.

Remote Command	<code>[:SENSe]:OFDM:STITching:SPECTrum[:STATE] ON OFF 1 0</code> <code>[:SENSe]:OFDM:STITching:SPECTrum[:STATE]?</code>
Example	<code>:OFDM:STIT:SPEC 1</code> <code>:OFDM:STIT:SPEC?</code>
Preset	OFF
State Saved	Saved in instrument state

Cross-Correlated EVM

Enables Cross-Correlated EVM.

Remote Command	<code>[:SENSe]:OFDM:CCEVm[:ENABLE] ON OFF 1 0</code> <code>[:SENSe]:OFDM:CCEVm[:ENABLE]?</code>
Example	<code>:OFDM:CCEV 1</code> <code>:OFDM:CCEV?</code>
Preset	OFF
State Saved	Saved in instrument state

Multi Channel Config

Lets you perform a detailed configuration of your component carriers, including number of carriers, bandwidth, offset, integration bandwidth, and so on.

Multi Channel Config

Only available for the Modulation Analysis measurement. Enables you to configure multiple channel receiver. Different hardware platforms have different parameters.

Input Channel IP address

Sets instrument IP address for channel configuration, "local" is used for current instrument.

Remote Command	<code>[:SENSe]:OFDM:MCHannel:IPAddress1 2 <String></code> <code>[:SENSe]:OFDM:MCHannel:IPAddress1 2?</code>
Example	<code>:OFDM:MCH:IPAD1 '192.168.1.2'</code>
Preset	Local
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:OFDM:MIMO:IPAddress1 2</code>

Input Channel Instrument port

Sets instrument port for channel configuration.

Remote Command	<code>[:SENSe]:OFDM:MCHannel:IPAddress1 2:PORT <int></code> <code>[:SENSe]:OFDM:MCHannel:IPAddress1 2:PORT?</code>
Example	<code>:OFDM:MCH:IPAD1:PORT 3574</code>
Dependencies	Only visible on VXT platforms
Preset	3574
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:OFDM:MIMO:IPAddress1 2:PORT</code>

Lock

Locks the instrument and assigns to a channel in sequence.

3 VMA Mode
3.2 Custom OFDM Measurement

Remote Command	<code>[:SENSe]:OFDM:MCHannel:IPADdress1 2:LOCKed OFF ON 0 1</code>
Example	<code>:OFDM:MCH:IPAD1:LOCK 1</code> <code>:OFDM:MCH:IPAD1:LOCK?</code>
Preset	0
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:OFDM:MIMO:IPADdress1 2:LOCKed</code>

Channel Configuration Information (Remote Query only)

Returns channel configuration information.

Remote Command	<code>[:SENSe]:OFDM:MCHannel:CHANnel:INFO?</code>
Example	<code>:OFDM:MCH:CHAN:INFO?</code>
Backwards Compatibility SCPI	<code>[:SENSe]:OFDM:MIMO:CHANnel:INFO</code>

3.2.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.2.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 548

Remote	<code>:INITiate:CONTinuous OFF ON 0 1</code>
--------	--

Command	<code>:INITiate:CONTinuous?</code>
Example	<p>Put instrument into Single measurement operation:</p> <pre><code>:INIT:CONT 0</code></pre> <pre><code>:INIT:CONT OFF</code></pre> <p>Put instrument into Continuous measurement operation:</p> <pre><code>:INIT:CONT 1</code></pre> <pre><code>:INIT:CONT ON</code></pre>
Preset	<p>ON</p> <p>Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON, but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF</p>
State Saved	Saved in instrument state
Annunciation	<p>The Single/Continuous icon in the Meas Bar changes depending on the setting:</p> <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	<p>X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep</p> <p>X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep</p>

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "[Restart](#)" on page 1832 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 550

Remote `:INITiate[:IMMEDIATE]`

Command	:INITiate:REStart
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUEStionable register bit 9 (INTEgrity sum) is cleared The SWEEPING bit is set The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single

sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>

3 VMA Mode
3.2 Custom OFDM Measurement

Notes	<p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The STATUS:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATUS:QUESTionable register bit 9 (INTEGRity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p>

3.2.9.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

X Width

Sets the width of the X axis which is displayed for the selected trace. The X width can be set to less than the span for frequency-domain traces, enabling you to zoom in on just a portion of the measured values. Likewise, it can be less than the time span covered by the time-domain data. This, plus X **"Ref Value"** on page 554 and X **"Ref Position"** on page 554, control the range of X values that can be displayed on a trace.

Remote Command	<pre>:DISP:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:WIDTh <real></pre> <pre>:DISP:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:WIDTh?</pre>
Example	<pre>:DISP:OFDM:WIND3:X:WIDT 10e6</pre> <p>Set the X width of the third window to 10 MHz</p> <pre>:DISP:OFDM:WIND3:X:WIDT?</pre> <p>Query the X width of the third window</p>
Couplings	If "Auto Scaling" on page 554 is ON, X Width is determined by the trace data
Preset	Depends on trace data
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Ref Value

Controls the X value of the selected trace at the chosen X "Ref Position" on page 554.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:RLEVel <real></code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:RLEVel?</code>
Example	<code>:DISP:OFDM:WIND3:X:RLEV 10</code> Set the X ref value of the third window to 10 <code>:DISP:OFDM:WIND3:X:RLEV?</code> Query the X ref value of the third window
Couplings	If "Auto Scaling" on page 554 is ON, X Ref Value is determined by the trace data
Preset	Depends on trace data
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Ref Position

Determines the position from which the X scaling is calculated for the selected trace. It can be set to the left side, center, or right side of the grid.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:RPOsition LEFT CENTER RIGHT</code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:RPOsition?</code>
Example	<code>:DISP:OFDM:WIND3:X:RPOS CENT</code> Set the X ref position of the third window to CENT <code>:DISP:OFDM:WIND3:X:RPOS?</code> Query the X ref position of the third window
Preset	Depends on trace data
State Saved	Yes
Range	Left Ctr Right

Auto Scaling

Toggles this function On or Off.

Remote Command	<code>:DISPlay:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:COUPle 0 1 OFF ON</code> <code>:DISPlay:OFDM:WINDow[1] 2 ... 6:X[:SCALE]:COUPle?</code>
----------------	--

Example	<code>:DISP:OFDM:WIND3:X:COUP ON</code> Do the X auto scale for the third window <code>:DISP:OFDM:WIND3:X:COUP?</code> Query the X auto scale state of the third window
Couplings	When this is ON, pressing the front-panel Restart key activates the scale coupling function, that automatically determines scale per division and reference values based on the measurement results. When you set the value of either "X Width" on page 553 or "Ref Value" on page 554 manually, Auto Scaling is automatically set to OFF
Preset	ON
State Saved	Yes
Range	On Off

3.2.9.3 Recording

Displays the Sample Rate, Sample Points and Sample Time of the saved IQ data file.

Recording and playback of signal data files is a multi-step process that involves controls in several menus:

- **Save, Recording** (under the **Save** hardkey or the **Save** icon in the **File** panel)
- **Recall, Recording** (under the **Recall** hardkey or the **Recall** icon in the **File** panel)
- **Sweep, Recording** (this tab)
- **Sweep, "Playback"** on page 556
- **Input/Output, "Data Source"** on page 2195

NOTE

A complete tutorial for **Record/Playback** functionality, including how to load and save recording files, can be found in the help for the tab "**Data Source**" on page 2195 under **Input/Output**.

This menu includes the following display-only fields:

Sample Rate

Displays the sample rate of the saved IQ data file. If you have not saved an IQ data file, the value is 0.

Sample Points

Displays the total number of sample points in the saved IQ data file. If you have not saved an IQ data file, the value is 0.

Sampling Time

Displays the total sample time of the saved IQ data file. If you have not saved an IQ data file, the value is 0.

Saved Channels [Mode: 5GNR, VMA, WLAN]

Displays the channel index/number of the saved IQ data file. If you have not saved an IQ data file, no value is displayed.

This control is designed for multi-channel I/Q data recording and playback.

3.2.9.4 Playback

Contains parameters for playback of saved recording files recalled to the instrument.

Recording and playback of signal data files is a multi-step process that involves controls in several menus:

- **Save, Recording** (under the **Save** hardkey or the **Save** icon in the **File** panel)
- **Recall, Recording** (under the **Recall** hardkey or the **Recall** icon in the **File** panel)
- **Sweep, "Recording"** on page 555
- **Sweep, Playback** (this tab)
- **Input/Output, "Data Source"** on page 2195

NOTE

A complete tutorial for **Record/Playback** functionality, including how to load and save recording files, can be found in the help for the tab **"Data Source"** on page 2195 under the **Input/Output** menu.

This menu includes the following display-only fields:

Sample Points

Displays the total number of sample points in the recalled IQ data file. If you have not recalled an IQ data file, the value is 0.

Sampling Time

Displays the total sample time of the recalled IQ data file. If you have not recalled an IQ data file, the value is 0.

Input Channels [Mode: 5GNR, VMA, WLAN]

Displays the input channel number of the recalled IQ data file. If you have not recalled an IQ data file, the default value of 1 is displayed.

This control is designed for multi-channel I/Q data recording and playback.

Playback Mode

Specifies the mode of IQ data to be played back and analyzed:

- Fixed: Playback Stop value is ignored. Measurement will analyze the first chunk of IQ data start from Playback Start repeatedly
- Iterative: Measurement will analyze the IQ data chunk by chunk between Playback Start and Playback Stop, if the last chunk is not complete it will be ignored and start from the first chunk again

Remote Command	<code>:CALCulate:<meas>:PLAY:MODE FIXed ITERative</code> <code>:CALCulate:<meas>:PLAY:MODE?</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:MODE CONT</code> <code>:CALC:EVM:PLAY:MODE?</code>
Preset	<code>FIX</code>
State Saved	Saved in instrument state
Range	Fixed Iterative

Playback Start

Once you have loaded an IQ data file using **Recall, Recording**, this control enables you to specify the start position of the IQ data playback range to be analyzed. If its value is less than zero, an additional zero is inserted at the beginning of the IQ data.

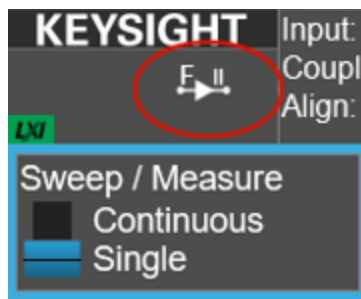

To go to a specific location in the recalled I/Q data, enter the desired **Playback Start** point.

You can use this control to examine the data you recalled from the recording file. How you proceed depends on whether you are in **Continuous** or **Single** mode. To determine which mode you are in, look at the first panel on the left in the **Meas Bar** above the data display.

If the panel looks like this, you are in **Continuous** mode:

If the panel looks like this, you are in **Single** mode:

The **F** indicates that the instrument is using data from a file (if you wish to return to looking at data at the analyzer input, change the **Data Source** control in the **Input/Output, Data Source** menu from **File** back to **Input**.)

To examine the data you loaded:

Continuous mode

In this mode, turn the knob or use the **Up/Down** keys on the front panel to move through records in the recording. You will see **Playback Start** change from 0 to successively higher values as you move deeper into the data.

Single mode

In this mode, you can only look at one record. Set the **Playback Start** time to the desired offset from zero, then press **Restart**. A single record will be displayed. Note

3 VMA Mode
3.2 Custom OFDM Measurement

that until you press **Restart**, the “invalid data” indicator (yellow asterisk) is displayed in each window. After you press **Restart**, the invalid data indicator disappears.

Remote Command	<code>:CALCulate:<meas>:PLAY:START <time></code> <code>:CALCulate:<meas>:PLAY:START?</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:STAR 0.01 s</code> <code>:CALC:EVM:PLAY:STAR?</code>
Preset	0
State Saved	Saved in instrument state
Min/Max	-/+Sample Points in IQ file / Sample Rate in IQ file

Playback Stop

Specifies the stop position of the IQ data playback range to be analyzed, when “Playback Mode” is iterative.

Remote Command	<code>:CALCulate:<meas>:PLAY:STOP <time></code> <code>:CALCulate:<meas>:PLAY:STOP?</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:STOP 0.01 s</code> <code>:CALC:EVM:PLAY:STOP?</code>
Preset	0
State Saved	No
Min	0
Max	Sample Points in IQ file x Sample Rate

Step Forward

Move to next chunk of IQ data when "[Playback Mode](#)" on page 557 is iterative.

Remote Command	<code>:CALCulate:<meas>:PLAY:STEP:FORward</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:STEP:FORW</code>
State Saved	Saved in instrument state

Sample Rate

Displays the sample rate of the recalled IQ data file if the recalled file format contains sampling rate information (`.csv`, `.sdf`, `.txt`). In this case, the *control* is grayed-out.

`BIN` and `BINX` files do not include sampling rate information inside the file, so after recalling one of these files, you must set **Sample Rate** manually. When you save a file in these formats, you must specify the sample rate, as displayed under **Sweep, Recording**.

Remote Command	<code>:CALCulate:<meas>:PLAY:SRATe <freq></code> <code>:CALCulate:<meas>:PLAY:SRATe?</code>
	Where <code><meas></code> is the mnemonic for the current measurement, for example, <code>EVM</code>
Example	For EVM measurement in 5G NR Mode: <code>:CALC:EVM:PLAY:SRAT 122.88MHz</code> <code>:CALC:EVM:PLAY:SRAT?</code>
Couplings	Displays only after recalling <code>.csv</code> , <code>.sdf</code> , or <code>.txt</code> files Settable after recalling <code>.bin</code> or <code>.binx</code> files
Preset	0
State Saved	No
Min	0

3.2.10 Trace

Trace functionality is not supported in this measurement.

3.3 Monitor Spectrum Measurement

The Monitor Spectrum measurement provides a quick, convenient means of looking at the entire spectrum. While the look and feel are similar to Spectrum Analyzer Mode, the functionality is greatly reduced for easy operation. The main purpose of this measurement is to show the spectrum. The default span should cover an appropriate frequency range of the application.

Measurement Commands

The following commands can be used to configure the measurement and retrieve results:

```
:CONFigure:MONitor  
:CONFigure:MONitor:NDEFault  
:INITiate:MONitor  
:FETCh:MONitor[n]?  
:READ:MONitor[n]?  
:MEASure:MONitor[n]?
```

Remote Command Results

The following table describes the results returned by the queries listed above, according to the index value **n**.

n	Results Returned
1 (or not specified)	Returns trace1 data with comma separated floating numbers
2	Returns trace2 data with comma separated floating numbers
3	Returns trace3 data with comma separated floating numbers

3.3.1 Views

For modes other than MSR, LTEAFDD/LTEATDD and 5GNR, there is a single view, **Normal**.

["Normal" on page 561](#)

This is a single window view of the spectrum

3.3.1.1 Normal

Windows: ["Spectrum" on page 562](#)

Single window view of the graph.

Example	<code>:DISP:MON:VIEW RTR</code>
Dependencies	This command is only available in the MSR, LTE-A FDD/TDD and 5G NR modes. In other Modes this is the only View

3.3.2 Windows

This section describes the windows used in the Monitor Spectrum measurement.

3.3.2.1 Spectrum

In all modes except MSR, LTEAFDD/LTEATDD, and 5GNR, this is a single trace window showing the spectrum.

In LTEAFDD/LTEATDD, MSR and 5GNR Modes, multi-carriers are supported. The Carrier Attribute on/off and Sub-block Attribute on/off settings (under Display, Meas Display) are defined to allow the carrier and sub-block legends to display.

When the Carrier Attribute is on, the carrier identification and name are shown on the spectrum trace:

3 VMA Mode
3.3 Monitor Spectrum Measurement

When Carrier and Sub-block attributes are both on, the sub-block scope and name are also shown on the spectrum trace:

3.3.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.3.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of **"Ref Position"** on page 566.

Remote Command	<code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:MON:WIND:TRAC:Y:RLEV 2.0</code> <code>:DISP:MON:WIND:TRAC:Y:RLEV?</code>
Couplings	When "Auto Scaling" on page 566 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF . Attenuation is not coupled to "Ref Value" on page 564.
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	<code>:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code>

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

3 VMA Mode
3.3 Monitor Spectrum Measurement

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	<code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl></code> <code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:MON:WIND:TRAC:Y:PDIV 5.0 dB</code> <code>:DISP:MON:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 566 is ON , this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to OFF
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	<code>:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code>

Scale Range

Sets the Y Axis scale range.

Remote Command	<code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl></code> <code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RANGe?</code>
Example	<code>:DISP:MON:WIND:TRAC:Y:RANG 100</code> <code>:DISP:MON:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change a value, Auto Scaling automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	<code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTom</code> <code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code>
Example	<code>:DISP:MON:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:MON:WIND:TRAC:Y:RPOS?</code>
Preset	TOP
State Saved	Saved in instrument state
Range	TOP CENTER BOTTOM
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	<code>:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition</code>

Auto Scaling

Toggles the **Auto Scaling** function On or Off.

Remote Command	<code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:COUPle?</code>
Example	<code>:DISP:MON:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:MON:WIND:TRAC:Y:COUP?</code>
Couplings	When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change a value of Scale/Div , Ref Value , or Scale Range , Auto Scaling automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle</code>

3.3.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 567
- See ["Single-Attenuator Configuration"](#) on page 568

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1766 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1760 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 572

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1769 See " Attenuator Configurations and Auto/Man " on page 572 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1765 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below</p>

3 VMA Mode
3.3 Monitor Spectrum Measurement

	7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB	
Preset	Auto	The Auto value is 10 dB
State Saved	Saved in instrument state	
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased	
Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
	Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB	
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p>	

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech AttenON : <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 1763, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 570 (or :POW:ATT) as the "main" attenuation; and the attenuation that is set by :POW:EATT as the "soft" attenuation (:POW:EATT is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 1769 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

3 VMA Mode
3.3 Monitor Spectrum Measurement

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 574](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1788 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1790 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p>
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator

	Transition Rules" on page 575
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description
Auto Function	
Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 576](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1773.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

3 VMA Mode
3.3 Monitor Spectrum Measurement

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 578

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to <code>COMBined</code>
Elec Atten Only	<code>ELECTrical</code>	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	<code>COMBined</code>	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>

Notes	<p>The parameter option ELECTRICAL sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBINED is mapped to ELECTRICAL in Single-Attenuator models. If you send COMBINED, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBINED</p>				
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 1769 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 577 is grayed-out</p> <p>Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>Appears in the Waveform measurement in BASIC and 5G NR Modes</p>				
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC				
State Saved	Saved in instrument state				
Range	<table border="1"> <tr> <td>Dual-Attenuator models:</td> <td>Off Elec Atten Only Mech + Elec Atten</td> </tr> <tr> <td>Single-Attenuator models:</td> <td>Off On</td> </tr> </table>	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten	Single-Attenuator models:	Off On
Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten				
Single-Attenuator models:	Off On				

Backwards Compatibility Command

Notes	<p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p>
Backwards Compatibility SCPI	<pre>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</pre> <pre>[:SENSe]:POWer[:RF]:RANGe:AUTO?</pre>

Adjustment Algorithm

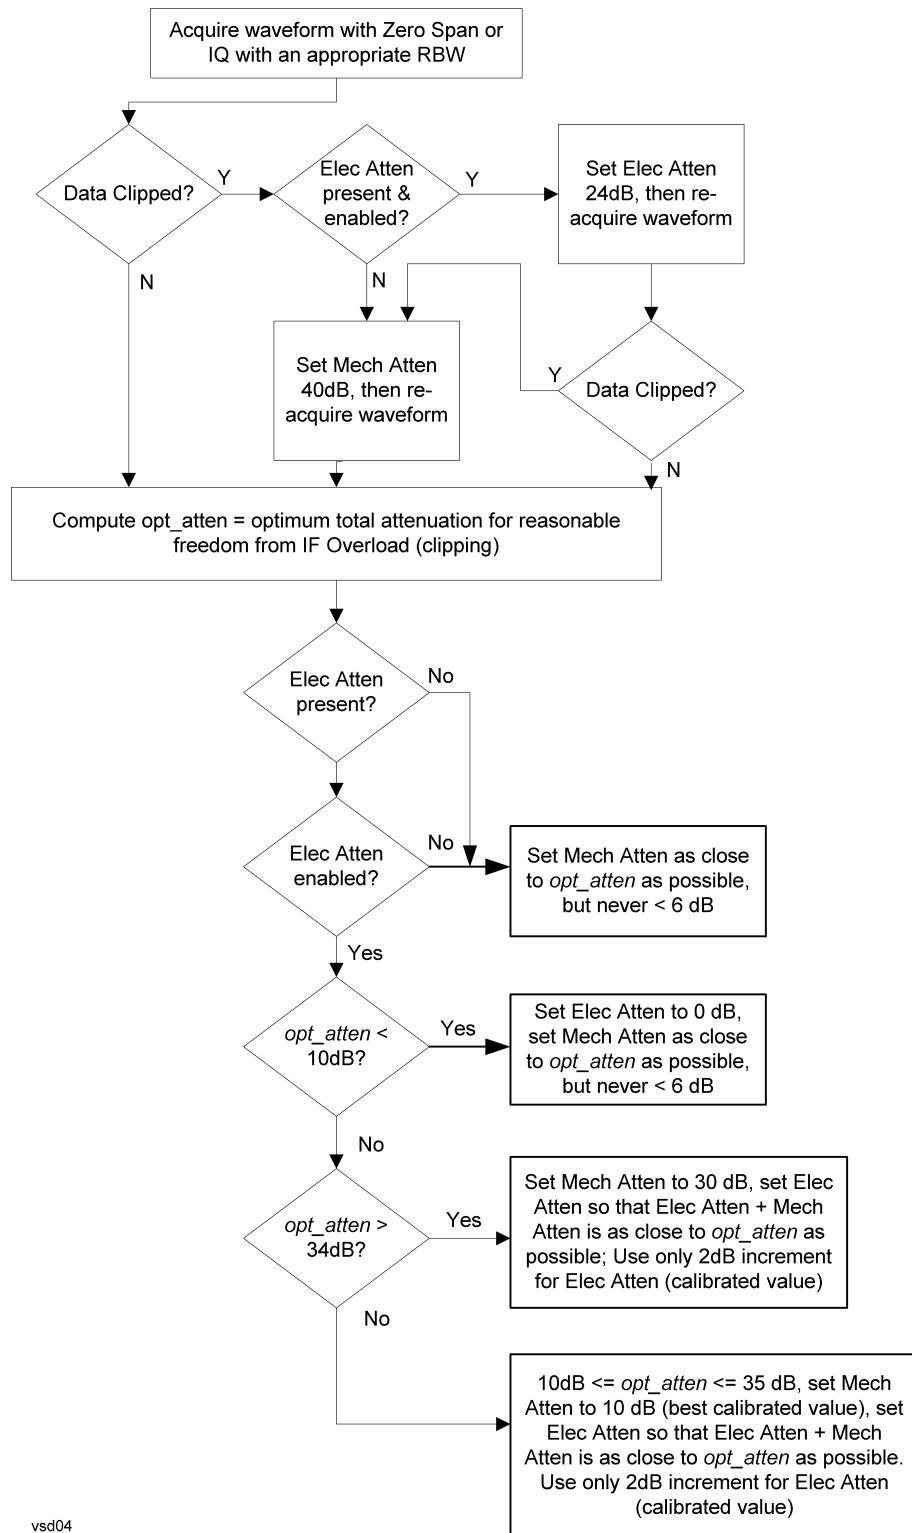

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 577 selection is Mech + Elec Atten:

vsd04

"Pre-Adjust for Min Clipping" on page 577 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.3.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>	
Example	<code>:POW:RANG:PAR 12 dB</code>	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.3.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1801 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 1787 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "[Proper Preselector Operation](#)" on page 586.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1787
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

3 VMA Mode
 3.3 Monitor Spectrum Measurement

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz

State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	LOW
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	OFF

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1788. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "Internal Preamp" on page 1788, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 590

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and Internal Preamp. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of Internal Preamp does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 595
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 597
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 598

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>														
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>														
Notes	<p>When "Presel Center" on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>														
Dependencies	<p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</p>

μW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **μW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	μW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	μ W Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	μ W Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypass
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto μ W path is standard For other cases, auto μ W path is presel bypass if presel bypass is enabled, auto μ W path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	μ W Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path

Couplings	See " μW Path Control Auto " on page 593 above
Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and **"Y Scale" on page 1760** is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1791.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command `[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ON | OFF | 1 | 0`
`[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ?`

Example `:POW :MW :PATH :AUTO :FULL ON`
`:POW :MW :PATH :AUTO :FULL ?`

Dependencies Only appears if Option FBP is installed, and in the following measurements

- 5GNRMode: Modulation Analysis and IQ Waveform
- WLAN Mode: IQ Waveform
- Channel Quality Mode: Group Delay and Noise Power Ratio

Preset **OFF**

State Saved Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

3 VMA Mode
 3.3 Monitor Spectrum Measurement

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPreSel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept

	method	
	Grayed-out when " Software Preselection " on page 1801 is OFF . The grayout message is "Unavailable unless SW Presel enabled"	
	For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled	
Preset	N9041B	NORMa1
	N9042B+V3050A	NARRow
State Saved	Saved in instrument state	

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 604 below
State Saved	Saved in instrument state

3.3.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

3.3.4.1 Settings

Contains the basic bandwidth functions. It is the only tab under **BW**.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the Resolution Bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio).

To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

See "[RBW Presets](#)" on page 607

Remote Command	<pre>[:SENSe]:MONitor:BANDwidth[:RESolution] <bandwidth> [:SENSe]:MONitor:BANDwidth[:RESolution]? [:SENSe]:MONitor:BANDwidth[:RESolution]:AUTO ON OFF 1 0 [:SENSe]:MONitor:BANDwidth[:RESolution]:AUTO?</pre>
Example	<pre>:MON:BAND 5 MHz :MON:BAND? :MON:BAND:AUTO ON :MON:BAND:AUTO?</pre>
Notes	<p>For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered</p> <p>The setting and querying of values depends on the current bandwidth type</p>
Couplings	<p>Sweep time is coupled to the RBW. As the RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration</p> <p>Video bandwidth (VBW) is coupled to the RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1)</p> <p>When the Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings</p>
Preset	<p>Auto (unless noted in the table below)</p> <p>See "RBW Presets" on page 607 below</p>
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent -3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than -3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	<p>For backwards compatibility this command obeys both the BANDwidth and BWIDth forms</p> <p>For ESA, the maximum Res BW was 5 MHz; on X-Series it is 8 MHz</p>

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset RBW
WLAN	100 kHz
LTE, LTETDD, LTEAFDD, LTEATDD	100 kHz
5GNR	100 kHz

Video BW

Lets you change the instrument post-detection filter (VBW or “video bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by the VBW:3 dB RBW control. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	<pre>[:SENSe]:MONitor:BANDwidth:VIDeo <bandwidth> [:SENSe]:MONitor:BANDwidth:VIDeo? [:SENSe]:MONitor:BANDwidth:VIDeo:AUTO ON OFF 1 0 [:SENSe]:MONitor:BANDwidth:VIDeo:AUTO?</pre>
Example	<pre>:MON:BAND:VID 2.4 MHz :MON:BAND:VID? :MON:BAND:VID:AUTO ON :MON:BAND:VID:AUTO?</pre>
Notes	<p>For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open”</p> <p>The values shown in this table reflect the conditions after a Mode Preset</p>
Dependencies	<p>Sometimes the displayed Video BW is not actually used to process the trace data:</p> <ul style="list-style-type: none"> – When the Average Detector is selected and Sweep Type is set to Swept, the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector – When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector

	When this is the case, the VBW still acts to change the Sweep Time, if Sweep Time is in Auto, and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If VBW is set to Auto, then the VBW is changed as the RBW changes, to maintain the ratio set by the VBW:3 dB RBW control (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)
Preset	Auto (unless noted in table below) ON
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command obeys both the BANDwidth and BWIDth forms

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset VBW
WLAN	1 MHz
LTE, LTETDD, LTEAFDD, LTEATDD	1 MHz
5GNR	1 MHz

VBW:3dB RBW

Selects the ratio between the video bandwidth and the equivalent 3 dB resolution bandwidth to be used for setting VBW when VBW is in Auto.

VBW:3dB RBW (Auto) selects automatic coupling of the VBW:3 dB RBW ratio to Detector using the rules described below in "[Coupling Auto Rules](#)" on page 609. To decouple the ratio, press the **Auto/Man** toggle on the VBW:3 dB RBW control, or simply enter a different value for VBW:3 dB RBW.

When the VBW:3dB RBW is manually selected, it may be returned to the coupled state by setting the toggle on the VBW:3 dB RBW control back to **Auto**. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	<code>[:SENSe]:MONitor: BANDwidth: VIDEo: RATio <real></code> <code>[:SENSe]:MONitor: BANDwidth: VIDEo: RATio?</code>
----------------	--

3 VMA Mode
3.3 Monitor Spectrum Measurement

	<code>[:SENSe] :MONitor :BANDwidth :VIDeo :RATio :AUTO OFF ON 0 1</code>
	<code>[:SENSe] :MONitor :BANDwidth :VIDeo :RATio :AUTO?</code>
Example	<code>:MON :BAND :VID :RAT 2</code> <code>:MON :BAND :VID :RAT?</code> <code>:MON :BAND :VID :RAT :AUTO 0</code> <code>:MON :BAND :VID :RAT :AUTO?</code>
Notes	The values shown in this table reflect the conditions after a Mode Preset
Couplings	See "Coupling Auto Rules" on page 609
Preset	1 ON
State Saved	Saved in instrument state
Min	0.00001
Max	3000000
Backwards Compatibility Notes	For backwards compatibility this command accepts both the <code>BANDwidth</code> and <code>BWIDth</code> forms

Coupling Auto Rules

The Auto Rules for the **VBW:3dB RBW** function are as follows.

First, if Source Mode is set to "Tracking": Use 1.0

Otherwise, we go through the following list of detector numbers and find the lowest numbered detector being used on any active traces (traces for which Update is On):

1. Peak
2. Normal
3. Average
4. Sample
5. Negative Peak
6. EMI Average
7. Quasi Peak
8. RMS Average

Use that detector to pick the ratio based on the following criteria:

1. If the measurement supports EMC Standard, and the detector is Peak and the EMC Standard is set to either CISPR or MIL, use 10.0 (we use wide VBWs to capture peak levels accurately).
2. Otherwise, if the detector is **Negative Peak**, use 1.0 (in the Negative Peak case, there are no known significant use models so we use a medium ratio).
3. Otherwise, if the detector is **Normal**, use 1.0.
4. Otherwise, if the detector is **Average**, and the span is nonzero, use 0.1. The use of a small ratio in Average detection is desirable because of its effect on the sweep time equations. The VBW filter is not actually in-circuit when the average detector is on. If the detector is Average, and the span is zero, use 10.0, which gives optimal behavior for Interval Markers in zero span. Note that only the Swept SA measurement supports Zero Span.
5. Otherwise, if the detector is EMI Average, Quasi Peak or RMS Average, use 10.0. In fact, this is a “don’t care” since no VBW is used for these detectors, as noted under “Dependencies” for the VBW control
6. Otherwise, the detector is simply **Peak** or **Sample**. These two detectors can use the same rules. In these cases, if any active trace is in max hold or min hold, use 10.0, because Max and Min Hold operations will usually be intended to capture peaks and pits without smoothing from the VBW filter; otherwise, use 1.0 as a compromise, because you have not set the instrument in a way that implies that you are measuring noise, pulsed-RF or CW signals, and for backward compatibility with earlier instruments.

Note that because the above couplings depend on which traces are active, they are re-examined whenever any trace goes active or inactive, except when this leaves no traces active. Transitioning to the state where no traces are active should not affect the couplings; in that way, the annotation will always reflect the state of the last trace which was active.

Note also that some detectors are not available in some measurements, but because of the way the above rules that does not change the logic of the rules.

Span:3dB RBW

Selects the ratio between span and resolution bandwidth.

Normally, Span:3dB RBW (Auto) selects a Span:3 dB RBW ratio of 106:1. If you manually enter the ratio, the toggle on the Span:3dB RBW control will change to **Man**. This enables you to manually select ratios more suitable for certain measurements.

3 VMA Mode
3.3 Monitor Spectrum Measurement

When the Span:3dB RBW is manually selected, it may be returned to the coupled state by setting the toggle on the RBW:3 dB RBW control back to **Auto**. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	<pre>[:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <integer> [:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio? [:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio:AUTO OFF ON 0 1 [:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio:AUTO?</pre>
Example	<pre>:MON:FREQ:SPAN:BAND:RAT 200 :MON:FREQ:SPAN:BAND:RAT? :MON:FREQ:SPAN:BAND:RAT:AUTO ON :MON:FREQ:SPAN:BAND:RAT:AUTO?</pre>
Notes	The values shown in this table reflect the conditions after a Mode Preset
Preset	106 ON
State Saved	Saved in instrument state
Min	2
Max	10000
Backwards Compatibility SCPI	<pre>[:SENSe]:MONitor:FREQuency:SPAN:BWIDth[:RESolution]:RATio</pre>

3.3.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.3.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

3.3.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "[Views](#)" on page 561

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node</p> <pre>:DISPlay:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
----------------	--

3 VMA Mode
3.3 Monitor Spectrum Measurement

Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code> No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined

3.3.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATICule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATICule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis

Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	:DISPlay:ANNotation:SCReem[:STATe] OFF ON 0 1 :DISPlay:ANNotation:SCReem[:STATe]?
Example	:DISP:ANN:SCR OFF
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0 :DISPlay:ANNotation:TRACe[:STATe]?
----------------	--

3 VMA Mode
3.3 Monitor Spectrum Measurement

Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display

2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPlay:VIEW:ADVanced:SElect</code>
Rename User View	<code>:DISPlay:VIEW:ADVanced:REName</code>
Delete User View	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Create User View	<code>:DISPlay:VIEW:ADVanced:NAME</code>
Select Screen	<code>:INSTrument:SCReen:SElect</code>
Delete Screen	<code>:INSTrument:SCReen:DElete</code>
Delete All But This Screen	<code>:INSTrument:SCReen:DElete:ALL</code>
Add Screen	<code>:INSTrument:SCReen:CREate</code>
Rename Screen	<code>:INSTrument:SCReen:REName</code>
Sequencer On/Off	<code>:SYSTem:SEQuencer</code>

Remote Command	<code>:DISPlay:ENABle OFF ON 0 1</code>
Example	<code>:DISP:ENAB OFF</code>
Couplings	<code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code>
Preset	ON Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code>

State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABLe as it did in legacy analyzers

3.3.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.3.6.1 Settings

The Settings tab contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus, you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ, and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

- "Center Frequency Presets" on page 622
- "VXT Models with Radio Heads/CIU Frequency Range" on page 624
- "RF Center Freq" on page 624
- "Ext Mix Center Freq" on page 625
- "I/Q Center Freq" on page 625

Remote Command	<code>[:SENSe]:FREQuency:CENTer <freq></code> <code>[:SENSe]:FREQuency:CENTer?</code>
Example	<code>:FREQ:CENT 50 MHz</code> Sets Center Frequency to 50 MHz <code>:FREQ:CENT UP</code> Increments the Center Frequency by the value of CF Step <code>:FREQ:CENT?</code> Returns the current value of Center Frequency
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF:CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code> - For External Mixer it is equivalent to <code>:FREQ:EMIX:CENT</code> Preset and Max values are dependent on Hardware Options (5xx) If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Couplings	In LTEAFDD/LTEATDD and 5GNR Modes: Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled with the following equation: Center Frequency = Carrier Reference Frequency + Center Frequency Offset If the following conditions are satisfied at the same time: <ul style="list-style-type: none"> - the Num Component Carrier equals to 1 - the Center Frequency Offset equals to 0 Hz - the mode of the Center Frequency is Auto The Center Frequency is equivalent to Carrier Reference Frequency The major purpose of this coupling is to keep BWCC with legacy LTE, in which <code>:SENSe:FREQuency:CENTer</code> is used to set up the Frequency of the measurement Otherwise, the Center Frequency Offset is changed following the Center Frequency and the Carrier Reference Frequency keeps intact

3 VMA Mode

3.3 Monitor Spectrum Measurement

In MSR, Center Freq, Center Freq Offset and Carrier Ref Freq are coupled with the equation, Center Freq = Carrier Ref Freq + Center Freq Offset. When Center Freq is changed, Center Freq Offset is updated and Carrier Ref Freq is not changed

When auto, Center Freq Offset remains the same value. Thus, Center Freq changes the same amount of Carrier Ref Freq change when Carrier Ref Freq is changed. The auto state changes to manual when either Center Freq is changed

In Bluetooth Mode:

Center Frequency is coupled to Channel and Geography

- If Geography is France: Center Frequency 2454 MHz + (channel number* channel space) MHz
- If Geography is Others: Center Frequency 2402 MHz + (channel number* channel space) MHz
- If Radio Stand is Basic or EDR, channel space is 1 MHz
- If Radio Stand is Low Energy, channel space is 2 MHz

In other modes:

Any value of the Center Frequency or Span that keeps start frequency and stop frequency within the frequency range of the instrument is allowed when the value is being set through the front panel numeric keypad or the SCPI command. Other frequency parameters are forced to different values if needed, to keep the start and stop frequencies within the instrument's frequency range

Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 622 , "RF Center Freq" on page 624 , "Ext Mix Center Freq" on page 625 , "I/Q Center Freq" on page 625 and "VXT Models with Radio Heads/CIU Frequency Range" on page 624
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 622 , "RF Center Freq" on page 624 , "Ext Mix Center Freq" on page 625 , "I/Q Center Freq" on page 625 and "VXT Models with Radio Heads/CIU Frequency Range" on page 624
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Auto State

Remote Command	<code>[:SENSe] :FREQuency:CENTer:AUTO ON OFF 1 0</code> <code>[:SENSe] :FREQuency:CENTer:AUTO?</code>
Example	<code>:FREQ:CENT:AUTO OFF</code> <code>:FREQ:CENT:AUTO?</code>
Dependencies	This is only available in MSR, LTEAFDD/LTEATDD and 5GNR Modes
Couplings	When the Center Frequency is changed, the state is automatically changed to Manual

Center Frequency, Center Frequency Offset and **Carrier Reference Frequency** are coupled. When Carrier Reference Frequency changes:

- Center Frequency : Auto Center Frequency = Carrier Reference Frequency + Center Frequency Offset (fixed)
- Center Frequency : Man Center Frequency (fixed) = Carrier Reference Frequency + Center Frequency Offset

Preset	ON
State Saved	Saved in instrument state
Range	Auto Man

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz

3 VMA Mode
 3.3 Monitor Spectrum Measurement

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. This command sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **"Center Frequency" on page 619** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :RF :CENTer <freq></code> <code>[:SENSe] :FREQuency :RF :CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See "Center Frequency Presets" on page 622 above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on the value of Span

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. This command sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note that **"Center Frequency" on page 619** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So, you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Specifies the I/Q Center Frequency. This command sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **"Center Frequency" on page 619** in the **Frequency** menu on the front panel always applies to the currently

selected input.

Remote Command	<code>[:SENSe]:FREQuency:IQ:CENTer <freq></code> <code>[:SENSe]:FREQuency:IQ:CENTer?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting the Span, the Center Frequency is held constant, this means that both Start Frequency and Stop Frequency will change.

If the Span is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

See ["Span Presets" on page 627](#)

Remote Command	<code>[:SENSe]:MONitor:FREQuency:SPAN <freq></code> <code>[:SENSe]:MONitor:FREQuency:SPAN?</code>
Example	<code>:MON:FREQ:SPAN 10 MHz</code> <code>:MON:FREQ:SPAN?</code>
Dependencies	If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz
Couplings	Span affects RBW, sweeptime, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) <ul style="list-style-type: none"> - Any value of the Center Frequency or Span that is within the frequency range of the instrument is allowed when the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range - When using the knob or the step up/down keys or the UP DOWN keywords in SCPI, the value that is being changed i.e., the Center Frequency or Span, is limited so that the other parameter is not forced to a new value

3 VMA Mode
3.3 Monitor Spectrum Measurement

Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See " Span Presets " on page 627
State Saved	Saved in instrument state
Min	10 Hz
Max	Depends on instrument maximum frequency, mode, measurement, and selected input; see " Span Presets " on page 627 If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency
Annunciation	Data out of range, value clipped to upper limit
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Radio Std	Preset Value
WCDMA		10.0 MHz
PN		1.0 MHz
GSM/EDGE		1.0 MHz
WLAN	802.11a/b/g/n/ac/ax/be (20 MHz)	25 MHz
	802.11n/ac/ax/be (40MHz)	50 MHz
	802.11ac/ax/be (80MHz)	100 MHz
	802.11ac /ax/be (160MHz)	200 MHz
	802.11be (320MHz)	400 MHz
MSR		20 MHz
LTEAFDD, LTEATDD		20 MHz
5G NR		150 MHz
RTS		40 kHz
CQM		10 MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP/DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command `[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
 `[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
 `[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
 `[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example `:FREQ:CENT:STEP 500 MHz`
 `:FREQ:CENT UP`
 Increases the current center frequency value by 500 MHz
 `:FREQ:CENT:STEP?`
 `:FREQ:CENT:STEP:AUTO ON`

3 VMA Mode

3.3 Monitor Spectrum Measurement

:FREQ:CENT:STEP:AUTO?	
Notes	Preset and Max values are dependent on Hardware Options
Dependencies	Not available in MSR, LTEAFDD/LTEATDD, 5GNR and Channel Quality Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.3.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.3.7.1 Select Marker

Specifies the *selected marker*. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

On any menu tab for which Select Marker displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.3.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:MON:MARK3:X 0</code> <code>:CALC:MON:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned OFF, so Marker X Axis Value query returns a not a number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X Axis Scale position in trace points. This setting has no effect if the control mode is Off, but is the SCPI equivalent of entering a value if the control mode is Normal or Delta – except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

3 VMA Mode

3.3 Monitor Spectrum Measurement

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:X:POSition <real></code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:X:POSition?</code>
Example	<code>:CALC:MON:MARK:X:POS 0</code> <code>:CALC:MON:MARK:X:POS?</code>
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is Off the response is not a number
Preset	After a preset, all markers are turned OFF , so Marker X Axis Value query returns a not a number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y Axis value in the current marker Y Axis unit.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:Y?</code>
Example	<code>:CALC:MON:MARK11:Y?</code>
Notes	Returns the marker Y-axis result if the control mode is Normal or Delta . If the marker is Off , the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCTION:RESult?</code>

Marker Mode

Sets the marker control mode to **Normal (Position)**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **Off**, there is no active function and the active function is turned off.

Remote Command	:CALCulate:MONitor:MARKer[1] 2 ... 12:MODE POSition DELTa OFF
Example	:CALC:MON:MARK:MODE POS :CALC:MON:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELTA OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it in **Normal** mode and places it at the center of the screen.

Remote Command	:CALCulate:MONitor:MARKer[1] 2 ... 12:STATe OFF ON 0 1
Example	:CALC:MON:MARK3:STAT ON :CALC:MON:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as selecting the **Delta** selection in **"Marker Mode" on page 631**. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:MONitor:MARKer:AOFF
Example	:CALC:MON:MARK:AOFF

Couple Markers

When this function is **ON**, moving any marker causes an equal X Axis movement of every other marker that is not Off. By “equal X Axis movement” we mean that we preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off screen.

Remote Command	:CALCulate:MONitor:MARKer:COUPle[:STATe] ON OFF 1 0 :CALCulate:MONitor:MARKer:COUPle[:STATe]?
Example	:CALC:MON:MARK:COUP ON :CALC:MON:MARK:COUP?
Preset	OFF Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.3.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu and performs a Peak Search.
 Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "**Marker Frequency**" on page 630 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker’s trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu and performs a Peak Search. If the selected marker was off, then it is turned on as a normal marker, and a Peak Search is performed.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:MAXimum</code>
Example	<code>:CALC:MON:MARK2:MAX</code> <code>:SYST:ERR?</code> can be used to query the errors to determine if a peak is found. If a search is unsuccessful, then the message "Execution error; No peak found" (-200) will be returned
Notes	Sending this command selects the subopcoded marker

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value. If there is no valid peak lower than the current marker value, an "Execution error; No peak found" message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:MAXimum:NEXT</code>
Example	<code>:CALC:MON:MARK2:MAX:NEXT</code> selects marker 2 and moves it to the peak that is next lower in amplitude than the current marker value
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Marker Delta

Pressing this control has exactly the same effect as selecting the **Delta** selection in "**Marker Mode**" on page 631 on the **Settings** tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.3.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "[Marker Frequency](#)" on page 630 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:REference <integer></code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:REference?</code>
Example	<code>:CALC:MON:MARK2:REF 1</code> <code>:CALC:MON:MARK2:REF?</code>
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not **OFF**, it moves the marker from the trace it was on to the new trace. If the marker is **OFF**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:MON:MARK:TRAC 1</code> <code>:CALC:MON:MARK:TRAC?</code>
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of Marker Trace is not affected by the "Auto Couple" on page 1825 key Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state
Min	1
Max	3

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as the **"Marker Settings Diagram" on page 632** control on the **Settings** tab.

3.3.7.5 Marker Function

The controls on this tab allow you to control the Marker Functions of the instrument. Marker Functions perform post-processing operations on marker data.

The **Marker Function** menu controls which marker functions are turned on and allows you to adjust the setup parameters for each function. These parameters include the following, but only one parameter can be assigned to a given marker:

3 VMA Mode
 3.3 Monitor Spectrum Measurement

- Marker Noise
- Band Power
- Band Density
- Off

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "Marker Frequency" on page 630 on the **Settings** tab.

Marker Function

Sets the marker control function type to one of the following:

NOISe	Marker Noise
BPOWer	Band Power
BDENsity	Band Density
OFF	Marker Function Off

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCtion NOISe BPOWer BDENsity OFF</code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCtion?</code>
Example	<code>:CALC:MON:MARK:FUNC NOIS</code> <code>:CALC:MON:MARK:FUNC?</code>
Preset	OFF
State Saved	Yes
Range	NOISe BPOWer BDENsity OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Band Span

Sets the width of the frequency span for the selected marker.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCtion:BAND:SPAN <freq></code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCtion:BAND:SPAN?</code>
Example	<code>:CALC:MON:MARK12:FUNC:BAND:SPAN 20 MHz</code> <code>:CALC:MON:MARK12:FUNC:BAND:SPAN?</code>
Couplings	Changing the Band Span necessarily changes the Band Left and Band Right values

Preset	Depends on X axis range of selected Trace 10% of Span
State Saved	Yes
Min	-9.9E+37 0
Max	9.9E+37 26.5GHz

Band Left

Sets the left edge frequency or time value for the band of the selected marker.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCTION:BAND:LEFT <freq></code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCTION:BAND:LEFT?</code>
Example	<code>:CALC:MON:MARK12:FUNC:BAND:LEFT 20 GHz</code> <code>:CALC:MON:MARK12:FUNC:BAND:LEFT?</code>
Couplings	Changing the Band Left necessarily changes the Band Span value
Preset	Depends on X axis range of selected Trace
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Band Right

Sets the right edge frequency or time value for the band of the selected marker.

Remote Command	<code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCTION:BAND:RIGHT <freq></code> <code>:CALCulate:MONitor:MARKer[1] 2 ... 12:FUNCTION:BAND:RIGHT?</code>
Example	<code>:CALC:MON:MARK12:FUNC:BAND:RIGH 20 GHz</code> <code>:CALC:MON:MARK12:FUNC:BAND:RIGH?</code>
Couplings	Changing the Band Right necessarily changes the Band Span value
Preset	Depends on X axis range of selected Trace
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

3.3.8 Meas Setup

This menu panel contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.3.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Avg|Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote Command	<code>[:SENSe]:MONitor:AVERage:COUNT <integer></code> <code>[:SENSe]:MONitor:AVERage:COUNT?</code>
Example	<code>:MON:AVER:COUN 25</code> <code>:MON:AVER:COUN?</code>
Preset	10
State Saved	Yes
Min/Max	1/1000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count

Averaging On/Off

Turns averaging on or off.

Remote Command	<code>[:SENSe]:MONitor:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:MONitor:AVERage[:STATe]?</code>
Example	<code>:MON:AVER ON</code> <code>:MON:AVER?</code>
Preset	OFF
State Saved	Yes
Range	OFF ON

Average Mode

Toggles the Average Mode:

- **EXponential**- continues measurement averaging, using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
- **REPeat**- causes the measurement to reset the average counter each time the specified number of averages is reached

Remote Command	<code>[:SENSe]:MONitor:AVERage:TCONtrol EXPonential REPeat</code> <code>[:SENSe]:MONitor:AVERage:TCONtrol?</code>
Example	<code>:MON:AVER:TCON EXP</code> <code>:MON:AVER:TCON?</code>
Preset	<code>EXPonential</code>
State Saved	Yes
Range	<code>EXPonential REPeat</code>

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed. For Spur Avoidance, the instrument uses a software algorithm to remove this spur from the displayed measurement data.

Some measurements allow you to turn off **Spur Avoidance**, but in this measurement it is always enabled. Therefore, in this measurement the Spur Avoidance switch is unavailable (grayed out) and set to Enabled.

Furthermore, if you press the grayed-out switch, this popup message appears:

`Always enabled in this measurement. See manual for details`

Remote Command	<code>[:SENSe]:MONitor:SAVoid[:STATe]?</code>
Example	<code>:MON:SAV?</code> Always returns <code>ON</code>
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	<code>ON</code>
State Saved	Saved in instrument state
Range	<code>ON</code>

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 642 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does not affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command `:CONFigure:MONitor`

Example `:CONF:MON`

3.3.8.2 Advanced

Contains controls for setting advanced functions of the instrument.

This tab does not appear in EXM or VXT.

Noise Floor Extension

When this function is **ON**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

Noise Floor Extension works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

NOTE

Noise Floor Extensions has no effect unless the RF Input is selected, therefore it does nothing when External Mixing is selected.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

See "[More Information](#)" on page 644.

Remote Command `[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0`
`[:SENSe]:CORRection:NOISe:FLOor?`

Example	<code>:CORR:NOIS:FLO ON</code>
Dependencies	This control only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command will be accepted without error (but will have no effect)
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset. Turned off by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

3 VMA Mode

3.3 Monitor Spectrum Measurement

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The key to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you Cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Conversion

Access a menu of functions that enable you to control the frequency conversion type for the current measurement. The following choices are available:

Auto	AUTO	Auto optimizes demodulation quality by selecting single conversion when available. Default value
Single High Side	SHSide	Single downconversion with the LO frequency above the receiver frequency. Not image protected, and available only above 400 MHz or at all frequencies under specific condition
Single Low Side	SLSide	Single downconversion with the LO frequency below the receiver frequency. Not image protected, and available only above 1.1 GHz
Image Protect	IPRotect	Double downconversion with pre-selection filtering. Available at all frequencies

Remote Command	<code>[:SENSE]:MONitor:CONversion:TYPE AUTO SHSide SLSide IPRotect</code> <code>[:SENSE]:MONitor:CONversion:TYPE?</code>
Example	<code>:MON:CON:TYPE AUTO</code> <code>:MON:CON:TYPE?</code>
Dependencies	This control only appears in the M9391A
Couplings	The availabilities of SingleHighSide and SingleLowSide depend on the current Sweep Parameters such as Center Freq, Span, Res BW and Points
Preset	<code>AUTO</code>
State Saved	Yes
Range	<code>AUTO SHSide SLSide IPRotect</code>

Phase Noise Optimization

Access a menu of functions that enable you to control the phase noise optimization for the current measurement. The following choices are available:

Normal	<code>NORmal</code>	Sets the Synthesizer's Phase Lock Loop to the Normal setting (Best Close-In)
Best Wide Offset	<code>BWOffset</code>	Sets the Synthesizer's Phase Lock Loop for narrow bandwidth to improve ORFS and EVM measurements for wide modulation

Remote Command	<code>[:SENSE]:MONitor:PNOise:OPTion NORmal BWOffset</code> <code>[:SENSE]:MONitor:PNOise:OPTion?</code>
Example	<code>:MON:PNO:OPT NOR</code> <code>:MON:PNO:OPT?</code>
Dependencies	This control only appears in the M9391A
Preset	<code>NORmal</code>
State Saved	Yes
Range	<code>NORmal BWOffset</code>

3.3.8.3 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "**Global Center Freq**" on page 1828) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code> <code>:INSTrument:COUPle:FREQuency:CENTer?</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATe]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When

Mode Preset is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTrument:COUPle:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	<code>:INSTrument:COUPle:DEFault</code>
Example	<code>:INST:COUP:DEF</code>
Backwards Compatibility SCPI	<code>:GLOBal:DEFault</code>

3.3.9 Sweep

Accesses controls that enable you configure and control the acquisition of data and the X-axis parameters of the instrument. These controls might include Sweep Time, Continuous/Single, Pause/Resume, X Scale, and number of Points.

3.3.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

3 VMA Mode
3.3 Monitor Spectrum Measurement

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE

Significantly faster sweep times are available with Option FS1.

NOTE

The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE

On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe] : <meas> : SWEep : TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command `[:SENSe] : <meas> : SWEep : TIME <time>`
`[:SENSe] : <meas> : SWEep : TIME ?`

Example Channel Power measurement:
`:CHP : SWE : TIME 25ms`
`:CHP : SWE : TIME ?`

Notes In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset values are as follows:

- IBW: 29 ms
- IBWR: 108 ms
- FAST 7.5 ms

Dependencies On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time
In those instruments, "[Minimum Acquisition Time](#)" on page 1357 is available

Couplings Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time**

	changes when these parameters are changed When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically Calculated unless noted below WCDMA Mode <ul style="list-style-type: none"> - Channel Power: 1.0 msOBW: 32.6 ms - ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when Meas Method is Fast Power , the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: STATus:QUESTionable:INTEgrity:UNCalibrated Auto Function
Remote Command	[:SENSe]:<meas>:SWEep:TIME:AUTO OFF ON 0 1 [:SENSe]:<meas>:SWEep:TIME:AUTO?
Example	Channel Power measurement: :CHP:SWE:TIME:AUTO OFF :CHP:SWE:TIME:AUTO?
Preset	WCDMA Mode OFF All others ON

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

$$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$$

3 VMA Mode
3.3 Monitor Spectrum Measurement

When in Auto, this parameter's value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	<pre>[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time> [:SENSe]:<meas>:SWEep:ACQuisition:TIME? <meas> is the identifier for the current measurement; any one of CHPower- ACPower OBwidth MONitor</pre>
Example	<pre>Channel Power measurement :CHP:SWE:ACQ:TIME 500 ms :CHP:SWE:ACQ:TIME?</pre>
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Span , RBW , and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks
Auto Function	
Remote Command	<pre>[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF ON 0 1 [:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO? <meas> is the identifier for the current measurement; any one of CHPower- ACPower OBwidth MONitor</pre>
Example	<pre>Channel Power measurement: :CHP:SWE:ACQ:TIME:AUTO OFF</pre>
Preset	ON

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See ["More Information" on page 652](#)

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold
Single Mode	The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num , then the count stops incrementing, and the instrument stops sweeping See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "[Restart](#)" on page 1832 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 654

Remote `:INITiate[:IMMEDIATE]`

Command	:INITiate:REStart
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATUS:OPERation register bits 0 through 8 are cleared , except bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUEStionable register bit 9 (INTEgrity sum) is cleared The SWEEPING bit is set The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write, but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average, but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single

sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>

3 VMA Mode

3.3 Monitor Spectrum Measurement

Notes	<p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The STATus:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATus:QUESTionable register bit 9 (INTegrity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p>

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	<p>[:SENSe] : <meas> : SWEEp : ETIME?</p> <p><meas> is the identifier for the current measurement; any one of CHPower- ACPower OBWidth MONitor</p>
Example	<p>Channel Power measurement</p> <p>:CHP:SWEE:ETIME?</p>
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.3.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer

points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if Sweep is in Cont, a new trace taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message "Sweep points changed, all traces cleared" is displayed and in the 5G NR mode, Auto Sweep Points is set to OFF(0).

Remote Command	<code>[:SENSe]:MONitor:SWEEp:POINTs <integer></code> <code>[:SENSe]:MONitor:SWEEp:POINTs?</code>
Example	<code>:MON:SWE:POIN 1000</code> <code>:MON:SWE:POIN?</code>
Dependencies	This function is not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in modes that do not support Swept
Couplings	Whenever the number of sweep points change: <ul style="list-style-type: none"> - All trace data is erased - Any traces with Update Off will also go to Display Off (like going from View to Blank in the older instruments) - Sweep time is re-quantized - Any limit lines that are on will be updated - If averaging/hold is on, averaging/hold starts over - Auto Sweep Points is OFF (Only 5G NR) <p>The resolution of setting the sweep time depends on the number of points selected</p>

3 VMA Mode
3.3 Monitor Spectrum Measurement

Preset	1001 unless noted below 2001: 5GNR
State Saved	Saved in instrument state
Min	1
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

Auto Sweep Points

When **Auto Sweep Points** is **ON**, the instrument determines the points using the following calculation formula:

$$\# \text{ points} = \text{ceil}(\text{Span} / (\text{Rbw} * 1\text{e}3)) * 1000 + 1$$

Where $\text{ceil}(x)$ returns the smallest possible integer value that is greater than or equal to x .

Remote Command	<code>[:SENSe]:MONitor:SWEEp:POINts:AUTO[:STATe] OFF ON 0 1</code> <code>[:SENSe]:MONitor:SWEEp:POINts:AUTO[:STATe]?</code>
Example	<code>:MON:SWE:POIN:AUTO 0</code> <code>:MON:SWE:POIN:AUTO?</code>
Dependencies	This parameter is available only in the 5GNR mode
Preset	ON
State Saved	Yes
Range	OFF ON

3.3.10 Trace

Lets you control the acquisition, display, storage, detection, and manipulation of trace data for the available traces.

The "**Trace Control**" on [page 1736](#) tab in this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

3.3.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the Trace menu
Dependencies	For the Swept SA measurement: <ul style="list-style-type: none"> - In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View - When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled
Preset	Trace 1
State Saved	Yes

3.3.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1737 and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "View/Blank" on page 1742 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITE	:TRAC2:TYPE WRIT	See: "Clear/Write" on page 663
Trace Average	AVERage	:TRAC2:TYPE AVER	See: "Trace Average" on page 664

3 VMA Mode
3.3 Monitor Spectrum Measurement

Option	Parameter	SCPI Example	Details
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: "Max Hold" on page 665
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: "Min Hold" on page 665

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "**View/Blank**" on page 1742 state must be set to **Active** (**Update: ON, Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "**Trace Mode Backwards Compatibility Commands**" on page 661

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre>
Couplings	<p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending :TRAC:TYPE) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" ([:SENSe] :<meas>:DETECTOR:AUTO?), Detector ([:SENSe] :<meas>:DETECTOR[:FUNCTION]?) switches aligning with the switch of this parameter: "NORMAL" with WRITe (Clear Write), "AVERAge" with AVERAge, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold</p>
Preset	<p>Swept SA and Monitor Spectrum: WRITe</p> <p>All other measurements: AVERAge</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p>
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1742.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	<code>WRITE</code>
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	<code>:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK</code> <code>:TRACe[1] 2 ... 6:MODE?</code>
Backwards Compatibility Notes	<p>The legacy <code>:TRACe:MODE</code> command is retained for backwards compatibility. In conjunction with the legacy <code>:AVERage</code> command, it works as follows:</p> <ul style="list-style-type: none"> - <code>:AVERage ON OFF</code> sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the <code>[:SENSe]:AVERage[:STATe]</code> command description below - <code>:TRACe:MODE WRITE</code> sets <code>:TRACe:TYPE WRITE</code> (Clear/Write) unless average is true, in which case it sets it to <code>:TRACe:TYPE AVERage</code>. It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE MAXHold</code> sets <code>:TRACe:TYPE MAXHold</code> (Max Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE MINHold</code> sets <code>:TRACe:TYPE MINHold</code> (Min Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE VIEW</code> sets <code>:TRACe:UPDate OFF</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace

3 VMA Mode

3.3 Monitor Spectrum Measurement

-
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	<code>OFF</code>
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	<code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code>
Backwards Compatibility Notes	<p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p>

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1737 had just been selected. The effect is exactly the same as reselecting the current Trace Type again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write:** Clear and Write
- **Trace Average:** Restart Averaging
- **Max Hold:** Restart Max Hold
- **Min Hold:** Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF ; Display ON
Blank	Update OFF ; Display OFF
Background	Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update “in the background”, which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "[More Information](#)" on page 668

Notes	For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 667 and " Trace Display State On/Off " on page 667 below
Dependencies	When Signal ID is on, this key is grayed-out

3 VMA Mode
3.3 Monitor Spectrum Measurement

Couplings

Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update **ON** and Display **ON**), even if that trace type was already selected

Selecting a detector for a trace (pressing the key or sending [:SENS] :DET :TRAC) puts the trace in **Active** (Update**ON** and Display**ON**), even if that detector was already selected

Selecting a "Math Function" on page 1745 other than **OFF** for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update**ON** and Display**ON**), even if that Math Mode was already selected

Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command

For Swept SA Measurement (in SA Mode):
:TRACe[1]|2|...|6:UPDate[:STATe] ON | OFF | 1 | 0
:TRACe[1]|2|...|6:UPDate[:STATe]?

For all other measurements:
:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0
:TRACe[1]|2|3:<meas>:UPDate[:STATe]?

where <meas> is the identifier for the current measurement

Example

Make trace 2 inactive (stop updating):
:TRAC2:UPD 0

Couplings

Whenever you set **Update** to **ON** for any trace, the **Display** is set to **ON** for that trace

Preset

For Swept SA Measurement (in SA Mode):
1|0|0|0|0|0

ON for Trace 1; **OFF** for 2–6

For all other measurements:
1|0|0

ON for Trace 1; **OFF** for 2 & 3

State Saved

Saved in instrument state

Trace Display State On/Off

Remote Command

For Swept SA Measurement (in SA Mode):
:TRACe[1]|2|...|6:DISPlay[:STATe] ON | OFF | 1 | 0
:TRACe[1]|2|...|6:DISPlay[:STATe]?

For all other measurements:
:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0
:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?

where <meas> is the identifier for the current measurement

Example	<p>Make trace 1 visible: :TRAC2:DISP 1</p> <p>Blank trace 3: :TRAC3:DISP 3</p>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode): 1 0 0 0 0 0</p> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements: 1 0 0</p> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

Trace Settings Table

Lets you configure the Trace system using a visual utility.

Clear All Traces

Clears all traces from the display.

Remote Command	:TRACe:MONitor:CLEAr:ALL
Example	:TRAC:MON:CLE:ALL
Backwards Compatibility SCPI	:DISPLay:MONitor:VIEW:WINDow:TRACe:CLEAr:ALL

3.3.10.3 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Allows you to select a specific detector for the current measurement. When the detector choice is Auto, the instrument selects the detector. The selected detector depends on marker functions, trace functions, and trace averaging functions for the current measurement.

The following options are available:

AUTO	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function In the ACP measurement, when in AUTO, the detector selected is set to AVERage, unless the Radio Standard defaults state otherwise e.g., it is set to Peak for Radio Standard = PDC when Device = both MS and BTS, and when Radio Standard = NADC and Device = MS
NORMal	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
AVERage	The detector determines the average of the signal within the sweep points, using RMS averaging
POSitive Peak	The detector determines the maximum of the signal within the sweep points
SAMPLE	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
NEGative	The detector determines the minimum of the signal within the sweep points

Peak

Because they may not find a spectral component's true peak, neither **AVERage** nor **SAMPle** detectors measure amplitudes of CW signals as accurately as Peak or **NORMal**, but they do measure noise without the biases of Peak detection.

Remote Command	<code>[:SENSe]:MONitor:DETEctor:TRACe[1]2 3 AVERage NEGative NORMal POSitive SAMPle RMS</code> <code>[:SENSe]:MONitor:DETEctor:TRACe?</code>												
Example	<code>:MON:DET:TRAC NORM</code> <code>:MON:DET:TRAC?</code> <code>:MON:DET RMS</code> Sets the detector to AVERage . AVERage uses RMS averaging, so this is equivalent to selecting RMS												
Notes	The query returns a string corresponding to the detector type as shown below <table border="1" data-bbox="393 814 1406 1071"> <thead> <tr> <th>String Returned</th> <th>Definition</th> </tr> </thead> <tbody> <tr> <td>NORM</td> <td>Normal</td> </tr> <tr> <td>AVER</td> <td>Average (RMS)</td> </tr> <tr> <td>POS</td> <td>Peak</td> </tr> <tr> <td>SAMP</td> <td>Sample</td> </tr> <tr> <td>NEG</td> <td>Negative Peak</td> </tr> </tbody> </table> <p>The RMS selection sets the detector type to AVERage with RMS averaging. Therefore, if RMS has been selected, the query returns “AVER”</p>	String Returned	Definition	NORM	Normal	AVER	Average (RMS)	POS	Peak	SAMP	Sample	NEG	Negative Peak
String Returned	Definition												
NORM	Normal												
AVER	Average (RMS)												
POS	Peak												
SAMP	Sample												
NEG	Negative Peak												
Couplings	When " Detector Select Auto/Man " on page 670 is ON , the detector selected depends on the Trace (Average) type												
Preset	NORMal												
State Saved	Yes												
Range	AVERage NEGative NORMal POSitive SAMPle RMS												
Annotation	The four letter mnemonic for the detector appears in the trace window next to the trace it applies to												
Backwards Compatibility	<code>[:SENSe]:MONitor:DETEctor[:FUNCTION]</code>												
SCPI	Applied to Trace 1 only												

Detector Select Auto/Man

Sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When any detector is selected by the user, this toggles automatically set to Man (manual).

3 VMA Mode

3.3 Monitor Spectrum Measurement

Remote Command	<code>[:SENSe]:MONitor:DETEctor:TRACe[1] 2 3:AUTO ON OFF 1 0</code> <code>[:SENSe]:MONitor:DETEctor:TRACe[1] 2 3:AUTO?</code>
Example	<code>:MON:DET:TRAC2:AUTO ON</code> <code>:MON:DET:TRAC2:AUTO?</code>
Couplings	When this function is ON , the "Detector" on page 669 and "Trace Type" on page 1737 settings automatically align as follows: <ul style="list-style-type: none"> - "NORMa1" with Clear Write - "AVERAge" with AVERAge - "POSitive (Peak)" with MAXHold - "NEGative (Peak)" with MINHold
Preset	ON
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:MONitor:DETEctor:AUTO</code> Applied to Trace 1 only

3.4 IQ Waveform Measurement

The IQ Waveform measurement is a time-domain measurement that lets you view the envelope, real and imaginary components of an RF or baseband signal. It is similar in many respects to the zero-span measurement in traditional spectrum analysis but gives you direct access to the I/Q pairs of the signal, such as those that make up modern communications signals. The IQ Waveform measurement can also be used to perform general purpose power measurements to a high degree of accuracy.

You can examine the RF envelope (magnitude) of the signal, or open an I/Q Waveform window, which shows the I and Q signal waveform voltage versus time, to disclose the voltages that comprise the complex modulated waveform of a digital signal.

Measurement Commands

The general functionality of ["CONFigure" on page 2551](#), ["INITiate" on page 2552](#), ["FETCh" on page 2552](#), ["MEASure" on page 2554](#), and ["READ" on page 2553](#) are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

The following measurement commands and queries are used to configure the measurement:

<code>:INITiate:WAVeform</code>	Initiates a trigger cycle for the WAV measurement, but does not return any data. You must then use <code>:FETC:WAV[n]?</code> to retrieve data Does not change any measurement settings
<code>:CONFigure?</code>	Returns the long form name of current measurement, in this case, WAVeform
<code>:CONFigure:WAVeform</code>	Selects WAV measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 767
<code>:CONFigure:WAVeform:NDEFault</code>	Selects WAV measurement <i>without</i> affecting settings

The following queries are used to retrieve the results:

<code>:FETCh:WAVeform?</code>	Retrieves the data defined by n
<code>:MEASure:WAVeform [n]?</code>	Switches to WAV measurement, restores default values, starts the measurement, then retrieves the data defined by n
<code>:READ:WAVeform[n]?</code>	Starts the measurement, then retrieves the data defined by n

Remote Command Results

For the **:FETCH**, **:MEASure** and **:READ** queries above, the results returned depend on the **n** parameter value as follows:

n	Results Returned																								
0	Returns unprocessed I/Q trace data, as a series of trace point pairs, in Volts Each pair consists of an I value (even-indexed, starting at 0), followed by a Q value (odd-indexed)																								
1	Returns the following scalar results:																								
	<table border="1"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit, if any</th> </tr> </thead> <tbody> <tr> <td>1</td> <td> Sample Time A floating-point number representing the time between samples. This value is important when analyzing signal results (that is, when you send a query using n = 0, 2, etc.) </td> <td></td> </tr> <tr> <td>2</td> <td> Mean Power The power across the entire trace. If Averaging State is ON, as set by "Avg/Hold Number (Averaging On/Off)" on page 757, the power is for the latest acquisition </td> <td>dBm</td> </tr> <tr> <td>3</td> <td> Mean Power Averaged The power across the entire trace If Averaging State is ON, the power for N averages (the latest acquisition), as set by "Avg/Hold Number (Averaging On/Off)" on page 757 If Averaging State is OFF, the value of the mean power averaged is the same as the value of the mean power </td> <td>dBm</td> </tr> <tr> <td>4</td> <td> Number of samples The number of data points in the captured signal. This value is important when analyzing signal results (that is, when you send a query using n = 0, 2, etc.) </td> <td></td> </tr> <tr> <td>5</td> <td> Peak-to-mean ratio The ratio of the maximum signal level to the mean power. Valid values are only obtained with Averaging State OFF. If Averaging State is ON, the peak-to-mean ratio is calculated using the highest peak value, rather than the displayed average peak value </td> <td>dB</td> </tr> <tr> <td>6</td> <td> Maximum value The maximum of the most recently acquired data </td> <td>dBm</td> </tr> <tr> <td>7</td> <td> Minimum value The minimum of the most recently acquired data </td> <td>dBm</td> </tr> </tbody> </table>	#	Item	Unit, if any	1	Sample Time A floating-point number representing the time between samples. This value is important when analyzing signal results (that is, when you send a query using n = 0, 2, etc.)		2	Mean Power The power across the entire trace. If Averaging State is ON , as set by " Avg/Hold Number (Averaging On/Off) " on page 757, the power is for the latest acquisition	dBm	3	Mean Power Averaged The power across the entire trace If Averaging State is ON , the power for N averages (the latest acquisition), as set by " Avg/Hold Number (Averaging On/Off) " on page 757 If Averaging State is OFF , the value of the mean power averaged is the same as the value of the mean power	dBm	4	Number of samples The number of data points in the captured signal. This value is important when analyzing signal results (that is, when you send a query using n = 0, 2, etc.)		5	Peak-to-mean ratio The ratio of the maximum signal level to the mean power. Valid values are only obtained with Averaging State OFF . If Averaging State is ON , the peak-to-mean ratio is calculated using the highest peak value, rather than the displayed average peak value	dB	6	Maximum value The maximum of the most recently acquired data	dBm	7	Minimum value The minimum of the most recently acquired data	dBm
#	Item	Unit, if any																							
1	Sample Time A floating-point number representing the time between samples. This value is important when analyzing signal results (that is, when you send a query using n = 0, 2, etc.)																								
2	Mean Power The power across the entire trace. If Averaging State is ON , as set by " Avg/Hold Number (Averaging On/Off) " on page 757, the power is for the latest acquisition	dBm																							
3	Mean Power Averaged The power across the entire trace If Averaging State is ON , the power for N averages (the latest acquisition), as set by " Avg/Hold Number (Averaging On/Off) " on page 757 If Averaging State is OFF , the value of the mean power averaged is the same as the value of the mean power	dBm																							
4	Number of samples The number of data points in the captured signal. This value is important when analyzing signal results (that is, when you send a query using n = 0, 2, etc.)																								
5	Peak-to-mean ratio The ratio of the maximum signal level to the mean power. Valid values are only obtained with Averaging State OFF . If Averaging State is ON , the peak-to-mean ratio is calculated using the highest peak value, rather than the displayed average peak value	dB																							
6	Maximum value The maximum of the most recently acquired data	dBm																							
7	Minimum value The minimum of the most recently acquired data	dBm																							
2	Returns trace point values of the entire captured signal envelope trace data Floating-point numbers, representing the power of the signal (in dBm). There are N data points, where N is the number of samples. The period between the samples is defined by the Sample Time (see n = 1 above)																								
3	Returns unprocessed I/Q trace data, as a series of trace point values, in volts The I values are listed first in each pair, as the even-indexed values (starting at 0). The Q values are odd-indexed. The number of points returned is defined by " Meas Time " on page 760 * " Sample Rate " on page 760, and is one point less than index 0																								

n Results Returned

4 Returns conjugated I/Q trace data, in Volts, if "Invert Spectrum" on page 779 is set to **INVert**. Otherwise, returns the same unprocessed I/Q trace data as n = 0 above

3.4.1 Views

You can select the measurement view you want to use from the **Mode/Measurement/View** selector screen. You can also specify the view programmatically, using one of these commands:

View Selection by name

Specify the desired View by its name:

Remote Command	<code>:DISPlay:WAVeform:VIEW[:SElect] RFENvelope IQ</code> <code>:DISPlay:WAVeform:VIEW[:SElect]?</code>
Example	<code>:DISP:WAV:VIEW RFEN</code> <code>:DISP:WAV:VIEW?</code>
Preset	<code>RFENvelope</code>
State Saved	Saved in instrument state
Range	RF Envelope I/Q Waveform

View Selection by number

Specify the desired View by its number:

Remote Command	<code>:DISPlay:WAVeform:VIEW:NSElect <integer></code> <code>:DISPlay:WAVeform:VIEW:NSElect?</code>
Example	<code>:DISP:WAV:VIEW:NSEL 1</code> <code>:DISP:WAV:VIEW:NSEL?</code>
Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.4.1.1 RF Envelope

Windows: "RF Envelope" on page 675, "Metrics" on page 676

3 VMA Mode
3.4 IQ Waveform Measurement

Shows an RF envelope (magnitude) window and a metrics table showing the measured values for the mean power and peak-to-mean power.

3.4.1.2 I/Q Waveform

Windows: ["I/Q Waveform" on page 676](#)

Shows a window with I and Q voltages vs time. SCPI commands can also be used to query the I/Q pairs while in this View.

3.4.2 Windows

The following windows are available in this measurement.

- ["RF Envelope" on page 675](#)
- ["Metrics" on page 676](#)
- ["I/Q Waveform" on page 676](#)

3.4.2.1 RF Envelope

Displays an amplitude-vs time (time domain) graph of the envelope (magnitude) of the RF waveform:

3.4.2.2 Metrics

Shows the measured values for the mean power and peak-to-mean power of the RF Envelope result of the waveform (time domain) measurements.

Numeric Results

Name	Type	Description	Unit	Format
Mean Pwr	Float64	The mean power (dBm). This is either the power across the entire trace, or the power between markers if the markers are enabled	dBm	XX.XX dBm
Pk-to-Mean	Float64	This is the ratio of the maximum signal level to the mean power	dB	XX.XX dB
Max Pt	Float64	The maximum of the most recently acquired data	dBm	XX.XX dBm
Min Pt	Float64	The minimum of the most recently acquired data	dBm	XX.XX dBm

3.4.2.3 I/Q Waveform

Shows an amplitude-vs time (time domain) graph of the quadrature (I and Q) components of the RF waveform. This allows you to measure the phase of the waveform as well as its magnitude. The yellow trace is the I (real) component and the blue trace is the Q (imaginary) component.

3 VMA Mode
3.4 IQ Waveform Measurement

3.4.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.4.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The functionality depends on the selected window. The reference line is at the top, center, or bottom of the graticule, depending on the value of "**Ref Position**" on page 680.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RLEVel <amptd></code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:RLEV -50 dBm</code>
Couplings	When " Auto Scaling " on page 681 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-/+250.00 dBm
Annotation	Ref <value> top of graph

IQ Waveform

Remote Command	<code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALE]:RLEVel <voltage></code>
Example	<code>:DISP:WAV:VIEW2:WIND:TRAC:Y:RLEV 25 V</code>
Couplings	When " Auto Scaling " on page 681 is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	0 V
State Saved	Saved in instrument state
Min/Max	-/+250.00 V
Annotation	Ref <value> top of graph

Scale/Div

Enables you to set the units per division of vertical scale in the logarithmic display. However, since "**Auto Scaling**" on page 681 defaults to **ON**, this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** automatically changes to **OFF**.

The SCPI command and default parameters are dependent on whether the View is "**RF Envelope**" on page 674 or "**I/Q Waveform**" on page 675.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:PDIVision <rel_amp1></code>
----------------	---

3 VMA Mode
3.4 IQ Waveform Measurement

Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to "Scale Range" on page 679 as follows Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 681 is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	10.00 dB
State Saved	Saved in instrument state
Min	0.10 dB
Max	20.00 dB
Annotation	<value> dB/ left upper of graph

IQ Waveform

Remote Command	<code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <voltage></code> <code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:WAV:VIEW2:WIND:TRAC:Y:PDIV 25mV</code> <code>:DISP:WAV:VIEW2:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to "Scale Range" on page 679 as follows Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 681 is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	100.0 mV
State Saved	Saved in instrument state
Min	1.0 nV
Max	20 V
Annotation	<value> dB/ left upper of graph

Scale Range

Sets the Y-Axis scale range.

The SCPI command and default parameters depend on whether the View is "RF Envelope" on page 674 or "I/Q Waveform" on page 675.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RANGe <rel_amp1></code> <code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RANGe?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:RANG 100</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to "Scale/Div" on page 678 as follows Scale Range = Scale/Div * 10 (number of divisions) When you change a value, "Auto Scaling" on page 681 automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

IQ Waveform

Remote Command	<code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALE]:RANGe <voltage></code> <code>:DISPlay:WAVeform:VIEW2:WINDow[1]:TRACe:Y[:SCALE]:RANGe?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:RANG 1000</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to "Scale/Div" on page 678 as follows Scale Range = Scale/Div * 10 (number of divisions) When you change a value, "Auto Scaling" on page 681 automatically changes to OFF
Preset	1 V
State Saved	Saved in instrument state
Min	10 nV
Max	200 V

Ref Position

Enables you to position the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

The SCPI command and default parameters depend on whether the View is "RF Envelope" on page 674 or "I/Q Waveform" on page 675.

RF Envelope

Remote Command	<code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTER BOTTom</code> <code>:DISPlay:WAVeform:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:RPOS?</code>
Preset	<code>TOP</code>

Range	<code>Top Center Bottom</code>
Annotation	> and < are displayed both side of graph to indicate Reference Position

Auto Scaling

Enables you to toggle Auto Scaling On or Off. When the **Restart** front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results.

Remote Command	<code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:Y[:SCALe]:COUPle?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:WAV:VIEW:WIND:TRAC:Y:COUP?</code>
Couplings	When " Auto Scaling " on page 681 is On, and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change a value of Scale/Div , Ref Value , or Scale Range , Auto Scaling automatically changes

	to OFF
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON

3.4.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 682
- See ["Single-Attenuator Configuration"](#) on page 683

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1766 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1760 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary:

-
- Total Atten below 50 GHz: 30 dB
 - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 687

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1769 See " Attenuator Configurations and Auto/Man " on page 687 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1765 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual</p>

	<p>attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>							
Preset	<p>Auto</p> <p>The Auto value is 10 dB</p>

Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>							
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>		CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB							
EXA	60 dB							
All other models	70 dB							
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p> <p>Auto Function</p>							
Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO?</pre>							
Example	<p>Turn Auto Mech AttenON:</p> <pre>:POW:ATT:AUTO ON</pre>							

Dependencies	:POW:ATT:AUTO is only available in measurements that support Auto , such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1763, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 685 (or :POW:ATT) as the "main" attenuation; and the attenuation that is set by :POW:EATT as the "soft" attenuation (:POW:EATT is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1769 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 689

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1788 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1790 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode

3 VMA Mode
3.4 IQ Waveform Measurement

- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 690
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description
Auto Function	
Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily

aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 691](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

3 VMA Mode

3.4 IQ Waveform Measurement

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under ["Pre-Adjust for Min Clipping" on page 1773](#).

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "**Adjust Atten for Min Clipping**" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "**Adjustment Algorithm**" on page 693

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to

3 VMA Mode
 3.4 IQ Waveform Measurement

Selection	SCPI	Note
Elec Atten Only	ELECTrical	COMBined Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?	
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?	
Notes	The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined	
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1769 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 692 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 692 selection is Mech + Elec Atten:

3 VMA Mode
 3.4 IQ Waveform Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 692 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 VMA Mode
3.4 IQ Waveform Measurement

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.4.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:VOLTage:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT:IQ:RANG:AUTO OFF</code> <code>:VOLT:IQ:RANG:AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to YMax
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.

Remote Command	<code>[:SENSe]:POWer:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code>

3 VMA Mode
3.4 IQ Waveform Measurement

	<code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 1782 is On, the I Range value will be copied to " Q Range " on page 1781 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V" the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <amp;pl></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "[I Range](#)" on page 1779 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1779 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1782 is On, the " I Range " on page 1779 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V" the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;gt;</code> <code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain

3 VMA Mode
3.4 IQ Waveform Measurement

range parameter as the **VOLTage** form of the command

The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the **VOLTage** form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:

50 Ω: 10, 4, -2, -8

75 Ω: 8.2, 2.2, -3.8, -9.8

600 Ω: -0.8, -6.8, -12.8, -18.9

Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe] :VOLTage POWer:IQ:MIRROred OFF ON 0 1</code> <code>[:SENSe] :VOLTage POWer:IQ:MIRROred?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the " I Range " on page 1779 value is mirrored (copied) to the " Q Range " on page 1781
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.4.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting.
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements.

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBined</code>
----------------	---

	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELEctrical , COMBined , and ON) are honored and all are mapped to ELEctrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query

	via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.4.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1801](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1787](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 706](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1787
Status Bits/OPC	When centering the preselector, *OPC does not return true until the process is complete and a

dependencies subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries
The **Measuring** bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when **"Presel Center"** on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe] :POWer [:RF] :PADJust <freq></code> <code>[:SENSe] :POWer [:RF] :PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	- Does not appear in CXA-m

3 VMA Mode

3.4 IQ Waveform Measurement

- Does not appear in VXT Models M9410A/11A/15A/16A
- Does not appear in M9410E/11E/15E/16E
- Grayed-out if microwave preselector is off
- Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz
- Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz
- Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0
- Grayed-out in the **Spectrogram View**

Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"

3 VMA Mode
3.4 IQ Waveform Measurement

When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1788. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "[Internal Preamp](#)" on page 1788, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 710

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	<code>OFF</code>
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and

3 VMA Mode
3.4 IQ Waveform Measurement

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 715
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 717
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 717

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	Mode	Value
	IQ Analyzer	MPB option present and licensed: MPB
	Pulse	MPB option not present and licensed: STD

Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1791.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Preset	<code>OFF</code>
State Saved	Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be

3 VMA Mode
 3.4 IQ Waveform Measurement

used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPResel:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPreSel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

3 VMA Mode
 3.4 IQ Waveform Measurement

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)

- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1801 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code>

	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: :SAN:PFIL ON
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.4.4 BW

Opens the **BW** (Bandwidth) menu. The Digital IF BW functions control filter bandwidth and filter type. There are two filter types: Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.4.4.1 Settings

Contains the basic bandwidth functions. It is the only tab under **Bandwidth**.

Digital IF BW

Sets the Digital IF (formerly Info BW) bandwidth of the instrument. When in Auto, it is set to the value that covers carriers set by carrier configuration.

Remote Command	<code>[:SENSe]:WAVeform:DIF:BA NDwidth <freq></code> <code>[:SENSe]:WAVeform:DIF:BA NDwidth?</code>								
Example	<code>:WAV:DIF:BA ND 1kHz</code> <code>:WAV:DIF:BA ND?</code>								
Notes	Auto/Man is available only for 5G NR, LTE, LTETDD, LTEAFDD, LTEA TDD Modes								
Dependencies	To set a 2 GHz Span with option R20, the Center Frequency must be equal to or greater than 3.5 GHz To set a 4 GHz Span with option R40, the Center Frequency must be equal to or greater than 10 GHz For applications that have the IF Path Selection menu, such as the BASIC mode:								
	<table border="1"> <thead> <tr> <th>IF Path</th> <th>Maximum Value Criteria</th> </tr> </thead> <tbody> <tr> <td>Auto State</td> <td></td> </tr> <tr> <td>OFF</td> <td>The maximum value depends on which IF Path is currently selected If 10 MHz, 25 MHz, 40 MHz, 85 MHz, 125 MHz, 140 MHz or 160 MHz, 255 MHz, or 510 MHz paths are selected, the maximum value of this parameter is 10, 25, 40, 85, 125, 140 or 160 MHz, 255 MHz, or 510 MHz respectively</td> </tr> <tr> <td>ON</td> <td>The maximum value is the maximum Digital IF BW available in the instrument, regardless of the current IF Path Selection For example, if the instrument has the options B25, B40, and B1X installed, the maximum available Digital IF BW of the instrument is 160 MHz. Thus, if IF Path Auto is ON and IF Path Selection is 25 MHz, the maximum Digital IF BW is <i>not</i> limited to 25 MHz, but is 160 MHz</td> </tr> </tbody> </table>	IF Path	Maximum Value Criteria	Auto State		OFF	The maximum value depends on which IF Path is currently selected If 10 MHz, 25 MHz, 40 MHz, 85 MHz, 125 MHz, 140 MHz or 160 MHz, 255 MHz, or 510 MHz paths are selected, the maximum value of this parameter is 10, 25, 40, 85, 125, 140 or 160 MHz, 255 MHz, or 510 MHz respectively	ON	The maximum value is the maximum Digital IF BW available in the instrument, regardless of the current IF Path Selection For example, if the instrument has the options B25, B40, and B1X installed, the maximum available Digital IF BW of the instrument is 160 MHz. Thus, if IF Path Auto is ON and IF Path Selection is 25 MHz, the maximum Digital IF BW is <i>not</i> limited to 25 MHz, but is 160 MHz
IF Path	Maximum Value Criteria								
Auto State									
OFF	The maximum value depends on which IF Path is currently selected If 10 MHz, 25 MHz, 40 MHz, 85 MHz, 125 MHz, 140 MHz or 160 MHz, 255 MHz, or 510 MHz paths are selected, the maximum value of this parameter is 10, 25, 40, 85, 125, 140 or 160 MHz, 255 MHz, or 510 MHz respectively								
ON	The maximum value is the maximum Digital IF BW available in the instrument, regardless of the current IF Path Selection For example, if the instrument has the options B25, B40, and B1X installed, the maximum available Digital IF BW of the instrument is 160 MHz. Thus, if IF Path Auto is ON and IF Path Selection is 25 MHz, the maximum Digital IF BW is <i>not</i> limited to 25 MHz, but is 160 MHz								
Couplings	Changing " Sample Rate " on page 760 automatically changes the state to Man

B1Y	802.11ac(160 MHz)	160 MHz	
All others			100 kHz

Filter Type

Lets you select the type of bandwidth filter that is used.

The following types are available:

Type	SCPI	Notes
Gaussian	<code>GAUSSian</code>	See " Gaussian " on page 728
Flat Top	<code>FLATtop</code>	See " Flattop " on page 728
Short Nyquist	<code>SNYquist</code>	Available only when Option B40, B85, B1A, or B1X WBDIF installed
Raised Short Nyquist	<code>RSNYquist</code>	
Raised Cosine	<code>RCOSine</code>	
Root Raised Cosine	<code>RRCosine</code>	

Remote Command	<pre>[:SENSe]:WAVeform:DIF:FILTer:TYPE GAUSSian FLATtop [:SENSe]:WAVeform:DIF:FILTer:TYPE? With DIF40 and/or WBDIF: [:SENSe]:WAVeform:DIF:FILTer:TYPE GAUSSian FLATtop SNYquist RSNYquist RCOSine RRCosine [:SENSe]:WAVeform:DIF:FILTer:TYPE?</pre>								
Example	<pre>:WAV:DIF:FILT:TYPE GAUS :WAV:DIF:FILT:TYPE?</pre>								
Dependencies	<p>Gaussian and Flattop are available in all DIF configurations. For the other filter types, the filters are only available when Option DP2, B40, or a wider IF Bandwidth option is installed</p> <p>When you select a filter type other than Gaussian or Flattop when using Option B40, B85, B1A, or B1X WBDIF, but then you either explicitly select an IF Path Selection of 10 MHz or 25 MHz (B10M/B25M), or set a Digital IF BW equal to or narrower than 25 MHz with IF Path Selection Auto ON, the default filter type (FLATtop) is automatically selected. If you then again set the IF Path Selection to 85 MHz (B85), 125 MHz (B125M), or 140 MHz (B140M), the filter type remains as FLATtop</p>								
Couplings	See the description above								
Preset	<table border="1"> <thead> <tr> <th>Modes</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>BASIC with DP2, B40, or wider, IF Bandwidth option</td> <td>FLATtop</td> </tr> <tr> <td>5G NR, WLAN, Channel Quality</td> <td>FLATtop</td> </tr> <tr> <td>All others</td> <td>GAUSSian</td> </tr> </tbody> </table>	Modes	Value	BASIC with DP2, B40, or wider, IF Bandwidth option	FLATtop	5G NR, WLAN, Channel Quality	FLATtop	All others	GAUSSian

All others	GAUSSian								
State Saved	Saved in instrument state								
Range	<pre>GAUSSian FLATtop</pre> <p>When Option DP2, B40, or wider IF Bandwidth option is installed, the range is as follows</p> <pre>GAUSSian FLATtop SNYquist RSNYquist RCOSine RRCosine</pre>								
Backwards Compatibility SCPI	<pre>[:SENSe]:WAVeform:BANDwidth:SHAPE [:SENSe]:WAVeform:BWIDth:SHAPE [:SENSe]:WAVeform:BANDwidth BWIDth [:RESolution]:TYPE</pre>								

Gaussian

When Option DP2, B40, or wider IF Bandwidth option is installed, the capability for arbitrary Digital IF bandwidths is available. However, for instruments without DP2, B40, or wider IF Bandwidth option, the selectable Gaussian filter bandwidths are predetermined. There are 160 Info BWs (RBWs) arranged in a 24-per-decade sequence from 1 Hz through 3 MHz, plus 4, 5, 6 and 8 MHz settings.

Flattop

When Option DP2, B40, or wider IF Bandwidth option is installed, the capability for arbitrary Digital IF bandwidths is available. However, for instruments without Option

3 VMA Mode
 3.4 IQ Waveform Measurement

DP2, B40 or wider IF Bandwidth option, , the selectable Flattop filter bandwidths are predefined. There are 134 Digital IF BWs (RBWs) arranged in a 6-per-decade sequence from 3 Hz through 3 MHz, plus 4, 5, 6 and 8 MHz settings.

Filter BW

This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed.

Remote Command	<code>[:SENSe] :WAVeform:DIF:FILTer:BANDwidth <freq></code> <code>[:SENSe] :WAVeform:DIF:FILTer:BANDwidth?</code>
Example	<code>:WAV:DIF:FILT:BAND 1MHz</code> <code>:WAV:DIF:FILT:BAND?</code>
Dependencies	Only available when Option DP2, B40, or wider IF Bandwidth option is installed. Disabled when the Filter Type is FLATtop
Couplings	Sets the same value as the current Digital IF BW value on Preset, or when Channel Filter Bandwidth Auto is ON
Preset	Same value as Digital IF BW
State Saved	Saved in instrument state
Min	10 Hz
Max	Clipped to the current Digital IF BW value

Auto Function

Remote Command	<code>[:SENSe] :WAVeform:DIF:FILTer:BANDwidth:AUTO ON OFF 1 0</code> <code>[:SENSe] :WAVeform:DIF:FILTer:BANDwidth:AUTO?</code>
Example	<code>:WAV:DIF:FILT:BAND:AUTO 0</code> <code>:WAV:DIF:FILT:BAND:AUTO?</code>
Preset	ON
Range	Auto Man

Filter Alpha

Sets the filter alpha for the DIF filter. This feature is only available when Option DP2, B40, or wider IF Bandwidth option is installed.

Remote Command	<code>[:SENSe] :WAVeform:DIF:FILTer:ALPHa <real></code> <code>[:SENSe] :WAVeform:DIF:FILTer:ALPHa?</code>
Example	<code>:WAV:DIF:FILT:ALPH 0.5</code> <code>:WAV:DIF:FILT:ALPH?</code>

Preset	0.2
State Saved	Saved in instrument state
Min	0.01
Max	1.00
Backwards Compatibility SCPI	<code>[:SENSe] :WAVeform:WBIF:FILTer:ALPHA</code>

Channel Filter Bandwidth (Backwards Compatibility Remote Command Only)

Dependencies	Only available when Option DP2, B40, or wider IF Bandwidth option is installed
Couplings	The value is determined by the following equation $\text{ChannelFilterBwBwcc} = (\text{ChannelFilterBw} / (\text{DigitalIFBw} * \text{OverSampleRatio}))$
Preset	0.8
State Saved	Saved in instrument state
Min	0.01
Max	1.0
Backwards Compatibility SCPI	<code>[:SENSe] :WAVeform:WBIF:FILTer:BANDwidth <real></code> <code>[:SENSe] :WAVeform:WBIF:FILTer:BANDwidth?</code>

3.4.5 Display

Lets you configure display items for the current Mode, Measurement, View, or Window.

3.4.5.1 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "[Views](#)" on page 674.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code>
--------	---

3 VMA Mode
3.4 IQ Waveform Measurement

Command	<code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node</p> <pre>:DISPlay:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code>

	Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN “Baseband”</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELeTe:ALL</code>
Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example:</p> <p><code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p>

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined</p>

3.4.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	<code>ON</code>
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<p><code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code></p> <p>This command is accepted for backwards compatibility with older instruments, but the <code>WINDow</code>, <code>TRACe</code> and <code>GRID</code> parameters are ignored</p>

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

3 VMA Mode
 3.4 IQ Waveform Measurement

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPLAY:VIEW:ADVANCED:SELECT</code>
Rename User View	<code>:DISPLAY:VIEW:ADVANCED:RENAME</code>
Delete User View	<code>:DISPLAY:VIEW:ADVANCED:DELETE</code>
Create User View	<code>:DISPLAY:VIEW:ADVANCED:NAME</code>
Select Screen	<code>:INSTRUMENT:SCREEN:SELECT</code>
Delete Screen	<code>:INSTRUMENT:SCREEN:DELETE</code>
Delete All But This Screen	<code>:INSTRUMENT:SCREEN:DELETE:ALL</code>
Add Screen	<code>:INSTRUMENT:SCREEN:CREATE</code>
Rename Screen	<code>:INSTRUMENT:SCREEN:RENAME</code>
Sequencer On/Off	<code>:SYSTEM:SEQUENCER</code>

Remote Command	<code>:DISPLAY:ENABLE OFF ON 0 1</code> <code>:DISPLAY:ENABLE?</code>
Example	<code>:DISP:ENAB OFF</code>
Couplings	<code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code>
Preset	ON Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTEM:PRESET</code>
State Saved	Not saved in instrument state
Backwards Compatibility Notes	<code>:SYST:PRES</code> no longer turns on <code>:DISPLAY:ENABLE</code> as it did in legacy analyzers

3.4.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.4.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a Global tab in its Meas Setup menu.

The Center Freq function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus, you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ, and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

For more details, see the following:

- ["RF Center Freq \(Remote Command Only\)" on page 742](#)
- ["Ext Mix Center Freq \(Remote Command Only\)" on page 742](#)
- ["I/Q Center Freq \(Remote Command Only\)" on page 743](#)

3 VMA Mode
 3.4 IQ Waveform Measurement

- ["Center Frequency Presets" on page 740](#)
- ["VXT Models with Radio Heads/CIU Frequency Range" on page 742](#)

Remote Command	<code>[:SENSe] :FREQuency:CENTer <freq></code> <code>[:SENSe] :FREQuency:CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of CF Step : <code>:FREQ:CENT UP</code> Return the current value of Center Frequency : <code>:FREQ:CENT?</code>
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input <ul style="list-style-type: none"> – For RF input it is equivalent to <code>FREQ:RF:CENT</code> – For I/Q input it is equivalent to <code>FREQ:IQ:CENT</code> – For External Mixer it is equivalent to <code>FREQ:EMIX:CENT</code> Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 740 , "RF Center Freq (Remote Command Only)" on page 742 , "Ext Mix Center Freq (Remote Command Only)" on page 742 , "I/Q Center Freq (Remote Command Only)" on page 743 and "VXT Models with Radio Heads/CIU Frequency Range" on page 742
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 740 , "RF Center Freq (Remote Command Only)" on page 742 , "Ext Mix Center Freq (Remote Command Only)" on page 742 , "I/Q Center Freq (Remote Command Only)" on page 743 and "VXT Models with Radio Heads/CIU Frequency Range" on page 742
Status Bits/OPC dependencies	Non-overlapped Auto Function (MSR, LTE-Advanced FDD/TDD and 5G NR Modes Only)
Remote Command	<code>[:SENSe] :FREQuency:CENTer:AUTO ON OFF 1 0</code> <code>[:SENSe] :FREQuency:CENTer:AUTO?</code>
Example	<code>:FREQ:CENT:AUTO OFF</code> <code>:FREQ:CENT:AUTO?</code>
Dependencies	Only available for Monitor Spectrum, Power Stat CCDF and IQ waveform measurements in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Couplings	When Center Frequency is changed, state is automatically changed to Manual

Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled. When **Carrier Reference Frequency** changes:

Center Frequency : Auto **Center Frequency = Carrier Reference Frequency + Center Frequency Offset** (fixed)

Center Frequency : Man **Center Frequency (fixed) = Carrier Reference Frequency + Center Frequency Offset**

Preset	ON
State Saved	Saved in instrument state
Range	Auto Man

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz

3 VMA Mode
 3.4 IQ Waveform Measurement

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq (Remote Command Only)

Specifies the RF Center Frequency. Sets the **Center Frequency** to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically, instrument maximum frequency - 5 Hz

Ext Mix Center Freq (Remote Command Only)

Specifies the External Mixer Center Frequency. Sets the **Center Frequency** to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>

3 VMA Mode
3.4 IQ Waveform Measurement

Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you return to the settings that existed when you left External Mixing. So, you return to the band you were in, with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore the Span setting from the other input is retained. Thus, the instrument returns to the Span setting from the previous input, limited as necessary by the current mixer setup
Preset	<p>When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies</p> <p>Note that, if the current measurement has a limited Span available to it, and cannot achieve the span shown in the table (Span = Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets Center Frequency to the midpoint of the Start and Stop Freq values in the Harmonic Table</p> <p>When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after Restore Input/Output Defaults, if you go into External Mixing and do a <i>Mode Preset</i> while in the Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz</p>
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band +5 Hz
Max	The maximum frequency in the currently selected mixer band –5 Hz

I/Q Center Freq (Remote Command Only)

Specifies the I/Q Center Frequency. Sets the **Center Frequency** to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQuency :IQ :CENTer?</code>
Example	<code>:FREQ:IQ:CENT: 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	-/+40.049995 MHz

CF Step

Lets you change the step size for "**Center Frequency**" on page 738, and Start/Stop frequency. Once a step size has been selected and the **Center Frequency** function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the Start and Stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq></code> <code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?</code>
Example	Increase the current Center Frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Only available in VMA, W-CDMA, and WLAN Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key fails, and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	Auto
State Saved	Saved in instrument state
Min/Max	-/+ (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped
Auto Function	
Remote Command	<code>[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe]:FREQuency:CENTer:STEP:AUTO?</code>
Example	<code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Preset	ON

3.4.7 Marker

Displays a menu that enables you to select, set up and control the markers for the current measurement.

If there are no active markers, **Marker** selects **Marker 1**, sets it to **POSiTion** (Normal) mode, and places it at the center of the display. If the selected marker is **OFF**, it is set to **POSiTion** mode and placed at the center of the screen, on the trace determined by the Marker Trace rules.

For details of the **POSiTion**, **DELTA**, and **OFF** mode options, see "**Marker Mode**" on page 747.

3.4.7.1 Select Marker

Sets the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

For any menu that includes **Select Marker**, the first control is always "**Marker Time**" on page 745.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for POSiTion and Delta markers

3.4.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection for "**Marker Mode**" on page 747 (**POSiTion**, **DELTA**, or **OFF**) for the selected marker, as well as additional functions that help you use markers.

Marker Time

This is the fundamental control that you use to move a marker around on the trace. Because it is the default active function in the **Marker** menu, all you need to do is press **Marker** and turn the knob to move the marker left and right on the display. This is always the first control on any **Marker** menu page that follows the Selected Marker.

The SCPI command sets the marker X-Axis value in the current marker X-Axis Scale unit. The marker that is addressed becomes the selected marker. It has no effect (other than to cause the marker to become selected) if the control mode is **OFF**, but it is the SCPI equivalent of entering an X value if the control mode is **POSiTion** or **DELTA**.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X <time></code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:WAV:MARK1:X 1</code> <code>:CALC:WAV:MARK1:X?</code>
Notes	If no suffix is sent it will use the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an invalid suffix message will be generated The query returns the marker's absolute X-Axis value if the control mode is POStion . It returns the offset from the marker's reference marker if the control mode is DELTA . The query is returned in the fundamental units for the current marker X-Axis scale: seconds for Time . If the marker is OFF the response is Not A Number
Dependencies	Grayed-out, and displays three dashes, for the value when the selected Marker is OFF
Preset	LTE, LTE-A, 5G NR Modes: 5ms All other Modes: 1.0 ms
Min/Max	-/+infinity Unlike legacy instruments, where the markers were forced to be on screen, X-Series marker values are not limited and do not clip
Backwards Compatibility SCPI	<code>:CALCulate:MARKer[1] 2 ... 4:X:CENTer</code> This alias is provided for compatibility with the Band Power function in PSA and ESA

Marker X Axis Position (Remote Command Only)

Sets the marker X position in trace points. It has no effect if the control mode is **OFF**, but is the SCPI equivalent of entering a value if the control mode is Normal or Delta. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X:POStion <real></code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:X:POStion?</code>
Example	<code>:CALC:WAV:MARK:X:POS 500</code> <code>:CALC:WAV:MARK:X:POS?</code>
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is POStion , or the offset from the marker's reference marker in trace points if the control mode is DELTA . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points
Preset	After a preset, all markers are turned OFF , so the query returns a <i>Not A Number (NAN)</i>
State Saved	No
Min/Max	-/+9.9E+37

Marker Y Axis Value (Remote Query Only)

Queries the marker Y-Axis result value in the current marker Y-Axis unit. The “result” of a marker is the value that is displayed on the second line of the Marker Result

3 VMA Mode
 3.4 IQ Waveform Measurement

block. To properly interpret the returned value, you must also know how the instrument's Y-Axis Unit is set, as described below.

A marker can have up to two results, only one of which is displayed or returned in a query, as follows:

- **Absolute** Result: every marker has an Absolute Result. For **POSition** and **DELTA** markers, the Y-axis value of the trace point the marker is currently on. The Absolute Result is displayed in the result block or returned as a query, unless the marker control mode is **DELTA**
- **Relative** Result: if a marker's control mode is **DELTA**, the *relative* result is displayed in the result block or returned in a query. This is the ratio of the Absolute Result of a delta marker to the Absolute Result of its reference marker. The ratio is expressed in dB

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:Y?</code>
Example	<code>:CALC:WAV:MARK11:Y?</code>
Notes	<p>When the marker is on, IQ waveform returns I and Q values</p> <p>Case #1 - Trace RF, I or Q: returns a single double value</p> <pre>>:CALC:WAV:MARK1:Y? -2.402406506109E+001</pre> <p>Case #2 - Trace IQ: returns a double array of two values, the first is I, and the second is Q</p> <pre>>:CALC:WAV:MARK1:Y? -3.006944493834E-003,+9.9870666467354E-004</pre> <p>The IQ selection is for backwards compatibility purposes. For new designs, use the I and/or Q selection instead</p> <p>You must be in a Mode that includes the Waveform measurement to use this command. Use <code>:INSTru-ment:SElect</code> to set the Mode</p>
Preset	Result depends on the marker setup and signal source
State Saved	No
Backwards Compatibility SCPI	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCTion:RESult?</code>

Marker Mode

Sets the marker control mode to **POSition**, **DELTA**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **POSition (Normal)** and places it at the center of the screen on the trace determined by the

Marker Trace rules. At the same time, Marker X-Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MODE POSition DELTa OFF</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MODE?</code>
Example	<code>:CALC:WAV:MARK:MODE OFF</code> <code>:CALC:WAV:MARK:MODE?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELTA OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Command

Sets or queries the state of a marker. Setting a marker that is **OFF** to state **ON** or 1 puts it in **POSition** mode and places it at the center of the screen.

Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:STATe OFF ON 0 1</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:STATe?</code>

Delta Marker (Reset Delta)

Pressing this control has the same effect as pressing the **DELTA** selection in "**Marker Mode**" on page 747. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:WAVeform:MARKer:AOff
Example	:CALC:WAV:MARK:AOff

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By “equal X-Axis movement” we mean that we preserve the difference between each marker’s X-Axis value (in the fundamental x-axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off-screen.

Remote Command	:CALCulate:WAVeform:MARKer:COUPle[:STATe] ON OFF 1 0
Example	:CALC:WAV:MARK:COUP ON :CALC:WAV:MARK:COUP?
Preset	OFF Presets on Mode Preset and "All Markers Off" on page 749
State Saved	Saved in instrument state

3.4.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the **Delta** marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.
 Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Time" on page 745 in Settings.

Peak Search

Moves the selected marker to the trace point that has the maximum Y-Axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MAXimum</code>
Example	<code>:CALC:WAV:MARK2:MAX</code> <code>:SYST:ERR?</code> can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does <i>not</i> work when the selected marker is located on the Polar trace. In this case, the command is ignored

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was **OFF**, then it is turned **ON** as a **POSition** marker, and a peak search is performed.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:MAXimum:NEXT</code>
Example	<code>:CALC:WAV:MARK:MAX:NEXT</code>
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

3 VMA Mode
 3.4 IQ Waveform Measurement

If the selected marker is **OFF**, it is turned **ON** before the minimum search is performed.

Remote Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:MINimum
Example	:CALC:WAV:MARK:MIN
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Marker Delta

Pressing this control has the same effect as pressing **Delta** in "**Marker Mode**" on [page 747](#) on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a **Peak Search** and change the marker's control mode to **Delta**, without having to access two separate menus.

3.4.7.4 Pk Search Config

Contains controls that let you set up the **Peak Search** functions.

Since the **Pk Search Config** functions are independent of the selected **Marker**, the **Select Marker** control does not appear while in **Pk Search Config**.

Peak Search Range

Lets you specify the range of trace to perform peak search actions specified in the **Peak Search** menu.

Option	SCPI	Behavior
Full	FULL	Peak Search actions will be performed on the entire trace
Manual	MANual	Specifies the range of the trace to which Peak Search actions will apply

Remote Command	:CALCulate:WAVeform:MARKer:PEAK:SEARch:RANGe FULL MANual
Example	:CALC:WAV:MARK:PEAK:SEAR:RANG FULL
Preset	FULL
State Saved	Saved in instrument state
Range	FULL MANual

Peak Search Range Start

Specifies the start of the range, in seconds, to which **Peak Search** actions are applied. Displays as a green vertical line, with the label **Pk Search Start** on the left, as shown below.

Remote Command	<code>:CALCulate:WAVEform:MARKer:PEAK:SEARch:RANGe:STARt <time></code> <code>:CALCulate:WAVEform:MARKer:PEAK:SEARch:RANGe:STARt?</code>
Example	<code>:CALC:WAV:MARK:PEAK:SEAR:RANG:STAR 0.001</code>
Dependencies	Disabled when Peak Search Range is set to Full.
Preset	0.0 ms
Min/Max	0.0/+Meas Time

Peak Search Range Stop

Specifies the end of the range, in seconds, to which **Peak Search** actions are applied. Displays as a green vertical line, with the label **Pk Search Stop** on the left, as shown below.

Remote Command	<code>:CALCulate:WAVEform:MARKer:PEAK:SEARch:RANGe:STOP <time></code> <code>:CALCulate:WAVEform:MARKer:PEAK:SEARch:RANGe:STOP?</code>
Example	<code>:CALC:WAV:MARK:PEAK:SEAR:RANG:STOP 0.001</code>
Dependencies	Disabled when Peak Search Range is set to Full.
Preset	0.0 ms
Min/Max	0.0/+Meas Time

3.4.7.5 Marker Function

The controls in this tab perform post-processing operations on marker data.

The **Marker Function** menu controls which marker functions are turned on, and allows you to adjust the setup parameters for each function. These parameters include the following, but only one parameter can be assigned to a given marker:

- Marker Noise
- Interval Power
- Interval Density
- Off

More Information

In the Waveform measurement, post-processing operations on markers are based on the measurement specifications. **Marker Functions** are distinct from measurement functions, which automatically perform complex sequences of setup, data acquisition, and display operations, to measure specified signal characteristics. **Marker Functions** are specified for each individual marker, and may be turned on individually for each marker.

Marker Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as ["Marker Time" on page 745](#) in **Settings**.

Interval Function

Sets the marker control function type to one of:

Option	Parameter
Marker Noise	NOISe
Interval Power	BPOWer
Interval Density	BDENsity
Marker Function Off	OFF

All interactions and dependencies detailed under the control description are enforced when the remote command is sent.

Remote Command	:CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNctIon NOISe BPOWer BDENsity OFF :CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNctIon?
Example	:CALC:WAV:MARK:FUNC BPOW :CALC:WAV:MARK:FUNC?
Preset	OFF

State Saved	Saved in instrument state
Range	Marker Noise Interval Power Interval Density Off
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Interval Span

Sets the width of the Span for the selected marker.

Remote Command	<code>:CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNCtion:BAND:SPAN <time></code> <code>:CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNCtion:BAND:SPAN?</code>
Example	<code>:CALC:WAV:MARK:FUNC:BAND:SPAN 20 ms</code> <code>:CALC:WAV:MARK:FUNC:BAND:SPAN?</code>
Couplings	Changing Interval Span necessarily changes " Interval Left " on page 754 and " Interval Right " on page 754
Preset	10% of Meas Time
State Saved	Saved in instrument state
Min	0
Max	100 s

Interval Left

Sets the left edge time for the band of the selected marker.

Remote Command	<code>:CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNCtion:BAND:LEFT <time></code> <code>:CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNCtion:BAND:LEFT?</code>
Example	<code>:CALC:WAV:MARK12:FUNC:BAND:LEFT 1 s</code> <code>:CALC:WAV:MARK12:FUNC:BAND:LEFT?</code>
Couplings	Changing Interval Left necessarily changes " Interval Span " on page 754 and " Interval Right " on page 754
Preset	5% of Meas Time
State Saved	Yes
Min	0
Max	100 s

Interval Right

Sets the right edge time for the band of the selected marker.

Remote	<code>:CALCulate:WAVEform:MARKer[1] 2 ... 12:FUNCtion:BAND:RIGHT <time></code>
--------	--

Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:FUNCtion:BAND:RIGHT?
Example	:CALC:WAV:MARK12:FUNC:BAND:RIGH 1 s :CALC:WAV:MARK12:FUNC:BAND:RIGH?
Notes	You must be in the IQ Waveform measurement to use this command
Couplings	Changing Interval Right necessarily changes " Interval Left " on page 754 and " Interval Span " on page 754
Preset	5% of Meas Time
State Saved	Yes
Min	0
Max	100 s

3.4.7.6 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as "**Marker Time**" on page 745 in **Settings**.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "*reference marker*" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	:CALCulate:WAVeform:MARKer[1] 2 ... 12:REFerence <integer> :CALCulate:WAVeform:MARKer[1] 2 ... 12:REFerence?
Example	:CALC:WAV:MARK:REF 8 :CALC:WAV:MARK:REF?
Notes	This command causes the marker specified with the subopcode to become selected A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried, a single value is returned (the specified marker number's relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker

	If the reference marker is OFF , it is turned on in POSition mode at the Delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if Marker 2 is selected, then its default reference marker is Marker 3. The exception is Marker 12, which has a default reference of Marker 1 Set to default by Restore Mode Defaults . Not reset by Marker Off , All Markers Off , or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Range	1 to 12 Remote Command only: if the range is exceeded, then the value is clipped
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	<code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:TRACe RFENvelope I Q IQ</code> <code>:CALCulate:WAVeform:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:WAV:MARK:TRAC RFEN</code> <code>:CALC:WAV:MARK:TRAC?</code>
Notes	The IQ selection is for backwards compatibility. For new designs, use the I and/or Q selection instead
Preset	RFEN
State Saved	Yes
Range	RFEN velope I Q IQ

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. It is the same as "[Marker Settings Diagram](#)" on page 748 in **Settings**.

3.4.8 Meas Setup

Contains functions for setting up the measurement parameters, and for setting up parameters global to all measurements in the Mode.

3.4.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Number (Averaging On/Off)

Sets the number of sweeps (average counts) that are averaged. After the specified number of sweeps, the "Average Mode" on page 757 (terminal control) setting determines the averaging action.

Also lets you turn Averaging on or off.

Remote Command	<code>[:SENSe]:WAVeform:AVERage:COUNT <integer></code> <code>[:SENSe]:WAVeform:AVERage:COUNT?</code>
Example	<code>:WAV:AVER:COUN 1001</code> <code>:WAV:AVER:COUN?</code>
Preset	10
State Saved	Saved in instrument state
Min/Max	1/20001
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N, where n is the current average and N is the average count

Auto Function

Remote Command	<code>[:SENSe]:WAVeform:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:WAVeform:AVERage[:STATe]?</code>
Example	<code>:WAV:AVER ON</code> <code>:WAV:AVER?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON

Average Mode

Sets the Average Mode:

- **EXponential**, The measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
- **REPeat**: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	<code>[:SENSe]:WAVeform:AVERage:TCONtrol EXponential REPeat</code> <code>[:SENSe]:WAVeform:AVERage:TCONtrol?</code>
Example	<code>:WAV:AVER:TCON REP</code>

	<code>:WAV:AVER:TCON?</code>
Preset	<code>EXPonential</code>
State Saved	Saved in instrument state
Range	<code>EXPonential REPeat</code>

Average Type

Sets the type of averaging. When **AUTO** is selected, the instrument chooses the type of averaging. Available Average Types are:

Option	Parameter
Log-Pwr Avg	<code>LOG</code>
Power (RMS)	<code>RMS</code>
Voltage	<code>SCALar</code>

When one of the average types is selected manually, the instrument uses that type regardless of other instrument settings, and shows **Man** on the **Average Type** control.

Remote Command	<code>[:SENSe] :WAVeform:AVERage:TYPE LOG MAXimum MINimum RMS SCALar</code> <code>[:SENSe] :WAVeform:AVERage:TYPE?</code> For EXT-C, E6630A, E6640A, M90XA, use the following command <code>[:SENSe] :WAVeform:AVERage:TYPE LOG RMS SCALar</code>
Example	<code>:WAV:AVER:TYPE RMS</code> <code>:WAV:AVER:TYPE?</code>
Notes	The selections MAX and MIN are retained for backwards compatibility, but they are removed from the front panel access because they are not an Average function
Couplings	AUTO selects Power (RMS) averaging if a Marker Function (Marker Noise, Band/Intvl Power) is on
Preset	<code>RMS</code>
State Saved	Saved in instrument state
Range	Log-Pwr Avg Power (RMS) Voltage Auto Function
Remote Command	<code>[:SENSe] :WAVeform:AVERage:TYPE:AUTO ON OFF 1 0</code> <code>[:SENSe] :WAVeform:AVERage:TYPE:AUTO?</code>
Example	<code>:WAV:AVER:TYPE:AUTO 0</code> <code>:WAV:AVER:TYPE:AUTO?</code>
Preset	<code>ON</code>

Time Avg Num

Sets the number of HW averages to be executed per each data acquisition.

HW Averaging

Changes the number of time averages to be made using hardware. This averaging is much faster than the standard averaging done in software. The hardware averaging is done on the complex voltage time trace data before any measurement application averaging is done. Both types of averaging (HW and SW) can be done on the same measurement data.

When time averaging is being done in HW, each trace update represents N fresh data acquisitions averaged together, where N is the number of time averages. You cannot access the individual time data. Note that this averaging is done prior to the SW averaging done within the application. Thus, if time averaging is turned on, the trace in this measurement shows the result of HW averaging even if the normal (SW) averaging is turned off. Subsequent normal (SW) averaging is orthogonal to this hardware-based time averaging.

Thus, it is possible to turn off normal (SW) averaging within the application but still have the HW averaging set to a certain number greater than 1. In other words, turning averaging off within the measurement will not affect HW averaging. If HW averaging needs to be turned off, simply set the HW Averaging parameter to 1.

The **Auto/Man** feature of **Time Avg Num** works differently than other parameters. Since it is time averaging, a trigger source something other than **Free Run** should be used to synchronize successive data acquisitions to avoid cancelling out the signal to be measured. It is most useful for a periodic signal with known periods used in conjunction with the Periodic trigger. Thus, when in **Auto**, the Trigger Source automatically changes to **Periodic** trigger when **Time Avg Num** is turned **ON**. The trigger period is set to the current Meas Time value. Any changes to Meas Time change the **Periodic** trigger period to the same value and vice versa. If a trigger source other than **Periodic** trigger is manually selected, the **Time Avg Num Auto/Man** toggle is set to **Man**.

Remote Command	<code>[:SENSe]:WAVeform:AVERage:TACount <integer></code> <code>[:SENSe]:WAVeform:AVERage:TACount?</code>
Example	<code>:WAV:AVER:TAC 10</code> <code>:WAV:AVER:TAC?</code>
Notes	Only available when Option DP2, B40, or wider IF Bandwidth option is installed
Preset	1
State Saved	Saved in instrument state
Min/Max	1/65535

Auto Function

Remote Command	<code>[:SENSe]:WAVeform:AVERage:TACount:AUTO OFF ON 0 1</code> <code>[:SENSe]:WAVeform:AVERage:TACount:AUTO?</code>
Example	<code>:WAV:AVER:TAC:AUTO ON</code> <code>:WAV:AVER:TAC:AUTO?</code>
Preset	ON
Range	Auto Man

Meas Time

Lets you set how long the measurement is performed. X Scale *only* changes the scale of the display.

Remote Command	<code>[:SENSe]:WAVeform:SWEp:TIME <time></code> <code>[:SENSe]:WAVeform:SWEp:TIME?</code>
Example	<code>:WAV:SWE:TIME 50 ms</code> <code>:WAV:SWE:TIME?</code>
Notes	Specifies and returns how long the measurement is performed. It is the time record length of the measurement waveform. The Max time may be reduced when the sample frequency is high due to the memory limitation
Preset	LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR Modes: 10 ms All other Modes: 2.000000 ms
State Saved	Saved in instrument state
Range	1.000 us to 100.00 s
Min/Max	1.000 us/100.0 s 1.000 us/3200 s

Sample Rate

Sets an arbitrary sample rate for the acquired data to be processed.

Remote Command	<code>[:SENSe]:WAVeform:SRATe <freq></code> <code>[:SENSe]:WAVeform:SRATe?</code>
Example	<code>:WAV:SRAT 1.3636 MHz</code>
Notes	The command and query are available when Option DP2, B40, or wider IF Bandwidth option is installed. For other configurations, only the query is available
Dependencies	To set a 2.4 GHz Sample Rate with Options R15 or R20, Center Frequency must be greater than or equal to 3.5 GHz To set a 5.1 GHz Sample Rate with Option R40, Center Frequency must be greater than or equal to 10 GHz

3 VMA Mode
3.4 IQ Waveform Measurement

Preset	Mode	Value
	5G NR, LTEA FDD/TDD	Automatically calculated
	BASIC	125.0 kHz
	BASIC	100 MHz
	EDGE GSM	637.5 kHz
	MSR	125.0 kHz
	PNOISE	125.0 kHz
	WCDMA	125.0 kHz
	WLAN	31.25 MHz
Min/Max	12.5 Hz/Option dependent For Option DP2, B40 or wider IF Bandwidth option:	
	Digital IF 10 MHz path	12.5 MHz
	Digital IF 25 MHz path	31.25 MHz
	Digital IF 40 MHz path	50 MHz
	Option B85 85 MHz path	106.25 MHz
	Option B1A 125 MHz path	156.25 MHz
	Option B1X 140 MHz path	175 MHz
	Option B1Y 160 MHz path	200 MHz
	Option B2X 255 MHz path	300 MHz
	Option B5X 510 MHz path	600 MHz
	Option R10 1 GHz path	1.2 GHz
	Option R15 1.5 GHz path	2.4 GHz
	Option R20 2 GHz path	2.4 GHz
	Option R40 4 GHz path	5.1 GHz
	For all other configurations:	
	10 MHz path	15 MHz
	Option B25 25 MHz path	45 MHz

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Spur Avoidance

Because VXT models M9410A/11A/15A/16A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the Digital IF BW \leq maxBW/2.5. See "[More Information](#)" on page 762.

You can disable this function to speed up your measurement, by setting **Spur Avoidance** to **Disabled**.

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because the Digital IF BW $>$ maxBW/2.5, the following warning message appears in the status bar: "Settings Alert; Spur Avoidance Off". This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

The spur avoidance function is not available for:

- M9410A/11A with EP6 option at frequency above 6 GHz
- M9415A/16A at frequency below 380 MHz and above 12.3 GHz
- M9410E/11E/15E/16E at frequency below 380 MHz and above 25.9 GHz

Remote Command	<code>[:SENSe]:WAVeform:SAVoid[:STATe] ON OFF 0 1</code> <code>[:SENSe]:WAVeform:SAVoid[:STATe]?</code>
Example	<code>:WAV:SAVoid ON</code> <code>:WAV:SAVoid?</code>
Dependencies	Only appears in VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>ON OFF</code>

More Information

The Maximum Digital IF BW depends on the installed options, and selected **Center Frequency**.

VXT models M9410A/11A

Option limitation:

Option	Max Digital IF BW
B40	40 MHz
B3X	300 MHz
B6X	600 MHz
B12	1200 MHz

Center frequency limitation:

Center Frequency	Max Digital IF BW
330 MHz ~ 380 MHz	(CF - 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz (without Option EP6)	600 MHz
2000 MHz ~ 5480 MHz (without Option EP6)	1200 MHz
5480 MHz ~ 6080 MHz (without Option EP6)	(6080 MHz - CF) * 2
1310 MHz ~ 1900 MHz (Option EP6)	600 MHz
1900 MHz ~ 6000 MHz (Option EP6)	1200 MHz
6000 MHz ~ 6600 MHz (Option EP6)	(6600 MHz - CF) * 2

VXT models M9415A/16A

Option limitation:

Option	Max Digital IF BW
B4X	400 MHz
B8X	800 MHz
B12	1200 MHz

Center frequency limitation:

Center Frequency	Max Digital IF BW
330 MHz ~ 380 MHz	(CF - 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz	600 MHz
2000 MHz ~ 12300 MHz	1200 MHz
12300 MHz ~ 12900 MHz	(12900 MHz - CF) * 2

M9410E/11E

Option Limitation:

Option	Maximum IF BW
B40	40 MHz
B3X	300 MHz
B6X	600 MHz
B12	1200 MHz

Center Frequency Limitation:

Center Frequency	Maximum IF BW
1 MHz ~ 10 MHz (Option LFE)	500 kHz
10 MHz ~ 20 MHz (Option LFE)	5 MHz
20 MHz ~ 60 MHz (Option LFE)	10 MHz
60 MHz ~ 80 MHz (Option LFE)	20 MHz
80 MHz ~ 380 MHz (Option LFE)	40 MHz
330 MHz ~ 380 MHz (without Option LFE)	(CF - 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz (without Option EP6)	600 MHz
2000 MHz ~ 25.9 GHz (without Option EP6)	1200 MHz
1310 MHz ~ 1900 MHz (Option EP6)	600 MHz
1900 MHz ~ 25.9 GHz (Option EP6)	1200 MHz
25.9 GHz ~ 26.5 GHz	Min(Max BW by option, 2*(26.5 GHz-Center Freq))

M9415E/16E

Option Limitation:

Option	Maximum IF BW
B4X	400 MHz
B8X	800 MHz
B12	1200 MHz

Center Frequency Limitation:

Center Frequency	Maximum IF BW
1 MHz ~ 10 MHz (Option LFE)	500 kHz

3 VMA Mode
 3.4 IQ Waveform Measurement

Center Frequency	Maximum IF BW
10 MHz ~ 20 MHz (Option LFE)	5 MHz
20 MHz ~ 60 MHz (Option LFE)	10 MHz
60 MHz ~ 80 MHz (Option LFE)	20 MHz
80 MHz ~ 380 MHz (Option LFE)	40 MHz
330 MHz ~ 380 MHz (without Option LFE)	(CF - 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz	600 MHz
2000 MHz ~ 25.9 GHz	1200 MHz
25.9 GHz ~ 26.5 GHz	Min(Max BW by option, 2*(26.5 GHz-Center Freq))

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 766 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency

3 VMA Mode
 3.4 IQ Waveform Measurement

- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	:CONFigure:WAVeform
Example	:CONF:WAV
Notes	Restore default values of all parameters

3.4.8.2 Advanced

Contains advanced functions that are used for specific applications. These settings should not be changed for most measurements.

Does not appear in VXT.

Phase Noise Optimization

Sets the LO (local oscillator) phase noise behavior for various desired operating conditions.

Remote Command	[:SENSe]:WAVeform:FREQuency:SYNThesis[:STATe] 1 ... 5 For the meaning of each numeric option value, see "Parameter Options & Installed Options" on page 768 below [:SENSe]:WAVeform:FREQuency:SYNThesis[:STATe]?
Example	:WAV:FREQ:SYNT 2 Selects optimization for best wide offset phase noise
Dependencies	Does not appear in all models. For models that do not display this control, the SCPI command is accepted for compatibility, but no action is taken Not available in VXT models M9410A/11A/15A/16A and M9410E/11E/15E/116E
Preset	Because this function is in AUTO after Preset , the state of this function after Preset will be automatically calculated
State Saved	Saved in instrument state
Range	See "Ranges" on page 772 below

Auto Function

Remote Command	<code>[:SENSe]:WAVeform:FREQuency:SYNThesis:AUTO[:STATe] OFF ON 0 1</code>
Example	<code>:WAV:FREQ:SYNT:AUTO ON</code>
Preset	ON

Parameter Options & Installed Options

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 769	1	<ul style="list-style-type: none"> - In instruments with EPO, balances close-in phase noise with spur avoidance - In instruments without EPO optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 769	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 770	3	Optimizes LO for tuning speed
"Best Close-in" on page 769	4 or 1*	<ul style="list-style-type: none"> - In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance - In instruments without EPO, this setting is accepted but no action is taken
"Best Spurs" on page 769	5	<ul style="list-style-type: none"> - In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance - In instruments without EPO, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EPO installation. See "Best Close-in" on page 769 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 770 is identical in effect to "Best Close-in" on page 769.

Best Close-in

Without option EPO

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

`:FREQ:SYNT 4`

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 769 setting, parameter 1 selects "Balanced" on page 769 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 769, which is usually not as good a choice as "Balanced" on page 769.

Balanced

`:FREQ:SYNT 1`

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 769 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 769 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 769 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "[Fast Tuning](#)" on page 770 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EPO, this is the same configuration as "[Best Spurs](#)" on page 769. It is available with the "[Fast Tuning](#)" on page 770 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "[Fast Tuning](#)" on page 770 option, the settings for "[Best Close-in](#)" on page 769 are used if "[Fast Tuning](#)" on page 770 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EPO Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz Span > 114.1 MHz, <i>or</i> RBW > 800 kHz RBW > 290 kHz, <i>or</i> Span > 4.2 MHz Other conditions	"Balanced" on page 769 "Fast Tuning" on page 770 "Best Wide-offset" on page 769 "Balanced" on page 769
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz and Span <= 1.3 MHz and RBW <= 75 kHz All other conditions	"Fast Tuning" on page 770 "Best Close-in" on page 769 "Best Wide-offset" on page 769
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 769; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz, <i>or</i> CF > 12 MHz and Span < 495 kHz and RBW < 40 kHz Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz and Span < 495 kHz and RBW < 23 kHz All other conditions	"Best Close-in" on page 769 "Fast Tuning" on page 770 "Best Wide-offset" on page 769
EP4 (available in CXA for improved phase noise)	Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" CF is < 109 kHz <i>or</i> CF >= 4.95 MHz and Span <= 666 kHz and RBW < 28 kHz	"Fast Tuning" on page 770 "Best Close-in" on page 769

Models with Option	Conditions	Selection
	All other conditions	"Best Wide-offset" on page 769
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 770 are actually the same as "Best Close-in" on page 769, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, or RBW > 250 kHz, or Source Mode is set to "Tracking"	"Fast Tuning" on page 770
	Center frequency is < 25 kHz, or CF >= 1 MHz and Span <= 141.4 kHz and RBW <= 5 kHz	"Best Close-in" on page 769
	All other conditions	"Best Wide-offset" on page 769

In all the above cases:

- The RBW to be used in the calculations is the equivalent -3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EPO	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]

3 VMA Mode
3.4 IQ Waveform Measurement

Option	Option #	Phase Noise Option	Range
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

ADC Dither

Toggles the dither function On and Off. The dither function improves linearity for low level signals, at the expense of a higher noise floor.

The reduced clipping-to-noise ratio results in higher noise because the clipping level of the ADC relative to the front terminals remains unchanged with the introduction of dither. The enhanced linearity is mostly improved scale fidelity.

With dither on, the third-order distortions are usually invisible for mixer levels below -35 dBm. With dither off, these distortions can be visible, with typical power levels of -110 dBm referred to the mixer. Detection nonlinearity can reach 1 dB for dither off at mixer levels around -70 dBm and lower, while the specified nonlinearity is many times smaller with dither on.

Remote Command	<code>[:SENSe] :WAVeform:ADC:DITHer [:STATe] OFF ON 0 1</code> <code>[:SENSe] :WAVeform:ADC:DITHer [:STATe] ?</code>
Example	<code>:WAV:ADC:DITH ON</code> <code>:WAV:ADC:DITH?</code>
Notes	The dither function improves linearity for low level signals, at the expense of a higher noise floor
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF
Backwards Compatibility SCPI	<code>[:SENSe] :WAVeform:WBIF:ADC:DITHer</code> <code>[:SENSe] :WAVeform:PDITHer</code>

Auto Function

Remote Command	<code>[:SENSe] :WAVeform:ADC:DITHer:AUTO [:STATe] OFF ON 0 1</code> <code>[:SENSe] :WAVeform:ADC:DITHer:AUTO [:STATe] ?</code>
Example	<code>:WAV:ADC:DITH:AUTO ON</code> <code>:WAV:ADC:DITH:AUTO?</code>
Notes	Sets ADC dithering to automatically select whether dithering is needed

	The dither function improves linearity for low level signals, at the expense of a higher noise floor
Preset	OFF
State Saved	Saved in instrument state
Range	Auto Man

LO Dither

When **LO Dither** is turned on, the local oscillator frequency is rapidly changed by small, random amounts. This helps spread the power of spurious signals within the passband, which lowers their level, thus increasing dynamic range. This is only required in very wide passbands, so this feature only appears with Option H1G.

Remote Command	<code>[:SENSe]:WAVeform:LO:DITHer[:STATe] ON OFF 1 0</code> <code>[:SENSe]:WAVeform:LO:DITHer[:STATe]?</code>
Example	<code>:WAV:LO:DITH 1</code> <code>:WAV:LO:DITH?</code>
Dependencies	Only available when the instrument has the Option H1G installed. If you try to turn ON LO Dither in any other case, an error message is generated, "-241, "Hardware missing; Option H1G required" Only appears in some Modes (for example, VMA and IQ Analyzer) The LO Dither function is turned OFF and grayed-out when the IF Path is set to a path other than 1 GHz. If you press the grayed-out control, a warning message "LO Dither only available with IF Path 1 GHz" is shown. If you try to set LO Dither to ON remotely while it is grayed-out, a message "-221, Settings conflict; LO Dither only available with IF Path 1 GHz" is returned When LO Dither is turned ON , the Phase Noise Optimization control is grayed-out. If you try to change the PNO value via front panel or SCPI in that case, an error is generated, "LO Dither must be turned off to change this value"
Couplings	As with most parameters with an AUTO state, " Auto Couple " on page 1825 sets it to Auto, which then selects AUTOorange . Setting any specific value (AUTOorange , LOW or HIGH) sets the AUTO state to false When LO Dither is turned ON , Phase Noise Optimization is set to "Best Close-In". If the Phase Noise Optimization value changes due to turning on LO Dither , a warning message "Phase Noise Optimization changed due to LO Dither activation" is displayed
Preset	OFF
State Saved	Saved in instrument state

IF Gain

Selects the range of IF gain.

When in **AUTOorange** mode, the IF checks its range once for data acquisition, to provide the best signal to noise ratio. You can specify the range for the best speed, and optimize for noise or for large signals.

3 VMA Mode
3.4 IQ Waveform Measurement

When **IF Gain** is set to **AUTOorange**, the IF Gain is set to **HIGH** initially for each chunk of data. The data is then acquired. If the IF overloads, then the IF Gain is set to **LOW**, and the data is re-acquired. Because of this operation, the **AUTOorange** setting requires more measurement time, as the instrument checks/resets its range. You can get faster measurement speed by forcing the range to either the **HIGH** or **LOW** gain setting, *but* you must ensure that your measurement conditions will not overload the IF (in the **HIGH** gain range), that your signals are well above the noise floor (for the **LOW** gain range), and that the signals are not changing.

When **Digital Bus Out** (under the **Input/Output** menu) is **ON**, the IF Gain State **AUTOorange** selection is not allowed. Thus, in this case IF Gain State will be set to **LOW**.

This only applies to the RF input. It does not apply to baseband I/Q input.

Remote Command	<code>[:SENSe]:WAVeform:IF:GAIN[:STATe] AUTOorange LOW HIGH OTHer</code> <code>[:SENSe]:WAVeform:IF:GAIN[:STATe]?</code>
Example	<code>:WAV:IF:GAIN HIGH</code> <code>:WAV:IF:GAIN?</code>
Notes	Only applies to the RF input. Does not apply to baseband I/Q input
Dependencies	If you try to select AUTOorange via SCPI while Digital Bus Out is ON , an error message -224, "Illegal parameter value; "IF Gain Autorange not allowed when Digital Bus Out is on" is displayed If you try to select AUTOorange via the front panel while Digital Bus Out is ON , an error message -221 "Settings conflict; "IF Gain Autorange not allowed when Digital Bus Out is ON" is displayed Other IF Gain is available only in models with DIF40
Couplings	As for most parameters that have an AUTO state, " Auto Couple " on page 1825 sets it to AUTOorange , which then selects LOW or HIGH depending on the IF Path. Setting any specific value (AUTOorange , LOW , HIGH , or OTHer) sets the AUTO state to OFF
Preset	LOW
State Saved	Saved in instrument state
Range	Autorange (Slower Follows Signals) Low (Best for Large Signals) High (Best Noise Level) Other (Explicit)

Auto Function

Remote Command	<code>[:SENSe]:WAVeform:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:WAVeform:IF:GAIN:AUTO[:STATe]?</code>
Example	<code>:WAV:IF:GAIN:AUTO ON</code> <code>:WAV:IF:GAIN:AUTO?</code>
Notes	Activates the auto rules for IF Gain
Preset	ON
Range	OFF ON

IF Gain Offset

Sets **IF Gain Offset** for the 40 MHz, 140 MHz, 160 MHz IF Paths in 1 dB steps from the minimum gain available to the maximum. Increasing the gain can increase the amplitude of small signals, as long as you do not overdrive the hardware. Wideband gain should usually be adjusted after setting the input attenuation.

Internally, the **IF Gain** value will change based on the current configuration of the Hardware. You can choose to offset this value with this parameter. Hence the value specified is not an absolute value but relative to the current internal **IF Gain** setting.

For example:

- IF Gain Low + IF Gain Offset +4 dB = Total IF Gain of +4 dB (0 + 4 = 4)
- IF Gain High + IF Gain Offset +4 dB = Total IF Gain of +14 dB (10 + 4 = 14)
- IF Gain Low + IF Gain Offset -6 dB = Total IF Gain of -6 dB (0 - 6 = -6)
- IF Gain High + IF Gain Offset -6 dB = Total IF Gain of +6dB (10 - 6 = 4)

The available **IF Gain** depends on the **IF Path** and center frequency. The maximum **IF Gain** may not be achievable at all times, depending on the configuration.

Remote Command	<code>[:SENSe] :WAVeform:IF:GAIN:OFFSet <rel_amp1></code> <code>[:SENSe] :WAVeform:IF:GAIN:OFFSet?</code>
Example	Set IF Gain Offset to 2: <code>:WAV:IF:GAIN:OFFS 2</code>
Couplings	Not available in EXM, or UXM When " IF Gain " on page 774 State is set to OTHer , the " Other IF Gain " on page 776 value is used and IF Gain Offset is ignored
Preset	0
State Saved	Saved in instrument state
Min/Max	Depends on hardware present

Other IF Gain

Explicitly specifies the IF gain value.

Only applies when "**IF Gain**" on page 774 is set to **OTHer**. When **IF Gain** is set to **AUTOrange**, **LOW**, or **HIGH**, this value is ignored.

Available only in models with DIF40.

Remote	<code>[:SENSe] :WAVeform:IF:GAIN:LEVe1 <rel_amp1></code>
--------	--

3 VMA Mode
3.4 IQ Waveform Measurement

Command	<code>[:SENSe] :WAVeform:IF:GAIN:LEVel?</code>
Example	<code>:WAV:IF:GAIN:LEV -10</code> <code>:WAV:IF:GAIN:LEV?</code>
Preset	0
State Saved	Saved in instrument state
Min/Max	Depends upon hardware present

Mixing Mode

Lets you alternate between mixing modes for the Local Oscillator (LO). The default setting is **NORMa1** LO mixing mode, which is determined by the instrument configuration to be either “high side” or “low side”. Typically, “high side” mixing mode is used for the **NORMa1** LO mixing mode. Selecting the **ALTeRnate** mixing mode selects “low side” mixing when the **NORMa1** mixing mode is “high side” mixing, and selects “high side” mixing mode when the **NORMa1** mixing mode is “low side” mixing.

This function can be useful in eliminating images that may be seen from adjacent channels. Whenever you have signals that are twice the IF above your signal of interest, they will alias on top of your signal. To eliminate this issue, switch to **ALTeRnate** side mixing and your measurement will be image free.

Example

When testing a 5G signal with all 8 channels **ON**, where each channel is 100 MHz wide, there may be cases where you see images from adjacent channels. To measure the highest frequency carrier, you will need to switch to alternate side mixing, to avoid the 8th carrier from aliasing on top of other carriers.

Remote Command	<code>[:SENSe] :WAVeform:LO:MIXMode NORMal ALTeRNate</code> <code>[:SENSe] :WAVeform:LO:MIXMode?</code>
Example	<code>:WAV:LO:MIXM NORM</code> <code>:WAV:LO:MIXM?</code>
Dependencies	Not available in N9000B Grayed-out when the RF Input is set to something other than RF (such as External Mixer). If you press

3 VMA Mode
3.4 IQ Waveform Measurement

the grayed-out control, a warning message “Feature only available with Signal Input RF” appears
If you try to set **Mixing Mode** via SCPI when disabled, a message -221, "Settings conflict; Feature only available with signal input RF" is returned

Preset	NORMa1
State Saved	Yes
Range	NORMa1 ALTErnate

Invert Spectrum

When set to **NORMa1**, the Spectrum toggle has no effect on the measurement. When set to **INVert**, the I/Q data is conjugated, which inverts the spectrum. This parameter also affects the results of the **:MEASure**, **:READ**, and **:FETCh** queries for **WAVEform4** data. If set to **INVert**, the I/Q data returned is conjugated, otherwise the data is raw I/Q.

Remote Command	[:SENSe] :WAVEform :SPECTrum NORMa1 INVert [:SENSe] :WAVEform :SPECTrum ?
Example	:WAV :SPEC INVert
Preset	NORMAL
State Saved	Saved in instrument state

Power Reference Plane

Allows you to increase the power by 3 dB for Baseband I+jQ measurements. Options are:

Menu	SCPI
Baseband	BASEband
RF	RF

Remote Command	For valid <meas> values, see " Valid Measurement Keywords " on page 780 [:SENSe] :<meas> :POWer :IQ :REFerence :PLANe RF BASEband [:SENSe] :<meas> :POWer :IQ :REFerence :PLANe ?
Example	(Complex Spectrum measurement) SPEC :POW :IQ :REF :PLAN BAS SPEC :POW :IQ :REF :PLAN ?
Dependencies	Only available if the I/Q input exists Enabled only when the input is I/Q and I/Q Path is I+jQ Disabled for all other conditions
Preset	RF
State Saved	Saved in instrument state

Valid Measurement Keywords

This function is available *only* in certain Modes and measurements. Only the following listed values of `<meas>` are valid.

Mode(s)	Meas	<meas>
BASIC	Complex Spectrum	SPECTrum
BASIC	IQ Waveform	WAVEform
CQM		
EDGE GSM		
LTEAFDD		
LTEATDD		
MSR		
NR5G		
PNOISE		
SRCOMMS		
VMA		
WCDMA		
WLAN		
WLAN	Modulation Analysis	EVM
WLAN	MIMO Modulation Analysis	EVMMimo

Mixing Mode State (Remote Command Only)

Available *only* in the Complex Spectrum, Streaming, and Waveform measurements.

Lets you alternate between mixing modes for the Local Oscillator (LO). The default setting is **NORMa1** LO mixing mode, which is determined by the instrument configuration to be either “high side” or “low side”. The query returns “High” or “Low” to determine whether the mixing is “high side” or “low side”. If **Mixing Mode** is toggled between **NORMa1** and **ALternate**, then **Mixing Mode State** also toggles between “High” and “Low”.

Remote Command	<code>[:SENSe] :SPECTrum:LO:MIXMode:SIDE?</code> <code>[:SENSe] :WAVEform:LO:MIXMode:SIDE?</code>
Example	<code>:SPEC:LO:MIXM:SIDE?</code> <code>:WAV:LO:MIXM:SIDE?</code>
Dependencies	Not available in N9000B
Couplings	When Mixing Mode is toggled between NORMa1 and ALternate , Mixing Mode State also toggles

	between High and Low
Range	High Low

IF Frequency (Remote Command Only)

Available *only* in the Complex Spectrum, Streaming, and Waveform measurements.
 Returns the current IF Frequency used in the IF Path.

Remote Command	<code>[:SENSe] :SPECTrum: IF: FREQuency?</code> <code>[:SENSe] :WAVeform: IF: FREQuency?</code>
Example	<code>:SPEC: IF: FREQ?</code> <code>:WAV: IF: FREQ?</code>
Couplings	A change in Span , Digital IF BW or IF Path parameters can result in a change of the IF Frequency value

3.4.8.3 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "**Global Center Freq**" on page 1828) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code> <code>:INSTrument:COUPle:FREQuency:CENTer?</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATE] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATE]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTrument:COUPle:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTrument:COUPlE:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.4.8.4 Sample Period (Aperture) Setting (Remote Query Only)

Returns the time between samples (sample period or aperture).

Remote Command	[:SENSe] :WAVeform:APERture?
Example	:WAV:APER?
Couplings	Coupled to Sample Rate by the following equation Sample Period = 1/(Sample Rate)
Preset	1/(Sample Rate Default)
Min/Max	1/(Max Sample Rate)/1/(Min Sample Rate)

3.4.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale and Number of Points.**

3.4.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 784

Remote Command	<code>:INITiate[:IMMediate]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUEStionable</code> register bit 9 (<code>INTEgrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

3 VMA Mode
 3.4 IQ Waveform Measurement

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 787

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
----------------	--

3 VMA Mode
3.4 IQ Waveform Measurement

Example	<p>Put instrument into Single measurement operation:</p> <pre>:INIT:CONT 0</pre> <pre>:INIT:CONT OFF</pre> <p>Put instrument into Continuous measurement operation:</p> <pre>:INIT:CONT 1</pre> <pre>:INIT:CONT ON</pre>
Preset	<p>ON</p> <p>Note that :SYST:PRES sets :INIT:CONT to ON, but *RST sets :INIT:CONT to OFF</p>
State Saved	Saved in instrument state
Annunciation	<p>The Single/Continuous icon in the Meas Bar changes depending on the setting:</p> <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	<p>X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and INIT:CONT ON) switched to continuous measurement, but never restarted a measurement and never reset a sweep</p> <p>X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep</p>

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "[Restart](#)" on page 1832 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met

3 VMA Mode
3.4 IQ Waveform Measurement

	If :INIT:CONT is OFF , then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, :ABORT is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUEStionable register bit 9 (INTEgrity sum) is cleared Since all the bits that feed into OPC are cleared by :ABORT , the Abort command will cause the *OPC query to return true

3.4.9.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the display X reference value.

Remote Command	:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:RLEVe1 <time> :DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:RLEVe1?
Example	:DISP:WAV:VIEW:WIND:TRAC:X:RLEV 10 ms :DISP:WAV:VIEW:WIND:TRAC:X:RLEV?
Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Couplings	If X " Auto Scaling " on page 790 is ON , this value is automatically determined by the measurement result. When you set a value manually, X Auto Scaling automatically changes to OFF
Preset	0.000 s
State Saved	Saved in instrument state
Min/Max	-1 s /10.0 s
Annotation	<value> s bottom left of graph

Scale/Div

Sets the display X scale/division value.

Remote Command	:DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:PDIVision <time> :DISPlay:WAVeform:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:PDIVision?
Example	:DISP:WAV:VIEW:WIND:TRAC:X:PDIV 500 us :DISP:WAV:VIEW:WIND:TRAC:X:PDIV?

Notes	View 1 is the RF Envelope View View 2 is the I/Q Waveform View
Couplings	If X "Auto Scaling" on page 790 is ON , this value is automatically determined by the measurement result. When you set a value manually, X Auto Scaling automatically changes to OFF
Preset	200.0 us
State Saved	Saved in instrument state
Min	1.00 ns
Max	320 s

Ref Position

Sets the reference position for the X axis to **LEFT**, **CENTer** or **RIGHT**.

Remote Command	<code>:DISPlay:WAVeForm:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:RPOSition LEFT CENTer RIGHT</code> <code>:DISPlay:WAVeForm:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:RPOSition?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:X:RPOS LEFT</code> <code>:DISP:WAV:VIEW:WIND:TRAC:X:RPOS?</code>
Preset	LEFT
State Saved	Saved in instrument state
Range	LEFT CENTer RIGHT

Auto Scaling

Toggles the scale coupling function **ON** or **OFF**.

Remote Command	<code>:DISPlay:WAVeForm:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:WAVeForm:VIEW[1] 2:WINDow[1]:TRACe:X[:SCALe]:COUPle?</code>
Example	<code>:DISP:WAV:VIEW:WIND:TRAC:X:COUP ON</code> <code>:DISP:WAV:VIEW:WIND:TRAC:X:COUP?</code>
Couplings	When Auto Scaling is ON and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set the value of either "Scale/Div" on page 789 or "Ref Value" on page 789 manually, Auto Scaling automatically changes to OFF
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

- 3 VMA Mode
- 3.4 IQ Waveform Measurement

3.4.10 Trace

There are no **Trace** controls in this measurement.

3.5 Channel Power Measurement

This measurement is used to find the total power present in a specified bandwidth. Power Spectral Density (signal power normalized to 1 Hz) is also reported.

When in WLAN Mode, or when WLAN radio standard is selected in SA Mode, the peak Power Spectral Density for 1 MHz is reported.

Measurement Commands

The general functionality of "CONFigure" on page 2551, "INITiate" on page 2552, "FETCh" on page 2552, "MEASure" on page 2554, and "READ" on page 2553 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF: <Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

Command	Function
<code>:INITiate:CHPower</code>	Initiates a trigger cycle for the CHP measurement, but does not return any data. You must then use <code>:FETC:CHP[n]?</code> to retrieve data Does not change any measurement settings
<code>:CONFigure?</code>	Returns the long form name of current measurement, in this case, CHPower
<code>:CONFigure:CHPower</code>	Selects CHP measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 882
<code>:CONFigure:CHPower:NDEFault</code>	Selects CHP measurement <i>without</i> affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of `n`.

Query	Function
<code>:FETCh:CHPower[n]?</code>	Retrieves the data defined by <code>n</code>
<code>:MEASure:CHPower[n]?</code>	Switches to CHP measurement, restores default values, starts the measurement, then retrieves the data defined by <code>n</code>
<code>:READ:CHPower[n]?</code>	Starts the measurement, then retrieves the data defined by <code>n</code>

Backwards Compatibility Queries

Query	Return Value
:FETCh:CHPower:CHPower?	Returns the Channel Power (dBm)
:MEASure:CHPower:CHPower?	
:READ:CHPower:CHPower?	
:FETCh:CHPower:DENSity?	Returns the Power Spectral Density (dBm/Hz)
:MEASure:CHPower:DENSity?	
:READ:CHPower:DENSity?	

The results returned by the queries depend on the currently-selected Mode and the value of *n* (where required). The sections below provide mode-specific details for each Mode.

SA Mode Measurement Results

n	Results Returned						
1 or not specified	Returns scalar results: <table border="1" data-bbox="357 966 1315 1134"> <tr> <td>1</td> <td>Channel Power</td> <td>A floating-point number representing the total channel power in the specified integration bandwidth</td> </tr> <tr> <td>2</td> <td>PSD (Power Spectral Density)</td> <td>The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 879; either dBm/Hz or dBm/MHz</td> </tr> </table>	1	Channel Power	A floating-point number representing the total channel power in the specified integration bandwidth	2	PSD (Power Spectral Density)	The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 879; either dBm/Hz or dBm/MHz
1	Channel Power	A floating-point number representing the total channel power in the specified integration bandwidth					
2	PSD (Power Spectral Density)	The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 879; either dBm/Hz or dBm/MHz					
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 865						
3	n/a						
4	n/a						
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by Span						
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by Span						
7	Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table						

MSR Mode Measurement Results

n	Results Returned
1 or not specified	Returns scalar results:

n Results Returned

- 1 Channel Power A floating-point number representing the total channel power in the specified integration bandwidth
- 2 PSD (Power Spectral Density) The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 879; either dBm/Hz or dBm/MHz
- 2 Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 865
- 3 Returns [Carriers] comma-separated scalar results, in the following order

#	Item	Unit
1	Total Power of Carrier 1	dBm
2	Total Power of Carrier 2	dBm
...	...	
[Carriers]	Total Power of Carrier [Carriers]	dBm

If the result is not available, NaN (9.91E+37) is returned. Number of returned values might be changed in future releases

- 4 Returns comma-separated scalar results, in the following order

#	Item	Unit
1	Total Power of LTE FDD carriers	dBm
2	Total Power of W-CDMA carriers	dBm
3	Total Power of GSM/EDGE carriers	dBm
4	Total Power of cdma2000 carriers	dBm
5	Total Power of 1xEV-DO carriers	dBm
6	...	

The number of results is incremented by one when a new format is supported

If the result is not available, NaN (9.91E+37) is returned. Number of returned values will be changed in future releases if the number of supported radio format is increased

- 5 Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
- 6 Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control
- 7 Returns Marker Table data as a series of comma separated values in the following form:
<Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved>
Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table

LTE-Advanced FDD/TDD Mode Measurement Results

The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz</p>
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 865
3	n/a
4	n/a

n	Results Returned
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by Span
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by Span
7	Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table

Additionally, WLAN Mode supports an **n** parameter for the following queries:

```
:FETCh:CHPower:DENSity[n]?
:MEASure:CHPower:DENSity[n]?
:READ:CHPower:DENSity[n]?
```

For these queries *in WLAN Mode only*, the results returned depend on the value of **n** as follows:

n	Radio Standard	Results Returned
1 or not specified	Not 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	Peak PSD (Power Spectral Density) The Peak PSD over the integration bandwidth. The unit bandwidth is selected by "PSD Unit" on page 879 in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the peak PSD for segment 1, the second value is the peak PSD for segment 2
2	Not 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	Mean PSD (Power Spectral Density) The Mean PSD over the integration bandwidth. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the mean PSD for segment 1, the second value is the mean PSD for segment 2

3.5.1 Views

In SA, WCDMA, WLAN, SRCOMMS, and VMA Modes, there is only one predefined view, the "Normal" on page 798 view.

3.5.1.1 Normal

Windows: "Graph" on page 799, "Metrics" on page 800

Dual window view: Channel Power graph and Channel Power metrics.

Example :DISP:CHP:VIEW PRES

3.5.1.2 Carrier Info

Windows: "Graph" on page 799, "Metrics" on page 800

Dual window view: Channel Power graph and Carrier Info table.

Example	:DISP:CHP:VIEW CINF
Dependencies	Only available in MSR, LTE-A FDD/TDD and 5G NR Modes

3.5.2 Windows

This section describes the windows that are available in the Channel Power measurement:

Window	Number
"Graph" on page 799	1
"Metrics" on page 800	2
"Gate" on page 804	3
"Marker Table" on page 804	4

3.5.2.1 Graph

Window #1

Used to display the spectrum trace and power bars.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace. The Bar Graph appears between the markers that indicate the measured output power level. The bar graph is activated when the "Bar Graph" control is set to ON under the Display menu. The Graph window appears in the following views.

View	Size	Position
Normal	Two thirds, full width	Top
Gate View	One third, full width	Middle

Spectrum View with Bar Graph Off

Spectrum View with Bar Graph On

This is the same as the **Spectrum** view, but has a blue bar between the markers that indicates the measured output power level. The bar graph is activated when the “Bar Graph” control is set to **ON** under the **Display** hardkey. The actual measured output power level is displayed on the display at the top of the bar.

If the current Mode is WLAN and the format is WLAN 802.11ac 80+80 MHz, Spectrum View is slightly different so that the results of both carrier segments can be displayed.

3.5.2.2 Metrics

Window #2

The actual measured output power level is displayed in the Metrics window

The **Metrics** window appears in the following Views.

View	Size	Position
Normal	One third, full width	Bottom
Gate View	One third, full width	Bottom

3 VMA Mode
3.5 Channel Power Measurement

2 Metrics		Component Carrier	
Total Channel Power	-13.69 dBm/100.000 MHz	Carrier Power	
Total Power Spectral Density	-93.69 dBm/Hz	CC0	-13.69 dBm/100.000 MHz
Measure Trace	Trace 1		

Measure Trace

See: "[Measure Trace](#)" on page 1755.

Power Results

Total carrier power, total PSD and total format carrier power are displayed in the lower window. Total format carrier power is total power of carriers of the same Radio Format. If there is no carrier of the corresponding format, it is not displayed. Thus, items in the total format power table changes depending on the carrier configuration. Since the metrics window of MSR, LTE-Advanced FDD/TDD and 5G NR is slightly denser than that for common CHP, the vertical positions of total power and power spectral density are raised.

Carrier Info: LTE-Advanced FDD/TDD and 5G NR Modes

The following diagram shows the Metrics Window in the Carrier Info view for LTE-Advanced FDD/TDD and 5G NR. The Power Results window is replaced by the carrier info table.

2 Carrier Info							
Total Car Pwr	-6.70 dBm/500.000 MHz						
Total PSD	-93.69 dBm/Hz						
RF-BW	99.970 MHz						
	Carrier Power	Carrier PSD	Integ BW	Filter	Offset Freq	Measure	
CC0	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On	
CC1	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On	
CC2	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On	
CC3	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On	
CC4	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On	

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier}$

Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block (LTE-Advanced FDD/TDD Modes only)

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes as either Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Carrier Info: MSR Mode

The text window displays the following results:

Total Carrier Power

3 VMA Mode

3.5 Channel Power Measurement

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier Integ Bw})$ multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes according to whether Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Parameter Set

Displays which format parameter set is selected.

3.5.2.3 Gate

Window #3

Turning on **Gate** View displays the **Gate** Window, which allows you to see your gating signal at the same time as the measured data. See the description under "[Gate View On/Off](#)" on page 2484 in **Trigger, Gate Settings**.

View	Size	Position
Gate View	One third, full width	Top

3.5.2.4 Marker Table

Window #4

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.5.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.5.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "[Ref Position](#)" on page 806.

3 VMA Mode
3.5 Channel Power Measurement

Remote Command	<code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:RLEV 10 dBm</code> <code>:DISP:CHP:WIND:TRAC:Y:RLEV?</code>
Couplings	When "Auto Scaling" on page 806 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to Ref Value
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-/+250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	<code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code>

Scale/Div

Sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	<code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_amp></code> <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:CHP:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to "Scale Range" on page 1612 as follows: Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 806 is ON, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to OFF
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	<code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code>

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace <meas> with the identifier for the current measurement :DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_amp1> :DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?
Example	:DISP:CHP:WIND:TRAC:Y:RANG 100 :DISP:CHP:WIND:TRAC:Y:RANG?
Couplings	Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTom :DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?
Example	:DISP:CHP:WIND:TRAC:Y:RPOS CENT :DISP:CHP:WIND:TRAC:Y:RPOS?
Preset	TOP
State Saved	Saved in instrument state
Range	TOP CENTer BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles **Auto Scaling** On or Off.

3 VMA Mode
3.5 Channel Power Measurement

Remote Command	<code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:CHP:WIND:TRAC:Y:COUP?</code>
Couplings	When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of Scale/Div , Ref Value , or Scale Range , Auto Scaling automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle</code>

3.5.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 808](#)
- See ["Single-Attenuator Configuration" on page 808](#)

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_ampl></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1766 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed:

On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, **"Y Scale"** on page 1760 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, **"Internal Preamp"** on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See **"Attenuator Configurations and Auto/Man"** on page 812

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of

3 VMA Mode
 3.5 Channel Power Measurement

Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in ["Elec Atten" on page 1769](#)

See ["Attenuator Configurations and Auto/Man" on page 812](#) for more information on the **Auto/Man** functionality

Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1765 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>						
Preset	<p>Auto</p> <p>The Auto value is 10 dB</p>						
State Saved	Saved in instrument state						
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p>						

For example:
 Dual-Attenuator configuration:
Atten: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB
 Single-Attenuator configuration:
A: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)
 When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	<code>ON</code>

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1763, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 810 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1769 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 815](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code> , and affects the total attenuation displayed on the Attenuation

control and the Meas Bar

The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If "**Internal Preamp**" on page 1788 is **ON** (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned

If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1790 is **ON**, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 815
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe] :POWer [:RF] :EATTenuation :STATe OFF ON 0 1</code> <code>[:SENSe] :POWer [:RF] :EATTenuation :STATe?</code>
Example	<code>:POW:EATT:STAT ON</code>

:POW:EATT:STAT?

Preset **OFF** (Disabled) for Swept SA measurement
 ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 816](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under ["Pre-Adjust for Min Clipping" on page 1773](#).

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 819

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECTrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>
Notes	The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1769 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 818 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state

3 VMA Mode
 3.5 Channel Power Measurement

Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	<p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p>
Backwards Compatibility SCPI	<p>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</p> <p>[:SENSe]:POWer[:RF]:RANGe:AUTO?</p>

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 818 selection is Mech + Elec Atten:

3 VMA Mode
 3.5 Channel Power Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 818 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 VMA Mode
3.5 Channel Power Measurement

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.5.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

3 VMA Mode
3.5 Channel Power Measurement

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:PARatio <real> [:SENSe]:POWer[:RF]:RANGe:PARatio?	
Example	:POW:RANG:PAR 12 dB	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.5.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1801 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

3 VMA Mode
3.5 Channel Power Measurement

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "**Preselector Adjust**" on page 1787 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "**Proper Preselector Operation**" on page 827.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1787
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "**Presel Center**" on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz

State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :MW :PADJust</code> <code>[:SENSe] :POWer [:RF] :MMW :PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :PADJust :PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe] :POWer [:RF] :PADJust :PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

3 VMA Mode
3.5 Channel Power Measurement

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1788. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "Internal Preamp" on page 1788, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 831

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and Internal Preamp. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 836
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 838
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 839

3 VMA Mode
3.5 Channel Power Measurement

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>														
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>														
Notes	<p>When "Presel Center" on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

3 VMA Mode

3.5 Channel Power Measurement

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1791.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command	<code>[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ON OFF 1 0</code> <code>[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ?</code>

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>

3.5.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.5.4.1 Settings

Contains the basic bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW (Auto)** selects automatic coupling of **Res BW** to **"Span"** on page 865, using the ratio set by **Span:3 dB RBW** (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Res BW**, or simply enter a different value for **Res BW**.

When **Res BW** is manually selected, you can return it to the coupled state by pressing the **Auto/Man** toggle on **Res BW**. This may also be done by pressing **"Auto Couple"** on page 1825 or by performing a **Preset**.

For more details, see **"More Information"** on page 848

Remote Command	<code>[:SENSe]:CHPower:BANDwidth[:RESolution] <bandwidth></code> <code>[:SENSe]:CHPower:BANDwidth[:RESolution]?</code>
Example	<code>:CHP:BAND 5 MHz</code> <code>:CHP:BAND?</code>
Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type
Couplings	Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When Res BW is set to Auto , the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	See "RBW Presets" on page 848
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent -3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than -3 dB Gaussian
Annotation	A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility, this command supports both the BANDwidth and BWIDth forms
Auto Function	
Remote	<code>[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO ON OFF 1 0</code>

Command	<code>[:SENSe] :CHPower :BANDwidth [:RESolution] :AUTO?</code>
Example	<code>:CHP :BAND :AUTO ON</code> <code>:CHP :BAND :AUTO?</code>

RBW Presets

LTEAFDD	Auto
LTEATDD	Auto
MSR	100 kHz
NR5G	Auto
SA	Auto
SRCOMMS	3.9 kHz
VMA	240 kHz
WCDMA	240 kHz
WLAN	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "**RBW Filter Type**" on page 851.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some PowerSuite measurements, in the LTE-Advanced (both FDD and TDD) and 5G NR modes, when **Res BW** is in **Auto**, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, as shown in the table below. In the Multi-carrier case, the narrowest RBW among the active carriers is used.

LTE-A FDD/TDD Modes

Carrier BW	Auto RBW, kHz
1.4 MHz	20
3 MHz	43
5 MHz	68
10 MHz	150
15 MHz	220
20 MHz	270

30 MHz	430
35 MHz	510
40 MHz	560
45 MHz	620
50 MHz	680
60 MHz	820
70 MHz	1000
80 MHz	1100
90 MHz	1300
100 MHz	1500
200 MHz	2700
400 MHz	3000
800 MHz	3000
1600 MHz	3000
2000 MHz	3000

Video BW

Lets you change the instrument post-detection filter (VBW or “Video Bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by **VBW:3 dB RBW**. To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Video BW**, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing **"Auto Couple"** on page 1825 or by performing a **Preset**.

Remote Command `[:SENSe]:CHPower:BANDwidth:VIDeo <bandwidth>`
 `[:SENSe]:CHPower:BANDwidth:VIDeo?`

Example `:CHP:BAND:VID 2.4 MHz`

<code>:CHP:BAND:VID?</code>	
Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed Video BW is not actually used to process the trace data: When the Average Detector is selected and Sweep Type is set to Swept , the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, VBW still acts to change the Sweep Time, if "Sweep Time" on page 1355 is in Auto , and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to "Res BW" on page 847. If VBW is set to Auto , then VBW is changed as RBW changes, to maintain the ratio set by VBW:3 dB RBW (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)
Preset	Auto (unless noted in table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility, this command supports both the BANDwidth and BWIDth forms

Auto Function

Remote Command	<code>[:SENSe] :CHPower :BANDwidth :VIDeo :AUTO ON OFF 1 0</code> <code>[:SENSe] :CHPower :BANDwidth :VIDeo :AUTO?</code>
Example	<code>:CHP:BAND:VID:AUTO OFF</code> <code>:CHP:BAND:VID:AUTO?</code>
Preset	ON

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset Value
WCDMA	2.40 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum instruments were Gaussian filters, specified using the -3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its -3 dB points 10 MHz apart. In X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example														
Gaussian	<code>:BAND:SHAP GAUS</code>														
Flattop	<code>:BAND:SHAP FLAT</code>														
Remote Command	<code>[:SENSe]:CHPower:BANDwidth:SHAPE GAUSSian FLATtop</code> <code>[:SENSe]:CHPower:BANDwidth:SHAPE?</code>														
Example	<code>:CHP:BAND:SHAP GAUS</code> <code>:CHP:BAND:SHAP?</code>														
Notes	GAUSSian = Gaussian FLATtop = Flattop We use SHAPE instead of TYPE (even though the control name uses Type) because TYPE is used for backwards compatibility														
Preset	"Auto Couple" on page 1825 selects the preset value														
State Saved	Saved in instrument state														
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:														
	<table border="1"> <tbody> <tr> <td>-3 dB (Normal) filter BW</td> <td>Res BW 300 Hz</td> </tr> <tr> <td>-6 dB filter BW</td> <td>Res BW (-6 dB) 422 Hz</td> </tr> <tr> <td>Noise filter BW</td> <td>Res BW (Noise) 317 Hz</td> </tr> <tr> <td>Impulse filter BW</td> <td>Res BW (Impulse) 444 Hz</td> </tr> <tr> <td>CISPR filter BW</td> <td>Res BW (CISPR) 200 Hz</td> </tr> <tr> <td>MIL filter BW</td> <td>Res BW (MIL) 1 kHz</td> </tr> <tr> <td>Flattop filter type</td> <td>Res BW (Flattop) 300 Hz</td> </tr> </tbody> </table>	-3 dB (Normal) filter BW	Res BW 300 Hz	-6 dB filter BW	Res BW (-6 dB) 422 Hz	Noise filter BW	Res BW (Noise) 317 Hz	Impulse filter BW	Res BW (Impulse) 444 Hz	CISPR filter BW	Res BW (CISPR) 200 Hz	MIL filter BW	Res BW (MIL) 1 kHz	Flattop filter type	Res BW (Flattop) 300 Hz
-3 dB (Normal) filter BW	Res BW 300 Hz														
-6 dB filter BW	Res BW (-6 dB) 422 Hz														
Noise filter BW	Res BW (Noise) 317 Hz														
Impulse filter BW	Res BW (Impulse) 444 Hz														
CISPR filter BW	Res BW (CISPR) 200 Hz														
MIL filter BW	Res BW (MIL) 1 kHz														
Flattop filter type	Res BW (Flattop) 300 Hz														
Backwards Compatibility SCPI	<code>[:SENSe]:CHPower:BWIDth:SHAPE</code>														

3.5.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.5.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

Remote Command	<code>:DISPlay:CHPower:WINDow[1]:BGRaph ON OFF 1 0</code> <code>:DISPlay:CHPower:WINDow[1]:BGRaph?</code>
Example	<code>:DISP:CHP:WIND:BGR ON</code> <code>:DISP:CHP:WIND:BGR?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF
Backwards Compatibility SCPI	<code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:BGRaph</code>

3.5.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATICule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATICule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis

Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	:DISPlay:ANNOtation:SCReem[:STATe] OFF ON 0 1 :DISPlay:ANNOtation:SCReem[:STATe]?
Example	:DISP:ANN:SCR OFF
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	:DISPlay:ANNOtation:TRACe[:STATe] ON OFF 1 0 :DISPlay:ANNOtation:TRACe[:STATe]?
----------------	--

Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display

3 VMA Mode
 3.5 Channel Power Measurement

2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPlay:VIEW:ADVanced:SElect</code>
Rename User View	<code>:DISPlay:VIEW:ADVanced:REName</code>
Delete User View	<code>:DISPlay:VIEW:ADVanced:DELeTe</code>
Create User View	<code>:DISPlay:VIEW:ADVanced:NAME</code>
Select Screen	<code>:INSTrument:SCReen:SElect</code>
Delete Screen	<code>:INSTrument:SCReen:DELeTe</code>
Delete All But This Screen	<code>:INSTrument:SCReen:DELeTe:ALL</code>
Add Screen	<code>:INSTrument:SCReen:CREate</code>
Rename Screen	<code>:INSTrument:SCReen:REName</code>
Sequencer On/Off	<code>:SYSTem:SEQuencer</code>

Remote Command	<code>:DISPlay:ENABle OFF ON 0 1</code> <code>:DISPlay:ENABle?</code>
Example	<code>:DISP:ENAB OFF</code>
Couplings	<code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code>
Preset	ON Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code>
State Saved	Not saved in instrument state

Backwards Compatibility Notes **:SYST:PRES** no longer turns on **:DISPlay:ENABLe** as it did in legacy analyzers

3.5.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "[Views](#)" on page 798.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	:DISPlay:VIEW:ADVanced:SElect <alphanumeric> :DISPlay:VIEW:ADVanced:SElect?
Example	Select Baseband as the current View :DISP:VIEW:ADV:SEL "Baseband"
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <p>:DISP:VIEW:ADV:SEL "Trace Zoom"</p> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be TZOOM) with :DISP:VIEW:ADV:SEL</p> <p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <p>:DISP:VIEW:ADV:SEL "Trace Zoom"</p> <p>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</p> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via :DISP:ENAB OFF) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node :DISPlay:VIEW[:SElect]</p> <p>is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
----------------	---

Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELeTe</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELeTe:ALL</code>
Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy

nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code> No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined

3.5.6 Frequency

Contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by ["Meas Preset" on page 882](#).

For example, **Center Frequency** is the same for all measurements – it does not change as you change measurements.

3.5.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, "[Span](#)" on page 865 is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global Center Frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz, and when you go back to the RF Input, **Center Frequency** will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

- ["RF Center Freq" on page 863](#)
- ["Ext Mix Center Freq" on page 864](#)
- ["I/Q Center Freq" on page 865](#)
- ["Center Frequency Presets" on page 861](#)
- ["VXT Models with Radio Heads/CIU Frequency Range" on page 863](#)

Remote Command	<code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer?</code>
----------------	--

Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code>
---------	---

3 VMA Mode
3.5 Channel Power Measurement

	<p>Increment the Center Frequency by the value of CF Step: :FREQ:CENT UP</p> <p>Return the current value of Center Frequency: :FREQ:CENT?</p>
Notes	<p>Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input:</p> <ul style="list-style-type: none"> - For RF input, equivalent to :FREQ:RF:CENT - For I/Q input, equivalent to :FREQ:IQ:CENT - For External Mixer, equivalent to :FREQ:EMIX:CENT <p>Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated</p>
Dependencies	Not available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	<p>Depends on instrument maximum frequency, mode, measurement, and selected input</p> <p>See "Center Frequency Presets" on page 861 and "RF Center Freq" on page 863 and "Ext Mix Center Freq" on page 864 and "I/Q Center Freq" on page 865 and "VXT Models with Radio Heads/CIU Frequency Range" on page 863</p>
State Saved	Saved in instrument state
Min/Max	<p>Depends on instrument maximum frequency, mode, measurement, and selected input</p> <p>See "Center Frequency Presets" on page 861 and "RF Center Freq" on page 863 and "I/Q Center Freq" on page 865 and "VXT Models with Radio Heads/CIU Frequency Range" on page 863</p>
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

3 VMA Mode
 3.5 Channel Power Measurement

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Sets the **Center Frequency** to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message

	If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	26.99999995 GHz See " Center Frequency Presets " on page 861. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on " Span " on page 865

Ext Mix Center Freq

Sets the **Center Frequency** to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQUency :EMIXer :CENTer <freq></code> <code>[:SENSe] :FREQUency :EMIXer :CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all measurements in the Mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing, so you will return to the band you were in, with the Center Frequency that you had. However, " Span " on page 865 is not an input-dependent parameter, so you will retain the span from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table ($\text{Span} = \text{Stop Freq} - \text{Start Freq}$), the instrument uses the maximum Span the measurement allows, and still sets Center Frequency to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A values, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, following Restore Input/Output Defaults , if you go into External Mixing and do a Mode Preset while in Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz
State Saved	Yes

3 VMA Mode
3.5 Channel Power Measurement

Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band – 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Sets the **Center Frequency** to use when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQUency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQUency :IQ :CENTer ?</code>
Example	<code>:FREQ :IQ :CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	-/+40.049995 MHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting **Span**, **Center Frequency** is held constant, which means that both Start Frequency and Stop Frequency will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) **Span** is calculated using the number of carriers and the carrier width where;

$$\text{Span} = (\text{Upper Carrier Freq} + (\text{max offset IBW} * (1 + \alpha)) / 2) - (\text{Lower Carrier Freq} - (\text{max offset IBW} * (1 + \alpha)) / 2)$$

If the RRC Filter is on, then span is increased by a factor of 1 + Filter Alpha.

See "[Span Presets](#)" on page 867

Remote Command	<code>[:SENSe] :CHPower :FREQUency :SPAN <freq></code> <code>[:SENSe] :CHPower :FREQUency :SPAN ?</code>
Example	<code>:CHP :FREQ :SPAN 10 MHz</code>

:CHP:FREQ:SPAN?	
Dependencies	<p>If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error</p> <p>In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz. See the Stop Frequency control description for details of this limitation</p> <p>For MSR Mode, this control is not shown</p> <p>For WLAN 802.11ac (80 MHz + 80 MHz), the control is not enabled, and its value is coupled with the spacing between the center frequencies of the two carriers</p> <p>$\text{Span} = \text{Center Frequency 1} - \text{Center Frequency 2} + \text{Integ BW} + 40 \text{ MHz Margin}$</p> <p>When the calculated span is over 1 GHz, it is still coupled to its maximum value, which is 1 GHz</p>
Couplings	<p>Span affects "Res BW" on page 847, Sweep Time, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings)</p> <p>Any value of Center Frequency or Span that is within the frequency range of the instrument is allowed <i>when</i> the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range</p> <p>When using the knob or the step up/down keys or the UP DOWN keywords in SCPI, the value that is being changed, that is, Center Frequency or Span, is limited so that the other parameter is not forced to a new value</p> <p>When Res BW is set to Auto, the resolution bandwidth is auto-coupled to span. The ratio of span /RBW is approximately 106:1. When Res BW is set to Man, bandwidths are entered by the user, and these bandwidths are used regardless of other instrument settings</p> <p>Since Span is coupled to Integ BW in the factory default condition, if you change the Integ BW setting, the span setting changes by a proportional amount until a limit value is reached. However, the span can be individually set. The minimum value of the span is coupled with the integration bandwidth</p> <p>Span cannot be set less than the Integ BW value. When Span is changed, the ratio of Span/Integ BW is set, and retained when Integ BW is changed</p>
Preset	<p>Depends on instrument maximum frequency, mode, measurement, and selected input</p> <p>See "Span Presets" on page 867</p>
State Saved	Saved in instrument state
Min	<p>100 Hz</p> <p>In 5G NR, LTEAFDD, and LTEATDD Modes, this value is the minimum value required for the measurement, which depends on the Component Carrier configuration</p>
Max	<p>Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 867</p> <p>If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency</p>
Annunciation	Data out of range, value clipped to upper limit
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

LTE, 5G NR Modes only:

3 VMA Mode
3.5 Channel Power Measurement

Remote Command	<code>[:SENSe]:CHPower:FREQuency:SPAN:AUTO ON OFF 1 0</code> <code>[:SENSe]:CHPower:FREQuency:SPAN:AUTO?</code>
Example	<code>:CHP:FREQ:SPAN:AUTO OFF</code> <code>:CHP:FREQ:SPAN:AUTO?</code>
Notes	The span value is adjusted when the relevant carrier parameters such as bandwidth, integration bandwidth, number of component carriers etc., are changed, whatever the span state (Auto or Man) When in Man state, if the input value is less than the required sum of total integration bandwidths and gaps of the multi-carriers, the required span value is set
Dependencies	Only available in LTE/LTE-Advanced FDD/TDD Modes and 5G NR Mode, CHP measurement
Preset	ON
State Saved	Saved in instrument state
Range	Auto Man

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz

Freq Option	Max Span (can't set higher than this)
F06 (VXT models M9410A/11A)	5.75 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Radio Std	Preset Value
SA		3 MHz
WCDMA		7.5 MHz
LTE		7.5 MHz
LTETDD		7.5 MHz
5G NR		150 MHz
WLAN	802.11a/g(OFDM/DSSS-OFDM)	30 MHz
	802.11b	37.5 MHz
	802.11n/ac/ax/be 20MHz	30 MHz
	802.11n/ac/ax/be 40MHz	60 MHz
	802.11n/ac/ax/be 80 MHz	120 MHz
	802.11n/ac/ax/be 160 MHz	240 MHz
	802.11n/ac/ax/be 80 MHz + 80 MHz	360 MHz
	802.11be 320 MHz	480MHz
	802.11be 160MHz + 160MHz	440MHz

CF Step

Changes the step size for **Center Frequency** and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq></code> <code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?</code>
Example	Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning Not available in the MSR, LTE-A FDD/TDD and 5G NR Modes
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min/Max	-/+ (the maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	<code>[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe]:FREQuency:CENTer:STEP:AUTO?</code>
Example	<code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>

Full Span (Remote Command Only)

Changes the span to show the full frequency range of the instrument. It maximizes the span within a range not changing the center frequency.

Remote Command	<code>[:SENSe] :CHPower:FREQuency:SPAN:FULL</code>
Example	<code>:CHP:FREQ:SPAN:FULL</code>
Couplings	Selecting full span changes the measurement span value

3.5.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.5.7.1 Select Marker

Specifies the *selected marker*. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. If you select a tab whose controls do *not* depend on the selected marker (for example, Counter), then this control is blanked.

For any menu that includes **Select Marker**, the first control is always **Marker Frequency**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal , Delta and Fixed markers

3.5.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the

control mode is **Normal** or **Delta**.

Remote Command	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:CHP:MARK3:X 0</code> <code>:CALC:CHP:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned OFF , so Marker X-Axis Value query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	-/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta**, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X:POSition <real></code> <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X:POSition?</code>
Example	<code>:CALC:CHP:MARK10:X:POS 0</code> <code>:CALC:CHP:MARK10:X:POS?</code>
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points. When a marker is turned on, it is placed at the center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is Off , the response is Not A Number
Preset	After a preset, all markers are turned Off , so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	-/+9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y-Axis unit.

Remote Command	:CALCulate:CHPower:MARKer[1] 2 ... 12:Y?
Example	:CALC:CHP:MARK11:Y?
Notes	Returns the marker Y-Axis result if the control mode is Normal or Delta If the marker is Off , then the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:CHPower:MARKer[1] 2 ... 12:FUNCTION:RESult?

Marker Mode

Sets the marker control mode to **POSITION** (**Normal**), **DELTA**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **POSITION** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

Remote Command	:CALCulate:CHPower:MARKer[1] 2 ... 12:MODE Position DELTa OFF :CALCulate:CHPower:MARKer[1] 2 ... 12:MODE?
Example	:CALC:CHP:MARK3:MODE POS :CALC:CHP:MARK3:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSITION DELTA OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it in **POSITION** (**Normal**) mode and places it at the center of the screen.

Example	<code>:CALC:CHP:MARK3:STAT ON</code> <code>:CALC:CHP:MARK3:STAT?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:STATe OFF ON 0 1</code>
Compatibility SCPI	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:STATe?</code>

Delta Marker (Reset Delta)

This control has the same effect as pressing **Delta** in "**Marker Mode**" on page 872. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	<code>:CALCulate:CHPower:MARKer:AOFF</code>
Example	<code>:CALC:CHP:MARK:AOFF</code>

3.5.7.3 Peak Search

The controls on this tab let you move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "**Marker Delta**" on page 874.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search. Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on [page 870](#) in the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum Y-Axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:MAXimum</code>
Example	<code>:CALC:CHP:MARK2:MAX</code> <code>:SYST:ERR?</code> can be used to query the errors to determine if a peak is found. Following an unsuccessful search, the message "No peak found" is returned
Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "[Marker Mode](#)" on [page 872](#) on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.5.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on page 870 in the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:REFerence <integer></code>
Example	<code>:CALC:CHP:MARK:REF 5</code> <code>:CALC:CHP:MARK:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	If the reference marker is Off , it is turned on in Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . Not reset by Marker Off , All Markers Off , or Preset
State Saved	Saved in instrument state. Not affected by Marker Off, and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves the marker from the trace it was on to the new trace. If the marker is **Off**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	<code>:CALCulate:CHPower:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:CHP:MARK2:TRAC 2</code> <code>:CALC:CHP:MARK2:TRAC?</code>
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of Marker Trace is not affected by " Auto Couple " on page 1825 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "[Marker Settings Diagram](#)" on page 873 in the **Settings** tab.

3.5.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.5.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote	<code>[[:SENSe]:CHPower:AVERage:COUNT <integer></code>
--------	--

Command	<code>[:SENSe] :CHPower:AVERage:COUNT?</code>
Example	<code>:CHP:AVER:COUN 15</code> <code>:CHP:AVER:COUN?</code>
Preset	SA, WLAN: 10 WCDMA, LTEAFDD, LTEATDD, 5G NR, MSR: 200
State Saved	Saved in instrument state
Min/Max	1 / 10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count

Averaging On/Off

Turns averaging on or off for this measurement.

NOTE

In this measurement, the **Average Type** is preset to the **Log-Pwr Avg (Video)** method. Other averaging methods are not available.

Remote Command	<code>[:SENSe] :CHPower:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe] :CHPower:AVERage[:STATe]?</code>
Example	<code>:CHP:AVER ON</code> <code>:CHP:AVER?</code>
Preset	ON
State Saved	Yes
Range	ON OFF

Avg Mode

Allows you to select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. Options are:

- **EXponential**: The measurement averaging continues using the specified number of averages to compute each exponentially-weighted averaged value. The average is displayed at the end of each sweep
- **REPeat**: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	<code>[:SENSe] :CHPower:AVERage:TCONtrol EXponential REPeat</code> <code>[:SENSe] :CHPower:AVERage:TCONtrol?</code>
----------------	--

Example	<code>:CHP:AVER:TCON EXP</code> <code>:CHP:AVER:TCON?</code>
Preset	EXP
State Saved	Yes
Range	EXPonential REPeat

Integ BW

Specifies the range of integration used in calculating the power in the channel. The integration bandwidth (IBW) is displayed on the trace as two markers connected by an arrow.

Remote Command	<code>[:SENSe] :CHPower :BANDwidth :INTEgration <bandwidth></code> <code>[:SENSe] :CHPower :BANDwidth :INTEgration?</code>		
Example	<code>:CHP :BAND :INT 10MHz</code> <code>:CHP :BAND :INT?</code>		
Dependencies	For LTE-Advanced FDD/TDD, 5G NR and MSR Modes, this control is not shown		
Couplings	The minimum value of the span is coupled with Integ BW When you change Integ BW, the span changes accordingly by keeping the same ratio of Span/Integ BW		
Preset	Mode	Radio Std	Integ BW
	SA		2 MHz
	WCDMA		5 MHz
	LTEAFDD, LTEATDD		5 MHz
	WLAN	802.11a/g(OFDM/DSSS-OFDM)	20 MHz
		802.11b	25 MHz
		802.11n/ac/ax/be (20MHz)	20 MHz
		802.11n/ac/ax/be (40MHz)	40 MHz
		802.11n/ac/ax/be (80MHz)	80 MHz
		802.11ax/be (80 MHz + 80 MHz)	80 MHz
		802.11ac/ax/be (160 MHz)	160 MHz
		802.11be (160 MHz + 160MHz)	160 MHz
		802.11be (320MHz)	320 MHz
State Saved	Saved in instrument state		
Min/Max	100 Hz / Hardware Maximum Span		
Backwards Compatibility SCPI	<code>[:SENSe] :CHPower :BWIDth :INTEgration</code>		

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz (**DBMHZ**) and dBm/MHz (**DBMMHZ**).

Remote Command	<code>:UNIT:CHPower:POWer:PSD DBMHZ DBMMHZ</code> <code>:UNIT:CHPower:POWer:PSD?</code>
Example	<code>:UNIT:CHP:POW:PSD DBMMHZ</code> <code>:UNIT:CHP:POW:PSD?</code>
Couplings	When the PSD unit is changed, the response to <code>:MEAS READ FETCH:CHP1?</code> also changes by the PSD unit basis (either dBm/Hz or dBm/MHz)
Preset	WLAN mode or SA mode with WLAN radio standard: DBMMHZ Otherwise: DBMHZ
State Saved	Saved in instrument state
Range	dBm/Hz dBm/MHz

IF Gain

Sets **IF Gain** to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	<code>[:SENSe]:CHPower:IF:GAIN[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CHPower:IF:GAIN[:STATe]?</code>
Example	<code>:CHP:IF:GAIN ON</code> <code>:CHP:IF:GAIN?</code>
Notes	ON = high gain OFF = low gain
Dependencies	The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamp-lifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls Not available in VXT model M9421A
Preset	OFF
State Saved	Saved in instrument state
Range	Low Gain High Gain Auto Function
Remote Command	<code>[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe]?</code>

Example	<code>:CHP:IF:GAIN:AUTO ON</code> <code>:CHP:IF:GAIN:AUTO?</code>
Couplings	Auto sets IF Gain to High Gain if the input attenuator is set to 0 dB, or if the preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low Gain
Preset	<code>OFF</code>

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is **Enabled** (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to **Disabled** (`OFF`).

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be negatively impacted.

Remote Command	<code>[:SENSe]:CHPower:SAVoid[:STATe] ON OFF 0 1</code> <code>[:SENSe]:CHPower:SAVoid[:STATe]?</code>
Example	<code>:CHP:SAV ON</code> <code>:CHP:SAV?</code>
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>ON OFF</code>

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 882 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	: COUP :NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does not affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command `:CONFigure:CHPower`

Example `:CONF:CHP`

3.5.8.2 Meas Method

Allows you to choose between Integration Bandwidth and RRC Weighted methods of making the measurement, and to set certain other relevant parameters.

In MSR, LTE-A FDD/TDD and 5G NR Modes, this feature is not supported.

Meas Method

Selects either the Integration BW (**OFF**) or RRC Weighted (**ON**) methods. Selecting the RRC Weighted method turns the Root Raised Cosine (RRC) filter on. The α value (roll off) for the filter is set to the value of "RRC Filter Alpha" on page 883, and the RRC filter bandwidth is set to "RRC Filter BW" on page 884.

Remote Command	<code>[:SENSe]:CHPower:FILTer[:RRC][:STATe] OFF ON 0 1</code> <code>[:SENSe]:CHPower:FILTer[:RRC][:STATe]?</code>
Example	<code>:CHP:FILT OFF</code> <code>:CHP:FILT?</code>
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Dependencies	For WLAN 802.11 ac (80 + 80 MHz), RRC Weighted is not supported
Preset	OFF
State Saved	Saved in instrument state
Range	Integration BW RRC Weighted

RRC Filter Alpha

Inputs the alpha value for the Root Raised Cosine (RRC) filter.

Remote Command	<code>[:SENSe]:CHPower:FILTer[:RRC]:ALPHa <real></code> <code>[:SENSe]:CHPower:FILTer[:RRC]:ALPHa?</code>
Example	<code>:CHP:FILT:ALPH 0.5</code> <code>:CHP:FILT:ALPH?</code>
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01 / 1.00

RRC Filter BW

Sets the Root Raised Cosine (RRC) filter bandwidth. Normally, the filter bandwidth is the same as the symbol rate of the signal.

Remote Command	<code>[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth <real></code> <code>[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth?</code>										
Example	<code>:CHP:FILT:BAND 10MHz</code> <code>:CHP:FILT:BAND?</code>										
Notes	This parameter is normally used when TETRA is selected as the Radio Std										
Preset	SA, WCDMA, LTE, LTETDD Modes: 3.84 MHz WLAN Mode:										
	<table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11a/g (OFDM/DSSS-OFDM)</td> <td>16.6 MHz</td> </tr> <tr> <td>802.11b</td> <td>22 MHz</td> </tr> <tr> <td>802.11n (20MHz)</td> <td>17.8 MHz</td> </tr> <tr> <td>802.11n (40MHz)</td> <td>36.6 MHz</td> </tr> </tbody> </table>	Radio Std	Value	802.11a/g (OFDM/DSSS-OFDM)	16.6 MHz	802.11b	22 MHz	802.11n (20MHz)	17.8 MHz	802.11n (40MHz)	36.6 MHz
Radio Std	Value										
802.11a/g (OFDM/DSSS-OFDM)	16.6 MHz										
802.11b	22 MHz										
802.11n (20MHz)	17.8 MHz										
802.11n (40MHz)	36.6 MHz										
State Saved	Saved in instrument state										
Min/Max	100 Hz / 100 MHz										
Backwards Compatibility SCPI	<code>[:SENSe]:CHPower:FILTer[:RRC]:BWIDth</code>										

3.5.8.3 Limits

Lets you set up the test limit for channel power or power spectral density.

When DVB-T radio standard is selected in SA Mode, this functionality is disabled, and the input signal is instead compared against a pre-defined spectrum mask.

In LTE-A FDD/TDD and 5G NR Modes, this feature is not supported.

In MSR Mode, this feature is not supported, because the power of each carrier may be different.

Power Limit

If **Power Limit** state is **ON**, this setting is a threshold to determine whether the real measured channel power can be passed or not. If real measured channel power exceeds **Power Limit**, the channel power test fails, otherwise, it passes.

If **Power Limit** state is **OFF**, the channel power test always passes.

3 VMA Mode
3.5 Channel Power Measurement

Remote Command	<code>:CALCulate:CHPower:LIMit:POWer <ampl></code> <code>:CALCulate:CHPower:LIMit:POWer?</code>															
Example	<code>:CALC:CHP:LIM:POW 16.00</code> <code>:CALC:CHP:LIM:POW?</code>															
Notes	This parameter and PSD Limit can determine Pass/Fail criteria <table border="1"> <thead> <tr> <th>Power Limit state</th> <th>PSD Limit state</th> <th>Result</th> </tr> </thead> <tbody> <tr> <td>ON</td> <td>OFF</td> <td>Pass if power test passes Fail if power test fails</td> </tr> <tr> <td>ON</td> <td>ON</td> <td>Pass if both power test and PSD test pass Fail if either of power test or PSD test fails</td> </tr> <tr> <td>OFF</td> <td>ON</td> <td>Pass if PSD test passes Fail if PSD test fails</td> </tr> <tr> <td>OFF</td> <td>OFF</td> <td>Always Pass</td> </tr> </tbody> </table> <p>For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers, which means the power (or PSD) readouts of both carriers should be compared with the power (or PSD) limit individually, and the test passes only when <i>both</i> values are lower than the limit</p>	Power Limit state	PSD Limit state	Result	ON	OFF	Pass if power test passes Fail if power test fails	ON	ON	Pass if both power test and PSD test pass Fail if either of power test or PSD test fails	OFF	ON	Pass if PSD test passes Fail if PSD test fails	OFF	OFF	Always Pass
Power Limit state	PSD Limit state	Result														
ON	OFF	Pass if power test passes Fail if power test fails

OFF	OFF	Always Pass														
Preset	16.00															
State Saved	Saved in instrument state															
Min/Max	-/+200.0 Auto Function															
Remote Command	<code>:CALCulate:CHPower:LIMit:POWer:StAtE OFF ON 0 1</code> <code>:CALCulate:CHPower:LIMit:POWer:StAtE?</code>															
Example	<code>:CALC:CHP:LIM:POW:STAT ON</code> <code>:CALC:CHP:LIM:POW:STAT?</code>															
Preset	WLAN Mode: ON All other Modes: OFF															
State Saved	Yes															
Range	OFF ON															

PSD Limit

Power Spectral Density Limit.

If **PSD Limit** state is **ON**, **PSD Limit** is a threshold to determine whether the real measured PSD will pass or not. If real measured PSD exceeds PSD Limit, the test fails, otherwise, it passes.

If **PSD Limit** state is **OFF**, the test always passes.

Remote Command	<code>:CALCulate:CHPower:LIMit:PSDensity <real></code> <code>:CALCulate:CHPower:LIMit:PSDensity?</code>															
Example	<code>:CALC:CHP:LIM:PSD 4.00</code> <code>:CALC:CHP:LIM:PSD?</code>															
Notes	This parameter and Power Limit can determine Pass/Fail criteria <table border="1" data-bbox="393 508 1406 840"> <thead> <tr> <th>Power Limit state</th> <th>PSD Limit state</th> <th>Result</th> </tr> </thead> <tbody> <tr> <td>ON</td> <td>OFF</td> <td>Pass if power test passes Fail if power test fails</td> </tr> <tr> <td>ON</td> <td>ON</td> <td>Pass if both power test and PSD test pass Fail if either of power test or PSD test fails</td> </tr> <tr> <td>OFF</td> <td>ON</td> <td>Pass if PSD test passes Fail if PSD test fails</td> </tr> <tr> <td>OFF</td> <td>OFF</td> <td>Always Pass</td> </tr> </tbody> </table> <p>For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers. Which means the PSD (or power) readouts of both carriers should be compared with the PSD (or power) limit individually, and the test passes only when both values are lower than the limit</p>	Power Limit state	PSD Limit state	Result	ON	OFF	Pass if power test passes Fail if power test fails	ON	ON	Pass if both power test and PSD test pass Fail if either of power test or PSD test fails	OFF	ON	Pass if PSD test passes Fail if PSD test fails	OFF	OFF	Always Pass
Power Limit state	PSD Limit state	Result														
ON	OFF	Pass if power test passes Fail if power test fails														
ON	ON	Pass if both power test and PSD test pass Fail if either of power test or PSD test fails														
OFF	ON	Pass if PSD test passes Fail if PSD test fails														
OFF	OFF	Always Pass														
Couplings	The value is automatically converted when PSD Unit is changed															
Preset	WLAN mode or SA mode with WLAN radio standard: 4.00 dBm/MHz Otherwise: 4.00 dBm/Hz															
State Saved	Saved in instrument state															
Min/Max	-/+200.0 Auto Function															
Remote Command	<code>:CALCulate:CHPower:LIMit:PSDensity:STATe OFF ON 0 1</code> <code>:CALCulate:CHPower:LIMit:PSDensity:STATe?</code>															
Example	<code>:CALC:CHP:LIM:POW:STAT ON</code> <code>:CALC:CHP:LIM:POW:STAT?</code>															
Preset	WLAN Mode: ON All other Modes: OFF															
State Saved	Yes															
Range	OFF ON															

Power Limit Fail (Remote Query Only)

Queries whether a power test passes or fails. When DVB-T radio standard is selected in SA Mode, the result of this query has no meaning.

3 VMA Mode
3.5 Channel Power Measurement

While implementing the scpi, don't try to remove the SCPI command from the SCPI tree when DVB-T is selected as current radio standard.

Remote Command	<code>:CALCulate:CHPower:LIMit:POWer:FAIL?</code>
Example	<code>:CALC:CHP:LIM:POW:FAIL?</code>
Notes	Query only When "Power Limit" on page 884 state is OFF , the returned value is always 0 (pass) When Power Limit state is ON , the returned value is 0 (pass) if power test passes and 1(fail) if power test fails

PSD Limit Fail (Remote Query only)

Queries whether PSD test passes or fails. When DVB-T radio standard is selected in SA Mode, the result of this query has no meaning.

While implementing the scpi, don't try to remove the SCPI command from the SCPI tree when DVB-T is selected as current radio standard.

Remote Command	<code>:CALCulate:CHPower:LIMit:PSD:FAIL?</code>
Example	<code>:CALC:CHP:LIM:PSD:FAIL?</code>
Notes	Query only When "PSD Limit" on page 885 state is OFF , the returned value is always 0 (pass) When PSD Limit state is ON , the returned value is 0 (pass) if PSD test passes and 1(fail) if PSD test fails

3.5.8.4 Advanced

Contains controls for setting advanced functions of the instrument.

Does not appear in VXT.

Phase Noise Optimization

Lets you select the LO (local oscillator) phase noise behavior for various operating conditions. When in Auto, selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions.

For full details, see "Parameter Options, Installed Options & Ranges" on page 888 below.

Remote Command	<code>[:SENSe] :CHPower:FREQuency:SYNThesis[:STATe] 1 ... 5</code> For the meaning of each numeric option value, see "Parameter Options, Installed Options & Ranges" on page 888 below
----------------	---

	<code>[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe]?</code>
Example	<code>:CHP:FREQ:SYNT 1</code> <code>:CHP:FREQ:SYNT?</code>
Dependencies	Does not appear in all models. For models in which the control is not displayed, the SCPI command is accepted for compatibility, although no action is taken
Preset	3
State Saved	Saved in instrument state
Range	See "Ranges" on page 893 below
Auto Function	
Remote Command	<code>[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe] OFF ON 0 1</code> <code>[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe]?</code>
Example	<code>:CHP:FREQ:SYNT:AUTO 1</code> <code>:CHP:FREQ:SYNT:AUTO?</code>
Preset	OFF

Parameter Options, Installed Options & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 889	1	<ul style="list-style-type: none"> In instruments with EPO, balances close-in phase noise with spur avoidance In instruments without EPO optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 890	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 890	3	Optimizes LO for tuning speed
"Best Close-in" on page 889	4 or 1*	<ul style="list-style-type: none"> In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance In instruments without EPO, this setting is accepted but no action is taken
"Best Spurs"	5	<ul style="list-style-type: none"> In instruments with EPO, emphasizes spur avoidance over close-in

Option	#	Description
on page 890		phase noise performance - In instruments without EPO, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EPO installation. See "Best Close-in" on page 889 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 890 is identical in effect to "Best Close-in" on page 889.

Best Close-in

Without option EPO

:FREQ:SYNT 1

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

:FREQ:SYNT 4

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 889 setting, parameter 1 selects "Balanced" on page 889 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 889, which is usually not as good a choice as "Balanced" on page 889.

Balanced

:FREQ:SYNT 1

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

:FREQ:SYNT 5

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 890 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 889 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 889 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

:FREQ:SYNT 2

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

:FREQ:SYNT 3

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 890 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EPO, this is the same configuration as "Best Spurs" on page 890. It is available with the "Fast Tuning" on page 890 label for convenience,

and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 890 option, the settings for "Best Close-in" on page 889 are used if "Fast Tuning" on page 890 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

:FREQ:SYNT:AUTO ON

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EPO Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz Span > 114.1 MHz, <i>or</i> RBW > 800 kHz RBW > 290 kHz, <i>or</i> Span > 4.2 MHz Other conditions	"Balanced" on page 889 "Fast Tuning" on page 890 "Best Wide-offset" on page 890 "Balanced" on page 889
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 1.3 MHz <i>and</i> RBW <= 75 kHz All other conditions	"Fast Tuning" on page 890 "Best Close-in" on page 889 "Best Wide-offset" on page 890
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise	CF < 130 kHz, <i>or</i> CF > 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 40 kHz	"Best Close-in" on page 889

Models with Option	Conditions	Selection
between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 889; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 23 kHz All other conditions	"Fast Tuning" on page 890 "Best Wide-offset" on page 890
EP4 (available in CXA for improved phase noise)	Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" CF is < 109 kHz <i>or</i> CF ≥ 4.95 MHz <i>and</i> Span ≤ 666 kHz <i>and</i> RBW < 28 kHz All other conditions	"Fast Tuning" on page 890 "Best Close-in" on page 889 "Best Wide-offset" on page 890
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 890 are actually the same as "Best Close-in" on page 889, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, <i>or</i> RBW > 250 kHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 25 kHz, <i>or</i> CF ≥ 1 MHz <i>and</i> Span ≤ 141.4 kHz <i>and</i> RBW ≤ 5 kHz All other conditions	"Fast Tuning" on page 890 "Best Close-in" on page 889 "Best Wide-offset" on page 890

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
	1	Best Close-in	[offset < 140 kHz]
EP1	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
	1	Best Close-in	[offset < 70 kHz]
EP2, EP3, EP5	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
	1	Best Close-in	[offset < 90 kHz]
EP4	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Noise Floor Extension

Lets you turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The **ON** state (in Modes which do not support Adaptive NFE) matches the **FULL** state (in Modes that *do* support Adaptive NFE).

In **ON** or **FULL** NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes which support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, so it does nothing when **External Mixing** is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive (**ON**). In Modes that do not support Adaptive NFE, the default state of NFE is **OFF**. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was **OFF** for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On|Off** to **Full|Adaptive|Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on or off was retained, and a new command was added to set the state to turn Adaptive On or Off:

- `[:SENSe]:CORRection:NOISe:FLOOr ON|OFF|1|0` is retained, default changed to On for modes that support Adaptive NFE
- `[:SENSe]:CORRection:NOISe:FLOOr:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = On
- **FULL = `:CORRection:NOISe:FLOOr ON` plus `:CORRection:NOISe:FLOOr:ADAPtive ON`**

See "[More Information](#)" on page 895

Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOOr ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOOr?</code>
Example	<code>:CORR:NOIS:FLO ON</code>
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, does not appear, but

3 VMA Mode
3.5 Channel Power Measurement

	the SCPI command will be accepted without error but has no effect
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive
State Saved	No
Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?</code>
Example	Turn NFE ON (Full mode): <code>:CORR:NOIS:FLO ON</code> Set to Adaptive: <code>:CORR:NOIS:FLO:ADAP ON</code>
Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect)
Couplings	For backwards compatibility, sending <code>:CORR:NOIS:FLO ON</code> turns NFE Adaptive OFF . To turn Adaptive ON , you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus instrument noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the instrument noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you **Cancel**, you will be prompted again the next time you turn NFE **ON**. If you **Postpone**, you will be prompted again after a week passes and you then turn NFE **ON**.

3.5.8.5 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, **"Global Center Freq"** on page 1828) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "Restore Defaults" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:FREQUENCY:CENTER ALL NONE :INSTRUMENT:COUPLE:FREQUENCY:CENTER?
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBAL:FREQUENCY:CENTER[:STATE] 1 0 ON OFF :GLOBAL:FREQUENCY:CENTER[:STATE]?

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "Restore Defaults" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:EMC:STANDARD ALL NONE :INSTRUMENT:COUPLE:EMC:STANDARD?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTRument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.5.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.5.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE

Significantly faster sweep times are available with Option FS1.

NOTE

The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW

and/or VBW.

NOTE	On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send <code>[:SENSe] :<meas> :SWEEp:TIME <time></code> . The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.
Remote Command	<code>[:SENSe] :<meas> :SWEEp:TIME <time></code> <code>[:SENSe] :<meas> :SWEEp:TIME?</code>
Example	Channel Power measurement: <code>:CHP:SWE:TIME 25ms</code> <code>:CHP:SWE:TIME?</code>
Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by Meas Method selection. Preset values are as follows: <ul style="list-style-type: none"> - IBW: 29 ms - IBWR: 108 ms - FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, " Minimum Acquisition Time " on page 1357 is available
Couplings	Coupled to Span , RBW , VBW , and Sweep Time Rules when Sweep Time is set to Auto; Sweep Time changes when these parameters are changed When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically Calculated unless noted below WCDMA Mode <ul style="list-style-type: none"> - Channel Power: 1.0 msOBW: 32.6 ms - ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when Meas Method is Fast Power , the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s

3 VMA Mode
3.5 Channel Power Measurement

	Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: <code>STATus:QUEStionable:INTEgrity:UNCalibrated</code>
	Auto Function
Remote Command	<code>[:SENSe]:<meas>:SWEep:TIME:AUTO OFF ON 0 1</code> <code>[:SENSe]:<meas>:SWEep:TIME:AUTO?</code>
Example	Channel Power measurement: <code>:CHP:SWE:TIME:AUTO OFF</code> <code>:CHP:SWE:TIME:AUTO?</code>
Preset	WCDMA Mode <code>OFF</code> All others <code>ON</code>

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

$$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$$

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	<code>[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time></code> <code>[:SENSe]:<meas>:SWEep:ACQuisition:TIME?</code>
----------------	--

	<code><meas></code> is the identifier for the current measurement; any one of CHPower- ACPower OBWidth MONitor
Example	Channel Power measurement <code>:CHP:SWE:ACQ:TIME 500 ms</code> <code>:CHP:SWE:ACQ:TIME?</code>
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Span , RBW , and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	<code>[[:SENSe]:<meas>:SWEep:ACQquisition:TIME:AUTO OFF ON 0 1</code> <code>[[:SENSe]:<meas>:SWEep:ACQquisition:TIME:AUTO?</code> <code><meas></code> is the identifier for the current measurement; any one of CHPower- ACPower OBWidth MONitor
Example	Channel Power measurement: <code>:CHP:SWE:ACQ:TIME:AUTO OFF</code>
Preset	ON

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 903

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON

Note that **:SYST:PRES** sets **:INIT:CONT** to **ON**, but ***RST** sets **:INIT:CONT** to **OFF**

State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and INIT:CONT ON) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1832 for details of **:INIT:IMmediate**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/hold sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending **:INIT:IMM**
- Sending **:INIT:REST**

See "[More Information](#)" on page 905

Remote Command	:INITiate[:IMMEDIATE] :INITiate:REStart
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATus:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATus:QUEStionable register bit 9 (INTegrity sum) is cleared

	The Sweeping bit is set
	The Measuring bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORt</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORt</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATus:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUEStionable</code> register bit 9 (INTEGRity sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORt</code> , the Abort command will cause the <code>*OPC</code> query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	<code>[:SENSe] : < meas > : SWEep : ETIME ?</code> <code>< meas ></code> is the identifier for the current measurement; any one of CHPower - ACPower OBWidth MONitor
Example	Channel Power measurement <code>:CHP : SWE : ETIME ?</code>
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.5.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Time Rules

Switches the instrument between **NORMa1** and **ACCuracy** sweep states.

Setting **Auto Sweep Time** to **ACCuracy** results in slower sweep times (usually about three times as long) but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **ACCuracy**.

Additional amplitude errors that occur when **Auto Sweep Time** is set to **NORMa1** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **NORMa1** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **NORMa1** on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	<code>[:SENSe] : CHPower : SWEep : TIME : AUTO : RULEs NORMa1 ACCuracy</code> <code>[:SENSe] : CHPower : SWEep : TIME : AUTO : RULEs ?</code>
Example	<code>:CHP : SWE : TIME : AUTO : RUL NORM</code> <code>:CHP : SWE : TIME : AUTO : RUL ?</code>

3 VMA Mode
 3.5 Channel Power Measurement

Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9421A
Preset	NORMa1
State Saved	Saved in instrument state
Range	NORMa1 ACCuracy

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of **Points** is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **"Sweep/Measure" on page 1830** is **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

Remote Command	<code>[:SENSe] :CHPower :SWEep :POINts <integer></code> <code>[:SENSe] :CHPower :SWEep :POINts ?</code>
Example	<code>:CHP :SWE :POIN 501</code> <code>:CHP :SWE :POIN ?</code>
Dependencies	Not available when Signal ID is ON in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support Swept
Couplings	Whenever the number of sweep points change:

- All trace data is erased
- Any traces with Update Off also switch to Display Off (equivalent to switching from View to Blank in older instruments)
- Sweep time is re-quantized
- Any limit lines that are on will be updated
- If averaging/hold is on, averaging/hold starts over

The resolution of setting the sweep time depends on the number of points selected

Preset	1001
State Saved	Saved in instrument state
Min	11
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	<code>[:SENSe] :SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe] :SWEep:IF:DITHer?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	OFF
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	<code>[:SENSe] :SWEep:IMAGeprot OFF ON 0 1</code> <code>[:SENSe] :SWEep:IMAGeprot?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	ON
State Saved	Saved in instrument state

3.5.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

3.5.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the Trace menu
Dependencies	For the Swept SA measurement: <ul style="list-style-type: none">- In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View- When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled
Preset	Trace 1
State Saved	Yes

3.5.10.2 Trace Control

The controls on this tab allow you to set the "**Trace Type**" on page 1737 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "[View/Blank](#)" on page 1742 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	<code>WRITE</code>	<code>:TRAC2:TYPE WRIT</code>	See: " Clear/Write " on page 915
Trace Average	<code>AVERage</code>	<code>:TRAC2:TYPE AVER</code>	See: " Trace Average " on page 915
Maximum Hold	<code>MAXHold</code>	<code>:TRAC3:TYPE MAXH</code>	See: " Max Hold " on page 916
Minimum Hold	<code>MINHold</code>	<code>:TRAC5:TYPE MINH</code>	See: " Min Hold " on page 916

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "[View/Blank](#)" on page 1742 state must be set to **Active** (**Update**: **ON**, **Display**: **ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "[Trace Mode Backwards Compatibility Commands](#)" on page 913

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITE AVERage MAXHold MINHold :TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITE AVERage MAXHold MINHold :TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <code><meas></code> is the identifier for the current measurement</p>
Example	<pre>:TRAC:TYPE WRIT :TRAC:TYPE?</pre>
Couplings	<p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe] : <meas> : DETector : AUTO?</code>), Detector (<code>[:SENSe] : <meas> : DETector [:FUNCTION]?</code>) switches aligning with the switch of this parameter: "NORMal" with <code>WRITE</code> (Clear Write), "AVERage" with <code>AVERage</code>, "POSitive (peak)" with <code>MAXHold</code>, and "NEGative (peak)" with <code>MINHold</code></p>

Preset	Swept SA and Monitor Spectrum: WRITe All other measurements: AVERage Following Preset , all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "**View/Blank**" on page 1742.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The **:TRACe:MODE** command is retained for backwards compatibility, and the **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay** commands introduced for ongoing use. The old Trace Modes are selected using **:TRAC:MODE**, whose parameters are mapped into calls to **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay**, and the old global Averaging command **[:SENSe]:AVERage[:STATe]** is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart, Single** or **:INIT:IMM**, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	WRITe
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	:TRACe[1] 2 ... 6:MODE WRITe MAXHold MINHold VIEW BLANK :TRACe[1] 2 ... 6:MODE?
Backwards Compatibility Notes	The legacy :TRACe:MODE command is retained for backwards compatibility. In conjunction with the legacy :AVERage command, it works as follows: <ul style="list-style-type: none"> – :AVERage ON OFF sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the

`[:SENSe]:AVERage[:STATe]` command description below

- `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVERage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	<code>OFF</code>
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	<code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code>
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage [:STATe] ON OFF 1 0</code> was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy

variable, turned on and off and queried by the legacy command `[:SENSe] :AVERage [:STATe] OFF | ON | 0 | 1`. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "**Trace Type**" on page 1737 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF ; Display ON
Blank	Update OFF ; Display OFF
Background	Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace

annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: ["More Information" on page 919](#)

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 918 and "Trace Display State On/Off" on page 919 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	<p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending <code>[:SENS] :DET :TRAC</code>) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 1745 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p>

Trace Update State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 2 inactive (stop updating):</p> <pre>:TRAC2:UPD 0</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 1 visible:</p> <pre>:TRAC2:DISP 1</pre> <p>Blank trace 3:</p> <pre>:TRAC3:DISP 3</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.5.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "[Operand 1 / Operand 2](#)" on page 1751 controls.

- See "[How trace math is processed](#)" on page 924

Remote Command	<p>For option details, see "Trace Math Options" on page 922</p> <p>For Swept SA Measurement (in SA Mode):</p> <pre style="font-family: monospace;">:CALCulate:MATH <trace_num>, PDIFference PSUM LOFFset LDIFference OFF, <trace_num>, <trace_num>, <real>,<real> :CALCulate:MATH? <trace_num></pre> <p>where <trace_num> is any one of:</p> <pre style="font-family: monospace;">TRACE1 ... TRACE6</pre> <p>For all other measurements:</p> <pre style="font-family: monospace;">:CALCulate:<meas>:MATH <trace_num>, PDIFference PSUM LOFFset LDIFference OFF, <trace_num>, <trace_num>, <real>,<real> :CALCulate[:<meas>]:MATH? <trace_num></pre> <p>where:</p> <p><meas> is the identifier for the current measurement, and</p> <p><trace_num> is any one of:</p> <pre style="font-family: monospace;">TRACe1 TRACe2 TRACe3</pre> <p>Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement</p>
----------------	--

Example	<pre style="font-family: monospace;">:CALC:MATH TRACe3,PDIF,TRACe1,TRACe2,0,0</pre>
---------	---

3 VMA Mode
 3.5 Channel Power Measurement

	<p>Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2</p> <p><code>:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0</code></p> <p>Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2</p> <p><code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code></p> <p>Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB</p> <p><code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code></p> <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0</code></p> <p>Turns off trace math for trace 1</p>
Notes	<p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> - Set 2 defines the “function”: <code>PDIFference PSUM LOFFset LDIFference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p>
Dependencies	<p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p>
Couplings	When a math function is changed for a trace, that trace is set to Display = ON ; and Update = ON
Preset	For Swept SA Measurement (in SA Mode):

	<code>OFF, TRACE5, TRACE6, 0, 0 OFF, TRACE6, TRACE1, 0, 0 OFF, TRACE1, TRACE2, 0, 0 </code> <code>OFF, TRACE2, TRACE3, 0, 0 OFF, TRACE3, TRACE4, 0, 0 OFF, TRACE4, TRACE5, 0, 0</code>
	For all other measurements: <code>OFF, TRACE2, TRACE3, 0, 0 OFF, TRACE3, TRACE1, 0, 0 OFF, TRACE1, TRACE2, 0, 0</code>
State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “F” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log_{10}(1/10)(\text{FirstTrace}) - 10(1/10)(\text{SecondTrace})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log_{10}(10^{(1/10)(\text{FirstTrace})} + 10^{(1/10)(\text{SecondTrace})})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

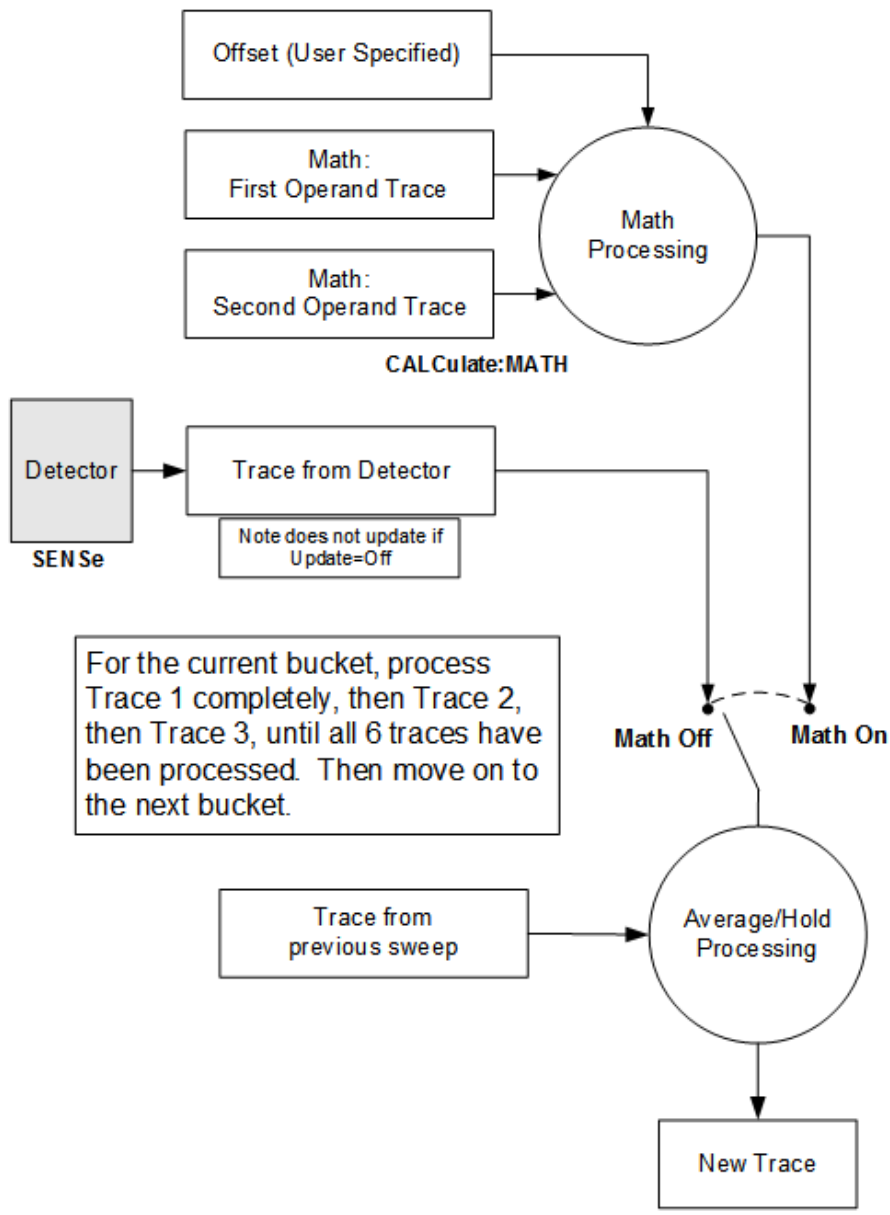

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

3 VMA Mode
 3.5 Channel Power Measurement

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	<p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre>
Notes	See " Math Function " on page 1745 for how to specify Operands 1 and 2 using :CALCulate:MATH
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the

	dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace 5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code>
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	-100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code>
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.5.10.4 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following choices are available:

Option	Parameter	Detector Behavior
Auto	n/a	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function This option is set using " Detector Select Auto/Man " on page 929
Normal	NORMa1	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
Average	AVERage	The detector determines the average of the signal within the sweep points, using RMS averaging
Peak (Positive)	POSitive	The detector determines the maximum of the signal within the sweep points
Sample	SAMPle	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
Negative Peak	NEGative	The detector determines the minimum of the signal within the sweep points
RMS	RMS	Equivalent to Average . See Notes below

Because they may not find a spectral component's true peak, neither **Average** nor **Sample** detectors measure amplitudes of CW signals as accurately as **Peak** or **Normal**, but they do measure noise without the biases of peak detection.

Remote Command `[:SENSe]:CHPower:DETEctor[:FUNction] NORMa1 | AVERage | POSitive | SAMPle | NEGative | RMS`
`[:SENSe]:CHPower:DETEctor[:FUNction]?`

Example `:CHP:DET NORM`
`:CHP:DET?`
Set the detector to **Average**, which uses RMS averaging, so this is equivalent to selecting an **RMS** detector:
`:CHP:DET RMS`

Notes The query returns a name that corresponds to the detector type, as shown below
The **RMS** selection sets the detector type to **AVERage** with **RMS** averaging. Therefore, if **RMS** has been selected, the query returns **AVER**

String Returned	Definition
NORM	Normal
AVER	Average (RMS)
POS	Peak
SAMP	Sample
NEG	Negative Peak

Couplings When the **Detector** setting is **Auto**, switches to align with "[Trace Type](#)" on page 1737:
– [NORMa1](#) with Clear Write

- **AVERage** with **AVERage**
- **POSitive** (peak) with **MAXHold**
- **NEGative** (peak) with **MINHold**

Preset	AVERage
State Saved	Saved in instrument state
Range	NORMal AVERage POSitive SAMPle NEGative RMS

Detector Select Auto/Man

Sets the Detector mode to **Auto** or **Manual**. In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any detector explicitly, this setting switches automatically to **Man** (manual).

Remote Command	[:SENSe] :CHPower:DETECTOR:AUTo ON OFF 1 0 [:SENSe] :CHPower:DETECTOR:AUTo?
Example	:CHP:DET:AUTo ON :CHP:DET:AUTo?
Couplings	When the Detector setting is Auto , switches to align with " Trace Type " on page 1737: <ul style="list-style-type: none"> - NORMal with Clear Write - AVERage with AVERage - POSitive (peak) with MAXHold - NEGative (peak) with MINHold
Preset	ON
State Saved	Yes

3.5.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **"To Trace" on page 1753** when a **"Copy" on page 1753** or **"Exchange" on page 1754** is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 1753** when a **"Copy" on page 1753** or **"Exchange" on page 1754** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 1753** and **"To Trace" on page 1753** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`
 For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
 where **<meas>** is the identifier for the current measurement
 Note that the format of the **TRACe<n>** parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1, TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>, <dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`
 For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1753 and "To Trace" on page 1753 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	<p>For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code></p> <p>For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code></p> <p>where <code><meas></code> is the identifier for the current measurement</p> <p>Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement</p>
Example	<p>Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1, TRACE2</code></p>
Notes	<p>The command is of the form: <code>:TRACe:EXCHange <trace_1>, <trace_2></code></p>
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	<code>:TRACe[:<meas>]:PRESet:ALL</code>
Example	<code>:TRAC:PRE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

Remote Command	<code>:TRACe[:<meas>]:CLEar:ALL</code>
Example	<code>:TRAC:CLE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

3.5.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	<pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre>
Example	<pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre>
Dependencies	In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled
Preset	TRACe1
State Saved	No
Range	Trace 1 Trace 2 Trace 3

3.6 Occupied BW Measurement

This measurement computes and displays the bandwidth occupied by a given percentage of the total mean power of a signal.

Measurement Commands

The general functionality of "CONFigure" on page 2551, "INITiate" on page 2552, "FETCh" on page 2552, "MEASure" on page 2554, and "READ" on page 2553 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF : <Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

Command	Function
<code>:INITiate:OBwidth</code>	Initiates a trigger cycle for the OBW measurement, but does not return any data. You must then use <code>:FETC:OBW[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings
<code>:CONFigure:OBwidth</code>	Returns the long form name of current measurement, in this case, OBwidth
<code>:CONFigure:OBwidth</code>	Selects OBW measurement with Meas Setup settings in preset state – same as Meas Preset
<code>:CONFigure:OBwidth:NDEFault</code>	Selects OBW measurement <i>without</i> affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of *n*, as detailed in "Remote Command Results" on page 934.

Command	Function
<code>:FETCh:OBwidth[n]?</code>	Retrieves the data defined by <i>n</i>
<code>:MEASure:OBwidth[n]?</code>	Switches to OBW measurement, restores default values, starts the measurement, then retrieves the data defined by <i>n</i>
<code>:READ:OBwidth[n]?</code>	Starts the measurement, then retrieves the data defined by <i>n</i>

Backwards Compatibility Queries

Command	Return Value
<code>:FETCh:OBwidth:OBwidth?</code>	Returns the Occupied Bandwidth (Hz)
<code>:MEASure:OBwidth:OBwidth?</code>	
<code>:READ:OBwidth:OBwidth?</code>	

Command	Return Value
:FETCh:OBWidth:FERRor?	Returns the Transmit Frequency Error (Hz)
:MEASure:OBWidth:FERRor?	
:READ:OBWidth:FERRor?	
:FETCh:OBWidth:XDB?	Returns the xdB Bandwidth (Hz)
:MEASure:OBWidth:XDB?	
:READ:OBWidth:XDB?	

Remote Command Results

The following table describes the results returned by the **FETCh**, **MEASure**, and **READ** queries listed above, according to the index value **n**.

n	Results Returned																								
1, or not specified	Returns scalar results, in the following order: <table border="1" data-bbox="381 882 1404 1281"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Occupied Bandwidth</td> <td>Hz</td> </tr> <tr> <td>2</td> <td>Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 1014 in Meas Setup</td> <td>dBm</td> </tr> <tr> <td>3</td> <td>Span</td> <td>Hz</td> </tr> <tr> <td>4</td> <td>Spectrum Trace Points</td> <td>points</td> </tr> <tr> <td>5</td> <td>Res BW</td> <td>Hz</td> </tr> <tr> <td>6</td> <td>Transmit Frequency Error</td> <td>Hz</td> </tr> <tr> <td>7</td> <td>7. x dB Bandwidth</td> <td>Hz</td> </tr> </tbody> </table>	#	Item	Unit	1	Occupied Bandwidth	Hz	2	Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 1014 in Meas Setup	dBm	3	Span	Hz	4	Spectrum Trace Points	points	5	Res BW	Hz	6	Transmit Frequency Error	Hz	7	7. x dB Bandwidth	Hz
#	Item	Unit																							
1	Occupied Bandwidth	Hz																							
2	Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 1014 in Meas Setup	dBm																							
3	Span	Hz																							
4	Spectrum Trace Points	points																							
5	Res BW	Hz																							
6	Transmit Frequency Error	Hz																							
7	7. x dB Bandwidth	Hz																							
2	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 1																								
3	Only available in LTEAFDD, LTEATDD, 5GNR Modes 1. Number of active carriers Returns number of active carriers within Span in Auto detected mode, otherwise the command is out of scope																								
4	Returns OBW Boundaries table results in the following order: <table border="1" data-bbox="381 1575 1404 1795"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit, if any</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Occupied bandwidth</td> <td>Hz</td> </tr> <tr> <td>2</td> <td>Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 1014 in Meas Setup</td> <td>dBm</td> </tr> </tbody> </table>	#	Item	Unit, if any	1	Occupied bandwidth	Hz	2	Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 1014 in Meas Setup	dBm															
#	Item	Unit, if any																							
1	Occupied bandwidth	Hz																							
2	Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 1014 in Meas Setup	dBm																							

3 VMA Mode
3.6 Occupied BW Measurement

n Results Returned		
#	Item	Unit, if any
3	x dB Reference Power	dBm
4	x dB Reference Power Frequency - offset frequency	Hz
5	x dB Reference Power Frequency - absolute frequency	Hz
6	NaN (9.91E+37)	-
7	NaN (9.91E+37)	-
8	NaN (9.91E+37)	-
9	Lower OBW boundary - offset frequency	Hz
10	Lower OBW boundary - absolute frequency	Hz
11	Lower OBW boundary - absolute power	dBm
12	Lower OBW boundary - relative power	dBc
13	Upper OBW boundary - offset frequency	Hz
14	Upper OBW boundary - absolute frequency	Hz
15	Upper OBW boundary - absolute power	dBm
16	Upper OBW boundary - relative power	dBc
17	Lower x dB BW boundary - offset frequency	Hz
18	Lower x dB BW boundary - absolute frequency	Hz
19	Lower x dB BW boundary - absolute power	dBm
20	NaN (9.91E+37)	-
21	Upper x dB BW boundary - offset frequency	Hz
22	Upper x dB BW boundary - absolute frequency	Hz
23	Upper x dB BW boundary - absolute power	dBm
24	NaN (9.91E+37)	-
Results 6, 7, 8, 20 and 24 always return NaN (9.91E+37)		
5	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 2	
6	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 3	

3.6.1 Views

This measurement has three predefined views:

Name	SCPI Name	SCPI #
"OBW Results" on page 936	OBWResults	1

Name	SCPI Name	SCPI #
"OBW Boundaries" on page 937	BOUNDaries	2
"Gate" on page 937	See "Gate View On/Off" on page 2484	

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the **View** changes, the default menu is **Frequency**, unless otherwise specified in the **View** description.

The following SCPI commands can be used to select any view other than **Gate**.

View Selection by Name

Remote Command	<code>:DISPlay:OBwidth:VIEW[:SElect] OBWResults BOUNDaries</code> <code>:DISPlay:OBwidth:VIEW[:SElect]?</code>
Example	<code>:DISP:OBW:VIEW OBWR</code> <code>:DISP:OBW:VIEW?</code>
Preset	<code>OBWResults</code>
State Saved	Saved in instrument state
Range	<code>OBWResults BOUNDaries</code>

View Selection by Number

Remote Command	<code>:DISPlay:OBwidth:VIEW:NSElect <integer></code> <code>:DISPlay:OBwidth:VIEW:NSElect?</code>
Example	<code>:DISP:OBW:VIEW:NSEL 2</code> <code>:DISP:OBW:VIEW:NSEL?</code>
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.6.1.1 OBW Results

Windows: "Graph" on page 937, "Metrics - OBW Results" on page 938

The spectrum trace is displayed in the upper window. Measurement results such as Occupied Bandwidth or Power are displayed in the lower window.

Example	<code>:DISP:OBW:VIEW OBWR</code>
---------	----------------------------------

3.6.1.2 OBW Boundaries

Windows: "Graph" on page 937, "Metrics - OBW Boundaries" on page 940

The spectrum trace is displayed in the upper window. The lower window of OBW Results view is replaced by the OBW boundaries table in this view. Occupied bandwidth and X dB bandwidth for both lower and upper boundaries are displayed.

Example `:DISP:OBW:VIEW BOUN`

3.6.1.3 Gate

See "Gate View On/Off" on page 2484

3.6.2 Windows

There are four available window types. The **Gate** window is available only when "Gate View On/Off" on page 2484 is **ON** in the **Gate Settings** menu under **Trigger**.

View	#
"Graph" on page 937	1
"OBW Results" on page 936	2
"OBW Boundaries" on page 937	3
"Gate" on page 941	4

3.6.2.1 Graph

Window #1

Appears in two Views, as follows:

View	Size	Position
"OBW Results" on page 936	Three fifth, full width	Top
"OBW Boundaries" on page 937	Half, full width	Top

Spectrum View

For SA, WCDMA, WLAN mode:

For LTE-Advanced FDD/TDD mode only

3.6.2.2 Metrics - OBW Results

Window #2

Displays the textual results of the Occupied BW measurement.

View	Size	Position
"OBW Results" on page 936	Two fifth, full width	Bottom
Gate	One third, full width	Bottom

3 VMA Mode

3.6 Occupied BW Measurement

Metrics	
Occupied Bandwidth	2.9730 MHz
Transmit Freq Error	0 Hz
x dB Bandwidth	3.000 MHz
Total Power	20.2 dBm
% of OBW Power	99.00 %
x dB	-26.00 dB

For the LTE-Advanced FDD/TDD and 5G NR modes, the metric result is shown as below:

Metrics	
Occupied Bandwidth	2.9730 MHz
Transmit Freq Error	0 Hz
x dB Bandwidth	3.000 MHz
Total Power	20.2 dBm
% of OBW Power	99.00 %
x dB	-26.00 dB

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

The total power is the power integrated in the specified span setting. The OBW power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

Transmit Freq Error

The transmit freq error (transmit frequency error) result is calculated as the difference between $(f_2+f_1)/2$ and the tuned center frequency of the signal, where f_1 and f_2 are the lower and upper carrier boundary point.

x dB Bandwidth

The x dB result is a bandwidth measured between two points on the signal which are a certain number of dBs down from the highest signal point within the OBW Span. For example, If the 'x dB' parameter is set to -26 dB, and the 'Occupied BW Span' is set to 10 MHz, then the maximum signal power level is first determined from the 10 MHz wide trace sweep. Next, the two furthest frequencies below ($x_{db_f_1}$) and above ($x_{db_f_2}$) the frequency of the maximum level occurrence are found where the signal level is 26 dB below the peak level. This calculation also uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points).

The x dB bandwidth is calculated to be $x_{db_f_2} - x_{db_f_1}$.

% of OBW Power

This is the setting parameter. See "[% of OBW Power](#)" on page 1013

x dB

This is the setting parameter. See "[x dB](#)" on page 1014.

Active Carriers

In the LTE-Advanced FDD/TDD and 5G NR modes, the number of active carriers is displayed to show how many carriers are identified as active in auto detected mode of span, otherwise “-” is displayed to indicate that it is out of scope. When there is one active carrier, Transmit Freq Error is displayed. Otherwise, “---” is displayed.

Measure Trace

See "[Measure Trace](#)" on page 1755.

3.6.2.3 Metrics - OBW Boundaries

Window #3

Displays occupied bandwidth and X dB bandwidth for both lower and upper boundaries.

View	Size	Position
"OBW Boundaries" on page 937	Half, full width	Bottom
Gate	One third, full width	Bottom

Metrics		Occupied Bandwidth			x dB Reference		
		2.9730 MHz			x dB	-26.00 dB	
	Total Power	20.2 dBm			Power	0.00 dBm	
					Offset Frequency	-1.5000 MHz	
		Lower Boundary			Upper Boundary		
		Offset Freq	Abs Power	Rel Power	Offset Freq	Abs Power	Rel Power
	Occupied Bandwidth	-1.4865 MHz	0.00 dBm	-20.2 dBc	1.4865 MHz	0.00 dBm	-20.2 dBc
	x dB Bandwidth	-1.5000 MHz	-26.0 dBm		1.5000 MHz	-26.0 dBm	

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

Total Power is the power integrated in the specified span setting. OBW Power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

x dB

This is the setting parameter. See "[x dB](#)" on page 1014.

x dB Ref Pwr

3 VMA Mode
3.6 Occupied BW Measurement

The x dB reference power result shows the power of the highest signal point within the OBW Span.

x dB At Freq

The x dB reference power frequency result shows the frequency of the highest signal point within the OBW Span. The frequency display type, either Offset or Absolute, can be selected with the Boundary Frequency control under Display.

OBW Boundary Results

Name	Unit	Corresponding Results
Lower OBW boundary - offset frequency	Hz	Offset frequency of the lower OBW boundary from center frequency
Lower OBW boundary - absolute power	dB	Absolute power on the point of lower OBW boundary
Lower OBW boundary - relative power	dBc	Relative power on the point of lower OBW boundary
Upper OBW boundary - offset frequency	Hz	Offset frequency of the upper OBW boundary from center frequency
Upper OBW boundary - absolute power	dB	Absolute power on the point of upper OBW boundary
Upper OBW boundary - relative power	dBc	Relative power on the point of upper OBW boundary
Lower x dB BW boundary - offset frequency	Hz	Offset frequency of the lower x dB BW boundary from center frequency
Lower x dB BW boundary - absolute power	dB	Absolute power on the point of lower x dB BW boundary
Upper x dB BW boundary - offset frequency	Hz	Offset frequency of the lower x dB BW boundary from center frequency
Upper x dB BW boundary - absolute power	dB	Absolute power on the point of lower x dB BW boundary

3.6.2.4 Gate

Window #4

Turning on **Gate** View shows the **Gate** Window, which lets you see your Gating signal at the same time as the measured data. See the description in "[Gate View On/Off](#)" on page 2484 under **Trigger, Gate Settings**.

Views in which this window appears:

View	Size	Position
Gate	One third, full width	Top

3.6.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.6.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	<code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:OBW:WIND:TRAC:Y:RLEV 125</code> <code>:DISP:OBW:WIND:TRAC:Y:RLEV?</code>
Couplings	When " Auto Scaling " on page 945 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF " Attenuation " on page 1763 is not coupled to Ref Value
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	<code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code>

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

3 VMA Mode
3.6 Occupied BW Measurement

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	<code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_amp1></code> <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:OBW:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:OBW:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When the Auto Scaling is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	<code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code>

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace <meas> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_amp1></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off (**AUTO**) switch turns **Ref Level Offset** on or off. Setting a value for **Ref Level Offset** turns **AUTOOFF**.

Remote Command	<pre>:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_amp1> :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet? :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF ON 0 1 :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?</pre>
Example	<p>Set Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB is assumed:</p> <pre>:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7 :DISP:WIND:TRAC:Y:RLEV:OFFS?</pre> <p>Turn Ref Level Offset AUTOON:</p> <pre>:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON</pre>
Dependencies	Appears only in Spectrum Analyzer Mode
Preset	0 dBm OFF
State Saved	Saved in instrument state
Min	Variable. Limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	<pre>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTom :DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</pre>
Example	<pre>:DISP:OBW:WIND:TRAC:Y:RPOS CENT :DISP:OBW:WIND:TRAC:Y:RPOS?</pre>
Preset	TOP
State Saved	Saved in instrument state
Range	TOP CENTer BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the

	Reference Position
Backwards Compatibility SCPI	<code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOsition</code>

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	<code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPlE 0 1 OFF ON</code> <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPlE?</code>
Example	<code>:DISP:OBW:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:OBW:WIND:TRAC:Y:COUP?</code>
Couplings	When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change a value of "Scale/Div" on page 942 , "Ref Value" on page 942 , or "Scale Range" on page 1612 , Auto Scaling automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPlE</code>

3.6.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See **"Dual-Attenuator Configurations" on page 946**
- See **"Single-Attenuator Configuration" on page 946**

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1766 command descriptions
Preset	20 dB

State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1760 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, **"Internal Preamp"** on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See **"Attenuator Configurations and Auto/Man"** on page 950

Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1> [:SENSe]:POWer[:RF]:ATTenuation?</pre>
Example	<pre>:POW:ATT 20</pre> <p>Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)</p>

3 VMA Mode
3.6 Occupied BW Measurement

	In either case, if the attenuator was in Auto, it is set to Manual						
Dependencies	<p>Some measurements do not support Auto setting of Mech Atten. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available</p> <p>In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1769</p> <p>See "Attenuator Configurations and Auto/Man" on page 950 for more information on the Auto/Man functionality</p>						
Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1765 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>						
Preset	<p>Auto</p> <p>The Auto value is 10 dB</p>						
State Saved	Saved in instrument state						
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						

Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p> <p>Auto Function</p>
------------	---

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	<code>ON</code>

Attenuator Configurations and Auto/Man

As described under ["Attenuation" on page 1763](#), there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using ["Mech Atten" on page 948](#) (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See ["Elec Atten" on page 1769](#) for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 953](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code> , and affects the total attenuation displayed on the Attenuation

control and the Meas Bar

The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If "**Internal Preamp**" on page 1788 is **ON** (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned

If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1790 is **ON**, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 953
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe] :POWer [:RF] :EATTenuation :STATE OFF ON 0 1</code> <code>[:SENSe] :POWer [:RF] :EATTenuation :STATE?</code>
Example	<code>:POW:EATT:STAT ON</code>

:POW:EATT:STAT?

Preset **OFF** (Disabled) for Swept SA measurement
 ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 954](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under ["Pre-Adjust for Min Clipping" on page 1773](#).

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 957

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECTrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>
Notes	The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1769 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 956 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state

3 VMA Mode
 3.6 Occupied BW Measurement

Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 956 selection is Mech + Elec Atten:

3 VMA Mode
 3.6 Occupied BW Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 956 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 VMA Mode
 3.6 Occupied BW Measurement

	<code>[:SENSe] :POWer [:RF] :ATTenuation :STEP [:INCRement] ?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.6.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe] :POWer [:RF] :RANGe <real></code> <code>[:SENSe] :POWer [:RF] :RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

3 VMA Mode
3.6 Occupied BW Measurement

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:PARatio <real> [:SENSe]:POWer[:RF]:RANGe:PARatio?	
Example	:POW:RANG:PAR 12 dB	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.6.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1801 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

3 VMA Mode
3.6 Occupied BW Measurement

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "**Preselector Adjust**" on page 1787 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "**Proper Preselector Operation**" on page 965.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1787
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "**Presel Center**" on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz

State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :MW :PADJust</code> <code>[:SENSe] :POWer [:RF] :MMW :PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns <code>MWAVE</code>
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :PADJust :PRESelector MWAVE MMWave EXternal</code> <code>[:SENSe] :POWer [:RF] :PADJust :PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

3 VMA Mode
3.6 Occupied BW Measurement

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1788. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "Internal Preamp" on page 1788, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 969

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and Internal Preamp. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 974
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 976
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 977

3 VMA Mode
 3.6 Occupied BW Measurement

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>														
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>														
Notes	<p>When "Presel Center" on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>														
Dependencies	<p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"</p>

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

3 VMA Mode

3.6 Occupied BW Measurement

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μ W Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: :POW:MW:PRES OFF
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB)
Preset	ON
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1791.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSE]:<measurement>:PFILter[:STATE] ON OFF 1 0</code> <code>[:SENSE]:<measurement>:PFILter[:STATE]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>

3.6.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for "[Res BW](#)" on page 985 and "[Video BW](#)" on page 986.

The **Resolution BW** functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.6.4.1 Settings

Contains the basic bandwidth functions. In this measurement, it is the only tab under **BW**.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the **Res BW** to "**Span**" on [page 1003](#) using the ratio set by **Span:3 dB RBW** (some measurements do not have a **Span:3 dB RBW** control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing "**Auto Couple**" on [page 1825](#) or by performing a **Preset**.

When **Res BW** is set to **Auto**, the bandwidth selected depends on "**RBW Filter Type**" on [page 987](#).

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	<pre>[:SENSe]:OBwidth:BANDwidth[:RESolution] <bandwidth> [:SENSe]:OBwidth:BANDwidth[:RESolution]? [:SENSe]:OBwidth:BANDwidth[:RESolution]:AUTO ON OFF 1 0 [:SENSe]:OBwidth:BANDwidth[:RESolution]:AUTO?</pre>
Example	<pre>:OBW:BAND 5 MHz :OBW:BAND? :OBW:BAND:AUTO ON :OBW:BAND:AUTO?</pre>
Notes	<p>For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered</p> <p>The setting and querying of values depend on the current bandwidth type</p>
Couplings	<p>Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration</p> <p>"Video BW" on page 986 is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1)</p> <p>When Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings</p>
Preset	<p>Auto, unless noted in "RBW Presets" on page 986 below</p> <p>See table below</p>
State Saved	<p>Saved in instrument state</p>

Min	1 Hz
Max	8 MHz is the max equivalent -3 dB RBW, which means that the named RBW (the one shown on the control etc.) can exceed 8 MHz if using a filter other than -3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility, this command supports both BANDwidth and BwIDth forms For ESA, the maximum Res BW was 5 MHz; for X-Series it is 8 MHz

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset Value
WCDMA	30 kHz
BT	10 kHz
WLAN	100 kHz
MSR	30 kHz
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR	30 kHz

Video BW

Lets you change the instrument post-detection filter (VBW or “video bandwidth”) from 1 Hz to 8 MHz, in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Video BW (Auto) selects automatic coupling of **Video BW** to **"Res BW"** on page 985. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing **"Auto Couple"** on page 1825 or by performing a **Preset**.

Remote Command	<pre>[:SENSe]:OBwidth:BANDwidth:VIDeo <bandwidth> [:SENSe]:OBwidth:BANDwidth:VIDeo? [:SENSe]:OBwidth:BANDwidth:VIDeo:AUTO ON OFF 1 0 [:SENSe]:OBwidth:BANDwidth:VIDeo:AUTO?</pre>
Example	<pre>:OBW:BAND:VID 2.4 MHz :OBW:BAND:VID? :OBW:BAND:VID:AUTO ON :OBW:BAND:VID:AUTO?</pre>

3 VMA Mode
3.6 Occupied BW Measurement

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed Video BW is not actually used to process the trace data: When the Average detector is selected, and Sweep Type is set to Swept , the video bandwidth filter cannot be used, because it uses the same hardware as the Average detector When the Quasi-Peak , EMI Average , or RMS Average detector is selected, Video BW is implemented by the digital IF as part of the detector In this case, Video BW still acts to change the Sweep Time, if Sweep Time is in Auto , and still affects the data on other traces for which this is not the case
Couplings	Normally coupled to Res BW . If Video BW is set to Auto , then video bandwidth is changed as Res BW changes, to maintain the preset ratio (normally 10:1)
Preset	Auto , unless noted in " Video BW Presets " on page 987 below ON
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility, this command supports both BANDwidth and BWIDTH forms

Video BW Presets

Unless noted in the table below, the Preset value is **Auto**.

Mode ID	Preset Value
WCDMA	300 kHz
BT	30 kHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the **Res BW** filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz **Res BW** filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, you can choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

	Filter Type	SCPI
	Gaussian	GAUSSian
	Flattop	FLATtop
Remote Command	[:SENSe]:OBwidth:BANDwidth:SHAPE GAUSSian FLATtop [:SENSe]:OBwidth:BANDwidth:SHAPE?	
Example	:OBW:BAND:SHAP GAUS :OBW:BAND:SHAP?	
Preset	"Auto Couple" on page 1825 selects the preset value	
State Saved	Saved in instrument state	
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:	
	-3 dB (Normal) filter BW	Res BW 300 Hz
	-6 dB filter BW	Res BW (-6 dB) 422 Hz
	Noise filter BW	Res BW (Noise) 317 Hz
	Impulse filter BW	Res BW (Impulse) 444 Hz
	CISPR filter BW	Res BW (CISPR) 200 Hz
	MIL filter BW	Res BW (MIL) 1 kHz
	Flattop filter type	Res BW (Flattop) 300 Hz
Backwards Compatibility SCPI	[:SENSe]:OBwidth:BWIDth:SHAPE	

3.6.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.6.5.1 Meas Display

Contains controls for setting the display for the current Measurement, View or Window.

x dB BW Boundaries On/Off

Turns the x dB BW Boundaries On or Off.

Remote Command	:DISPlay:OBwidth:WINDow[1]:XDB 0 1 OFF ON :DISPlay:OBwidth:WINDow[1]:XDB?
----------------	--

3 VMA Mode
3.6 Occupied BW Measurement

Example	<code>:DISP:OBW:WIND:XDB 1</code> <code>:DISP:OBW:WIND:XDB?</code>
Preset	0
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:DISPlay:OBWidth:VIEW:WINDow[1]:XDB</code>

Boundary Frequency

Selects frequency display type:

- **OFFSet**: offsets from Center Freq to OBW boundary frequency are displayed
- **ABSolute**: absolute frequencies are displayed

Remote Command	<code>:DISPlay:OBWidth:WINDow2:BOUNDaries:FREQuency OFFSet ABSolute</code> <code>:DISPlay:OBWidth:WINDow2:BOUNDaries:FREQuency?</code>
Example	<code>:DISP:OBW:WIND2:BOUN:FREQ ABS</code> <code>:DISP:OBW:WIND2:BOUN:FREQ?</code>
Preset	OFFSet
State Saved	Saved in instrument state
Range	OFFSet ABSolute
Backwards Compatibility SCPI	<code>:DISPlay:OBWidth:VIEW2:WINDow2:BOUNDaries:FREQuency</code>

3.6.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>

Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code>
----------------	---

	<code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPlay:VIEW:ADVanced:SElect</code>
Rename User View	<code>:DISPlay:VIEW:ADVanced:REName</code>
Delete User View	<code>:DISPlay:VIEW:ADVanced:DELeTe</code>
Create User View	<code>:DISPlay:VIEW:ADVanced:NAME</code>
Select Screen	<code>:INSTrument:SCReen:SElect</code>
Delete Screen	<code>:INSTrument:SCReen:DELeTe</code>
Delete All But This Screen	<code>:INSTrument:SCReen:DELeTe:ALL</code>
Add Screen	<code>:INSTrument:SCReen:CREate</code>
Rename Screen	<code>:INSTrument:SCReen:REName</code>
Sequencer On/Off	<code>:SYSTem:SEQuencer</code>

Remote Command	<code>:DISPlay:ENABle OFF ON 0 1</code>
Example	<code>:DISP:ENAB OFF</code>
Couplings	<code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code>
Preset	ON

	Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code>
State Saved	Not saved in instrument state
Backwards Compatibility Notes	<code>:SYST:PRES</code> no longer turns on <code>:DISPlay:ENABle</code> as it did in legacy analyzers

3.6.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 935

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOom</code>) with</p> <pre><code>:DISP:VIEW:ADV:SEL</code></pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <pre><code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Backwards Compatibility SCPI	The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views
------------------------------	--

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p>

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined</p>

3.6.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.6.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule (when frequency Scale Type is set to linear). While adjusting **Center Frequency**, **Span** is held constant, which means that both **Start Freq** and **Stop Freq** will change.

In measurements that also have **Start Freq** and **Stop Freq** controls, pressing **Center Frequency** sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**. In the Start/Stop annotation mode, **Start Freq** and **Stop Freq** are displayed below the graticule instead of **Center Frequency** and **Span**.

Pressing **Center Frequency** also sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**.

When **Display Scale Type** is set to **LOG**, pressing **Center Frequency** sets the frequency that corresponds to the arithmetic mean of the start frequency and stop frequency, which is not at the horizontal center of the graticule.

The center frequency setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center**

Frequency changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input (see "**RF Center Frequency**" on page 1001 and "**Ext Mix Center Freq**" on page 1002).

Center Frequency is remembered as you go from input to input. Thus you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Remote Command	<code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of CF Step : <code>:FREQ:CENT UP</code> Return the current value of Center Frequency : <code>:FREQ:CENT?</code>
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF :CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ :CENT</code> - For External Mixer it is equivalent to <code>:FREQ:EMIX :CENT</code> Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated
Dependencies	Center Frequency can be limited by Start Freq or Stop Freq limits, if Span is so large that start or stop reach their limits
Couplings	When operating in "swept span", any value of Center Frequency or Span that is within the frequency range of the instrument is allowed, <i>if</i> the value is being set through the front panel numeric key pad or the SCPI command. The other parameter is forced to a different value if needed, to keep Start and Stop Frequencies within the instrument's frequency range Coupling between center frequency and span: numeric (keypad) entries are treated differently than changing the value using the step keys (Up/Down Arrows) or the knob. Similarly, for remote operation, sending a numeric frequency value is treated differently than the UP DOWN keywords: <ul style="list-style-type: none"> - Numeric entries (keypad or remote): Any value of Center Frequency or Span (within the frequency range of the instrument) is allowed. The other parameter is changed, as necessary, to keep the Start Freq and Stop Freq within the instrument frequency range - Knob or Step keys (up/down arrows) or UP DOWN keywords: The value of the parameter being changed (Center Frequency or Span) is limited so the other parameter is not forced to a new value. Thus, if only the step keys and knob are used, you can return to the initial Center Frequency and Span by changing only the current parameter

3 VMA Mode
3.6 Occupied BW Measurement

	Note that, since out-of-range Start Freq and Stop Freq are never allowed, markers and trace math work correctly without requiring any special handling for out-of-range conditions
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 999 and "Ext Mix Center Freq" on page 1002
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 999 and "Ext Mix Center Freq" on page 1002
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz

3 VMA Mode
3.6 Occupied BW Measurement

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Frequency

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning If Source Mode is set to Tracking, and the Max or Min Center Frequency is therefore limited by the limits of the source, a warning message is generated, “Data out of range; clipped to source max/min” if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep
Preset	See " Center Frequency Presets " on page 999
State Saved	Saved in instrument state

Min	Instrument Types	Value
	VXT model M9421A	55.000005 MHz
	VXT models M9410A/11A	6.505 kHz with Option LFE 330.000005 MHz without Option LFE 330.000005 MHz
	VXT model M9415A	330.000005 MHz
	M8920A	80.005 kHz
	All other instruments	-79.999995 MHz

	Instrument Types	Value
	<i>Unless Source Mode is set to Tracking, in which case it is limited by the minimum frequency of the Source</i>	
Max	See table above. Basically, instrument maximum frequency – 5 Hz. Note that, if the Source Mode is set to Tracking, the effective instrument maximum frequency may be limited by the source maximum frequency If the knob or step keys are being used, also depends on the value of the other three interdependent parameters: Span , Start Frequency and Stop Frequency	
	<p>Ext Mix Center Freq</p> <p>Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the Center Frequency function in the Frequency menu on the front panel always applies to the currently selected input.</p>	
Remote Command	[:SENSe]:FREQUency:EMIXer:CENTer <freq> [:SENSe]:FREQUency:EMIXer:CENTer?	
Example	:FREQ:EMIX:CENT 60 GHz :FREQ:EMIX:CENT?	
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode	
Couplings	When you return to External Mixing after using one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the Center Frequency that you had. However, Span is <i>not</i> an input-dependent parameter, so it does not change. Therefore, the instrument comes back with the Span from the previous input, limited as necessary by the current mixer setup	
Preset	<p>When Mode Preset is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min frequency of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max frequency of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies</p> <p>Note that, if the current measurement has a limited Span available to it, and cannot achieve the span shown in the table (Span = Stop Freq – Start Freq), the instrument uses the maximum span that the measurement allows, and still sets Center Frequency to the midpoint of the Start Freq and Stop Freq values in the Harmonic Table</p> <p>When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after Restore Input/Output Defaults, if you switch to External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz</p>	

3 VMA Mode
3.6 Occupied BW Measurement

State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on the value of the other three interdependent parameters Span , Start Freq and Stop Freq

Span

Set the frequency of the occupied bandwidth span for the current measurement.

Remote Command	<pre>[:SENSe]:OBWidth:FREQuency:SPAN <freq> [:SENSe]:OBWidth:FREQuency:SPAN? [:SENSe]:OBWidth:FREQuency:SPAN:AUTO ON OFF 0 1 [:SENSe]:OBWidth:FREQuency:SPAN:AUTO?</pre>																																	
Example	<pre>:OBW:FREQ:SPAN 2.4 MHz :OBW:FREQ:SPAN? :OBW:FREQ:SPAN:AUTO 0 :OBW:FREQ:SPAN:AUTO?</pre>																																	
Notes	Span Auto Detector ([:SENSe]:OBWidth:FREQuency:SPAN:AUTO) is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes																																	
Dependencies	The Auto Detect functionality is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes

Mode	Value
State Saved	Yes
Min	100 Hz
Max	Hardware Maximum Span
Backwards Compatibility SCPI	<code>[:SENSe] : EBWidth : FREQUENCY : SPAN</code>

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected, and the center frequency function is active, the step keys (and the **UP** | **DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that Start Frequency and Stop Frequency also step by the **CF Step** value.

Remote Command	<code>[:SENSe] : FREQUENCY : CENTER : STEP [: INCRement] <freq></code> <code>[:SENSe] : FREQUENCY : CENTER : STEP [: INCRement] ?</code> <code>[:SENSe] : FREQUENCY : CENTER : STEP : AUTO OFF ON 0 1</code> <code>[:SENSe] : FREQUENCY : CENTER : STEP : AUTO ?</code>
Example	Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up Arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto ON

State Saved	Saved in instrument state
Min	- /+(the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Full Span (Remote Command Only)

Changes the Occupied Bandwidth Span to show the full frequency range of the instrument. It maximizes the span within a range but does not change **Center Frequency**. When using external mixing, it changes the displayed frequency span to the frequency range specified for the selected external mixing band.

Remote Command	<code>[:SENSe] :OBWidth :FREQuency :SPAN :FULL</code>
Example	<code>:OBW :FREQ :SPAN :FULL</code>
Couplings	Selecting full span changes the measurement span value

3.6.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** mode (see "**Marker Mode**" on page 1007), and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed at the center of the screen, on the trace determined by the Marker Trace rules.

3.6.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
-------	--

Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.6.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection for the marker control mode (**Normal/Position**, **Delta** or **Off**; see "**Marker Mode**" on page 1007) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode (see "**Marker Mode**" on page 1007) is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	<code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:OBW:MARK3:X 0</code> <code>:CALC:OBW:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time
Preset	After a preset, all markers are turned OFF , so Marker X Axis Value query returns Not a Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote	<code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:X:POSition <real></code>
--------	--

3 VMA Mode
3.6 Occupied BW Measurement

Command	:CALCulate:OBWidth:MARKer[1] 2 ... 12:X:POSition?
Example	:CALC:OBW:MARK10:X:POS 0 :CALC:OBW:MARK10:X:POS?
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition If the marker is Off , the query response is Not A Number
Preset	After a preset, all markers are turned Off , so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	:CALCulate:OBWidth:MARKer[1] 2 ... 12:Y?
Example	:CALC:OBW:MARK11:Y?
Notes	Returns the marker Y-Axis result, if the control mode is Normal or Delta If the marker is Off , the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:OBWidth:MARKer[1] 2 ... 12:FUNCTION:RESult?

Marker Mode

Sets the marker control mode to **Normal (POSition)**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **Off**, there is no active function, and the active function is turned off.

Remote Command	:CALCulate:OBWidth:MARKer[1] 2 ... 12:MODE POSition DELTa OFF
Example	:CALC:OBW:MARK:MODE POS :CALC:OBW:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELTA OFF

Annotation Mkr # <X value> and <Marker value> upper right on graph
When Marker Trace is Polar in WCDMA mode:
Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Command

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1), puts it in **Normal** mode, and places it at the center of the screen.

Example	:CALC:OBW:MARK3:STAT ON :CALC:OBW:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	:CALCulate:OBWidth:MARKer[1] 2 ... 12:STATE OFF ON 0 1 :CALCulate:OBWidth:MARKer[1] 2 ... 12:STATE?

Delta Marker (Reset Delta)

Pressing this button has the same effect as pressing **Delta** in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command :CALCulate:OBWidth:MARKer:AOff

Example :CALC:OBW:MARK:AOff

3.6.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "[Marker Delta](#)" on page 1010.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on page 1006 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command :CALCulate:OBWidth:MARKer[1]|2|...|12:MAXimum

Example :CALC:OBW:MARK2:MAX
 :SYST:ERR?

can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search

Notes Sending this command selects the subopcoded marker
 In WCDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "**Marker Mode**" on [page 1007](#) on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.6.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "**Marker Frequency**" on [page 1006](#) on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:REFerence <integer></code>
Example	<code>:CALC:OBW:MARK:REF 2</code> <code>:CALC:OBW:MARK:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded, the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" The query returns a single value (the specified marker number's relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker

	If the reference marker is Off , it is turned on in Normal mode at the Delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off , All Markers Off , or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers (see "[Marker Mode](#)" on page 1007).

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves from the trace it was on to the new trace. If the marker is **Off**, it stays off, but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	<code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:OBW:MARK2:TRAC 2</code> <code>:CALC:OBW:MARK2:TRAC?</code>
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of Marker Trace is not affected by " Auto Couple " on page 1825 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "[Marker Settings Diagram](#)" on page 1008 on the **Settings** tab.

3.6.8 Meas Setup

Contains functions for setting up the measurement parameters and contains functions for setting up parameters global to all measurements in the mode.

3.6.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

Initiates an averaging routine that averages the sweep points in several successive sweeps, resulting in trace smoothing.

After the specified number of average counts, "[Average Mode](#)" on page 1013 (termination control) determines the average action.

Remote Command	<code>[:SENSe] :OBwidth:AVERage:COUNT <integer></code>
Example	<code>:OBW:AVER:COUN 1500</code> <code>:OBW:AVER:COUN?</code>
Preset	10
State Saved	Yes
Min/Max	1/10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count
Backwards Compatibility SCPI	<code>[:SENSe] :EBwidth:AVERage:COUNT</code>

Averaging On/Off

Turns averaging on or off.

NOTE

In this measurement, **Average Type** is always preset to the [Log-Pwr Avg \(Video\)](#) method. Other averaging methods are not available.

3 VMA Mode
3.6 Occupied BW Measurement

Remote Command	<code>[:SENSe]:OBWidth:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:OBWidth:AVERage[:STATe]?</code>
Example	<code>:OBW:AVER ON</code> <code>:OBW:AVER?</code>
Couplings	Averaging state is coupled to " Max Hold (Remote Command Only) " on page 1018. If Max Hold is changed from OFF to ON , Averaging state is automatically set to ON
Preset	ON
State Saved	Yes
Range	ON OFF
Backwards Compatibility SCPI	<code>[:SENSe]:EBWidth:AVERage[:STATe]</code>

Average Mode

Lets you set the averaging mode.

EXponential	Measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
REPeat	The measurement resets the average counter each time the specified number of averages is reached

Remote Command	<code>[:SENSe]:OBWidth:AVERage:TCONtrol EXponential REPeat</code> <code>[:SENSe]:OBWidth:AVERage:TCONtrol?</code>
Example	<code>:OBW:AVER:TCON REP</code> <code>:OBW:AVER:TCON?</code>
Preset	EXP
State Saved	Yes
Range	EXponential REPeat

% of OBW Power

Assigns the percentage of the total power that is measured within the Occupied Bandwidth for the current measurement. The resulting Occupied Bandwidth limits are displayed by markers placed on the frequencies of the specified percentage.

Remote Command	<code>[:SENSe]:OBWidth:PERCent <real></code> <code>[:SENSe]:OBWidth:PERCent?</code>
Example	<code>:OBW:PERC 75</code>

	<code>:OBW:PERC?</code>
Preset	99.00
State Saved	Yes
Min/Max	10/99.99

Power Ref

Lets you select Power Ref type:

Total Power	<code>TPOWer</code>	Total power in the current span is displayed
OBW Power	<code>OBWPower</code>	Occupied power is displayed

When **Power Ref** type is changed, the annotation in the lower window and Remote Command SCPI Results also change.

Remote Command	<code>[:SENSe]:OBWidth:PREFERENCE OBWPower</code> <code>[:SENSe]:OBWidth:PREFERENCE?</code>
Example	<code>:OBW:PREF TPOW</code> <code>:OBW:PREF?</code>
Preset	<code>TPOWer</code>
State Saved	Saved in instrument state
Range	<code>TPOWer OBWPower</code>

x dB

Sets the x dB value used for the "x dB bandwidth" result that measures the bandwidth between two points on the signal that is x dB down from the highest signal point within the OBW Span.

Remote Command	<code>[:SENSe]:OBWidth:XDB <rel_amp></code> <code>[:SENSe]:OBWidth:XDB?</code>
Example	<code>:OBW:XDB -20</code> <code>:OBW:XDB?</code>
Preset	BT Mode: -20.0 dB All other Modes: -26.0 dB
State Saved	Yes
Min/Max	-100.0 dB/-0.1 dB
Backwards Compatibility SCPI	<code>[:SENSe]:EBWidth:XDB</code>

Power Integration Method

Selects the power integration method:

Normal	NORMal	By integrating the linear power bucket values from the lower edge of the trace, and interpolating to find the point where the integrated power equals $(1 - [\text{Occ BW \% Pwr}]) / 2$ (0.5% if, for example, the 99% occupied bandwidth is to be found) of the total power, frequency f1 is obtained. This procedure is repeated from the upper trace edge to find frequency f2. This calculation uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points), f1 and f2
From Center	ICENter	Measures the power spectrum distribution within two times or more frequency range over the requirement for Occupied Bandwidth specification centering on the current carrier frequency

Remote Command	<code>[:SENSe]:OBwidth:INTEgration[:METHod] NORMal ICENter</code> <code>[:SENSe]:OBwidth:INTEgration[:METHod]?</code>
Example	<code>:OBW:INT NORM</code> <code>:OBW:INT?</code>
Preset	For 5GNR Mode, Uplink: ICENter All other Modes NORMal
State Saved	Yes
Range	NORMal ICENter

Spur Avoidance

Because VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to “Disabled.”

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

Settings Alert;Spur Avoidance Off

This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

The spur avoidance function is not available for:

- M9410A/11A with EP6 option at frequency above 6 GHz
- M9415A/16A at frequency below 380 MHz and above 12.3 GHz
- M9410E/11E/15E/16E at frequency below 380 MHz and above 25.9 GHz

Remote Command	<code>[:SENSe]:OBWidth:SAVoid[:STATe] OFF ON 0 1</code> <code>[:SENSe]:OBWidth:SAVoid[:STATe]?</code>
Example	<code>:OBW:SAV ON</code> <code>:OBW:SAV?</code>
Dependencies	Only appears in VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1017 below.

Remote Command	:COUPl ^e ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio

- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	<code>:CONFigure:OBwidth</code>
Example	<code>:CONF:OBW</code>

Max Hold (Remote Command Only)

When **ON**, **Max Hold** displays and holds the maximum responses of the current measurement. Turn **Max HoldOFF** to disable the maximum hold feature.

Remote Command	<code>[:SENSe]:OBwidth:MAXHold ON OFF 1 0</code> <code>[:SENSe]:OBwidth:MAXHold?</code>
Example	<code>:OBW:MAXH ON</code> <code>:OBW:MAXH?</code>
Couplings	Max Hold is coupled to " Averaging On/Off " on page 1012. Max Hold is activated only if Average state is ON . If Max Hold is changed to ON when Average state is OFF , Average state is automatically set to ON
Preset	OFF

State Saved	Yes
Range	OFF ON
Backwards Compatibility SCPI	[:SENSe]:EBWidth:MAXHold

3.6.8.2 Limits

Lets you set measurement limits and be alerted when they have been exceeded.

Limit

Enables you to turn on or off limit checking at the specified frequency. For results that fail the limit test, a red FAIL appears in the Meas Bar.

Remote Command	<pre>:CALCulate:OBWidth:LIMit:FBLimit <freq> :CALCulate:OBWidth:LIMit:FBLimit? :CALCulate:OBWidth:LIMit[:TEST] ON OFF 1 0 :CALCulate:OBWidth:LIMit[:TEST]?</pre>																											
Example	<pre>:CALC:OBW:LIM:FBL 50 kHz :CALC:OBW:LIM:FBL? :CALC:OBW:LIM OFF :CALC:OBW:LIM?</pre>																											
Dependencies	Appears in all Modes except MSR, LTE-A and 5G NR																											
Preset	<table border="1"> <thead> <tr> <th>Mode</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>SA</td> <td>5 MHz</td> </tr> <tr> <td>WCDMA</td> <td></td> </tr> <tr> <td>MSR</td> <td></td> </tr> <tr> <td>WLAN</td> <td> <table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11a/g(OFDM/DSSS-OFDM)</td> <td>20 MHz</td> </tr> <tr> <td>802.11b</td> <td>25 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (20MHz)</td> <td>20 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (40MHz)</td> <td>40 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (80MHz)</td> <td>80 MHz</td> </tr> <tr> <td>802.11ac/ax/be (160MHz)</td> <td>160 MHz</td> </tr> <tr> <td>802.11be (320MHz)</td> <td>320 MHz</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>		Mode	Value	SA	5 MHz	WCDMA		MSR		WLAN	<table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11a/g(OFDM/DSSS-OFDM)</td> <td>20 MHz</td> </tr> <tr> <td>802.11b</td> <td>25 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (20MHz)</td> <td>20 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (40MHz)</td> <td>40 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (80MHz)</td> <td>80 MHz</td> </tr> <tr> <td>802.11ac/ax/be (160MHz)</td> <td>160 MHz</td> </tr> <tr> <td>802.11be (320MHz)</td> <td>320 MHz</td> </tr> </tbody> </table>	Radio Std	Value	802.11a/g(OFDM/DSSS-OFDM)	20 MHz	802.11b	25 MHz	802.11n/ac/ax/be (20MHz)	20 MHz	802.11n/ac/ax/be (40MHz)	40 MHz	802.11n/ac/ax/be (80MHz)	80 MHz	802.11ac/ax/be (160MHz)	160 MHz	802.11be (320MHz)	320 MHz

Mode	Value
BT	1 MHz
RTS	25 kHz

Mode	Value
SA	OFF
All others	ON

State Saved	Yes
	Yes
Range	OFF ON
Min/Max	1 kHz/Depends on instrument maximum frequency

Limit Test

Toggles the limit test.

Remote Command	<code>:CALCulate:OBWidth:LIMit[:TEST] ON OFF 1 0</code> <code>:CALCulate:OBWidth:LIMit[:TEST]?</code>
Example	<code>:CALC:OBW:LIM 0</code> <code>:CALC:OBW:LIM?</code>
Dependencies	Only appears in LTEAFDD/LTEATDD and 5G NR Modes
Preset	ON
State Saved	Saved in instrument state
Range	ON OFF

Bandwidth

Sets the limit bandwidth for OBW measurement.

Remote Command	<code>:CALCulate:OBWidth:LIMit:FBLimit <freq></code> <code>:CALCulate:OBWidth:LIMit:FBLimit?</code>
Example	<code>:CALC:OBW:LIM:FBL 10</code> <code>:CALC:OBW:LIM:FBL?</code>
Dependencies	Only appears in LTEAFDD/LTEATDD and 5G NR Modes
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	1 kHz/Depends on instrument maximum frequency

3 VMA Mode
3.6 Occupied BW Measurement

Remote Command	<code>:CALCulate:OBwidth:LIMit:FBLimit:AUTO ON OFF 1 0</code> <code>:CALCulate:OBwidth:LIMit:FBLimit:AUTO?</code>
Example	<code>:CALC:OBW:LIM:FBL:AUTO OFF</code> <code>:CALC:OBW:LIM:FBL:AUTO?</code>
Dependencies	Only available in LTE-A and 5G NR Modes
Couplings	When the state of limit bandwidth is ON , the bandwidth value is automatically determined by multi-carrier configuration (system bandwidth and freq offset of each component carrier). Otherwise, the bandwidth value depends on user input When the bandwidth value is set manually, the state of limit bandwidth automatically changes to OFF
Preset	ON
State Saved	Yes
Range	Auto Man

3.6.8.3 Advanced

Contains controls for setting advanced functions of the instrument. This tab does not appear in EXM, nor in VXT models M9420A/10A/11A.

Noise Floor Extension

Lets you configure **Noise Floor Extension** (NFE). All Modes that support NFE let you set it on or off. Additionally, some Modes support two “on” states for NFE, **Full** and **Adaptive**, as described below.

Adaptive Option Support

At present (Release: X-Apps 2024), support for **Adaptive** NFE is as follows:

Mode	Measurements	Supports Adaptive NFE?
BT	ACP, IBEM, IBSP	No
CQM	MON	Yes
EDGE GSM	EORF, ETSP, MON	No
EMI	APD, DAN, FSC, MON, RTSC, SCH	Yes
LTEAFDD	PVT	No
LTEATDD	PVT	No
MSR	ACP, CHP, MON, OBW, SEM, SPUR	Yes
NR5G	PVT	No
PNOISE	LPL, MON, SFR	No

Mode	Measurements	Supports Adaptive NFE?
SA	SAN	Yes
SRCOMMS	ACP, CHP, MON, OBW, SEM, SPUR	Yes
VMA	ACP, CHP, OBW, SEM, SPUR	Yes
WCDMA	ACP, CHP, MON, OBW, SEM, SPUR	Yes
WLAN	CHP, MON, OBW, SEM, SPUR	Yes

The menus and command options are as follows:

NFE State	Modes with Adaptive NFE	Modes without Adaptive NFE	SCPI
Off	Off	Off	See "NFE On/Off Command" on page 1023
On	Full	On	
Adaptive	Adaptive	n/a	See "Adaptive NFE Command" on page 1024

As shown in the table above, the **On** state (in Modes that do not support **Adaptive NFE**) matches the **Full** state in Modes that *do* support **Adaptive NFE**.

To maintain SCPI backwards compatibility, the existing command to turn NFE on or off is retained, and a new command is added to set the state to turn **AdaptiveON** or **OFF**:

- `[[:SENSe]:CORRection:NOISe:FLOOr ON|OFF|1|0]` is retained, with the default changed to **ON** for Modes that support **Adaptive NFE**
- `[[:SENSe]:CORRection:NOISe:FLOOr:ADAPtive ON|OFF|1|0]` is added (for certain Modes), default = **ON**

When NFE is **On** or **Full**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

NFE works with any RBW, VBW, detector, any setting of **Average Type**, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the **Average** detector, results are better with long sweep times and fewer trace averages. When using the **Sample** detector,

the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, so when External Mixing is selected, it does nothing.

For more details, see ["Optimal Detector & Averaging Selections" on page 1024](#) and ["Recalibration of Noise Floor" on page 1026](#).

Pros & Cons of Adaptive NFE

Adaptive NFE provides an alternative to fully-on or fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the fully-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

In **Adaptive** NFE, there is not the same dramatic visual impact on the noise floor as there is in **Full** NFE. **Adaptive** NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the fully-off case; and when lots of averaging is being performed, the signal displays more like the **Full** NFE case.

Adaptive NFE is recommended for general-purpose use. For fully-ATE (automatic test equipment) applications, where possible distraction of the instrument user is not a risk, **Full** NFE is recommended.

NFE On/Off Command

Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOor ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor?</code>
Example	<code>:CORR:NOIS:FLO ON</code>
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear. In those cases, the SCPI command is accepted without error, but has no effect
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the

	<p>Characterize Noise Floor operation if it is needed</p> <p>When NFE is enabled through SCPI, and a Characterize Noise Floor operation is needed, an error is entered in the system error queue</p>
Preset	<p>Unaffected by Mode Preset. Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do <i>not</i> support Adaptive</p> <p>In Modes that support Adaptive NFE, the default (preset) state of NFE is Adaptive. In Modes that do not support Adaptive NFE, the default state of NFE is Off</p>
State Saved	No

Adaptive NFE Command

Only effective in instruments with the NFE or NF2 license installed, and in Modes that support **Adaptive** NFE. For coverage, see "[Adaptive Option Support](#)" on page 1021 above.

For all other cases, the SCPI command below is accepted without error, but has no effect.

Remote Command	<pre>[:SENSe]:CORRection:NOISe:FLOOr:ADAPtive ON OFF 1 0 [:SENSe]:CORRection:NOISe:FLOOr:ADAPtive?</pre>
Example	<p>First turn NFE on, this is Full mode</p> <pre>:CORR:NOIS:FLO ON</pre> <p>Then set it to Adaptive</p> <pre>:CORR:NOIS:FLO:ADAP ON</pre>
Couplings	To maintain backwards compatibility, sending <code>:CORR:NOIS:FLO ON</code> turns NFE AdaptiveOFF . To turn Adaptive on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults
State Saved	No

Optimal Detector & Averaging Selections

Note that some measurements do not allow you to switch the **Detector** type (which is set by default to **Average**), so the discussion of detector types here is irrelevant for those measurements. Similarly, some measurements do not allow you to set **Average Type** (set by default to **LOG**), so that discussion here is irrelevant in those cases.

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

3 VMA Mode

3.6 Occupied BW Measurement

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to obtain the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when **Detector** is **Average** and **Average Type** is set to **Power (RMS)**.

For best operation, **AverageDetector** (default) and **Average Type. = Power** are recommended, as already stated. In other cases, operation is often not quite as good but still highly effective. Other **Detector** options, when available, behave as follows:

Positive Peak The noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage

Positive Peak is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise

For pulsed-RF, **Positive Peak** can still give excellent effectiveness

FFT analysis does not work well, and does not perform NFE well, with pulsed-RF signals, so this combination is *not* recommended

Negative Peak Not very useful

Sample Works well, but never better than **Average**, because it does not smooth as well

Normal A combination of peak and negative peak behaviors, and works about as well as these

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, **Average Type = Power (RMS)** is optimal (when this option is available). When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. Using NFE with **Average Type = Log-Power (LOG)** is not synergistic, though; NFE with **Average Type = Power (RMS)** works a little better than NFE with **LOG**.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that exceeds the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes

with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Recalibration of Noise Floor

In instruments with the NF2 license installed, the calibrated noise floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. To do this, use "**Characterize Noise Floor**" on page 1941, under **System, Alignments, Advanced**. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog stating:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

IF Gain

Sets the **IF Gain** function to one of:

Setting	SCPI	Comments
Auto	AUTO = ON	Auto
Low	OFF	Low Gain
	AUTO = OFF	
High	ON	High Gain
	AUTO = OFF	

This setting affects sensitivity and IF overloads. It only applies to the RF input; not to the baseband I/Q input.

Remote Command [:SENSe]:OBWidth:IF:GAIN[:STATe] ON | OFF | 1 | 0
 [:SENSe]:OBWidth:IF:GAIN[:STATe]?
 [:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0
 [:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe]?

Example :OBW:IF:GAIN ON
 :OBW:IF:GAIN?
 :OBW:IF:GAIN:AUTO OFF
 :OBW:IF:GAIN:AUTO?

Dependencies	Has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed-out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control Not available in VXT models M9420A/10A/11A, EXM, or UXM
Couplings	Auto sets IF Gain to High (ON) under any of the following conditions: <ul style="list-style-type: none"> - The input attenuator is set to 0 dB, or - The preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low (OFF)
Preset	OFF OFF
State Saved	Saved in instrument state
Range	Low Gain High Gain

3.6.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 1828) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "Restore Defaults" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:FREQUENCY:CENTER ALL NONE :INSTRUMENT:COUPLE:FREQUENCY:CENTER?
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBAL:FREQUENCY:CENTER[:STATE] 1 0 ON OFF :GLOBAL:FREQUENCY:CENTER[:STATE]?

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "Restore Defaults" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:EMC:STANDARD ALL NONE :INSTRUMENT:COUPLE:EMC:STANDARD?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTRument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.6.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.6.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE

Significantly faster sweep times are available with Option FS1.

NOTE

The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW

and/or VBW.

NOTE	On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send <code>[:SENSe] :<meas> :SWEEp:TIME <time></code> . The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.
Remote Command	<code>[:SENSe] :<meas> :SWEEp:TIME <time></code> <code>[:SENSe] :<meas> :SWEEp:TIME?</code>
Example	Channel Power measurement: <code>:CHP:SWE:TIME 25ms</code> <code>:CHP:SWE:TIME?</code>
Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by Meas Method selection. Preset values are as follows: <ul style="list-style-type: none"> - IBW: 29 ms - IBWR: 108 ms - FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, " Minimum Acquisition Time " on page 1357 is available
Couplings	Coupled to Span , RBW , VBW , and Sweep Time Rules when Sweep Time is set to Auto; Sweep Time changes when these parameters are changed When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically Calculated unless noted below WCDMA Mode <ul style="list-style-type: none"> - Channel Power: 1.0 msOBW: 32.6 ms - ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when Meas Method is Fast Power , the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s

3 VMA Mode
3.6 Occupied BW Measurement

	Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: <code>STATus:QUEStionable:INTEgrity:UNCalibrated</code>
	Auto Function
Remote Command	<code>[:SENSe]:<meas>:SWEep:TIME:AUTO OFF ON 0 1</code> <code>[:SENSe]:<meas>:SWEep:TIME:AUTO?</code>
Example	Channel Power measurement: <code>:CHP:SWE:TIME:AUTO OFF</code> <code>:CHP:SWE:TIME:AUTO?</code>
Preset	WCDMA Mode <code>OFF</code> All others <code>ON</code>

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	<code>[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time></code> <code>[:SENSe]:<meas>:SWEep:ACQuisition:TIME?</code>
----------------	--

	<code><meas></code> is the identifier for the current measurement; any one of CHPower- ACPower OBWidth MONitor
Example	Channel Power measurement <code>:CHP:SWE:ACQ:TIME 500 ms</code> <code>:CHP:SWE:ACQ:TIME?</code>
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Span , RBW , and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	<code>[:SENSe]:<meas>:SWEep:ACQquisition:TIME:AUTO OFF ON 0 1</code> <code>[:SENSe]:<meas>:SWEep:ACQquisition:TIME:AUTO?</code> <code><meas></code> is the identifier for the current measurement; any one of CHPower- ACPower OBWidth MONitor
Example	Channel Power measurement: <code>:CHP:SWE:ACQ:TIME:AUTO OFF</code>
Preset	ON

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1033

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON

Note that **:SYST:PRES** sets **:INIT:CONT** to **ON**, but ***RST** sets **:INIT:CONT** to **OFF**

State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and INIT:CONT ON) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1832 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/hold sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending **:INIT:IMM**
- Sending **:INIT:REST**

See "[More Information](#)" on page 1035

Remote Command	:INITiate[:IMMediate] :INITiate:REStart
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATus:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATus:QUEStionable register bit 9 (INTegrity sum) is cleared

	The Sweeping bit is set
	The Measuring bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORt</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORt</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATus:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUEStionable</code> register bit 9 (INTEGRity sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORt</code> , the Abort command will cause the <code>*OPC</code> query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	<code>[:SENSe] : <meas> : SWEep : ETIME?</code> <code><meas></code> is the identifier for the current measurement; any one of <code>CHPower-</code> <code> ACPower OBWidth MONitor</code>
Example	Channel Power measurement <code>:CHP:SWE:ETIME?</code>
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.6.9.2 Sweep Config

Accesses controls that let you configure the sweep and control functions of the instrument, such as "[Sweep Time Rules](#)" on page 1038.

Sweep Time Rules

Switches the instrument between normal and accuracy sweep states:

Accy	<code>ACCuracy</code>
Norm	<code>NORMal</code>

Setting **Auto Sweep Time** to **Accy** results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	<code>[:SENSe] : OBWidth : SWEep : TIME : AUTO : RULEs NORMal ACCuracy</code> <code>[:SENSe] : OBWidth : SWEep : TIME : AUTO : RULEs?</code>
Example	<code>:OBW:SWE:TIME:AUTO:RUL NORM</code>

3 VMA Mode
3.6 Occupied BW Measurement

	<code>:OBW:SWE:TIME:AUTO:RUL?</code>
Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9420A
Preset	<code>NORMa1</code>
State Saved	Saved in instrument state
Range	<code>NORMa1 ACCuracy</code>

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys *cannot* be used to adjust the number of points.

When in a split-screen display, each window may have its own value for points.

When sweep **Points** is changed, an informational message "Sweep points changed, all traces cleared" is displayed, and in 5G NR Mode, **Auto Sweep Points** is set to **OFF** (0).

Remote Command	<code>[:SENSe] :OBWidth :SWEep :POINts <integer></code> <code>[:SENSe] :OBWidth :SWEep :POINts ?</code>
Example	<code>:OBW:SWE:POIN 501</code> <code>:OBW:SWE:POIN?</code>
Dependencies	Not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given

	Not displayed in Modes that do not support Swept								
Couplings	Whenever the number of sweep points change: <ul style="list-style-type: none"> - All trace data is erased - Any traces with Update Off will also go to Display Off - Sweep time is re-quantized - Any limit lines that are on will be updated - If averaging/hold is on, averaging/hold starts over - Auto Sweep Points is set to OFF (5G NR Mode only) <p>The resolution of setting the sweep time depends on the number of points selected</p>								
Preset	<table border="1"> <thead> <tr> <th>Mode</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>MSR, LTEAFDD, LTEATDD</td> <td>2001</td> </tr> <tr> <td>5GNR</td> <td>Automatically calculated</td> </tr> <tr> <td>All Others</td> <td>1001</td> </tr> </tbody> </table>	Mode	Value	MSR, LTEAFDD, LTEATDD	2001	5GNR	Automatically calculated	All Others	1001
Mode	Value								
MSR, LTEAFDD, LTEATDD	2001								
5GNR	Automatically calculated								
All Others	1001								
State Saved	Saved in instrument state								
Min	101								
Max	20001								
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation								

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	<code>[:SENSe] :SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe] :SWEep:IF:DITHer?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	OFF
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

3 VMA Mode
 3.6 Occupied BW Measurement

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	<code>[:SENSe]:SWEep:IMAGeprot OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeprot?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	ON
State Saved	Saved in instrument state

3.6.10 Trace

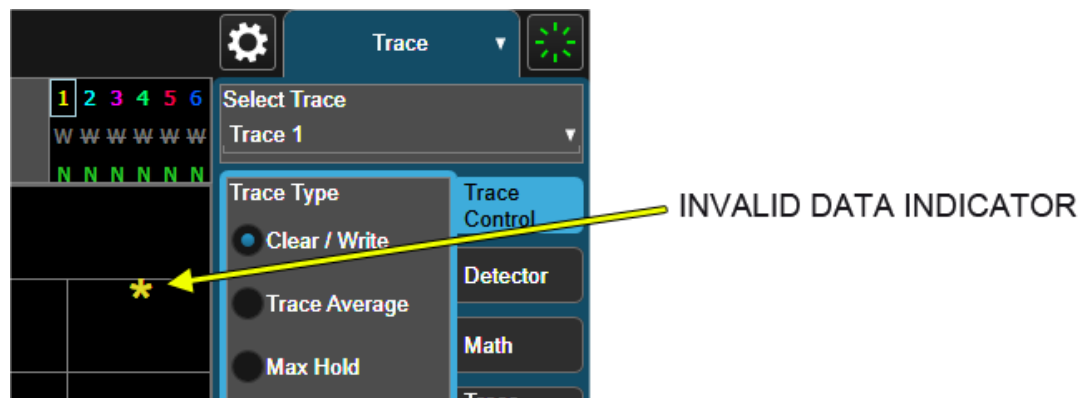

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The "Trace Control" on page 1736 tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points - 1*) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator

The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

The Invalid Data Indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE

The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.

Trace right-click menu

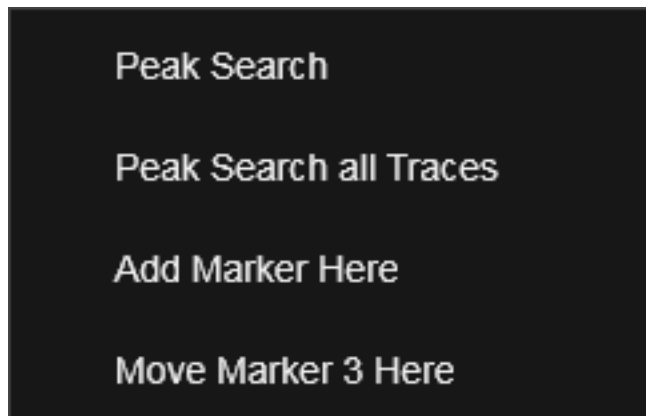

If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:

If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on [page 1737](#). **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on [page 1742](#) type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:

In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT's, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^), which moves across the bottom of the graticule showing the current trace point.

Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:

3 VMA Mode

3.6 Occupied BW Measurement

Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

W	Clear/Write
A	Trace Average
M	Max Hold
m	Min Hold

If the letter is white, it means the trace is being updated (**Update = ON**); if the letter is dimmed, it means the trace is not being updated (**Update = OFF**). A strikethrough indicates that the trace is blanked (**Display = OFF**). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

N	Normal
A	Average
P	peak
p	negative peak
S	Sample
Q	Quasi Peak
E	EMI Average
R	RMS Average
f	math function

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is **ON**, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the **"Math Function"** on page 1745.

The detector labels are:

NORM	Normal
PEAK	Peak
SAMP	Sample
NPEAK	Negative Peak
RMS	Average detector with Power Average (RMS)
LG AVG	Average detector with Log-Pwr Average
VAVG	Average detector with Voltage Average
QPEAK	Quasi Peak
EMI AVG	EMI Average
RMS AVG	RMS Average

The trace math labels are:

PDIF	Power Difference
PSUM	Power Sum
LOFF	Log Offset
LDIF	Log Difference

3.6.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the Trace menu
Dependencies	For the Swept SA measurement: <ul style="list-style-type: none">- In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View- When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled
Preset	Trace 1
State Saved	Yes

3.6.10.2 Trace Control

The controls on this tab allow you to set the "**Trace Type**" on page 1737 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "**View/Blank**" on page 1742 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITe	:TRAC2:TYPE WRIT	See: "Clear/Write" on page 1051
Trace Average	AVERAge	:TRAC2:TYPE AVER	See: "Trace Average" on page 1051
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: "Max Hold" on page 1052
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: "Min Hold" on page 1052

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "**View/Blank**" on page 1742 state must be set to **Active** (**Update: ON**, **Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "**Trace Mode Backwards Compatibility Commands**" on page 1049

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre>
Couplings	<p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe]: <meas>:DETector:AUTO?</code>), Detector (<code>[:SENSe]: <meas>:DETector[:FUNCTion]?</code>) switches aligning with the switch of this parameter: "NORMAL" with WRITe (Clear Write), "AVERAge" with AVERAge, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold</p>
Preset	<p>Swept SA and Monitor Spectrum: WRITe</p> <p>All other measurements: AVERAge</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p>
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1742.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	<code>WRITE</code>
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	<code>:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK</code> <code>:TRACe[1] 2 ... 6:MODE?</code>
Backwards Compatibility Notes	<p>The legacy <code>:TRACe:MODE</code> command is retained for backwards compatibility. In conjunction with the legacy <code>:AVERage</code> command, it works as follows:</p> <ul style="list-style-type: none"> – <code>:AVERage ON OFF</code> sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the <code>[:SENSe]:AVERage[:STATe]</code> command description below – <code>:TRACe:MODE WRITE</code> sets <code>:TRACe:TYPE WRITE</code> (Clear/Write) unless average is true, in which case it sets it to <code>:TRACe:TYPE AVERage</code>. It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace – <code>:TRACe:MODE MAXHold</code> sets <code>:TRACe:TYPE MAXHold</code> (Max Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace

- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	<code>OFF</code>
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	<code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code>
Backwards Compatibility Notes	<p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p>

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

3 VMA Mode
3.6 Occupied BW Measurement

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1737 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again

- the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF ; Display ON
Blank	Update OFF ; Display OFF
Background	Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "[More Information](#)" on page 1055

Notes	For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 1054 and " Trace Display State On/Off " on page 1054 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	<p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending [:SENS] :DET :TRAC) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 1745 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p>

Trace Update State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 2 inactive (stop updating):</p> <pre>:TRAC2:UPD 0</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:DISPly[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:DISPly[:STATe]?</pre> <p>For all other measurements:</p>
----------------	--

	<pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 1 visible:</p> <pre>:TRAC2:DISP 1</pre> <p>Blank trace 3:</p> <pre>:TRAC3:DISP 3</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.6.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "[Operand 1 / Operand 2](#)" on [page 1751](#) controls.

- See "[How trace math is processed](#)" on [page 1060](#)

Remote Command For option details, see "[Trace Math Options](#)" on [page 1058](#)
For Swept SA Measurement (in SA Mode):
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
:CALCulate:MATH? <trace_num>
where <trace_num> is any one of:
TRACE1|...|TRACE6
For all other measurements:
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
:CALCulate[:<meas>]:MATH? <trace_num>
where:
<meas> is the identifier for the current measurement, and
<trace_num> is any one of:
TRACe1|TRACe2|TRACe3
Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement

Example :CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0

3 VMA Mode
3.6 Occupied BW Measurement

	<p>Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB</p> <p><code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code></p> <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0</code></p> <p>Turns off trace math for trace 1</p>
Notes	<p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> -Set 2 defines the “function”: <code>PDIFference PSUM LOFFset LDIFference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p>
Dependencies	<p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p>
Couplings	When a math function is changed for a trace, that trace is set to Display = ON ; and Update = ON
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <p><code>OFF,TRACE5,TRACE6,0,0 OFF,TRACE6,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0 </code> <code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE4,0,0 OFF,TRACE4,TRACE5,0,0</code></p> <p>For all other measurements:</p> <p><code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0</code></p>
State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log_{10}(1/10)(\text{FirstTrace}) - 10(1/10)(\text{SecondTrace})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

3 VMA Mode
 3.6 Occupied BW Measurement

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	<p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre>
Notes	See " Math Function " on page 1745 for how to specify Operands 1 and 2 using :CALCulate:MATH
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code>
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	-100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code>
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.6.10.4 Detector

Lets you select and configure detectors for the specified trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following selections are available:

Option	Behavior
<code>AUTO</code>	The detector selected depends on marker functions, trace functions, average type,

Option	Behavior
	and the trace averaging function For details, see " Detector Select Auto/Man " on page 1065
NORMal	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
AVERage	The detector determines the average of the signal within the sweep points, using RMS averaging
POSitive Peak	The detector determines the maximum of the signal within the sweep points
SAMPle	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
NEGative Peak	The detector determines the minimum of the signal within the sweep points
RMS	Equivalent to AVERage

Because they may not find a spectral component's true peak, neither **AVERage** nor **SAMPle** detectors measure amplitudes of CW signals as accurately as **POSitivePeak** or **NORMal**, but they do measure noise without the biases of peak detection.

Remote Command `[:SENSe]:OBWidth:DETECTOR[:FUNCTION] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS`
`[:SENSe]:OBWidth:DETECTOR[:FUNCTION]?`

Example `:OBW:DET NORM`
`:OBW:DET?`

Set the detector to **Average**. **Average** uses RMS averaging, so this is equivalent to selecting an **RMS** detector:
`:OBW:DET RMS`

Notes The query returns a name that corresponds to the detector type, as follows
The **RMS** selection sets the detector type to **AVERage**, with RMS averaging. Therefore, if **RMS** had been selected, the query returns **AVER**

String Returned	Definition
NORM	Normal
AVER	Average (RMS)
POS	Peak
SAMP	Sample
NEG	Negative Peak

Couplings When "[Detector Select Auto/Man](#)" on page 1065 is **ON**, the values returned by the query depend on the setting of "[Trace Type](#)" on page 1737 as follows:

	Trace Type	Query Returns:
	WRITE	NORMAL
	AVERAGE	AVERAGE
	MAXHOLD	POSITIVE
	MINHOLD	NEGATIVE
Preset	AVERAGE	
State Saved	Saved in instrument state	
Range	NORMAL AVERAGE POSITIVE SAMPLE NEGATIVE RMS	

Detector Select Auto/Man

Sets the Detector mode to **Auto (ON)** or **Man (OFF)**. In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any "Detector" on page 1063 manually, this setting reverts automatically to **Man** (manual).

Remote Command	[:SENSe]:OBWidth:DETECTOR:AUTO ON OFF 1 0 [:SENSe]:OBWidth:DETECTOR:AUTO?	
Example	:OBW:DET:AUTO ON :OBW:DET:AUTO?	
Couplings	When ON , the query "Detector" on page 1063 returns values that depend on the setting of "Trace Type" on page 1737 as follows:	
	Trace Type	Query Returns:
	WRITE	NORMAL
	AVERAGE	AVERAGE
	MAXHOLD	POSITIVE
	MINHOLD	NEGATIVE
Preset	ON	
State Saved	Yes	

3.6.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1753 when a "Copy" on page 1753 or "Exchange" on page 1754 is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1753 when a "Copy" on page 1753 or "Exchange" on page 1754 is performed

Preset 2

Copy

Executes a Trace Copy based on the "From Trace" on page 1753 and "To Trace" on page 1753 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`
 For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
 where <meas> is the identifier for the current measurement
 Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1, TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>, <dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`
 For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1753 and "To Trace" on page 1753 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	<p>For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code></p> <p>For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code></p> <p>where <code><meas></code> is the identifier for the current measurement</p> <p>Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement</p>
Example	<p>Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1, TRACE2</code></p>
Notes	<p>The command is of the form: <code>:TRACe:EXCHange <trace_1>, <trace_2></code></p>
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	<code>:TRACe[:<meas>]:PRESet:ALL</code>
Example	<code>:TRAC:PRE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

Remote Command	<code>:TRACe[:<meas>]:CLEAr:ALL</code>
Example	<code>:TRAC:CLE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

3.6.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCH** query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	<pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre>
Example	<pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre>
Dependencies	In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled
Preset	TRACe1
State Saved	No
Range	Trace 1 Trace 2 Trace 3

3.7 Power Stat CCDF Measurement

Many modern digitally-modulated signals look noise-like in the time and frequency domain, requiring statistical measurement of these signals for meaningful characterization and differentiation. The **Power Statistics Complementary Cumulative Distribution Function (CCDF)** measurement displays curves to characterize the higher-level power statistics of digitally modulated signals. The curves can be useful in determining design parameters for digital communications systems.

The Power Statistics CCDF measurement displays probability on the Y-Axis and amplitude on the X-axis, for a display of the statistical amplitude distribution of a signal. This distribution can be affected by many factors. For example, modulation filtering, modulation format, combining the multiple signals at different frequencies, number of active codes, and correlation between symbols on different codes with spread spectrum systems will all affect measurement results. These factors are all related to modulation and signal parameters. External factors such as signal compression and expansion by nonlinear components, group delay distortion from filtering, and power control within the observation interval also affect the measurement.

The power measured in power statistics CCDF curves is actually instantaneous envelope power defined by the equation:

$$P = (I^2 + Q^2) / Z_0$$

where I & Q are the quadrature voltage components of the waveform, and Z_0 is the characteristic impedance.

A CCDF curve is defined by how much time the waveform spends at or above a given power level. The percent of time the signal spends at or above the level defines the probability for that particular power level. For capturing a lower probability down to 0.0001%, this measurement is made in the single mode by pressing Single. To make the power statistics CCDF measurement, the instrument uses digital signal processing (DSP) to sample the input signal in the channel bandwidth. The Gaussian distribution line as the band-limited Gaussian noise CCDF reference line, the user-definable reference trace, and the currently measured trace can be displayed on a semi-log graph. If the currently measured trace is above the user reference trace, it means that the higher peak power levels against the average power are included in the input signal.

Power Stat CCDF Measurement Commands

The general functionality of ["CONFigure" on page 2551](#), ["INITiate" on page 2552](#), ["FETCh" on page 2552](#), ["MEASure" on page 2554](#), and ["READ" on page 2553](#) are described in the section **SCPI Operation and Results Query** in the topic

Programming the Instrument.

The following measurement commands and queries are used to configure the measurement:

<code>:INITiate:PSTatistic</code>	Initiates a trigger cycle for the PST measurement, but does not return any data. You must then use <code>:FETC:PST[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings Returns the long form name of current measurement, in this case, PSTatistic
<code>:CONFigure:PSTatistic</code>	Selects PST measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1143
<code>:CONFigure:PSTatistic:NDEFault</code>	Selects PST measurement <i>without</i> affecting settings

The following queries are used to retrieve the results:

<code>:FETCh:PSTatistic?</code>	Retrieves the data specified by n
<code>:MEASure:PSTatistic [n]?</code>	Switches to PST measurement, restores default values, starts the measurement, then retrieves the data specified by n
<code>:READ:PSTatistic[n]?</code>	Starts the measurement, then retrieves the data specified by n

Measurement Results for Power Stat CCDF

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value **n**.

n	Results Returned																								
0	Returns unprocessed I/Q trace data, as a series of trace point values, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values																								
1, or not specified	Returns 11 scalar results: <table border="1" data-bbox="360 1402 1406 1757"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit, if any</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Average input power</td> <td>dBm</td> </tr> <tr> <td>2</td> <td>Probability at the average input power level</td> <td>%</td> </tr> <tr> <td>3</td> <td>Power level that has 10 % of the power</td> <td></td> </tr> <tr> <td>4</td> <td>Power level that has 1 % of the power</td> <td></td> </tr> <tr> <td>5</td> <td>Power level that has 0.1 % of the power</td> <td></td> </tr> <tr> <td>6</td> <td>Power level that has 0.01 % of the power</td> <td></td> </tr> <tr> <td>7</td> <td>Power level that has 0.001 % of the power</td> <td></td> </tr> </tbody> </table>	#	Item	Unit, if any	1	Average input power	dBm	2	Probability at the average input power level	%	3	Power level that has 10 % of the power		4	Power level that has 1 % of the power		5	Power level that has 0.1 % of the power		6	Power level that has 0.01 % of the power		7	Power level that has 0.001 % of the power	
#	Item	Unit, if any																							
1	Average input power	dBm																							
2	Probability at the average input power level	%																							
3	Power level that has 10 % of the power																								
4	Power level that has 1 % of the power																								
5	Power level that has 0.1 % of the power																								
6	Power level that has 0.01 % of the power																								
7	Power level that has 0.001 % of the power																								

3 VMA Mode
 3.7 Power Stat CCDF Measurement

n Results Returned			
#	Item	Unit, if any	
8	Power level that has 0.0001 % of the power		
9	Peak power	dB	
10	Count		
11	Power level that has 0.00001% of the power if "Minimum Probability" on page 1075 is PP7 (0.00001 %) This value is returned only when PP7 is selected		
2	Returns a series of 5001 floating point numbers (in percent) that represent the current measured power stat trace. This is the probability at particular power levels (average power), in the following order: 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power ... 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power		
3	Returns a series of 5001 floating point numbers (in percent) that represent the Gaussian trace. This is the probability at particular power levels (average power), in the following order: 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power ... 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power		
4	Returns a series of 5001 floating point numbers (in percent) that represent the user-definable reference trace. This is the probability at particular power levels (average power), in the following order: 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power ... 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power		

3.7.1 Views

In the **LTEATDD** and **5GNR** Modes, this measurement has two views: "Normal" on page 1072 and **Slot**. In all other Modes, there is only a single view (**Normal**).

These are multiple-window Views. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

3.7.1.1 Normal

Windows: ["Metrics" on page 1073](#), ["Graph" on page 1072](#)

The Power Stat CCDF measurement provides CCDF curves and power statistics metrics. This is common for both Uplink (MS) and Downlink (BTS).

Example `:PST:SLTV OFF`

3.7.2 Windows

Three window types are defined:

1. ["Graph" on page 1072](#)
2. Slot
3. ["Metrics" on page 1073](#)

Slot only appears in LTEATDD and 5GNR Modes.

3.7.2.1 Graph

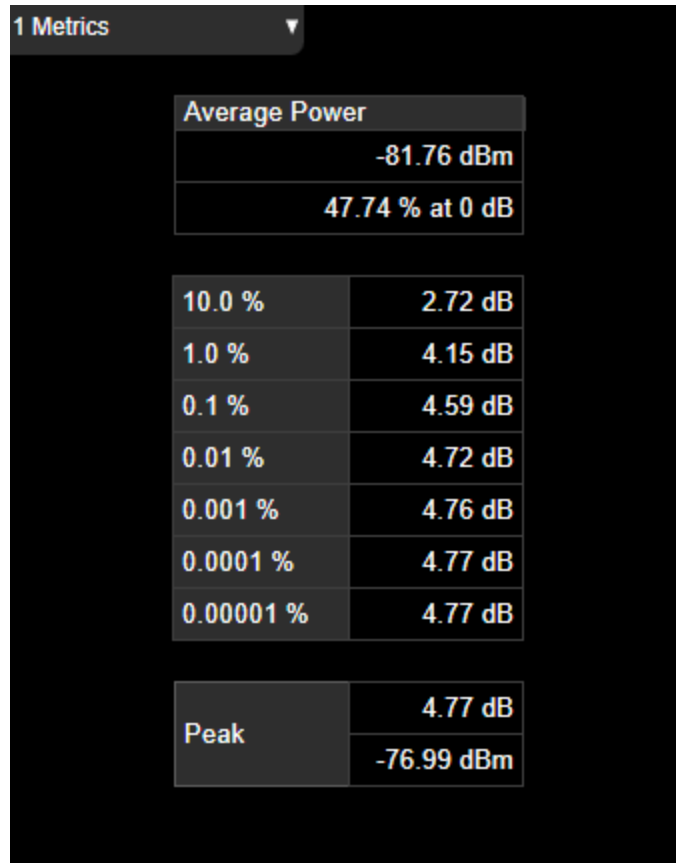

Displays Amplitude versus probability

3 VMA Mode
3.7 Power Stat CCDF Measurement

3.7.2.2 Metrics

Displays the textual results of the Power Stat CCDF measurement.

For the list of $n = 1$ measurement results, see "Measurement Results for Power Stat CCDF" on page 1070 above.

Name	Unit	Corresponding Results	Results Item for $n = 1$	Explanation
Average Power	dBm	Average input power	1	99.99 dBm
Average Power	%	Probability at the average input power level	2	99.99 %
10.0%	dB	Power level that has 10 % of the power	3	99.99 dB
1.0%	dB	Power level that has 1 % of the power	4	99.99 dB
0.1%	dB	Power level that has 0.1 % of the power	5	99.99 dB
0.01%	dB	Power level that has 0.01 % of the power	6	99.99 dB
0.001%	dB	Power level that has 0.001 % of the power	7	99.99 dB

3 VMA Mode
 3.7 Power Stat CCDF Measurement

Name	Unit	Corresponding Results	Results Item for n = 1	Explanation
0.0001%	dB	Power level that has 0.0001 % of the power	8	99.99 dB
0.00001%	dB	Power level that has 0.00001% of the power if " Minimum Probability " on page 1075 is PP7 (0.00001 %)	11	99.99 dB
Peak	dB	Peak power	9	99.99 dB
Peak	dBm	Not available via remote commands	n/a	99.99 dBm

3.7.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.7.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Minimum Probability

Sets the minimum probability range.

Remote Command	<code>:CALCulate:PStatistic:RANGe[:PROBability]:MINimum PP2 ... PP7</code> For parameter values, see " Parameter Options " on page 1076 below <code>:CALCulate:PStatistic:RANGe[:PROBability]:MINimum?</code>
Example	<code>:CALC:PST:RANG:MIN PP6</code> <code>:CALC:PST:RANG:MIN?</code>
Preset	PP6
State Saved	Yes
Range	1 % 0.1 % 0.01 % 0.001 % 0.0001 % 0.00001 %

Parameter Options

Option	Value
PP2	1.0e-2 (1 %)
PP3	1.0e-3 (0.1 %)
PP4	1.0e-4 (0.01 %)
PP5	1.0e-5 (0.001 %)
PP6	1.0e-6 (0.0001 %)
PP7	1.0e-7 (0.00001 %)

3.7.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 1076](#)
- See ["Single-Attenuator Configuration" on page 1077](#)

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

3 VMA Mode
 3.7 Power Stat CCDF Measurement

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1766 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten

In the **Amplitude**, "**Y Scale**" on page 1760 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten

"Total Atten above 50 GHz" followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "**Internal Preamp**" on page 1788 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "**Attenuator Configurations and Auto/Man**" on page 1081

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_aml></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1769 See " Attenuator Configurations and Auto/Man " on page 1081 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level , Int Preamp ,

External Gain, Ref Level Offset, Max Mixer Level, μ W Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto)

- In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "**Full Range Atten**" on page 1765 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto)

In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input

For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB

Preset	Auto The Auto value is 10 dB						
State Saved	Saved in instrument state						
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration: <i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration: <i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the "soft" attenuation is at 14 dB (see below for definition of "soft" attenuation)</p>						

When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1763, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 1079 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1769 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 1084](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1788 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the</p>

3 VMA Mode
 3.7 Power Stat CCDF Measurement

frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "LNA" on page 1790 is **ON**, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 1084
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected **IFBW** for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of

3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1085](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1768](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

3 VMA Mode

3.7 Power Stat CCDF Measurement

- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1773.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1772 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

3 VMA Mode
 3.7 Power Stat CCDF Measurement

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See ["Adjustment Algorithm" on page 1088](#)

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECtrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECtrical COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?	
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?	
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined	
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1769 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 1086 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)
-------	--

	<code>:POW:RANG:AUTO?</code> returns true if <code>:POW:RANG:OPT:ATT</code> is not <code>OFF</code>
Backwards	<code>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</code>
Compatibility	<code>[:SENSe]:POWer[:RF]:RANGe:AUTO?</code>
SCPI	

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1772 or "Pre-Adjust for Min Clipping" on page 1086 selection is Mech + Elec Atten:

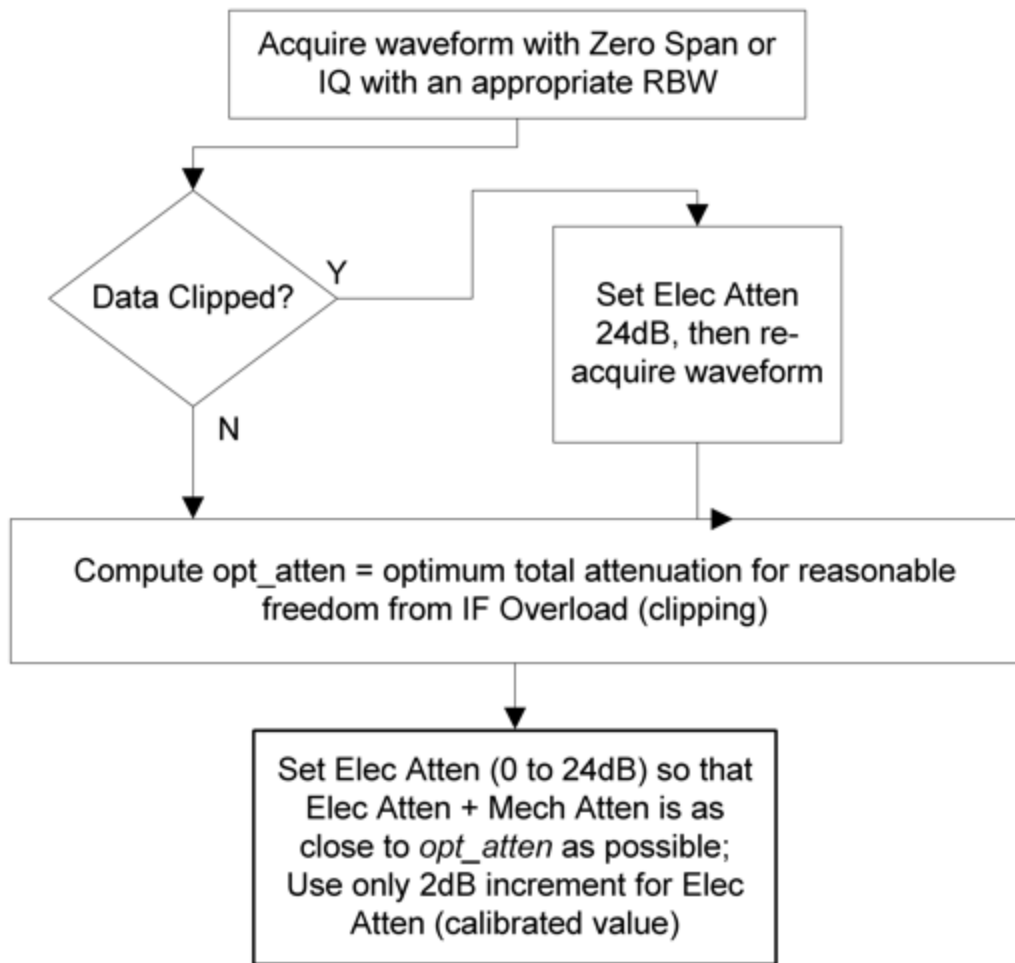

3 VMA Mode
 3.7 Power Stat CCDF Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 1086 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 VMA Mode
 3.7 Power Stat CCDF Measurement

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.7.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:VOLTage:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT:IQ:RANG:AUTO OFF</code> <code>:VOLT:IQ:RANG:AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to YMax
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.
Remote Command	<code>[:SENSe]:POWer:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code>

3 VMA Mode
3.7 Power Stat CCDF Measurement

	<code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 1782 is On, the I Range value will be copied to " Q Range " on page 1781 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <amp;pl></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "[I Range](#)" on page 1779 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1779 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1782 is On, the " I Range " on page 1779 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V" the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;gt;</code> <code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain

3 VMA Mode
3.7 Power Stat CCDF Measurement

range parameter as the **VOLTage** form of the command

The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the **VOLTage** form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:

50 Ω: 10, 4, -2, -8

75 Ω: 8.2, 2.2, -3.8, -9.8

600 Ω: -0.8, -6.8, -12.8, -18.9

Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe] :VOLTage POWer:IQ:MIRROred OFF ON 0 1</code> <code>[:SENSe] :VOLTage POWer:IQ:MIRROred?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the " I Range " on page 1779 value is mirrored (copied) to the " Q Range " on page 1781
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.7.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting.
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements.

Pre-Adjust for Min Clipping

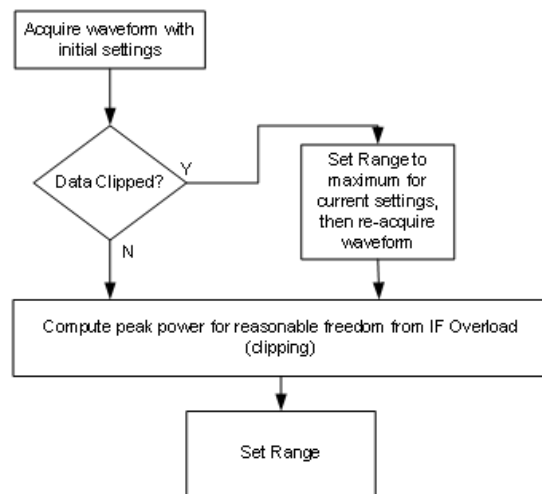

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBined</code>
----------------	---

	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1782 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query

	via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1784. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.7.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1801](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1787](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 1100](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1787
Status Bits/OPC	When centering the preselector, *OPC does not return true until the process is complete and a

dependencies subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries
The **Measuring** bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when **"Presel Center"** on page 1786 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe] :POWer [:RF] :PADJust <freq></code> <code>[:SENSe] :POWer [:RF] :PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	- Does not appear in CXA-m

3 VMA Mode
 3.7 Power Stat CCDF Measurement

- Does not appear in VXT Models M9410A/11A/15A/16A
- Does not appear in M9410E/11E/15E/16E
- Grayed-out if microwave preselector is off
- Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz
- Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz
- Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0
- Grayed-out in the **Spectrogram View**

Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 1786, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"

3 VMA Mode
3.7 Power Stat CCDF Measurement

When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1788. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with "[Internal Preamp](#)" on page 1788, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 1104

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	<code>OFF</code>
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and

3 VMA Mode
 3.7 Power Stat CCDF Measurement

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1109
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1111
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1111

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1786 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	Mode	Value
	IQ Analyzer	MPB option present and licensed: MPB
	Pulse	MPB option not present and licensed: STD
	RTSA	
	Avionics	
	All other Modes	STD
	-

Couplings	See " μW Path Control Auto " on page 1106 above
Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1791.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1791 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1760 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command [:SENSe]:POWer[:RF]:MW:PATH:AUTO:FULL ON | OFF | 1 | 0
[:SENSe]:POWer[:RF]:MW:PATH:AUTO:FULL?

Example	<code>:POW:MW:PATH:AUTO:FULL ON</code> <code>:POW:MW:PATH:AUTO:FULL?</code>
Dependencies	Only appears if Option FBP is installed, and in the following measurements <ul style="list-style-type: none"> - 5GNRMode: Modulation Analysis and IQ Waveform - WLAN Mode: IQ Waveform - Channel Quality Mode: Group Delay and Noise Power Ratio
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be

3 VMA Mode
 3.7 Power Stat CCDF Measurement

used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPResel:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPreSel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1801 is OFF. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

3 VMA Mode
 3.7 Power Stat CCDF Measurement

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)

- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1801 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code>

	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: :SAN:PFIL ON
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1118 below
State Saved	Saved in instrument state

3.7.4 BW

Opens the Bandwidth (**BW**) menu, which contains the Info BW control.

3.7.4.1 Settings

Contains basic bandwidth functions. It is the only tab under **BW**.

Info BW

Allows you to enter a frequency value to set the channel bandwidth that will be used for data acquisition. When in **Auto**, it is set to the value that covers carriers set by carrier configuration.

Remote Command	<code>[:SENSe]:PStatistic:BAWdwidth <freq></code> <code>[:SENSe]:PStatistic:BAWdwidth?</code>				
Example	<code>:PST:BAWd 8 MHz</code> <code>:PST:BAWd?</code>				
Notes	Auto/Man is available only for 5G NR, LTE, LTE-TDD, LTE-AFDD, LTE-A TDD				
Preset	Depends on Mode and installed Options. See " Preset Values " on page 1119 below

3.7.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.7.5.1 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "[Views](#)" on page 1071.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

3 VMA Mode
3.7 Power Stat CCDF Measurement

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node</p> <pre>:DISPlay:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
----------------	---

Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELeTe</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELeTe:ALL</code>
Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example:</p> <p><code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p>

No distinction is made between Predefined and User Views
If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1812), then query the list of available Views, the result is undefined

3.7.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	<code>ON</code>
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the <code>WINDow</code> , <code>TRACe</code> and <code>GRID</code> parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

3 VMA Mode
 3.7 Power Stat CCDF Measurement

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPlay:VIEW:ADVanced:SElect</code>
Rename User View	<code>:DISPlay:VIEW:ADVanced:REName</code>
Delete User View	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Create User View	<code>:DISPlay:VIEW:ADVanced:NAME</code>
Select Screen	<code>:INSTrument:SCReen:SElect</code>
Delete Screen	<code>:INSTrument:SCReen:DElete</code>
Delete All But This Screen	<code>:INSTrument:SCReen:DElete:ALL</code>
Add Screen	<code>:INSTrument:SCReen:CREate</code>
Rename Screen	<code>:INSTrument:SCReen:REName</code>
Sequencer On/Off	<code>:SYSTem:SEQuencer</code>

Remote Command	<code>:DISPlay:ENABle OFF ON 0 1</code>
Example	<code>:DISP:ENAB OFF</code>
Couplings	<code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code>
Preset	ON Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code>
State Saved	Not saved in instrument state
Backwards Compatibility Notes	<code>:SYST:PRES</code> no longer turns on <code>:DISPlay:ENABle</code> as it did in legacy analyzers

3.7.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, **Center Frequency** is the same for all measurements – it does not change as you change measurements.

3.7.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set the center frequency for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input, **Center Frequency** will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

- ["Center Frequency Presets" on page 1130](#)
- ["VXT Models with Radio Heads/CIU Frequency Range" on page 1132](#)
- ["RF Center Freq" on page 1132](#)

3 VMA Mode
 3.7 Power Stat CCDF Measurement

- ["Ext Mix Center Freq" on page 1133](#)
- ["I/Q Center Freq" on page 1133](#)

Remote Command	<code>[:SENSE] :FREQuency:CENTer <freq></code> <code>[:SENSE] :FREQuency:CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of CF Step : <code>:FREQ:CENT UP</code> Return the current value of Center Frequency: <code>:FREQ:CENT?</code>
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> – For RF input it is equivalent to <code>:FREQ:RF:CENT</code> – For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code> – For External Mixer it is equivalent to <code>:FREQ:EMIX:CENT</code> Preset and Max values are dependent on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1130 , "RF Center Freq" on page 1132 , "Ext Mix Center Freq" on page 1133 , "I/Q Center Freq" on page 1133 , and "VXT Models with Radio Heads/CIU Frequency Range" on page 1132
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1130 , "RF Center Freq" on page 1132 , "I/Q Center Freq" on page 1133 , and "VXT Models with Radio Heads/CIU Frequency Range" on page 1132
Status Bits/OPC dependencies	Non-overlapped The following command and parameters apply only to MSR, LTE-Advanced FDD/TDD and 5G NR Modes.
Remote Command	<code>[:SENSe] :FREQuency:CENTer:AUTO ON OFF 1 0</code> <code>[:SENSe] :FREQuency:CENTer:AUTO?</code>
Example	<code>:FREQ:CENT:AUTO OFF</code> <code>:FREQ:CENT:AUTO?</code>
Dependencies	Only available for the Monitor Spectrum, Power Stat CCDF and IQ waveform measurements in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Couplings	When Center Frequency changes, state automatically changes to Manual (OFF)

Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled. When Carrier Reference Frequency changes:

Center Frequency	Relationship
Auto	Center Frequency = Carrier Reference Frequency + Center Frequency Offset (fixed)
Man	Center Frequency (fixed) = Carrier Reference Frequency + Center Frequency Offset

Preset	ON
State Saved	Saved in instrument state
Range	Auto Man

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz

3 VMA Mode
 3.7 Power Stat CCDF Measurement

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Lets you specify the RF Center Frequency. Sets the Center Frequency to use when the RF input is selected, even if the RF input is not selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be > 3.6 GHz fails and results in an advisory message If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See " Center Frequency Presets " on page 1130
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See " Center Frequency Presets " on page 1130. Basically, instrument maximum frequency - 5 Hz

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the Center Frequency to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having switched to one of the other inputs (for example, RF), you will come back into the settings that you had when you left External Mixing. So, you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after Restore Input/Output Defaults , if you go to External Mixing and do a Mode Preset while in Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:IQ:CENTer <freq></code>
----------------	---

	<code>[:SENSe] :FREQuency :IQ :CENTer?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	-/+40.049995 MHz

CF Step

Changes the step size for the "Center Frequency" on page 1128 and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement]?</code>
Example	Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> <code>:FREQ:CENT:STEP?</code>
Notes	Preset and Max values are depending on Hardware Options
Dependencies	<i>Not</i> available in the MSR, LTEAFDD, LTEATDD, 5GNR, and Channel Quality Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-Arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min/Max	-/+ (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	<code>[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code>
Example	<code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Preset	ON

Adjust Center Frequency to Carrier Config

This immediate action control adjusts "Center Frequency" on page 1128 to cover all the configured carriers when "Info BW" on page 1119 is Auto.

Remote Command	<code>[:SENSe]:PStatistic:FREQuency:CENTer:ADJust</code>
Example	<code>:PST:FREQ:CENT:ADJ</code>
Couplings	When "Info BW" on page 1119 is Man , pressing this control automatically changes it to Auto

3.7.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed at the center of the screen on the trace determined by the Marker Trace rules.

3.7.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the Marker menu, and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.7.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Position/Normal**, **Delta** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker X-Axis Value

Sets the marker X-Axis value in the current marker X-Axis Scale unit. This function has no effect if the control mode is **Off**, but is the remote command equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:X <rel_amp></code> <code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:PST:MARK3:X 0</code> <code>:CALC:PST:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X-Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time . If the marker is Off the response is Not A Number
Preset	After a preset, all Markers are turned OFF , so Marker X-Axis Value query returns Not a Number (NAN)
State Saved	No
Min/Max	-/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker Y Axis Value (Remote Command Only)

Queries the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:Y?</code>
Example	<code>:CALC:PST:MARK11:Y?</code>
Notes	Returns the marker Y-Axis result, if the control mode is Normal , or Delta . If the marker is Off , the response is <i>Not a Number</i>
Preset	0
State Saved	No
Backwards Compatibility SCPI	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:FUNCtion:RESult?</code>

Marker Mode

Sets the marker control mode to **Normal (POSiTion)**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **Off**, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

Remote Command	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:MODE POSiTiOn DELTa OFF</code> <code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:MODE?</code>
Example	<code>:CALC:PST:MARK:MODE POS</code> <code>:CALC:PST:MARK:MODE?</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>POSiTiOn DELTa OFF</code>
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it into **Normal** mode and places it at the center of the screen.

Example	<code>:CALC:PST:MARK3:STAT 1</code> <code>:CALC:PST:MARK3:STAT?</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>
Backwards Compatibility SCPI	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:STATe OFF ON 0 1</code> <code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:STATe?</code>

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing **Delta** in "**Marker Mode**" on page 1137. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:PStatistic:MARKer:AOff
Example	:CALC:PST:MARK:AOff

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **Off**. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental x-axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off screen.

Remote Command	:CALCulate:PStatistic:MARKer:COUple[:STATe] ON OFF 1 0
Example	:CALC:PST:MARK:COUP ON :CALC:PST:MARK:COUP?
Preset	OFF Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.7.7.3 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker X-Axis Value

This is the fundamental control that you use to move a marker around on the trace. This is the same as "[Marker X-Axis Value](#)" on page 1136 in **Settings**.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:REFerence <integer></code> <code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:REFerence?</code>
Example	<code>:CALC:PST:MARK:REF 3</code> <code>:CALC:PST:MARK:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried, a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Fixed or Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Assigns the specified marker to the designated trace. The trace choices are:

- MEASured
- GAUSSian
- REFerence

Remote Command	:CALCulate:PSTatistic:MARKer[1] 2 ... 12:TRACe MEASured GAUSSian REFerence :CALCulate:PSTatistic:MARKer[1] 2 ... 12:TRACe?
Example	:CALC:PST:MARK3:TRAC MEAS :CALC:PST:MARK:TRACE?
Preset	MEASured
State Saved	Yes
Range	MEASured GAUSSian REFerence

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as "[Marker Settings Diagram](#)" on page 1138 in **Settings**.

3.7.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.7.8.1 Settings

Contains frequently used functions to which you will want the fastest access.

Counts

Sets the accumulated number of sampling points for data acquisition. The range is 1.000 kpt (k point) to 2.00000 Gpt (G point) with 1 kpt resolution.

Remote Command	[:SENSe]:PSTatistic:COUNts <integer> [:SENSe]:PSTatistic:COUNts?
Example	:PST:COUN 5001 :PST:COUN?
Couplings	Coupled to " Meas Cycles " on page 1141, by: Counts = Meas Cycles * SamplingFrequency * "Meas Interval" on page 1141
Preset	10000000

State Saved	Saved in instrument state
Min/Max	1000/2000000000

Meas Cycles

Set the number of measurement cycles to calculate power statistic data. This number is coupled to "Counts" on page 1140, by:

$$\text{Meas Cycles} = \text{Counts} / (\text{Sampling Frequency} * \text{Meas Interval})$$

When the **Counts** value cannot be divided by (**Sampling Frequency** * "**Meas Interval**" on page 1141), this value is displayed as a decimal fraction.

Remote Command	<code>[:SENSe]:PStatistic:SWEEP:CYCLes <real></code> <code>[:SENSe]:PStatistic:SWEEP:CYCLes?</code>
Example	<code>:PST:SWE:CYCL 1001</code> <code>:PST:SWE:CYCL?</code>
Preset	Depends on the sampling frequency
Min	0.001
Max	Depends on the sampling frequency

Meas Interval

Sets the number of data points to be used as the measurement interval. This value couples to "Counts" on page 1140, as:

$$\text{Meas Interval} = \text{Counts} / (\text{"Meas Cycles" on page 1141} * \text{Sampling Frequency})$$

Remote Command	<code>[:SENSe]:PStatistic:SWEEP:TIME <time></code> <code>[:SENSe]:PStatistic:SWEEP:TIME?</code>
Example	<code>:PST:SWE:TIME 2 ms</code> <code>:PST:SWE:TIME?</code>
Preset	1.0 ms !unless noted below LTEATDD, 5G NR: 500 us
Min/Max	50.0 us/10.0 ms !unless noted below LTEATDD, 5G NR: 1 us/10.0 ms

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1143 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does not affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command [:CONFigure:PStatistic](#)

Example	<code>:CONF:PST</code>
Couplings	Selecting Meas Preset restores all measurement parameters to their default values

3.7.8.2 Advanced

Contains controls for setting advanced functions of the instrument.

IF Gain

Used to set the IF Gain function to: Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Only applies to the RF input. Does not apply to baseband I/Q input.

Remote Command	<code>[:SENSe]:PStatistic:IF:GAIN[:STATe] ON OFF 1 0</code> <code>[:SENSe]:PStatistic:IF:GAIN[:STATe]?</code>
Example	<code>:PST:IF:GAIN ON</code> <code>:PST:IF:GAIN?</code>
Notes	ON = high gain OFF = low gain
Dependencies	Not available when IQ Input is selected Has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control Not available in VXT, EXM, or UXM
Couplings	Sending this command forces IF Gain Auto to OFF (Man)
Preset	OFF
State Saved	Saved in instrument state
Range	Low Gain High Gain Auto Function
Remote Command	<code>[:SENSe]:PStatistic:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:PStatistic:IF:GAIN:AUTO[:STATe]?</code>
Example	<code>:PST:IF:GAIN:AUTO ON</code> <code>:PST:IF:GAIN:AUTO?</code>
Couplings	Auto sets IF Gain to High Gain if the input attenuator is set to 0 dB, or the preamp is turned on, or the Max Mixer Level is -20 dBm or lower For other conditions, Auto sets IF Gain to Low Gain
Preset	OFF

IF Upsampling Ratio

Allows you to select the upsampling ratio after data is captured for a measurement. Using this method, mitigation of peak detection error can be expected when upsampling ratio is set to $> x1$.

Remote Command	<code>[:SENSe]:PStatistic:URATio X1 X2 X4 X8 X16 X32</code> <code>[:SENSe]:PStatistic:URATio?</code>
Example	<code>:PST:URAT X8</code> <code>:PST:URAT?</code>
Notes	X1 is for backwards compatibility
Preset	X1
State Saved	Yes, Saved in instrument state
Range	X1 X2 X4 X8 X16 X32

3.7.8.3 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 1828) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:FREQuency:CENTer ALL NONE</code> <code>:INSTRument:COUPlE:FREQuency:CENTer?</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATE] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATE]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1829 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPlE:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTrument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.7.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.7.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1148

Remote Command	:INITiate:CONTinuous OFF ON 0 1 :INITiate:CONTinuous?
Example	Put instrument into Single measurement operation: :INIT:CONT 0 :INIT:CONT OFF Put instrument into Continuous measurement operation: :INIT:CONT 1 :INIT:CONT ON
Preset	ON

Note that **:SYST:PRES** sets **:INIT:CONT** to **ON**, but ***RST** sets **:INIT:CONT** to **OFF**

State Saved	Saved in instrument state
Annunciation	<p>The Single/Continuous icon in the Meas Bar changes depending on the setting:</p> <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	<p>X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and INIT:CONT ON) switched to continuous measurement, but never restarted a measurement and never reset a sweep</p> <p>X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep</p>

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1832 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 1150

Remote Command	<code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATus:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUESTionable</code> register bit 9 (<code>INTEGRity</code> sum) is cleared The <code>SWEEPING</code> bit is set

	The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** > 1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCN UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSe</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORt</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORt</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATus:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUESTionable</code> register bit 9 (INTEGRity sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORt</code> , the Abort command will cause the <code>*OPC</code> query to return true

3.7.9.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Scale/Div

Enables you to enter a time value to change the horizontal scale.

Remote Command	<code>:DISPlay:PStatistic:VIEW[1]:WINDow2:TRACe:X[:SCALe]:PDIVision <rel_ampl></code>
Example	<code>:DISP:PST:VIEW:WIND2:TRAC:X:PDIV 10</code> <code>:DISP:PST:VIEW:WIND2:TRAC:X:PDIV?</code>
Notes	The CCDF measurement has the trace display only in Window 2, because values other than "2" are <i>not</i> available as the sub-op code
Preset	2.00
State Saved	Saved in instrument state
Min	0.1
Max	20
Backwards Compatibility SCPI	<code>:DISPlay:PStatistic:XScale</code>

3.7.10 Trace

Lets you control the display and storage of trace data for the available traces.

3.7.10.1 Trace Control

The controls on this tab allow you to select display of the Reference Trace and the Gaussian Line, and store the Reference Trace.

Store Ref Trace

Copies the currently measured curve as the user-definable reference trace. The captured data remains until the other mode is chosen. Pressing this key also refreshes the reference trace.

No query is available.

Remote Command	<code>:CALCulate:PStatistic:STORe:REFerence</code>
----------------	--

Example	<code>:CALC:PST:STOR:REF</code>
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:SRRace</code>

Ref Trace

Toggles the reference trace display On or Off.

Remote Command	<code>:DISPlay:PStatistic:RTRace[:STATe] OFF ON 0 1</code> <code>:DISPlay:PStatistic:RTRace[:STATe]?</code>
Example	<code>:DISP:PST:RTR OFF</code> <code>:DISP:PST:RTR?</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:RTRace[:STATe]</code>

Gaussian Line

Toggles the Gaussian trace display On or Off.

Remote Command	<code>:DISPlay:PStatistic:GAUSSian[:STATe] OFF ON 0 1</code> <code>:DISPlay:PStatistic:GAUSSian[:STATe]?</code>
Example	<code>:DISP:PST:GAUS OFF</code> <code>:DISP:PST:GAUS?</code>
Preset	<code>ON</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:GAUSSian[:STATe]</code>

3.8 ACP Measurement

ACP is a measurement of the amount of interference, or power, in an adjacent frequency channel. The results are displayed as a bar graph or as spectrum data, with measurement data at specified offsets.

Measurement Commands

The general functionality of ["CONFigure" on page 2551](#), ["INITiate" on page 2552](#), ["FETCh" on page 2552](#), ["MEASure" on page 2554](#), and ["READ" on page 2553](#) are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

The following measurement commands and queries are used to configure the measurement:

<code>:INITiate:ACPower</code>	Initiates a trigger cycle for the ACPower measurement, but does not return any data. You must then use <code>:FETC:ACP[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings Returns the long form name of current measurement, in this case, ACPower
<code>:CONFigure:ACPower</code>	Selects ACP measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1288
<code>:CONFigure:ACPower:NDEFault</code>	Selects ACP measurement <i>without</i> affecting settings

The following queries are used to retrieve the results:

<code>:FETCh:ACPower?</code>	Retrieves the data specified by n
<code>:MEASure:ACPower[n]?</code>	Switches to ACP measurement, restores default values, starts the measurement, then retrieves the data specified by n
<code>:READ:ACPower[n]?</code>	Starts the measurement, then retrieves the data specified by n

Remote Command Results

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value **n**.

n	Results Returned
1, or not specified	Dependent on Mode , "Meas Method" on page 1246 , "Power Ref" on page 1331 , and "Measurement Type" on page 1330 See "Measurement Results for n = 1, or no Index Specified" on page 1158
2	Dependent on "Measurement Type" on page 1330 . See "Measurement Results for n = 2" on page 1161
3	Dependent on Mode and "Measurement Type" on page 1330 . See "Measurement Results for n = 3" on page 1161

n Results Returned

1162

- 4 Returns <Num Pts> comma-separated scalar values representing the Y values in Trace 1
- 5 Returns <Num Pts> comma-separated scalar values representing the Y values in Trace 2
- 6 Returns <Num Pts> comma-separated scalar values representing the Y values in Trace 3
- 7 Dependent on **Mode** and "Measurement Type" on page 1330. See "Measurement Results for n = 7" on page 1163
- 8 Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes
Dependent on "Measurement Type" on page 1330, "PSD Unit" on page 1338, and "Power Ref" on page 1331. See "Measurement Results for n = 8" on page 1164
- 9 Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes
Returns scalar pass/fail values (0 = passed, or 1 = failed) for the trace specified by "Measure Trace" on page 1755, determined by comparing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies

#	Item
1	Inner Lower offset A - relative limit result
2	Inner Lower offset A - absolute limit result
3	Inner Upper offset A - relative limit result
4	Inner Upper offset A - absolute limit result
5	Inner Lower offset B - relative limit result
6	Inner Lower offset B - absolute limit result
7	Inner Upper offset B - relative limit result
8	Inner Upper offset B - absolute limit result
...	...

When "Max Num of Offsets" on page 1285 is 6, returns 24 results (Offset A-F: 24 = 4*6) and when set to 12, returns 48 results (Offset A-L: 48 = 4 * 12)

- 10 Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes
Returns scalar values of offset results for the trace specified by "Measure Trace" on page 1755
Numbers returned in this trace are 10 x the actual measured offsets. Note that upper and lower sides of an offset are returned separately. For example, when only outer offset A is measured with offset side both, 10 x 2 = 20 values are returned
In the table below, f is the Number of Offsets. See "Max Num of Offsets" on page 1285

#	Measurement Type	Item	Unit, if any
1		Inner = 1 or Outer = 2	
2		Offset A~L. (A = 1, B = 2, ... L = 12)	
3		Offset Side. Lower = 1 or Upper = 2	

3 VMA Mode
3.8 ACP Measurement

n Results Returned			
#	Measurement Type	Item	Unit, if any
4	TPRef	Relative power or	dBc
	PSDRef	Relative PSD	dB
5	TPRef	Absolute power	dBm
	PSDRef	Absolute PSD	dBm/Hz, dBm/MHz*
6	TPRef	Reference power	dBm
	PSDRef	Reference PSD	dBm/Hz, dBm/MHz*
7		Reference Index 1	
8		Reference Index 2	
9		0 (Reserved)	
10		0 (Reserved)	
...			
10(f - 1) + 1		Inner = 1 or Outer = 2	
10(f - 1) + 2		Offset A~L. (A = 1, B = 2, ... L = 12)	
10(f - 1) + 3		Offset Side. Lower = 1 or Upper = 2	
10(f - 1) + 4	TPRef	Relative power	dBc
	PSDRef	Relative PSD	dB
10(f - 1) + 5	TPRef	Absolute power	dBm
	PSDRef	Absolute PSD	dBm/Hz, dBm/MHz*
10(f - 1) + 6	TPRef	Reference power	dBm
	PSDRef	Reference PSD	dBm/Hz, dBm/MHz*
10(f - 1) + 7		Reference Index 1	
10(f - 1) + 8		Reference Index 2	
10(f - 1) + 9		0 (Reserved)	
10(f - 1) + 10		0 (Reserved)	

"Measurement Type" on page 1330 determines which type of power result is returned: Total Pwr Ref (TPRef) or PSD Ref (PSDRef)

*For PSD results, the unit is determined by "PSD Unit" on page 1338: DBMHZ or DBMMHZ

If any result is not available, 9.91E+37 (NaN) is returned

11 Returns Marker Table data as a series of comma separated values in the following form:

<Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved>

Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table

3.8.1 Measurement Results for n = 1, or no Index Specified

Mode = SA, Radio Std = None, Number of carriers = 1, Only Offset A is On

Returns 3 comma-separated values that correspond to:

#	Item	Unit, if any
1	Reference carrier power	
2	Lower-adjacent channel power of the trace specified by "Measure Trace" on page 1755	dBc
3	Upper-adjacent channel power of the trace specified by "Measure Trace" on page 1755	dBc

The values are in the current Y Axis Unit of the instrument

Meas Method = FAST

See also "Meas Method" on page 1246

For the trace specified by "Measure Trace" on page 1755, returns 5 comma-separated scalar results in the following order:

#	Item	Result	Unit, if any
1	Reference carrier	Absolute power	dBm
2	Lower offset A	Absolute power	dBm
3	Upper offset A	Absolute power	dBm
4	Lower offset B	Absolute power	dBm
5	Upper offset B	Absolute power	dBm

Measurement Type = Total Power Reference

Conditions	Results															
Mode: LTEAFDD, LTEATDD, 5GNR, MSR "Power Ref" on page 1331: LRCarriers LRSubblocks MPCSubblock MINSubblock	For the trace specified by "Measure Trace" on page 1755, returns comma-separated scalar results in the following order: <table border="1"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit, if any</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0.0</td> <td></td> </tr> <tr> <td>2</td> <td>Total carrier power</td> <td>dBm</td> </tr> <tr> <td>3</td> <td>Left Reference power</td> <td>dBm</td> </tr> <tr> <td>4</td> <td>Right Reference power</td> <td>dBm</td> </tr> </tbody> </table>	#	Item	Unit, if any	1	0.0		2	Total carrier power	dBm	3	Left Reference power	dBm	4	Right Reference power	dBm
#	Item	Unit, if any														
1	0.0															
2	Total carrier power	dBm														
3	Left Reference power	dBm														
4	Right Reference power	dBm														
For all other Power Ref settings, see All other Modes row below																

3 VMA Mode
3.8 ACP Measurement

Conditions	Results
------------	---------

#	Item	Unit, if any
5	Lower offset A - relative power	dB
6	Lower offset A - absolute power	dBm
7	Upper offset A - relative power	dB
8	Upper offset A - absolute power	dBm
9	Lower offset B - relative power	dB
10	Lower offset B - absolute power	dBm
11	Upper offset B - relative power	dB
12	Upper offset B - absolute power	dBm
...	...	

When "Max Num of Offsets" on page 1285 is 6, returns 28 results (Offset A-F: $28 = 4 + 4*6$) and when set to 12, returns 52 results (Offset A-L: $52 = 4 + 4 * 12$)

If any result is not available, -999.0 is returned

This trace includes only outer offset results and their reference value(s)

All other Modes and Power Ref settings

For the trace specified by "Measure Trace" on page 1755, returns comma-separated scalar results in the following order:

#	Item	Unit, if any
1	0.0	
2	Total carrier power	dBm
3	0.0	
4	Reference power	dBm
5	Lower offset A - relative power	dB
6	Lower offset A - absolute power	dBm
7	Upper offset A - relative power	dB
8	Upper offset A - absolute power	dBm
9	Lower offset B - relative power	dB
10	Lower offset B - absolute power	dBm
11	Upper offset B - relative power	dB
12	Upper offset B - absolute power	dBm
...	...	

When "Max Num of Offsets" on page 1285 is 6, returns 28 results (Offset A-F: $28 = 4 + 4*6$) and when set to 12, returns 52 results (Offset A-L: $52 = 4 + 4 * 12$)

If any result is not available, -999.0 is returned

For SA Mode, the values are in the current Y Axis Unit of the instrument

Measurement Type = Power Spectral Density Reference

3.8.2 Measurement Results for n = 2

- For SA Mode, the values are in the current Y Axis Unit of the instrument
- For MSR, LTE Advanced FDD/TDD, and 5G NR Modes, this trace includes only outer offset results and their reference value(s)

Measurement Type = Total power reference

For the trace specified by "Measure Trace" on page 1755, returns comma-separated scalar results in the following order:

#	Item	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm
...
23	Channel (12)	Relative power	dB
24	Channel (12)	Absolute power	dBm
25	Lower offset A	Relative power	dB
26	Lower offset A	Absolute power	dBm
27	Upper offset A	Relative power	dB
28	Upper offset A	Absolute power	dBm
29	Lower offset B	Relative power	dB
30	Lower offset B	Absolute power	dBm
31	Upper offset B	Relative power	dB

#	Item	Result	Unit, if any
32	Upper offset B	Absolute power	dBm
...	

When "Max Num of Offsets" on page 1285 is 6, returns 48 results (Offset A-F: $48 = 24 + 4*6$) and when set to 12, returns 72 results (Offset A-L: $72 = 24 + 4 * 12$)

If any result is not available, -999.0 is returned

Measurement Type = Power spectral density reference

For the trace specified by "Measure Trace" on page 1755, returns comma-separated scalar results in the following order:

#	Channel	Item	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm/Hz or dBm/MHz*
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm/Hz or dBm/MHz*
...	
23	Channel (12)	Relative power	dB
24	Channel (12)	Absolute power	dBm/Hz or dBm/MHz*
25	Lower offset A	Relative power	dB
26	Lower offset A	Absolute power	dBm/Hz or dBm/MHz*
27	Upper offset A	Relative power	dB
28	Upper offset A	Absolute power	dBm/Hz or dBm/MHz*
29	Lower offset B	Relative power	dB
30	Lower offset B	Absolute power	dBm/Hz or dBm/MHz*
31	Upper offset B	Relative power	dB
32	Upper offset B	Absolute power	dBm/Hz or dBm/MHz*
...	

When "Max Num of Offsets" on page 1285 is 6, returns 48 results (Offset A-F: $48 = 24 + 4*6$) and when set to 12, returns 72 results (Offset A-L: $72 = 24 + 4 * 12$)

*The unit is determined by "PSD Unit" on page 1338: **DBMHZ** or **DBMMHZ**

If any result is not available, -999.0 is returned

3.8.3 Measurement Results for n = 3

For the trace specified by "Measure Trace" on page 1755, returns scalar pass/fail values (0 = passed, or 1 = failed) determined by comparing the relative to the

3 VMA Mode
 3.8 ACP Measurement

reference carrier and by testing the absolute power limit of the offset frequencies (measured as total power in dB if "Measurement Type" on page 1330 is Total Pwr Ref, or as power spectral density in dB if Measurement Type is PSD Ref).

When "Max Num of Offsets" on page 1285 is 6, returns 24 results (Offset A-F: 24 = 4*6). When set to 12, returns 48 results (Offset A-L: 48 = 4 * 12).

For MSR, LTE-Advanced FDD/TDD, and 5G NR Modes, this trace includes only outer offset results.

#	Item
1	Lower offset A - relative limit result
2	Lower offset A - absolute limit result
3	Upper offset A - relative limit result
4	Upper offset A - absolute limit result
5	Lower offset B - relative limit result
6	Lower offset B - absolute limit result
7	Upper offset B - relative limit result
8	Upper offset B - absolute limit result
...	...

If any result is not available, 1 is returned.

3.8.4 Measurement Results for n = 7

In all cases below:

- for SA Mode, the values are in the current Y Axis Unit of the instrument
- if any result is not available, 9.91E+37 (NaN) is returned

Mode	Max Number of Carriers
MSR	100
LTEAFDD, LTEATDD	5
5G NR	16
All Others	18

Measurement Type = Total power reference

For the trace specified by "Measure Trace" on page 1755, returns (2 * Number of Carriers) comma-separated scalar results in the following order:

#	Channel	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm

#	Channel	Result	Unit, if any
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm
...	...		
2 * Number of Carriers - 1	Channel (Number of Carriers)	Relative power	dB
2 * Number of Carriers	Channel (Number of Carriers)	Absolute power	dBm

Measurement Type = Power spectral density reference

For the trace specified by "Measure Trace" on page 1755, returns (2 * Number of Carriers) comma-separated scalar results in the following order:

#	Channel	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm/Hz or dBm/MHz*
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm/Hz or dBm/MHz*
...	...		
2 * Number of Carriers - 1	Channel (Number of Carriers)	Relative power	dB
2 * Number of Carriers	Channel (Number of Carriers)	Absolute power	dBm/Hz or dBm/MHz*

*The unit is determined by "PSD Unit" on page 1338: **DBMHZ** or **DBMMHZ**

3.8.5 Measurement Results for n = 8

Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes

For the trace specified by "Measure Trace" on page 1755, returns scalar results in the following order:

#	Item	Unit, if any
1	0.0	
2	Total carrier power	dBm
3	Reference Power #1 (See "Reference Power Result Details" on page 1165)	
4	Reference Power #2 (See "Reference Power Result Details" on page 1165)	
5	Inner Lower offset A - relative power	dB
6	Inner Lower offset A - absolute power	dBm, dBm/Hz or dBm/MHz*
7	Inner Upper offset A - relative power	dB

3 VMA Mode
3.8 ACP Measurement

#	Item	Unit, if any
8	Inner Upper offset A - absolute power	dBm, dBm/Hz or dBm/MHz*
9	Inner Lower offset B - relative power	dB
10	Inner Lower offset B - absolute power	dBm, dBm/Hz or dBm/MHz*
11	Inner Upper offset B - relative power	dB
12	Inner Upper offset B - absolute power	dBm, dBm/Hz or dBm/MHz*
...	...	

This trace includes only inner offset results

When "Max Num of Offsets" on page 1285 is 6, returns 28 results (Offset A-F: 24 = 4 + 4*6) and when set to 12, returns 52 results (Offset A-L: 52 = 4 + 4 * 12)

Absolute Power Units

*For Absolute power results, the units depend on the "Measurement Type" on page 1330 and "PSD Unit" on page 1338 settings as follows:

Measurement Type	PSD Unit	Unit
Total Pwr Ref	All	dBm
PSD Reference	dBm/Hz, DBMHZ	dBm/Hz
	dBm/MHz, DBMMHZ	dBm/MHz

Reference Power Result Details

The values returned as Reference Power #1 and Reference Power #2 depend on "Power Ref" on page 1331:

Power Ref Setting	Option	Reference Power #1	Reference Power #2
Left & Right Carriers	LRCarriers	Left or Max Power Carrier in the lower sub-block	Right or Max Power Carrier in the upper sub-block
Max Power Carriers in Sub-block	MPCSubblock	dBm, dBm/Hz or dBm/MHz*	dBm, dBm/Hz or dBm/MHz*
Left & Right Sub-blocks	LRSubblocks	Integrated Power of the lower sub-block	Integrated Power of the upper sub-block
		dBm, dBm/Hz or dBm/MHz*	dBm, dBm/Hz or dBm/MHz*
Others		0.0	Reference carrier power
			dBm, dBm/Hz or dBm/MHz*

*For PSD results, the unit is determined by "PSD Unit" on page 1338. See "Absolute Power Units" on page 1165 above

If any result is not available, 9.91E+37 (NaN) is returned

3.8.6 Views

This measurement has two predefined views:

View	Enumerated Parameter	SCPI Number
"Normal" on page 1167	PRESult	1
"Carrier Info" on page 1167	CINformation	2

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the view changes, the default menu is **Frequency**, unless otherwise specified in the view description.

NOTE

Y Scale/Div, Y Ref Position, Y Auto Scale, Y Ref Value and Bar Graph affect both views. For example, power bars on the traces in both views appear or disappear when Bar Graph is toggled.

View Selection by Name

Selects the results view. The following command allows you to select the desired measurement view by enumerated parameter.

Remote Command	<code>:DISPlay:ACPower:VIEW[:SElect] PRESult CINformation</code> For view names, see table above <code>:DISPlay:ACPower:VIEW[:SElect]?</code>
Example	<code>:DISP:ACP:VIEW PRES</code> <code>:DISP:ACP:VIEW?</code>
Preset	<code>PRESult</code>
State Saved	Saved in instrument state
Range	<code>PRESult CINformation</code>

View Selection by Number (Remote Command Only)

Selects the results view. The following command allows you to select the desired measurement view numerically.

3 VMA Mode
3.8 ACP Measurement

Remote Command	<code>:DISPlay:ACPower:VIEW:NSElect <integer></code> For view numbers, see table above <code>:DISPlay:ACPower:VIEW:NSElect?</code>
Example	<code>:DISP:ACP:VIEW:NSEL 1</code> <code>:DISP:ACP:VIEW:NSEL?</code>
Dependencies	Available only for LTEAFDD, LTEATDD and 5G NR Modes
Preset	1
State Saved	Saved in instrument state
Min/Max	1 / 2

3.8.6.1 Normal

Windows: "Graph" on page 1167, "Metrics" on page 1168,
Dual window view of the graph and the metrics.

Example `:DISP:ACP:VIEW PRES`

3.8.6.2 Carrier Info

Windows: "Graph" on page 1167, "Metrics" on page 1168,
Dual window view of the graph and the metrics.

Example `:DISP:ACP:VIEW CINF`

3.8.7 Windows

This section describes the windows that are available in this measurement.

3.8.7.1 Graph

Window #1

Used to display the spectrum being measured by the ACP measurement.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace.

The Graph window appears in several Views, as follows:

View	Size	Position
Normal	Half, full width	Top
Carrier Info	Half, full width	Top
Gate View	One third, full width	Middle

When the Bar Graph is **ON** and Limit Test is **ON**, the color of each bar graph reflects the limit test result. When the limit test fails, the bar color is red, and when limit test passes, the bar color is green.

When RBW is selected as the measurement method, the spectrum trace is not displayed, only the bar graph is displayed. In addition, the Bar Graph control (under the Display front-panel key) is set to **ON** and is grayed-out.

3.8.7.2 Metrics

Window # 2 & 3

Displays the textual results of the ACP measurement.

Views in which the Metrics window appears:

View	Size	Position
Normal	Half, full width	Bottom
Carrier Info	Half, full width	Bottom
Gate View	One Third, full width	Bottom

Metrics Window in Normal view:

3 VMA Mode
3.8 ACP Measurement
