Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

U.S. Government Rights

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the US government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to US government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at

<http://www.keysight.com/find/sweula>. The license set forth in the EULA represents the exclusive authority by which the US government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the US government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED "AS IS," AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR OF ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT SHALL CONTROL.

Safety Information

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

1 Documentation Roadmap

This section describes the Keysight products covered by this document, and provides links to related documentation.

- ["Products Covered by this Document" on page 84](#)
- ["Additional Documentation" on page 85](#)

- 1 Documentation Roadmap
- 1.1 Products Covered by this Document

1.1 Products Covered by this Document

For the full list of instrument models covered by this documentation, see the title page: "[WLAN Mode User's & Programmer's Reference](#)" on page 1.

1.2 Additional Documentation

If your instrument or computer has an internet connection, then you can access the latest editions of all relevant X-Series documentation via the links below.

This document is available in 3 formats:

- **Embedded Help**, in the instrument
- **Online Help**, at Keysight's web site

For information on this Mode, browse to:

<http://rfmw.em.keysight.com/wireless/helpfiles/WLANMode/FlexUI.htm>

- **Users & Programmers Reference**, in downloadable PDF format

For information on this Mode, download from:

<http://literature.cdn.keysight.com/litweb/pdf/N9077-90006.pdf>

The following documents are available online at keysight.com:

2 User Interface

Here are the basic elements of the Multitouch User Interface. For more information, tap a topic.

Included in this section are also topics for several front panel keys not described in other topics. Tap one of these topics for more information.

"Cancel key" on
page 133

"Onscreen Keyboard key" on
page 134

"Touch On/Off Key" on
page 135

"Tab key" on
page 136

2.1 Screen Tabs

In the X-Series Multitouch User Interface (or Multitouch UI), you can run many different Measurement Applications, or “Modes”. Examples are Spectrum Analyzer Mode, LTE-A FDD Mode, IQ Analyzer Mode, and Real Time Spectrum Analyzer Mode. Each Mode has its own set of controls, windows and SCPI commands.

Each Mode runs within a “Screen”. The Multitouch UI supports multiple “Screens” (see ["Multiscreen" on page 177](#) for more information). Each screen displays one Measurement in one Mode. The set of configured screens is shown across the top of the display as a set of Screen Tabs, with a + tab at the right for adding new Screens:

You can see up to six tabs at a time on the UXA, and 4 at a time on the CXA, EXA, MXA and PXA. If there are more Screens configured than this, arrows appear to the left and right of the Screen Tabs; pressing the arrows scrolls the Screen Tabs to the left or right. A scroll bar also appears at the bottom of the Screen Tabs, indicating that you can scroll the tabs by dragging them with your finger; you can also scroll them by dragging the scroll bar.

Pressing a Screen Tab selects that screen for operation. Pressing the blue (selected) Screen Tab is the same as pressing the Mode/Meas front panel key.

Both actions open the ["Mode/Meas/View Dialog" on page 89](#). In addition, if you have a PC keyboard plugged in, the sequence CTL-SHIFT-M will open up this dialog.

The + tab at the right of the Screen Tabs bar adds a new Screen by cloning the current screen. The new Screen has the identical setup and settings as the current Screen. You can then change the Mode, Measurement and/or settings of the new Screen.

You can define up to 16 screens at once.

Example Multiscreen View

The example below shows a four-screen display in Multiscreen view.

The Screen called “Real-Time SA 2” is selected, as indicated by its blue tab. Touching any other screen or tab selects the screen for that tab and brings it to the foreground.

The following topics provide more information:

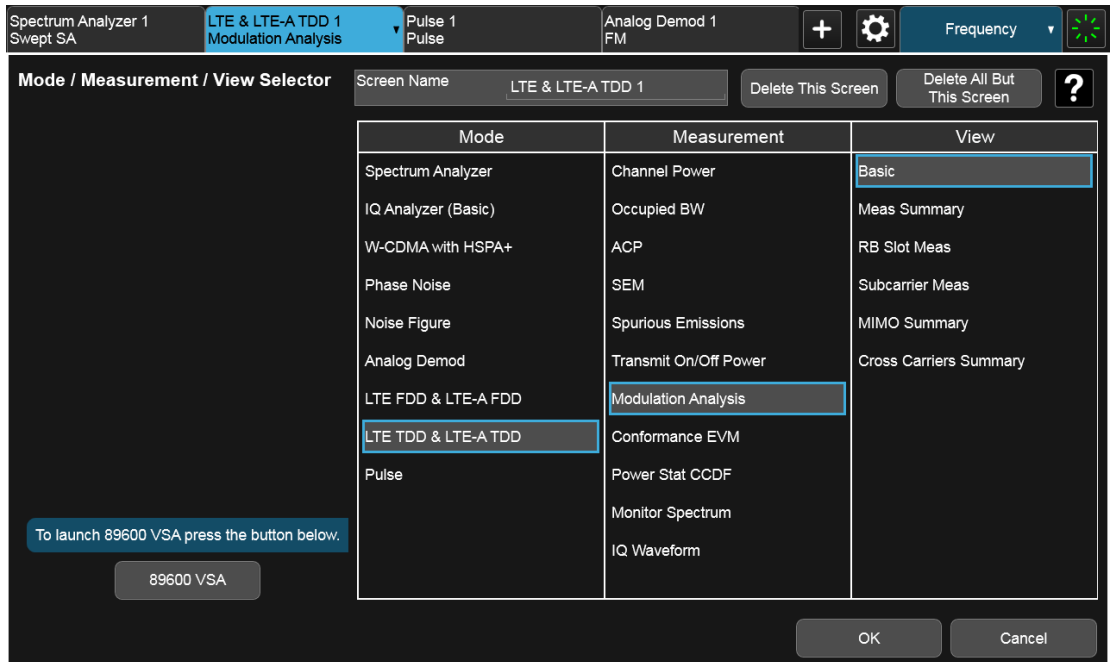

- "Mode/Meas/View Dialog" on page 89
- "Add Screen" on page 106
- "Multiscreen" on page 177

2.1.1 Mode/Meas/View Dialog

The Mode/Meas/View dialog opens when you press the selected (blue) Screen tab (see "Screen Tabs" on page 88) or the **Mode/Meas** front panel key.

This dialog displays lists of available Modes, Measurements and Views, as well as the "Sequencer" on page 100 control for configuring Screens.

2 User Interface
2.1 Screen Tabs

2.1.1.1 Mode

The first column in the Mode/Meas/View dialog allows you to select the desired Mode from those currently licensed in your instrument.

Modes, also known as “measurement applications”, are collections of measurement capabilities packaged together to provide you with an instrument personality specific to your measurement needs. Each Mode is ordered separately by Model Number and must be licensed in order for it to be available in the instrument.

You select the Mode you want to run using the Mode/Meas/View dialog. Once a Mode is selected, only the commands that are valid for that mode can be executed

For more information on Modes, preloading Modes, and memory requirements for Modes, see ["More Information" on page 93](#)

The `:INSTRUMENT[:SElect]` command is used to remotely select a Mode by sending the instrument a parameter which represents the name of the desired Mode. The Mode Names may be found in the table under ["Index to Modes" on page 92](#).

The `:INSTRUMENT:NSElect` command is used to remotely select a Mode by sending the Mode Number of the desired Mode. See ["Instrument Number Select" on page 91](#). The Mode Numbers may be found in the table under ["Index to Modes" on page 92](#).

The `:INSTRUMENT:CONFigure` command causes a Mode and Measurement switch at the same time. This generally results in faster overall switching than sending the

`:INSTRument:SElect` and `CONFigure` commands separately. See "Mode and Measurement Select" on page 91.

| | |
|----------------|--|
| Remote Command | <code>:INSTRument[:SElect] <mode_id></code> where <code><mode_id></code> is one of the values listed in "Index to Modes" on page 92 below <code>:INSTRument[:SElect]?</code> |
| Example | <code>:INST SA</code> |
| Notes | A list of the valid mode choices is returned by the <code>:INST:CAT?</code> query |
| Preset | The default Mode is set to <code>SA</code> on Restore System Defaults->All , unless noted below: For N8973B, N8974B, N8975B, or N8976B: <code>NFIG</code> |
| State Saved | Saved in instrument state |
| Annunciation | Application Title is in the Screen Tab |

Instrument Number Select

| | |
|----------------|--|
| Remote Command | <code>:INSTRument:NSElect <integer></code> <code>:INSTRument:NSElect?</code> |
| Example | <code>:INST:NSEL 1</code> |
| Notes | The Mode Numbers may be found in the table under "Index to Modes" on page 92 SA mode is number 1 The command is sequential: that is, continued parsing of commands cannot proceed until the instrument select is complete and the resultant SCPI trees are available |
| Preset | The default Mode is set to <code>1</code> by Restore System Defaults->All , unless noted in the table above |
| State Saved | Saved in instrument state |

Mode and Measurement Select

| | |
|----------------|--|
| Remote Command | <code>:INSTRument:CONFigure:<mode_id>:<meas></code> where <code><mode_id></code> is a valid parameter for the <code>:INST:SEL</code> command and <code><meas></code> is a valid parameter for the <code>:CONF</code> command in the Mode specified by <code><mode></code> |
| Example | <code>:INST:CONF:SA:SAN</code> selects the Spectrum Analyzer mode and the Swept SA measurement <code>:INST:CONF:WCDMA:RHO</code> selects the WCDMA mode and the Mod Accuracy measurement |
| Notes | The available parameters for <code><mode_id></code> are dependent upon installed and licensed applications resident in the instrument. The available parameters for <code><meas></code> are dependent on the <code><mode_id></code> parameter and the valid measurements available for that mode, which can depend on model numbers and installed options In general this command will execute more quickly than sending the equivalent separate <code>:INST:SEL</code> |

and `:CONF` commands

Index to Modes

The Mode Number in the table below is the parameter for use with the `:INSTrument:NSElect` command. The Mode Parameter is the parameter for use with the `:INSTrument[:SElect]` command. Your actual choices will depend upon which applications are installed in your instrument.

| Mode | Mode Number | Mode Parameter <mode_id> |
|-------------------------------|-------------|-----------------------------|
| 5G NR | 109 | NR5G |
| 89601 VSA | 101 | VSA89601 |
| Analog Demod | 234 | ADEM0D |
| Avionics | 232 | AVIONIC |
| Bluetooth | 228 | BT00th |
| Channel Quality / Group Delay | 161 | CQM |
| EMI Receiver | 141 | EMI |
| GSM/EDGE/EDGE Evo | 13 | EDGE GSM |
| I/Q Analyzer (Basic) | 8 | BASIC |
| LTE FDD & LTE-A FDD | 107 | LTEAFDD |
| LTE TDD & LTE-A TDD | 108 | LTEATDD |
| Measuring Receiver | 233 | MRECEIVE |
| MSR | 106 | MSR |
| Noise Figure | 219 | NFIGure |
| Phase Noise | 14 | PNOISE |
| Power Amplifier | 81 | PA |
| Pulse | 151 | PULSEX |
| Radio Test | 300 | RTS |
| Real Time Spectrum Analyzer | 2 | RTSA |
| Remote Language Compatibility | 266 | RLC |
| SCPI Language Compatibility | 270 | SCPILC |
| Sequence Analyzer | 123 | SEQAN |
| Short Range Comms | 218 | SRCOMMS |
| Spectrum Analyzer | 1 | SA |
| Vector Modulation Analyzer | 200 | VMA |
| WCDMA with HSPA+ | 9 | WCDMA |
| WLAN | 217 | WLAN |

More Information

The Mode name appears on the Screen Tab, followed by a number identifying which instance of the Mode appears on that screen. Each Screen contains one Mode. For example, in the image below, there is one Real-Time Spectrum Analyzer screen, and two Spectrum Analyzer screens. The current Screen contains **Real-Time SA 1**.

It is possible to specify the order in which the Modes appear in the Mode menu, using the **Configure Applications** utility on the Desktop. Using the same utility, it is also possible to specify a subset of the available applications to load into memory at startup time, which can decrease the startup time of the instrument and the amount of memory consumed.

Each application (Mode) that runs in an X-Series instrument consumes virtual memory. The various applications consume varying amounts of virtual memory, and as more applications run, the memory consumption increases. Keysight characterizes each Mode and assigns a memory usage quantity based on a conservative estimate. The **Configure Applications** utility shows an estimate for how much memory each Mode will consume.

You can still run a Mode even if it is not preloaded into memory – during runtime, the first time an application that is not loaded into memory is selected (either by pressing that application's **Mode** key or by sending that application's **:INST:SEL** command), the Application will be loaded, but this takes a few seconds. The instrument will pause while loading the application while displaying a message box that says “Loading application, please wait...” Preloading the application eliminates this wait time *but* consumes additional memory.

2.1.1.2 Application Mode Remote Commands

This section contains a number of remote commands that are provided for programming convenience and remote compatibility.

Application Mode Catalog Query (Remote Command Only)

Returns a string containing a comma-separated list of names of all the installed and licensed measurement modes (applications). These names can only be used with **:INSTrument[:SElect]**.

| | |
|----------------|-----------------------------|
| Remote Command | :INSTrument:CATalog? |
|----------------|-----------------------------|

| | |
|-------------------------------|---|
| Example | <code>:INST:CAT?</code> |
| Notes | Query returns a quoted string of the installed and licensed modes separated with a comma. Example: <code>"SA,PNOISE,WCDMA"</code> |
| Backwards Compatibility Notes | VSA (E4406A): <code>:INSTrument:CATalog?</code> returned a list of installed <code>INSTrument:SELECT</code> items as a comma separated list of string values, for example: <code>"BASIC", "GSM", "EDGE GSM", "CDMA", "SERVICE"</code> X-Series uses the ESA/PSA compatible query of a string contain comma separated values: <code>"SA,PNOISE,NFIG,BASIC"</code> |

Current Application Model (Remote Command Only)

Returns a string that is the Model Number of the currently selected application (mode). This information is also displayed in the **Show System** screen.

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:APPLication[:CURRent][:NAME]?</code> |
| Example | <code>:SYST:APPL?</code> |
| Notes | Query returns a quoted string that is the Model Number of the currently selected application (Mode). Example: <code>"N9060A"</code> String length between 6 to 9 characters. |
| Preset | Not affected by Preset |
| State Saved | Not saved in state, the value will be the selected application when a Save is done. |

Current Application Revision (Remote Command Only)

Returns a string that is the Revision of the currently selected application (mode). This information is also displayed in the Show System screen

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:APPLication[:CURRent]:REVIsion?</code> |
| Example | <code>:SYST:APPL:REV?</code> |
| Notes | Query returns a quoted string that is the Revision of the currently selected application (Mode). Example: <code>"1.0.0.0"</code> String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points) The format is Major.Minor.Build.Compile, where Major must correspond to the Integer portion of the Version in the license file for the application. |
| Preset | Not affected by a Preset |
| State Saved | Not saved in state, the value will be the selected application when a Save is done. |

Current Application Options (Remote Command Only)

Returns a string that is the Options list of the currently selected application (Mode). This information is also displayed in the Show System screen

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:APPLication[:CURRent]:OPTion?</code> |
| Example | <code>:SYST:APPL:OPT?</code> |
| Notes | Query returns a quoted string that is the Option list of the currently selected application (Mode). The format is the name as the *OPT? or SYSTem:OPTion command: a comma separated list of option identifiers. Example: "1FP,2FP" String length is a maximum of 255 characters. |
| Preset | Not affected by a Preset |
| State Saved | Not saved in state per se, the value will be the selected application when a Save is invoked. |

Application Catalog Number of Entries (Remote Command Only)

Returns the number of installed and licensed applications (Modes).

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:APPLication:CATalog[:NAME]:COUNT?</code> |
| Example | <code>:SYST:APPL:CAT:COUN?</code> |
| Preset | Not affected by Preset |
| State Saved | Not saved in instrument state. |

Application Catalog Model Numbers (Remote Command Only)

Returns a list of Model Numbers for the installed and licensed applications (Modes).

| | |
|----------------|---|
| Remote Command | <code>:SYSTem:APPLication:CATalog[:NAME]?</code> |
| Example | <code>:SYST:APPL:CAT?</code> |
| Notes | Returned value is a quoted string of a comma separated list of Model Numbers. Example, if SAMS and Phase Noise are installed and licensed: "N9060A,N9068A" String length varies based on licenses. Licenses are between 6 and 9 characters. So the string length will be between COUNT * 7 - 1 and COUNT * 10 - 1. (7 & 10 = Model Number length + 1 for comma. -1 = no comma for the 1st entry.) |
| Preset | Not affected by a Preset |
| State Saved | Not saved in instrument state. |

Application Catalog Revision (Remote Command Only)

Returns the Revision of the provided Model Number.

| | |
|----------------|---|
| Remote Command | <code>:SYSTem:APPLication:CATalog:REVision? <model></code> |
| Example | <code>:SYST:APPL:CAT:REV? 'N9060A'</code> |
| Notes | Returned value is a quoted string of revision for the provided Model Number. The revision will be a null-string ("") if the provided Model Number is not installed, licensed, and loaded. Example, if SAMS is installed and licensed: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points) |
| Preset | Not affected by a Preset. |
| State Saved | Not saved in instrument state. |

Application Catalog Options (Remote Command Only)

Returns a list of Options for the provided Model Number

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:APPLication:CATalog:OPTion? <model></code> |
| Example | <code>:SYST:APPL:CAT:OPT? 'N9060A'</code> |
| Notes | Returned value is a quoted string of a comma separated list of Options, in the same format as *OPT? or :SYSTem:OPTion?. If the provided Model Number is not installed and licensed a null-string ("") will be returned. Example, if SAMS is installed and licensed: "2FP" String length is a maximum of 255 characters. |
| Preset | Not affected by a Preset |
| State Saved | Not saved in instrument state. |

ESA SA compatibility command (Remote Command only)

Provided for backwards compatibility with ESA. When this command is received, the analyzer aliases it to the appropriate Mode.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument[:SElect] 'SA' 'PNOISE' 'EDGE' 'GSM' 'BASIC'</code> |
| Example | <code>:INST 'SA'</code> |
| Notes | The query is not a quoted string. It is an enumeration as indicated in the Instrument Select table above |

GSM Mode compatibility command (Remote Command only)

Provided for backwards compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EDGEGSM
```

| | |
|----------------|--------------------------|
| Remote Command | :INSTrument[:SElect] GSM |
|----------------|--------------------------|

| | |
|---------|-----------|
| Example | :INST GSM |
|---------|-----------|

SA compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL SCPILC
```

This results in the analyzer being placed in SCPI Language Compatibility Mode, in order to emulate the ESU Spectrum Analyzer Mode.

| | |
|----------------|--------------------------------|
| Remote Command | :INSTrument[:SElect] SANalyzer |
|----------------|--------------------------------|

| | |
|---------|-----------|
| Example | :INST SAN |
|---------|-----------|

Receiver compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the instrument aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF FSC
```

This results in the instrument being placed in the EMI Receiver Mode, running the Frequency Scan measurement, in order to emulate the ESU Receiver Mode.

| | |
|----------------|-------------------------------|
| Remote Command | :INSTrument[:SElect] REceiver |
|----------------|-------------------------------|

| | |
|---------|-----------|
| Example | :INST REC |
|---------|-----------|

APD compatibility command for EMC(Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF APD
```

2 User Interface

2.1 Screen Tabs

This results in the analyzer being placed in the EMI Receiver Mode, running the APD measurement, in order to emulate the ESU APD Mode.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument[:SElect] APDistribution</code> |
|----------------|--|

| | |
|---------|------------------------|
| Example | <code>:INST APD</code> |
|---------|------------------------|

IF Mode compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF MON
```

This results in the analyzer being placed in the EMI Receiver Mode, running the Monitor Spectrum measurement, in order to emulate the ESU IF Mode.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument[:SElect] IFANalyzer</code> |
|----------------|--|

| | |
|---------|-------------------------|
| Example | <code>:INST IFAN</code> |
|---------|-------------------------|

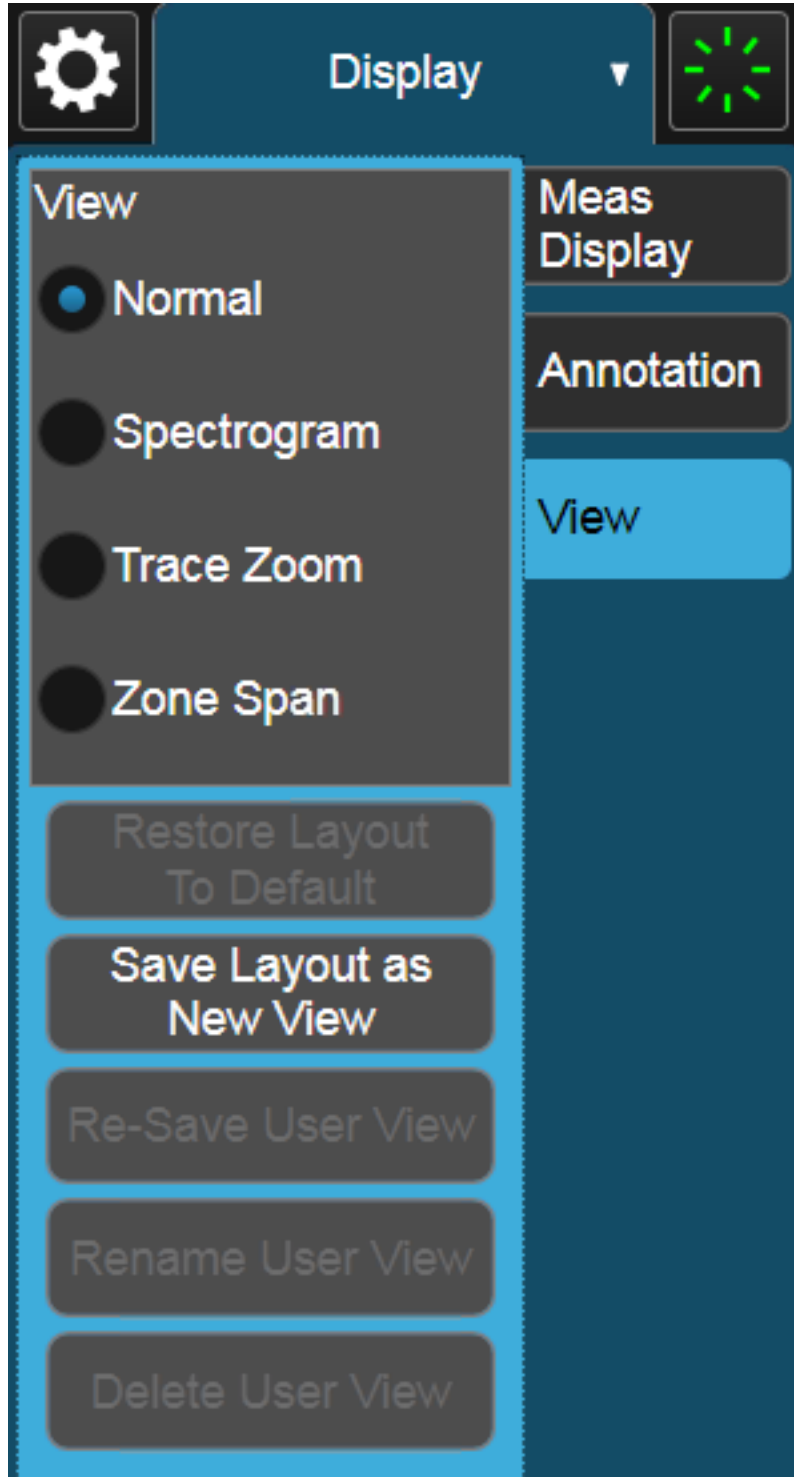

2.1.1.3 Measurement

The Measurement column of the Mode/Meas/View dialog shows all the Measurements available for the Mode which is selected in the first column. Select a Measurement in the second column and the View column will show all the Views available for that measurement. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

2.1.1.4 View

A View is a collection of Result Windows. The View column of the "Mode/Meas/View Dialog" on page 89 shows all the Views available for the Measurement which is selected in the second column. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

The View may also be set by using the View tab on the Display menu. The View tab is the last tab on the Display menu for every measurement. The Views are the same as those listed in the "Mode/Meas/View Dialog" on page 89.

2.1.1.5 Sequencer

Allows multiple Screens to update sequentially while in "Multiscreen" on page 177 display mode. Each Screen updates in sequence, and when all have updated, the sequence will start again.

To start the Sequencer, you must have more than one Screen defined, and you must have Multiscreen selected (see "Screen Tabs" on page 88).

If you want each Screen to use a different input, you must turn off **All Screens Use Same Input** under **Input/Output**, **Input**.

CAUTION

Differences in hardware settings between the Screens may cause switches and/or attenuators to cycle as you go from one Screen to another. This could potentially reduce the life of these components. To avoid this, make sure **Attenuation**, **µW Path Control** and other switch settings are the same in each Screen.

NOTE

When the Sequencer is running, the destination of remote commands is unpredictable, so you should stop the Sequencer before sending any measurement-related commands. Once the Sequencer has stopped, select a specific Screen using `:INSTrument:SCREen:SElect`, before sending any further commands. See "Select Screen" on page 179

NOTE

When the Sequencer is running, Auto alignment is temporarily disabled. A pending auto alignment might be executed when the sequencer is stopped.

See "More Information" on page 100

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:SEQuencer ON OFF 1 0</code> <code>:SYSTem:SEQuencer?</code> |
| Example | <code>:SYST:SEQ ON</code> |
| Notes | If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated |
| Dependencies | To start the Sequencer, you must have more than one Screen defined and you must have Multiscreen selected |
| Preset | <code>OFF</code> |

More Information

To start the Sequencer, tap the current (blue) Screen tab to go into the Mode/Meas/View Dialog:

2 User Interface
2.1 Screen Tabs

In the Sequencer block in the upper left hand corner, tap the Sequencing switch to turn it On:

Mode / Measurement / View Selector

Screen Name: Spectrum Analyzer 1 Delete This Screen Delete All But This Screen ?

Sequencer

Sequencing

On

Off

When Sequencing is On and there are multiple Screens, all Screens update in sequence. When Sequencing is Off, only the selected Screen updates.

TAP HERE

To launch 89600 VSA press the button below.

Launch VSA

| Mode | Measurement | View |
|---------------------|--------------------|-------------|
| Spectrum Analyzer | Swept SA | Normal |
| EMI Receiver | Channel Power | Spectrogram |
| IQ Analyzer (Basic) | Occupied BW | Trace Zoom |
| W-CDMA with HSPA+ | ACP | Zone Span |
| GSM/EDGE /EDGE Evo | Power Stat CCDF | User View |
| Phase Noise | Burst Power | Normal 1 |
| Noise Figure | Spurious Emissions | Normal 2 |
| Analog Demod | SEM | |
| Bluetooth | TOI | |
| LTE FDD & LTE-A FDD | Harmonics | |
| LTE TDD & LTE-A TDD | List Sweep | |
| WLAN | | |

OK Cancel

2 User Interface
2.1 Screen Tabs

The instrument will immediately exit the Mode/Meas/View Dialog and begin making measurements in each of the screens, one after the other. When a measurement is being made in a particular Screen, that Screen's tab will be blue.

Measurement being made in Screen 1:

Measurement being made in Screen 2:

Touching any key or control on the display will cause the Sequencer to stop, so that you can make desired changes. When this happens, the message “Sequencer stopped” is displayed.

When the Sequencer is running, the screens update in the order in which they were created.

Each Screen takes one measurement then passes control to the next Screen. Each Screen updates as though it were in Single Sweep or Single Measurement mode. Thus, if Averaging is on, a Screen may take multiple sweeps before moving on to the next Screen.

2.1.1.6 Screen Name

By default, the screen name is the Mode (Application) name followed by a number indicating the instance of the application.

You may change the name displayed on the Screen Tab of any screen. The control to do this appears in the ["Mode/Meas/View Dialog" on page 89](#):

When you touch this control an onscreen keyboard appears, allowing you to change the name. Whatever you change it to appears on the Tab, even if you subsequently change the screen to a different Mode.

To reset the name, delete the screen name entirely.

Each Screen Name must be unique; you cannot give the same name to more than one screen.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument:SCReen:REName <alphanumeric></code> |
| Example | <code>:INST:SCR:REN "Baseband"</code> |
| Notes | <p>The currently active screen is renamed.</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of screen names, the error message “-224, Illegal parameter value; New name <name> already exists” appears</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears</p> |

2.1.1.7 Delete This Screen

Pressing this button deletes the current Screen (the one with the blue tab). Deleting a screen removes it from view and selects the next lower screen in the list of screens. If only one screen is configured, it cannot be deleted.

If you press the **Delete This Screen** button, a prompt appears:

“This function will delete the current screen and its settings. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or **ESC** does not.

| | |
|----------------|---|
| Remote Command | <code>:INSTrument:SCReen:DELeTe</code> |
| Example | <code>:INST:SCR:DEL</code> |
| Notes | <p>The currently active screen is deleted</p> <p>If the screen you are attempting to delete is the only configured screen, the error message “-221, Settings conflict; Last screen cannot be deleted” is displayed</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated</p> |

2.1.1.8 Delete All But This Screen

Pressing this control deletes all the Screens except the current Screen (the one with the blue tab).

If you press the **Delete All But This Screen** button, a prompt appears:

“This function will delete all defined screens and their settings, except for the current screen. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or ESC does not.

| | |
|----------------|---|
| Remote Command | <code>:INSTrument:SCReen:DELeTe:ALL</code> |
| Example | <code>:INST:SCR:DEL:ALL</code> |
| Notes | <p>You can reset the instrument to the power-on configuration by invoking <code>:INST:SCR:DEL:ALL</code> followed by <code>:SYSTem:DEFault ALL</code></p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears</p> |

2.1.1.9 89600 VSA

Pressing this button launches the 89600 VSA software. The 89600 VSA software is powerful, PC-based software, offering the industry's most sophisticated general purpose and standards specific signal evaluation and troubleshooting tools for R&D engineers. Even for proprietary and non-standard signals in SATCOM or MILCOM applications, you can make signal quality measurements with customized IQ constellation.

The 89600 VSA software offers the following features:

- Over 35 general-purpose analog and digital demodulators ranging from 2FSK to 4096QAM
- Flexible and custom IQ and OFDM signal analysis for single carrier
- Standards specific modulation analysis including:
 - Cellular: GSM/EDGE, cdma2000, W-CDMA, TD-SCDMA, LTE(FDD/TDD),
 - LTE-Advanced and more
 - Wireless networking: 802.11a/b/g, 802.11n, 802.ac, 802.16 WiMAX (fixed/mobile), WiSUN (MR-FSK PHY)
 - RFID
 - Digital satellite video and other satellite signals, radar, LMDS
- Up to 400K bin FFT, for the highest resolution spectrum analysis
- A full suite of time domain analysis tools, including signal capture and playback, time gating, and CCDF measurements
- 20 simultaneous trace displays and the industry's most complete set of marker

functions

- Easy-to-use Microsoft Windows graphical user interface

For more information see the Keysight 89600 Series VSA web site at www.keysight.com/find/89600vsa

To learn more about how to use the 89600 VSA in the instrument, start the 89600 VSA software, then open the 89600 VSA Help and navigate to the topic "About Keysight X-Series Signal Analyzer with 89600 VSA Software".

Example `:INST:SEL VSA89601`
 `:INST:NSEL 101`

2.1.2 Add Screen

On X-Series analyzers you can configure up to 16 different Screens at one time. Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows.

You can add screens by pressing the “+” icon in the "Screen Tabs" on page 88 panel. The icon is shown below:

Every time you add a Screen, the instrument “clones” or “copies” the current Screen into the new Screen. If desired, you can then use the "Mode/Meas/View Dialog" on page 89 to change the Mode, Measurement and/or View of the new Screen, or simply operate a second copy of your previous Screen, thus preserving the settings of your previous Screen.

When you have defined the maximum number of Screens (16), the “+” icon disappears.

For more information about operating the instrument with multiple screens configured, see "Multiscreen" on page 177.

Remote Command `:INSTrument:SCReen:CREate`

Example `:INST:SCR:CRE`

Notes The maximum number of screens is 16. If an attempt to add a screen occurs when the maximum have been defined, the error message “-221, Settings conflict; Screen limit reached” appears
When you create a new screen the Screen Name is the current Mode name followed by a number indicating the instance of the Mode.

If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

2.2 Meas Bar

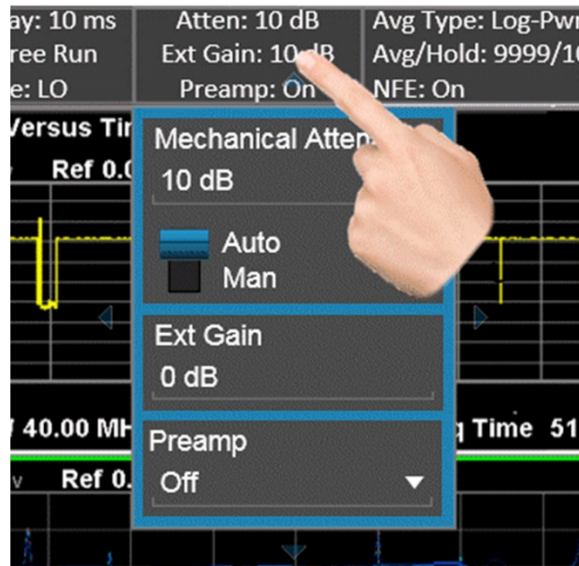

The Meas Bar is used to display annotation for the current measurement. There are three primary uses for the Meas Bar:

1. To show annotation for the most important parameters in the measurement so you can see them at a glance
2. To show the annotation that you will most want to have recorded in a screen dump
3. To give you quick access to settings.

The Meas Bar is made up of a number of annotation panels, each of which, when pressed, opens up a dialog below it which contains controls for those settings.

For example, here is what the display looks like when you touch one of the regions of the Meas Bar:

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function.

Settings that are colored amber are those that you need to be particularly aware of; for example, if Alignments are off, this is shown in amber, so you will know that you may not be meeting spec. Similarly, if DC coupling is on, this is shown amber, to alert you to be careful what voltage you put on the input.

You can turn the Meas Bar on and off with a switch on the Annotation tab of the Display menu.

System Control Panel

The leftmost panel holds the GPIB/Remote annunciators, the Single/Continuous symbol/control, the LXI indicator and the PASS/FAIL indicator. Tapping this panel drops down controls for Single/Continuous, Pause/Resume and restart.

GPIB/Remote annunciators

The GPIB/Remote annunciators are shown as the letters **KRLTS**. Each letter is shown if the state is true and is not shown if the state is false, as follows:

| | | |
|----------|-------------------------|--|
| K | Keylock indicator | This is shown when the instrument is in the Keylock state (turned on and off by the SYST:KLOCK command) |
| R | Remote annunciator | Shown when the instrument is in the remote state, as when being controlled via the IEEE-488 bus (GPIB) or TCP/IP connections |
| L | GPIB Listen annunciator | Shown when addressed to listen via GPIB or TCP/IP |
| T | GPIB Talk annunciator | Shown when addressed to talk via GPIB or TCP/IP |
| S | GPIB SRQ annunciator | Shown when the instrument is asserting SRQ on GPIB. This annunciator is an amber color |

Single/Continuous symbol/control

This annunciator shows as an arrow on an oval line when in Continuous, or an arrow on a straight line when in Single.

LXI indicator

This indicator displays in green when LAN is connected, in white when LAN is not connected, and in red when LAN is connected but has a connection problem.

PASS/FAIL indicator

This annunciator displays when Limits are turned on. It is green if all Limits are passing, and a red FAIL if any limit is not passing.

The following command queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

Remote Command `:CALCulate:CLIMits:FAIL?`

Example `:CALC:CLIM:FAIL?`

queries the current measurement to see if it fails the defined limits
Returns a 0 or 1: 0 it passes, 1 it fails

Trace Detector Settings Panel

In the Swept SA and some other measurements, there is a special panel summarizing the settings for the traces in the measurement:

There is one column for each trace. The rows are as follows:

- The top row shows the Trace Number, in the trace color.
- The second row shows the Trace Type for each trace (W=Clear/Write, A=Trace Average, M=Max Hold, m=Min Hold); this letter is in white if the trace is Active, in gray if the trace is inactive; there is a bar through the letter if the trace is not being displayed
- The third row shows the detector for each trace (N=Normal, S=Sample, A=Average, P=peak, p=negative peak, Q=Quasi Peak, E=EMI Average, R=RMS Average, f=math function)

In the example above, trace 1 is active, visible, and in Average using the Sample detector, the other traces are inactive, blanked and in Clear/Write using the Normal detector.

Tapping this panel drops down controls for the Traces.

2.3 Measurement Display

The Measurement Display contains one or more data windows displaying the result of the current measurement. These may be graphical or textual windows.

Each window in the Measurement display contains a "Window Title" on page 112, "Measurement Data" on page 116, and graphical windows also may contain "Annotation Hotspot" on page 119.

The selected window in the Measurement Display is indicated by a blue border. Window-dependent controls in the menu panel always refer to the selected window.

2.3.1 Window Title

The Window Title appears in the upper left hand corner of the window, and includes a title describing the measurement data currently being displayed in the window. The title may also contain additional information about the data in the window, for example in the LTE measurement supplication, the component carrier being displayed in the window will be indicated (e.g., "CC0").

Measurements that support User Views (see "View Editor" on page 156) also display the Window Number in the Window Title, to enable window addressing from SCPI. The number is the number that will be used in the SCPI command to address that window, for example, in the WCDMA Mod Accuracy measurement, Code Domain Power is assigned window number 6, so you address it with the following SCPI command:

```
:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0
```

Note the arrow pointing down on the right side of the Window Title. This indicates that touching the Window Title will display a dropdown, which enables you to select the Measurement Data to be displayed in the window.

For example, if we wish to assign the results of the upper window in the display below to the Marker Table, we would touch the window title and then the "Data" control that is revealed, as shown:

And then select Marker Table, yielding the result below:

2 User Interface
 2.3 Measurement Display

Note also that the Window Data dropdown can be a cascaded list, if the number of available results requires categorization to hold them all:

Note also that the Window Data dropdown sometimes includes controls for further configuring the window, for example, in LTE choosing the desired Component Carrier and Data format.

2 User Interface
 2.3 Measurement Display

Touching a window's title dropdown also selects the window.

2.3.2 Measurement Data

The Measurement Data region shows graphical or textual data for the Data selected in the Window Title Data control. Below you can see examples of both graphical and textual windows in a four-window display.

There are many gestures which you can use to interact with a measurement display window. They are detailed below.

Swipe

There are several swipe actions, as listed below. One of the most important actions is swiping a spectrum window to the left or right, or up or down, to adjust the frequency and level of the spectrum, as shown below.

Swipe actions are summarized in the table below. Not all of these may be available, depending on the measurement.

| Object | Action |
|------------------------------------|--|
| Spectrum Trace Left/Right | Drag trace (change Center Frequency) |
| Spectrum Trace up/down | Drag trace (change Ref Level) |
| Marker Left/Right | Drag marker along trace |
| Fixed Marker Left/Right/Up/Down | Drag marker in space |
| Scrollable area | Scroll vertically or horizontally. Scrollable areas include the Menu Panel (if overfull), tables and lists. A scrollable area is indicated by a vertical or horizontal translucent white bar which can also be dragged by a mouse When scrolling a table: <ul style="list-style-type: none"> – Row headers remain in place when the table is scrolled horizontally, and scroll with the table when the table is scrolled vertically – Column headers remain in place when the table is scrolled vertically, and scroll with the table when the table is scrolled horizontally |

2 User Interface
 2.3 Measurement Display

| Object | Action |
|----------------|--------------------------|
| Toggle control | Toggle in that direction |

Pinch

You can also pinch in or out either horizontally or vertically to zoom in the x-axis or y-axis dimension. For example, a pinch horizontally lets you adjust the Span of the Spectrum window. Also, pinching on the wings of a Band Power or other Band Function allows you to widen or narrow that Band Function.

Pinching may sometimes be easier if you use the index finger of each hand, rather than pinching with one hand.

Touch-and-Hold

You can also touch-and-hold the display, that is, touch it and hold your finger on the display. A circle is drawn, and when the drawing completes, a right-click gesture is performed that depends on the screen feature touched, as listed in the table below.

| | |
|-------------------------|---|
| Right Click on a Trace | Peak Search, Trace Type (Clear/Write, Trace Average, Max Hold, Min Hold), Trace View/Blank (Active, View, Blank, Background). Not all of these may be available, depending on the measurement |
| Right Click on a Marker | Marker Mode (Normal, Delta, Fixed, Off), Peak Search, Next Peak, Next Pk Right, Next Pk Left). Not all of these may be available, depending on the measurement |

| | |
|-------------------------------------|--|
| Right Click on the Background | Lets you select Help |
| Right Click on a Menu Panel control | Lets you add or remove that control from the User Menu or get Help on that control |

Tap

Tapping an object causes the actions defined in the table below:

| Object | Action |
|-----------------------------------|--|
| Marker | Select |
| Marker (repeated taps on stacked) | Cycle through stacked markers |
| Trace | Select. In addition if Marker is the active function, move the selected marker to the point where you tapped |
| Trace (repeated taps on stacked) | Cycle through stacked traces |
| Window | Select if unselected |
| Screen | Select if unselected |

Double Tap

Double-tapping an object causes the actions defined in the table below:

| Object | Action |
|--------|-------------|
| Window | Zoom/Unzoom |

2.3.3 Annotation Hotspot

You can tap on a graticule annotation to modify one of the fields in that annotation. For example if you tap on the region with Center Freq and Res BW in it, a menu panel pops up with just those settings on it.

2 User Interface
2.3 Measurement Display

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

Annotation which is not currently able to be adjusted is not grayed out on the display, but the control in the hotspot that drops down or pops up is grayed out.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function

2.4 Menu Panel

The menu panel is the main focus of the X-Series Multitouch user interface. The controls include active functions, dropdowns, action buttons, radio buttons and toggles.

The menu panel normally appears on the right side of the display and consists of a rectangular panel with multiple “sub-panels” lying on top of each other, each sub-panel being accessed by a tab on the right.

You press a front panel key (or “hardkey”) to access a particular menu. On the front panel there are twelve “measurement hardkeys” (the ones in the shaded region in the figures below) – these are the hardkeys that open up menus in the menu panel.

With a menu open, tap a tab to access the controls on its sub-panel. Whenever you press the front panel key associated with a menu, the default (top) tab is selected.

If the number of controls on a panel exceeds the height of the panel, scrolling is enabled, which is indicated by a white bar on the left that fades away after a few seconds. You swipe up or down with your finger to scroll the panel, or you can grab the white bar with a mouse.

2 User Interface
2.4 Menu Panel

If you move to a different menu panel or sub-panel and then come back to a previous panel, the previous panel is always reset to be scrolled all the way back to the top.

Accessing Menus Without Using Front-Panel Keys

You can access the menu panels without using the front panel keys, as you would need to do if you were operating the instrument using Remote Desktop. Touch or click on the menu title, as shown below. A dropdown containing the twelve measurement hardkeys appears. Selecting a hardkey from the dropdown displays the corresponding menu, and the dropdown disappears.

Entering Numeric Values

Many controls on the menu panel allow you to enter numeric values. These are called “active functions.” An active function control displays a number and a suffix,

2 User Interface

2.4 Menu Panel

for example 13.255 GHz, as in the example below:

An active function is “active” if the numeric value is surrounded by a black background with a blue border, as below. In this state, it is ready to receive numeric input from the number pad on the front panel, the knob, or the step keys.

When an active function is in the active state, you can start typing or pressing the number keys on the front panel, which causes the Numeric Entry Panel to appear, as shown below. The Numeric Entry Panel displays the typed value, and the terminators to complete the entry.

Here we see a UXA with an active function control in the active state. Although no Numeric Entry Panel is displayed, you can just touch the “2” key:

This causes the Numeric Entry Panel to pop up to receive the numbers you are typing:

Type in as many digits as required, then touch one of the unit terminator buttons in the Numeric Entry Panel to complete the entry. In this case, 2 GHz was the desired entry, so you just touch the “GHz” terminator:

2 User Interface
2.4 Menu Panel

The Numeric Entry Panel disappears and, in the example, the active function value becomes 2 GHz.

It is important to note that you can always pop up the Numeric Entry Panel by touching an active function control while it is active; for example, if you were to touch it in the figure above, the Numeric Entry Panel would pop up right next to the control:

2 User Interface
2.4 Menu Panel

You can display the Numeric Entry Panel by touching any active function control while it is active, but you don't have to pop up the Numeric Entry Panel first, you can just start typing and it will pop up on its own, thus saving you a keystroke.

You can also adjust a value without displaying the Numeric Entry panel by turning the knob or using the step keys while an active function is active. If you turn the knob or use the step keys while the Numeric Entry Panel is displayed, it disappears, allowing you to see the entire screen while you are making the adjustment.

You can also drag the Numeric Entry Panel to another part of the display if it is covering something that you wish to see while it is on the screen.

2.4.1 Right-Click Menu

If you click with the right mouse button on any of the menus in measurements, a popup menu appears, which includes:

The items in this menu are:

- ["Add to User Menu" on page 131](#)
- ["Help on this setting" on page 131](#)
- ["Show SCPI Command" on page 131](#)
- ["Add to SCPI Recorder" on page 132](#)
- ["Start/Stop SCPI Recorder" on page 132](#)
- ["Show SCPI Recorder" on page 132](#)

2.4.1.1 Add to User Menu

For details, see ["User Menu" on page 132](#).

2.4.1.2 Help on this setting

For details, see ["Help" on page 145](#).

2.4.1.3 Show SCPI Command

Enabled/visible when the currently-active feature has an associated SCPI command or query. Displays a popup dialog that shows the active GUI selection's SCPI command.

To close the popup dialog, click **OK**

2.4.1.4 Add to SCPI Recorder

Adds SCPI to the recorder from User Interface features that have equivalent SCPI.

This is the manual mode for adding SCPI to the recorder when you do not wish to add SCPI continuously. This control is enabled only when the current active feature has an associated SCPI command or query.

Irrespective of the continuous recording state, clicking this control adds the active entry into the recorder, including the active value if it is a setting.

2.4.1.5 Start/Stop SCPI Recorder

Starts or stops continuous recording mode. After starting the recording, any changes to settings will be recorded.

After continuous recording is enabled, the button label changes to **Stop SCPI Recorder**, which is displayed while recording is in progress. Clicking **Stop SCPI Recorder** halts recording and switches the control label back to **Start SCPI Recorder**.

2.4.1.6 Show SCPI Recorder

This shortcut opens the dialog "[SCPI Recorder](#)" on page 2010.

2.4.2 User Menu

Lets you create your own menu, to include controls that you frequently use. You can have one **User Menu** for each measurement, and all User Menus survive a power cycle.

You add a control to the User Menu for the current measurement by right-clicking on the control, then selecting "[Add to User Menu](#)" on page 131. You can also remove the control from the User Menu using the same right-click menu item.

User Menu appears at the bottom of the menu drop-down panel.

2.5 Cancel key

This front-panel key has the same functions as the Windows **Esc** (Escape) key. It does the following:

- Cancels dialogs
- Cancels active functions (unless there is an entry in progress, in which case it cancels that, and reverts to the previous value)
- Resets input overloads
- Aborts print operations
- Cancels certain other operations (such as alignments)
- Returns you to Local Control (if in Remote)
- If the backlight is off, turns on the backlight, and does nothing else

Most of this functionality is the same as earlier X-Series models and similar to ESA and PSA operation.

When the instrument is in Remote, any hardkey that is pressed on the front panel displays this message:

Analyzer is in Remote. Press ESC to return to Local

The exception is the **Cancel (ESC)** key, which takes the instrument out of Remote.

When the instrument is also in the LLO (local lockout state), the **Local** key is locked out as well. When this is the case, and the **Local** key is pressed, this message is displayed:

Local key is locked out by remote computer. Cancel Local Lockout on computer or release remote control

When you see this message, you should disconnect the remote computer, or use it to take the instrument out of the Local Lockout state.

2.6 Onscreen Keyboard key

This key turns the onscreen alpha keyboard (OSK) on and off.

There are two onscreen keyboards:

- The Multitouch OSK, which pops up automatically if, while using the analyzer application, a text field becomes the active function
- The Windows OSK, which you must open manually when a text field must be entered while interacting with Windows or other apps

2.7 Touch On/Off Key

This front-panel key turns the display touch functionality on and off. If off, you can turn it back on using the front panel **Touch On/Off** key. When the touch functionality is off, you can still use a mouse as a pointer.

When toggled, a dialog box appears midscreen that confirms “Touchscreen On” or “Touchscreen Off”.

This function remains in effect until it is turned off or until the app shuts down. The app always starts up with Touch enabled.

2.8 Tab key

This key has the same function as the **Tab** key on a PC keyboard. You can use this key to display the Windows Taskbar, as follows.

- Alt-Tab to the Desktop
- Touch the desktop
- Touch **TAB**
- The Taskbar appears

2.9 Local Button

Appears in the Menu Panel when the instrument is in remote, and can be brought back to local via the **Local (ESC)** Key. See also "[Cancel key](#)" on page 133.

2.10 Control Bar

The Control Bar contains controls and readouts that let you control instrument functions independent of the current measurement.

2.11 Windows

Pressing the Windows icon on the "Control Bar" on page 138 has the same effect as pressing the Windows icon on the Windows taskbar. It displays the Windows taskbar and Start Menu, which allows you to launch Windows programs and access features such as the Control Panel.

2.12 Undo/Redo

The Undo button in the "Control Bar" on page 138,

and the Undo front panel key,

Ctrl=Redo

are used to undo the most recently executed function.

If you Undo a function, and then decide you should not have done so, you can use the **Redo** button in the "Control Bar" on page 138 to put it back the way it was. The Redo function may also be executed by pressing **Ctrl+Undo** (holding the **Ctrl** key down while pressing the **Undo** front panel key).

Undo allows you to restore a setting, which you had previously set, back to its value before you changed it. When you press the Undo button or front panel key, the last setting you changed is "undone", that is, its previous setting is restored. You are notified of this fact with an advisory pop up message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would show:

UNDO: Center Freq 1 GHz -> 300 MHz

The instrument can store 5 levels of action for Undo.

To truly understand Undo and Redo, it helps to think of two "stacks", an Undo stack and a Redo stack,

UNDO stack

REDO stack

Whenever you perform an action, it is placed on the Undo stack. So for example, if you set the Center Frequency to 1 GHz, then set the RBW to 1 MHz, then set the Detector to Peak, each of these actions gets "pushed" onto the Undo stack:

| UNDO stack | REDO stack |
|------------|------------|
| Det = Peak | |
| RBW = 1MHz | |
| CF = 1 GHz | |

When you press **Undo**, the top item on the Undo stack is removed, the action represented by that item is undone, and the item is placed on the Redo stack. So pressing **Undo** once in the above case would undo the setting of the peak detector, and the stacks would look like this:

| UNDO stack | REDO stack |
|------------|------------|
| RBW = 1MHz | Det = Peak |
| CF = 1 GHz | |

Now pressing **Undo** again would undo the RBW = 1 MHz action, and the stacks would look like this:

| UNDO stack | REDO stack |
|------------|------------|
| CF = 1 GHz | RBW = 1MHz |
| | Det = Peak |

Now pressing Redo would Redo the RBW = 1 MHz action, and the stacks would again look like this:

| UNDO stack | REDO stack |
|------------|------------|
| RBW = 1MHz | Det = Peak |
| CF = 1 GHz | |

Also, whenever you set a value, the Redo stack is cleared; you can't redo an action once you have interrupted the original flow of actions. Think of the Undo stack as the past, and the Redo stack as the future; if you have items in both stacks it means you have gone back to a time in the past; if you then *do* something you have changed the future, so the old future (the Redo stack) gets cleared.

For example, in the example above, if you now were to change another setting, such as VBW = 1 kHz, the Redo stack gets cleared, and the stacks would look like this:

| UNDO stack | REDO stack |
|---|-------------------|
| VBW = 1 kHz RBW = 1MHz CF = 1 GHz | |

Undo can undo changes you make with the knob or step keys, however all contiguous events that affect the same parameter are aggregated into one event for the sake of Undo. For example, if CF is the active function and is 1 GHz, and you turn the knob back and forth, then enter a value, then use the step keys, when you press **Undo**, the instrument returns to CF = 1 GHz.

Actions that Cannot be Undone

There are some actions that cannot be undone, because these clear the Undo/Redo stack:

- Restore Mode Defaults clears the stack for that Mode in that Screen
- Sending SCPI commands clears the stack for that Mode in that Screen
- Loading a state file (including User Preset) clears the stack for that Mode in that Screen
- Deleting a Screen clears all the stacks in that screen
- Changing Views

Undo/Redo works within the context of a Mode. Each Mode in each Screen keeps its own record. Settings in the Control Panel or System Settings menus are not undoable.

There are several actions that may change many parameters. Among these are Auto Tune, and Adjust Atten for Min Clipping. After executing such a function, Undo sets all parameters back to their value before the function was selected. Auto Tune appears to be a single action, even though the instrument executes it in several steps.

Redo reverses the effect of the last Undo action, assuming that no other settings have been changed since the last Undo. Changing a setting after an Undo clears memory of all settings after that Undo, that is, it clears the Redo stack, as explained above.

When you press the **Redo** icon or **Ctl** and the **Undo** hardkey, you are notified with an advisory popup message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would say:

UNDO: Center Freq 1 GHz -> 300 MHz

If you then press **Redo**, the message will say:

REDO: Center Freq 300 MHz -> 1 GHz

Neither **Undo** nor **Redo** perform any navigation, and have no effect on which menu panel is displayed nor which function is active.

2.13 File Functions

The File Functions popup contains controls for executing Save, Recall, File and Print operations. You display the File Functions popup by tapping the File Functions icon in the "Control Bar" on page 138.

For more information on a control, tap an icon in the image below.

Tapping this folder icon displays the File Functions popup

2.13.1 File Explorer

Pressing the File Explorer button in the "File Functions" on page 144 dialog opens the Windows File Explorer, which allows you to perform operating system file functions such as Move, Copy and Delete.

File Explorer also allows you to map network drives to drive letters on your PC or intranet, in order to more easily save screen images, states and other data, and load them back into the instrument.

2.14 Help

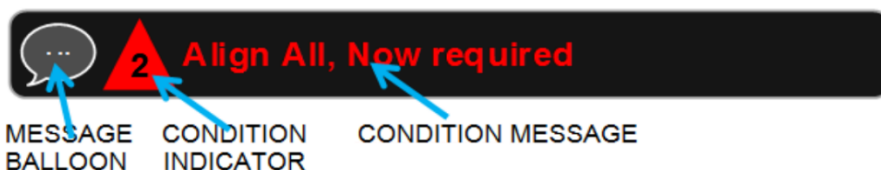

Pressing the **Help** button in the "[Control Bar](#)" on [page 138](#), the **Help** front panel key, or the **F1** key if you have a PC keyboard connected, opens the context-sensitive help system. The **Help** button appears in the "[Control Bar](#)" on [page 138](#) and in the banner of full-screen dialogs

You can also use the Help window's Contents pane to navigate to Help for any function in the instrument

You can also touch-and-hold a specific control to display a "right-click" menu, in which one of the choices is **Help on this setting**

2.15 Status Bar

The Status Panel (or Status Bar) appears at the bottom of the display and contains three fields:

The Message Balloon appears on the left side of the Status Panel and lets you know when there is an unread message in the queue.

No unread messages

Unread messages

The Message Balloon has a gray outline and no fill if there are no unread messages; it has a gray fill and a white outline and displays a white ellipsis in the middle if there are unread messages.

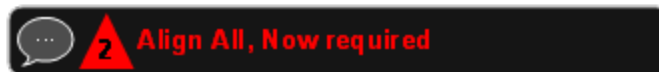

The Condition Indicator appears to the right of the Message Balloon and shows the current number of open conditions. Below are some examples of what the Condition Indicator can look like:

The triangle is unfilled if there are no open conditions, filled with yellow if all open conditions are warnings, and filled with red if at least one open condition is an error. The number displayed is the total number of open conditions.

Touching the Condition Indicator opens up the Show Status dialog (see below) with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

The Condition Message appears to the right of the Condition Indicator. In the example below, the Condition Message is “Align All, Now required”:

Warning condition messages display in yellow, error condition messages display in red.

If there is more than 1 open condition, the Condition Message cycles through the display of all of the open conditions, one at a time. Each message is displayed for 2 seconds, then the next for 2 seconds, and so on.

Show Status Dialog

The Show Status dialog appears if you tap anywhere in the Status Bar. Touching the Condition Indicator (the triangle in the Status Bar) opens up the Show Status dialog with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

2 User Interface

2.15 Status Bar

| Status | History | | | | |
|--------------------|---------|------|--|---------|-------------------------|
| History | Type | ID | Message | Repeats | Time |
| Current Conditions | ✓ | 1064 | Align Now All required - CLEARED | | 6:37:49 PM 2/24/2015 |
| Settings | ✓ | 1301 | Meas Uncal - CLEARED | | 6:37:37 PM 2/24/2015 |
| | ✗ | 64 | Align Now All required - DETECTED | | 6:36:59 PM 2/24/2015 |
| | ⚠ | 301 | Meas Uncal - DETECTED | | 6:33:27 PM 2/24/2015 |
| | ✓ | 1301 | Meas Uncal - CLEARED | | 6:31:27 PM 2/24/2015 |
| | ⚠ | 301 | Meas Uncal - DETECTED | | 6:33:27 PM 2/24/2015 |
| | ✓ | 1141 | Input Overload - CLEARED,ADC over range | 47 | 1:07:56 PM 2/24/2015 |
| | ✗ | 141 | Input Overload - DETECTED,ADC over range | 47 | 1:07:56 PM 2/24/2015 |
| | ✗ | 780 | No Peak Found | | 1:03:55 PM 2/24/2015 |

ℹ Informational ⚠ Warning ✗ Error
Press any row for more info about that Message
Clear Message Queue

If the display fills up, scrolling is enabled just as in other X-Series Multi-touch UI displays.

The Status dialog automatically refreshes as new messages and conditions occur.

At the bottom of the screen is a Clear Message Queue button. This button clears all errors in all error queues.

Note the following:

- Clear Message Queue does not affect the current status conditions
- Mode Preset does not clear the message queue
- Restore System Defaults (Super Preset) will clear all message queues
- *CLS only clears the queue if it is sent remotely and *RST does not affect any error queue
- Switching Modes does not affect any error queues

See "[More Information](#)" on page 149

Remote Command `:SYSTem:ERRor[:NEXT]?`

Example `:SYST:ERR?`

Notes The return string has the format:

<Error Number>, <Error>

Where <Error Number> and <Error> are those shown on the Show Errors screen

Backwards
Compatibility
Notes

In some legacy analyzers, the Repeat field shows the number of times the message has repeated since the last time the error queue was cleared. In the X-Series, the Repeat field shows the number of times the error has repeated since the last intervening error. So the count may very well be different than in the past even for identical signal conditions

Unlike previous analyzers, in the X-Series all errors are reported through the Message or Status lines and are logged to the event queue. They never appear as text in the graticule area (as they sometimes do in previous analyzers) and they are never displayed in the settings panel at the top of the screen (as they sometimes do, by changing color, in previous analyzers)

As a consequence of the above, the user can only see one status condition (the most recently generated) without looking at the queue. In the past, at least in the Spectrum Analyzer, multiple status conditions might display on the right side of the graticule

In general, there is no backwards compatibility specified or guaranteed between the error numbers in the X-Series and those of earlier products. Error, event, and status processing code in customers' software will probably need to be rewritten to work with X-Series

In the legacy analyzers, some conditions report as errors and others simply turn on status bits. Conditions that report as errors often report over and over as long as the condition exists. In the X-series, all conditions report as start and stop events. Consequently, software that repeatedly queries for a condition error until it stops reporting will have to be rewritten for the X-series

More Information

The Status Dialog has two screens, selectable by the tabs on the right: **History** and **Current Conditions**:

History

History brings up a screen displaying the front panel message queue in chronological order, with the newest event at the top. Remember that the front panel queue contains all of the events generated by front panel actions as well as error events from all of the SCPI queues. A typical History display appears below:

2 User Interface

2.15 Status Bar

| Status | | History | | | |
|--------------------|---|---------|--|---------|-------------------------|
| History | Type | ID | Message | Repeats | Time |
| Current Conditions |  | 301 | Meas Uncal - DETECTED | | 5:36:35 PM 2/24/2015 |
| Settings |  | 1141 | Input Overload - CLEARED,ADC over range | 49 | 1:07:56 PM 2/24/2015 |
| |  | 141 | Input Overload - DETECTED,ADC over range | 49 | 1:07:56 PM 2/24/2015 |
| |  | 1141 | Input Overload - CLEARED,ADC over range | | 1:07:53 PM 2/24/2015 |

Legend:  Informational  Warning  Error

Press any row for more info about that Message

Clear Message Queue

The fields on the History display are:

| | |
|---------------------|--|
| Type | Displays the icon identifying the event or condition as an error or warning |
| ID | Displays the error number |
| Message | Displays the message text |
| Repeat (RPT) | <p>This field shows the number of consecutive instances of the event, uninterrupted by other events. In other words, if an event occurs 5 times with no other intervening event, the value of repeat will be 5</p> <p>If the value of Repeat is 1 the field does not display. If the value of Repeat is >1, the time and date shown are those of the most recent occurrence. If the value of repeat reaches 999,999 it stops there. The Repeat field can run into some pretty large numbers when apps (like the GSM app) report things like “GSM sync burst not found” as events rather than conditions, which is actually fairly common</p> <p>Note that the repeat count is unavailable over SCPI</p> |
| Time | Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second |

To understand the History dialog, and to properly program the instrument’s messaging system, remember that there are two types of occurrences, events and conditions:

- An event is an occurrence of zero duration. Events generate messages which are displayed in the center of the display for a period of time and then fade away. These may be of an advisory nature or may represent errors, for example “No

peak found”

- A condition is an occurrence of finite duration, that is, it has a start and an end. Conditions are states of the analyzer characterized by some combination of settings or some kind of failure that the user needs to be told about while it is happening, but then can stop being told once it goes away; for example “Input overload; ADC over range”

The error queue contains error events as well as the DETECTED and CLEARED events for condition errors, as seen in the figure above.

DETECTED events have numbers less than 1000 and CLEARED events have the same number plus 1000. For example,

301, Meas Uncal – DETECTED

and later

1301, Meas Uncal – CLEARED

To detect a condition error over SCPI, you should read the error queue and note any DETECTED error which is not followed eventually by an associated CLEARED error. This means the condition is still in effect. It is not sufficient to simply read the error queue until you get “No Errors” back. You may still have the condition error; the condition may still be in effect, and if that is the case, all you have done by clearing the error queue is to remove the first event (the DETECTED event) from the queue. For a condition error, you have to read the error queue until you see the CLEARED event for that condition. THEN you know that the condition is gone.

Current Conditions

The **Current Conditions** display shows all of the open conditions in the instrument. An open condition is a condition error or warning for which a start (detected) event has occurred but for which no corresponding stop (cleared) event has occurred.

An example of the Current Conditions screen appears below:

2 User Interface

2.15 Status Bar

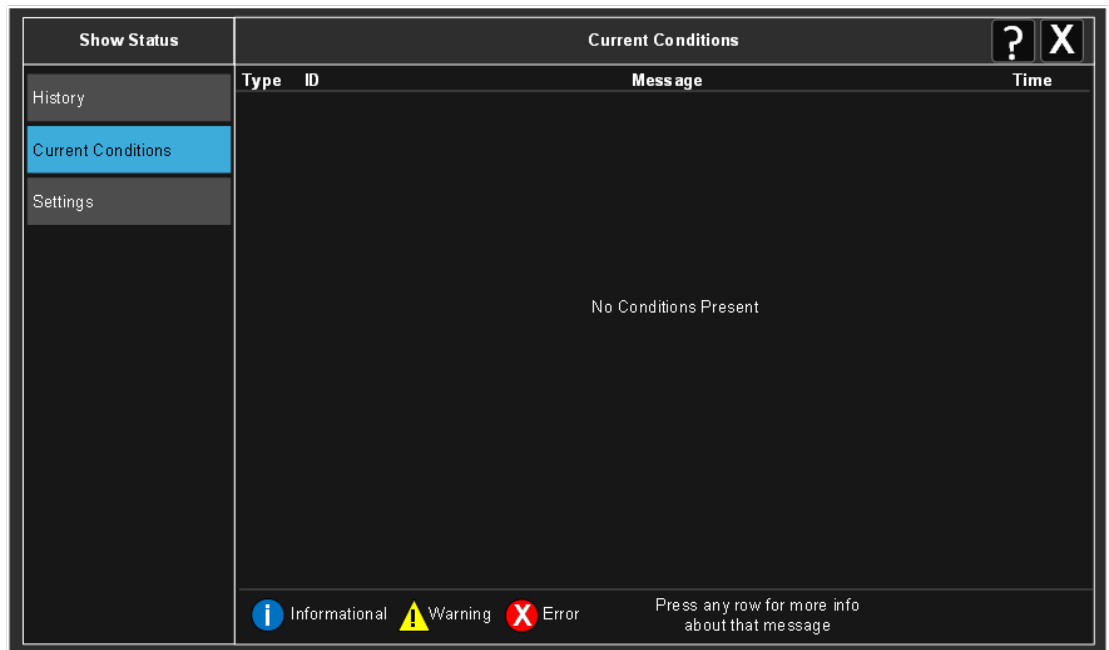

| Type | ID | Message | Time |
|------|-----|------------------------|-------------------------|
| | 64 | Align Now All required | 6:36:59 PM 2/24/2015 |
| | 301 | Meas Uncal | 6:33:27 PM 2/24/2015 |

The fields on the Current Conditions display are:

| | |
|----------------|--|
| Type | Displays the icon identifying the event or condition as an error or warning or informational |
| ID | Displays the error number |
| Message | Displays the message text |
| Time | Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second |

Touching a condition message expands the display of that message. Touching again collapses it. The description is the same as the one that appears on the message dialog. An example of this is shown in the History section, below.

When there are no open conditions, the display is as shown below:

2.16 Block Diagram

When you press the Block Diagram button in the "Control Bar" on page 138, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

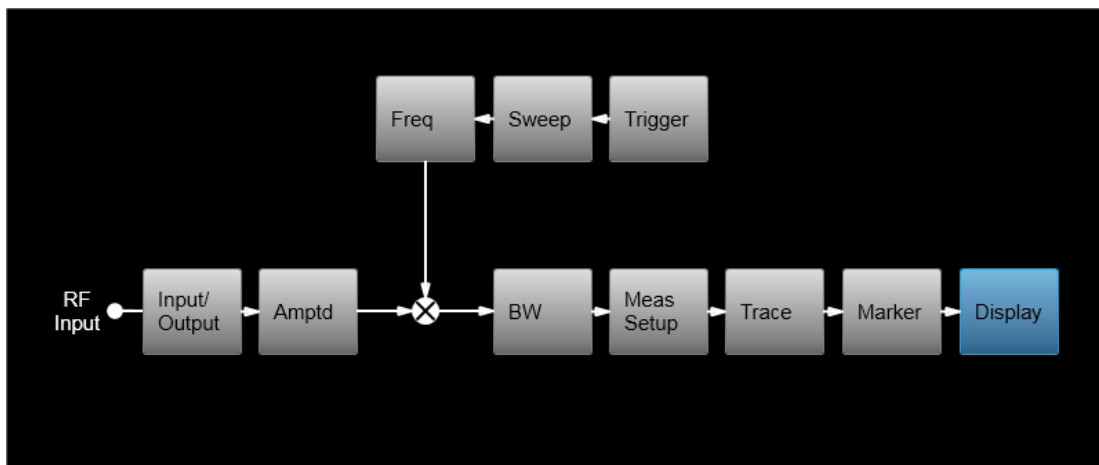

When you press the Block Diagram button, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

While in the Block Diagram display, the button is blue colored, as:

To exit the Block Diagram display, tap the button again.

The Block Diagram display is not meant to be a completely accurate representation, but one which can show differences as you change the hardware setup. For example, here is the basic RF Block Diagram:

And here is the Block Diagram when External Mixing is selected:

And here is the Block Diagram when the I/Q inputs are selected:

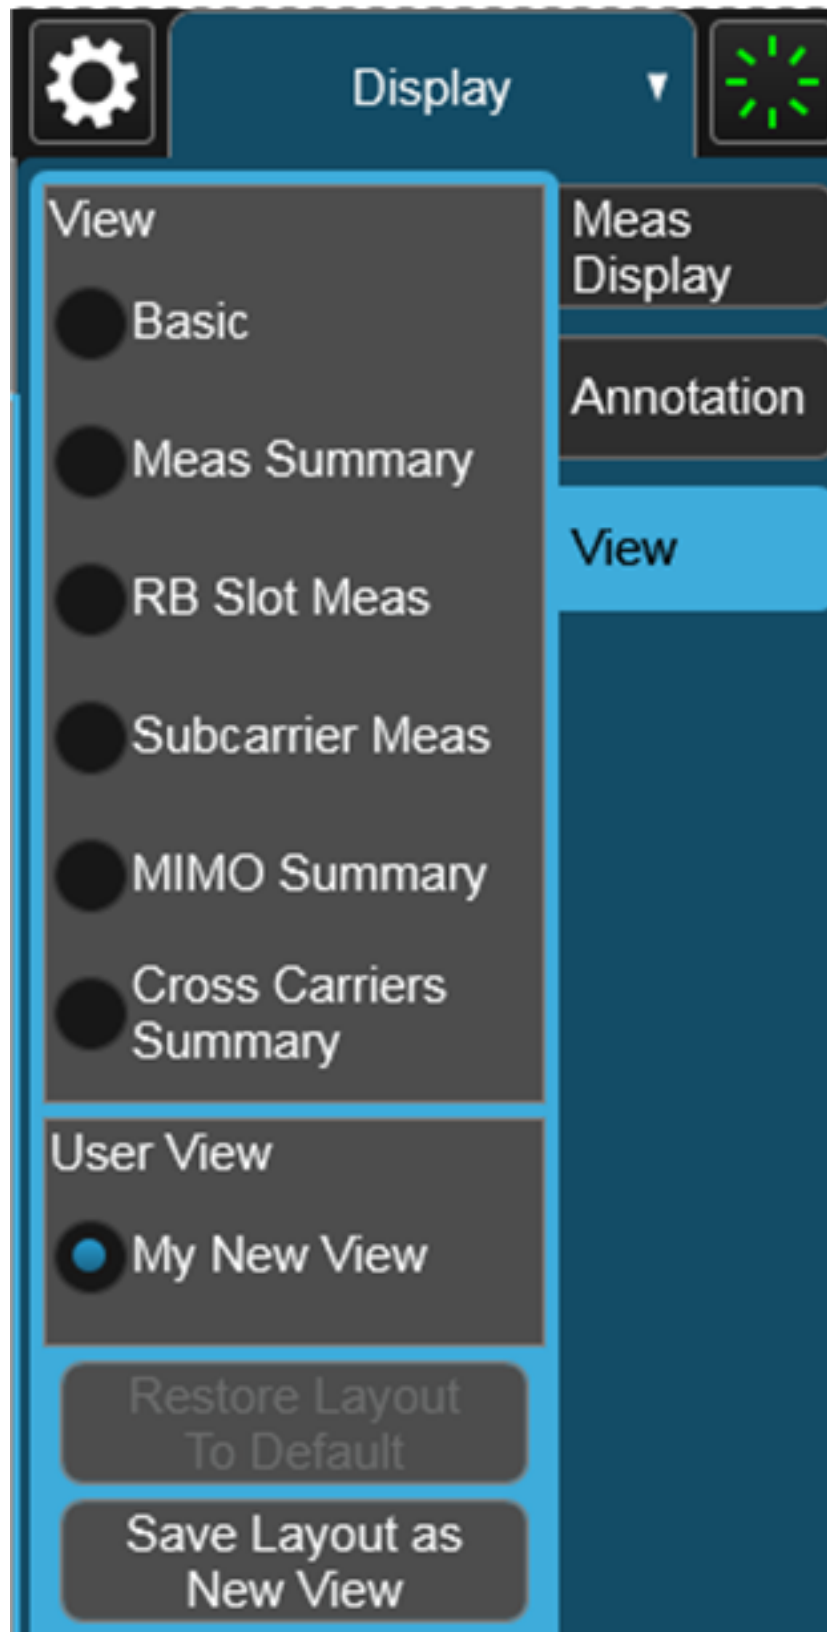

2.17 View Editor

This section describes the use of the View Editor, which allows you to:

- Add windows to and delete windows from the current measurement
- Resize and rearrange windows
- Create User Views

User Views are custom Views that you create by adding, deleting, rearranging, resizing, or changing the contents of the windows in an existing View, and then saving the edited View as a new View. The instrument lists the current User Views for a measurement after the Predefined Views, in the Mode/Meas dialog and on the View menu panel under Display:

| ent | View |
|-----|--|
| | Basic Meas Summary RB Slot Meas Subcarrier Meas MIMO Summary Cross Carriers Summary |
| | User View |
| | My New View |

You can save an edited View using the **Save Layout as New View** control in the View menu (see ["To Save a User View" on page 169](#)).

On occasion, the instrument may automatically save an edited View for you. If you have edited a View, so that the * is displaying next to the View name, you must save that View as a User View before you save State or switch measurements. If you forget that you have made changes to a View, then to keep from losing your edited View when you switch measurements, the instrument will save it for you. If you have an edited View that has not been saved and you try to do any of the following:

- Enter the "Save" menu
- Switch Measurements
- Switch Modes
- Switch Screens

the edited view will be saved for you with the name "Autosaved". When this happens, you will receive the following message:

If an Autosaved User View already exists, the User View called "Autosaved" will be overwritten with the currently edited view. If you have multiple edited views, the selected edited view will be Autosaved. If there is not an edited view selected the last selected edited view will be Autosaved.

To Open the View Editor

Pressing the View Editor button (shown above) in the ["Control Bar" on page 138](#), at the bottom right of the screen, opens the View Editor.

While in the View Editor, the icon is blue colored, as:

Pressing the View Editor button again exits the View Editor.

To Close the View Editor

Tap the View Editor button again.

The user chooses the desired View through the use of the Mode/Meas/View dialog (see "[Mode/Meas/View Dialog](#)" on page 89) or the View menu (a tab under the **Display** key). The View menu allows the user to browse the views in the current measurement. The View menu contains a list of Predefined Views for you to use. If you wish to modify a Predefined View or create your own, new View, you use the View Editor.

User Views & Predefined Views

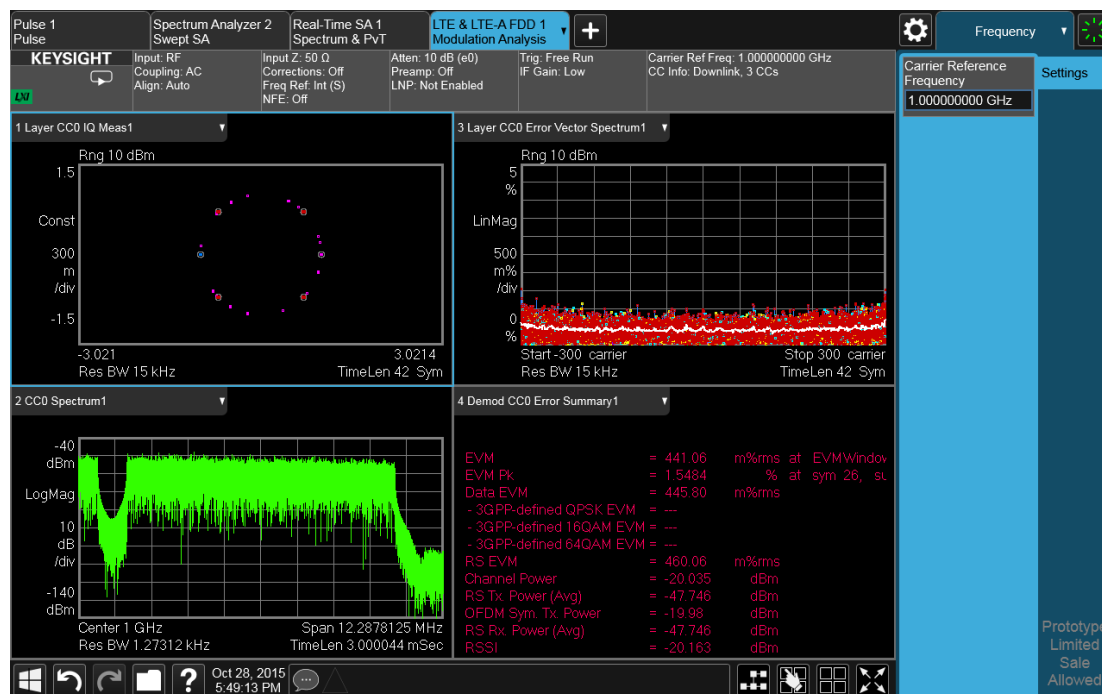

A User View is any View that is not in the list of predefined Views for the current measurement. For example, the Swept SA measurement has four predefined Views: Normal, Spectrogram, Zone Span, and Trace Zoom.

User Views allow you to add, delete, change and rearrange the windows of a predefined View, creating a new custom view.

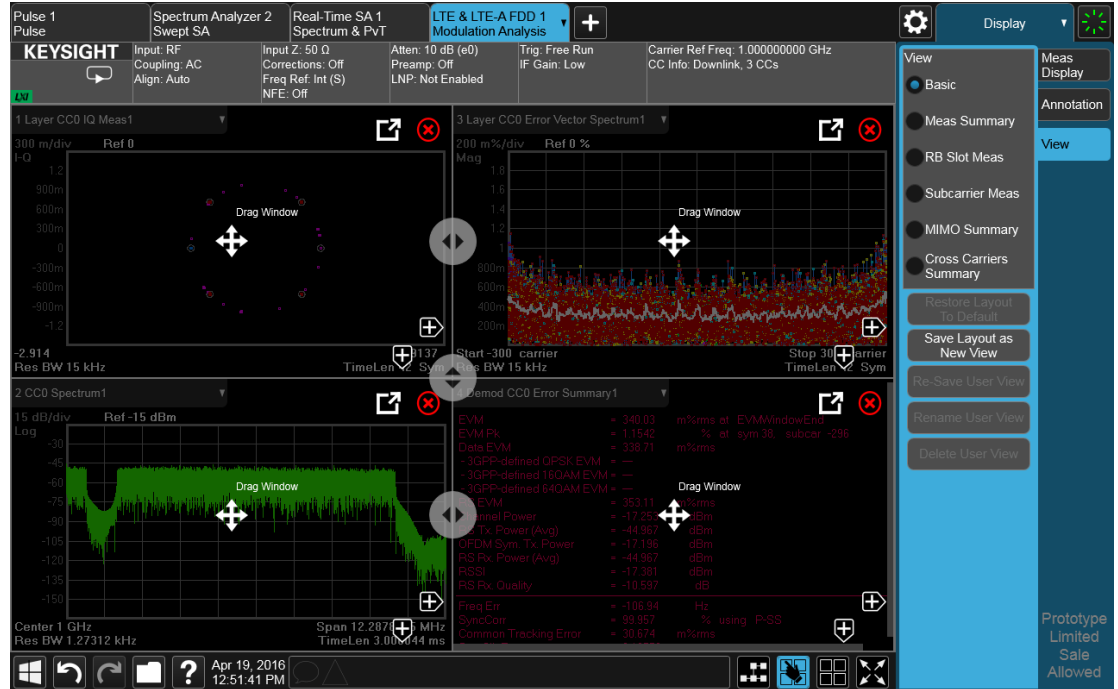

2.17.1 To Create a User View

Whenever you add or delete a window to/from a predefined View, or change what is being displayed in a Predefined View's window, the Predefined View is marked with an asterisk (*), to show that it has been modified.

For example, to edit the View shown below, you press the Edit View icon.

When you do this, you get the View Editor screen, which appears as below. The menu panel switches to the View menu. Here we see that we are in the Predefined View called “Basic”.

Each window has two arrows containing + signs. Pressing either of the “+” symbols adds a new window on that side. For example, let’s say you press the + symbol on the right of the lower left window:

You would then see this:

2 User Interface

2.17 View Editor

A fifth window has been added, and is automatically assigned the number 5. (The window number, which is displayed in the Window Title region, is used when sending SCPI commands to that window).

Note the * that now appears next to Basic in the View menu, indicating that you are now in the **modified** Basic View. You see the * if you add, delete or rearrange windows, but simply resizing windows does not display the *. The * means you are in a modified View, which must be saved as a User View before you leave the measurement (if you don't save it, the instrument will save it for you).

Note also that the Restore Layout to Default control is no longer grayed out. If you press this control it restores the Basic View to its default state. Restore Layout to Default becomes available when you add, delete or rearrange windows **and** when you resize them; otherwise it is grayed out.

You can add more windows with the "+" arrow symbols. Note that the "+" arrow symbols only appear if the current measurement has more windows available to display. If you are already displaying all the measurement's windows, the "+" symbols disappear.

You can exit the View Editor by again tapping the Edit View icon.

You can specify which result you want to see in the new window by tapping its title region.

A panel drops down, containing a Data control for specifying window results. Some measurements, such as LTE-A in this example, also provide controls on this dropdown for specifying other window parameters, such as the Component Carrier and Data Format, Tap the Data control and you will see a list of available results for the window. In some cases, as in LTE-A, this will be a cascading list, due to the number of results available:

2 User Interface

2.17 View Editor

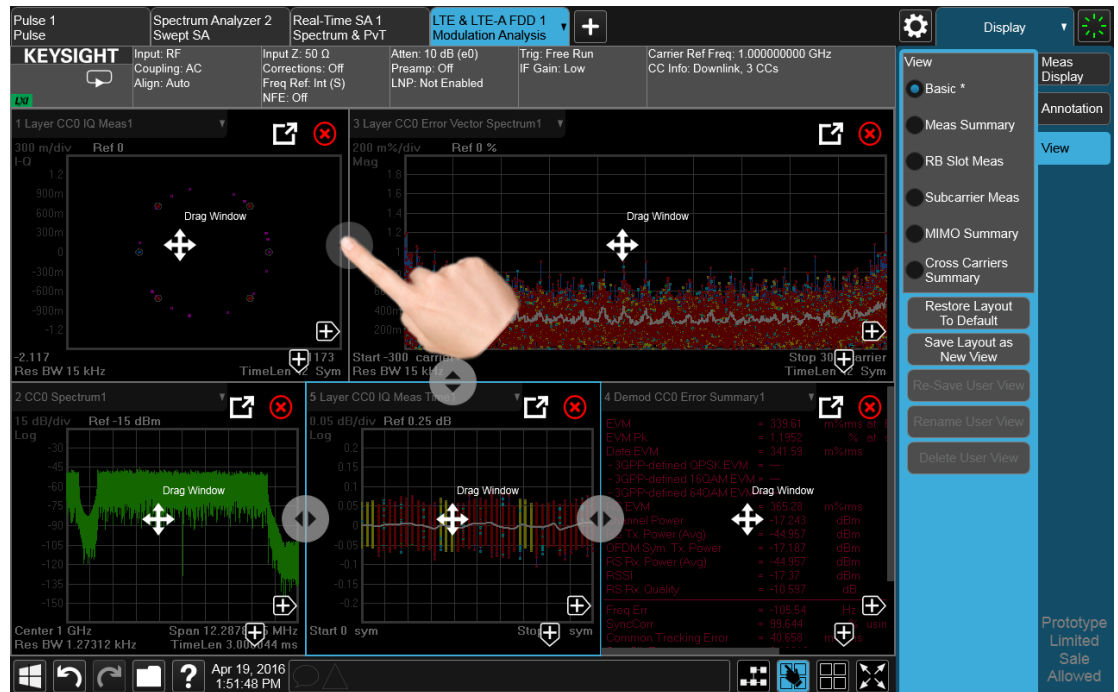

Choose the result you want and tap OK. Here we have chosen IQ Meas Time from the Demod group:

Your new, edited User View is now ready to use.

2.17.2 To Resize or Rearrange Windows in a View

Sometimes you may wish to resize a window. To do this go back into the View Editor and note the large, translucent white circles along the edges of the draggable borders. These are the “resize handles”. You can resize the windows by dragging these handles. Note that in their quiescent state they are slightly translucent; when you touch one it turns solid white, indicating that it is draggable. If you touch and drag one of them it moves the axis to which it is attached.

Another feature that comes with the View Editor is the ability to move windows around. You do this by dragging the four-arrow objects in the center of the window; the whole window goes along. Actually you can touch and drag anywhere in the window (except on one of the arrows or the delete circle) and it will drag, but the four-arrow objects give you an indication and a convenient finger target.

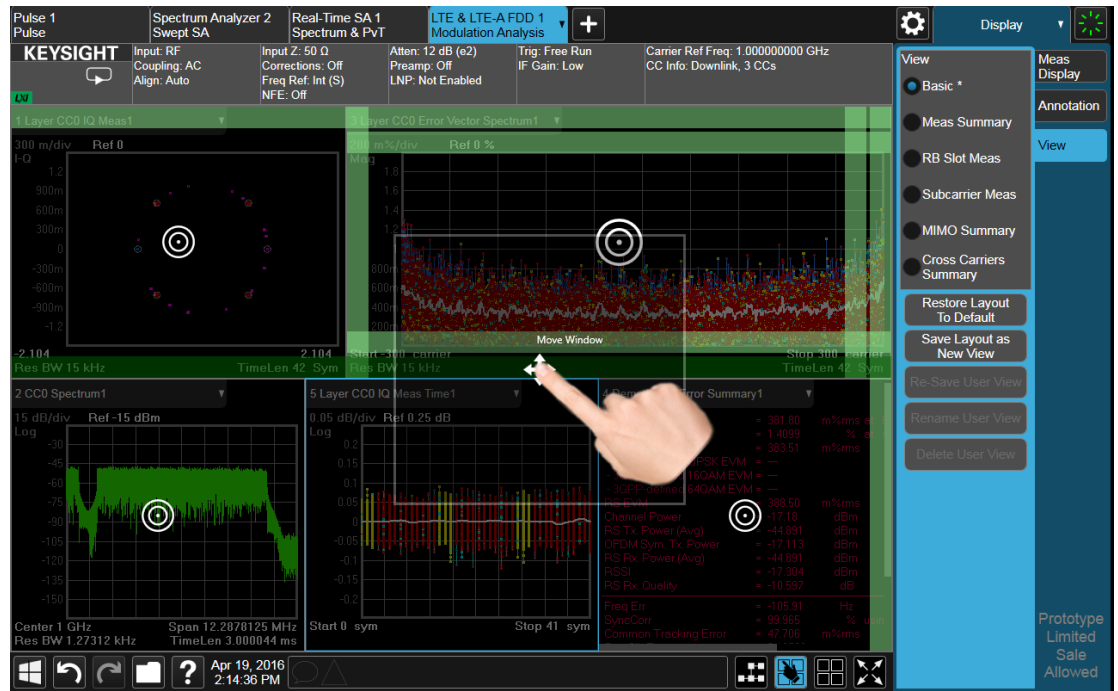

2 User Interface

2.17 View Editor

The outline of the window appears as it is being dragged. When you start to drag a window, target symbols appear in the other windows:

If you drop a window on one of the targets, it swaps positions with the target window. If you drag a window's center into another window, green stripes appear on the edges to show you where the window will go when you release it:

When you hover over one of the stripes it gets dimmer, to show the position the window being dragged will take on. If you release a window over an inner stripe, the window you are dragging and the window over which you were hovering resize to share the space the target window originally occupied. If you release a window over an outer stripe, as shown below, the window you are dragging takes on a new position outside the array of other windows:

2 User Interface

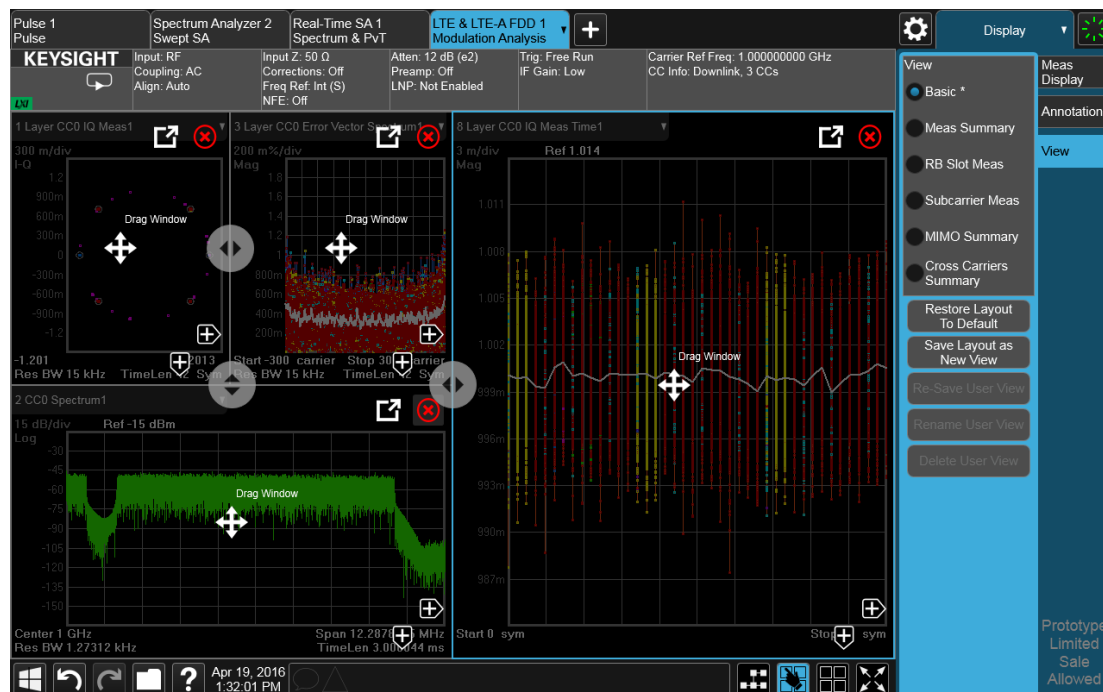

2.17 View Editor

In either case, one or more of the remaining windows resize to occupy the space formerly occupied by the window you were dragging.

2.17.3 To Delete a Window from a View

The View Editor also lets you delete a window. To do this, tap one of the circled red X's, as shown below.

There has to be more than one window for you to see the circled red Xs.

Now press the View Editor button (the blue hand) to exit the View Editor. At this point, you have an edited Predefined View, as shown by the * next to Basic:

When you are finished with it, you can restore the Layout to the default for Basic by pressing “Restore Layout to Default”. Or you can save your edited View as a “User View” (if you exit the measurement without saving the edited View, the instrument will save it for you as a User View called “Autosaved”).

If you clone the current Screen by pressing the “+” tab, the modified Predefined View will be saved as a User View called “Autosaved”, and it will be available in the new Screen.

2.17.4 To Save a User View

See also "[Transferring User Views Between Instruments](#)" on page 171

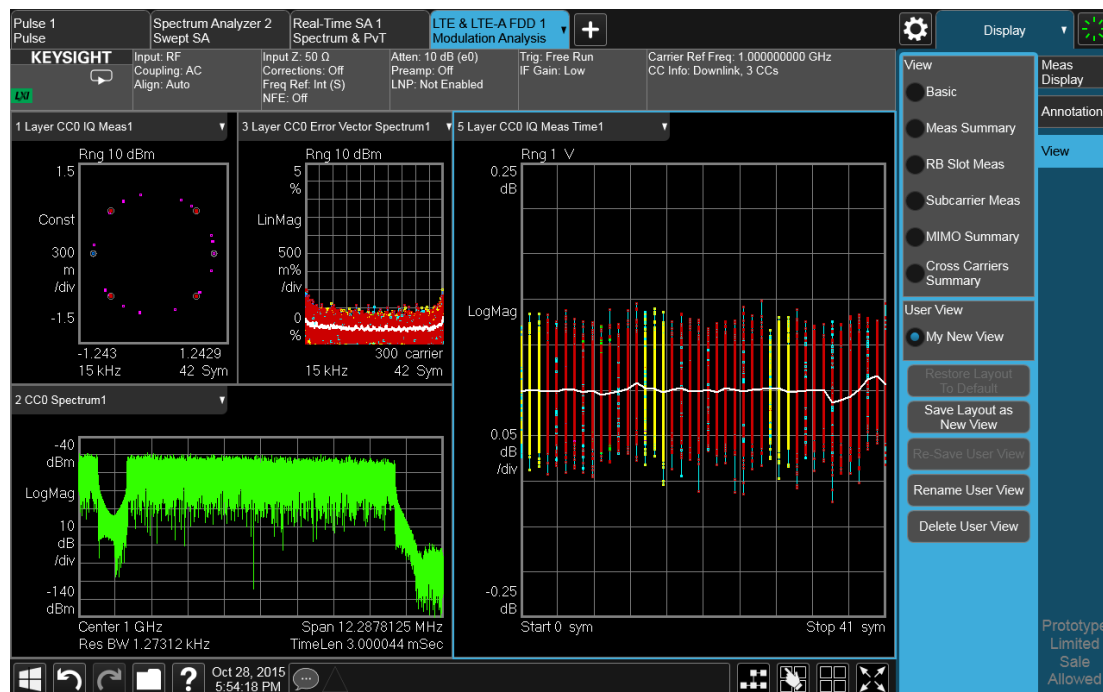

To save your new View as a User View, tap the “Save Layout as New View” control. You will get an alpha keyboard that lets you name your new View; the default is the old View name with a number. Below, we have typed in “My New View”:

2 User Interface

2.17 View Editor

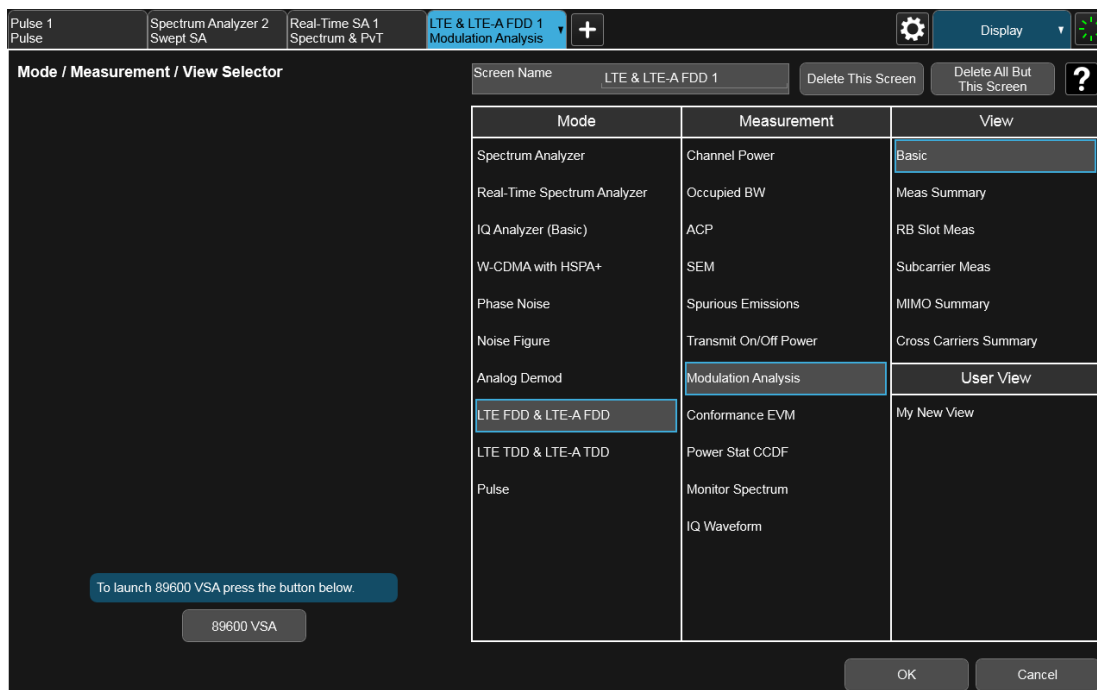

When you tap “Done”, the View is saved:

Notice the User View region which has appeared on the menu panel above, with the new User View called “My New View. Notice also that “Basic” has returned to its original, unedited state and the * is gone from its name. Note also that “Restore

Layout to Default” is grayed out. Note also that if you go to the Mode/Meas dialog, you will see the User View there as well:

When naming a new View, you must choose a name that is not already in use for any User View in any measurement; this is because User Views get written to permanent memory and are available to all instances of the Measurement in any screen. They survive a Mode Preset and also survive shutdown and restart of the application.

Transferring User Views Between Instruments

To transfer a User View to another instrument, you must copy the desired file to a portable drive or to your network and then copy it to the target instrument.

When you save a User View, a file is created (or updated if it already exists) containing all the User Views for the current measurement. All of these files are saved on the D: drive in the instrument, in the folder:

`D:\Users\Instrument\My Documents\UserViews`

(assuming you are logged in as Instrument, which is the default).

Look for the file for your measurement. The file naming convention is:

`ModeName.MeasName.layout`

Where `ModeName` is the long-form SCPI parameter for the `:INST:SEL` command for your Mode, and `MeasName` is the long-form SCPI parameter for the `:CONF` command for your Measurement.

For a full list of all `ModeName` parameters, see [Index to Modes](#) in "Mode" on page 90.

2 User Interface
 2.17 View Editor

The following is a full list of all **MeasName** parameters.

| Measurement Name | SCPI ID |
|------------------------------------|----------------|
| ACP, Adjacent Channel Power | ACPower |
| AM | AM |
| AM Depth | AMD |
| Amplitude Probability Distribution | APD |
| Audio Distortion | AUDDist |
| Audio Frequency | AUDFreq |
| Audio Level | AUDLevel |
| Audio SINAD | AUDSinad |
| Automatic Direction Finder | ADF |
| Channel Power | CHPower |
| Code Domain | CDPower |
| Combined GSM | CGSM |
| Combined WCDMA | CWCDma |
| Complex Spectrum | SPECTrum |
| Conformance EVM | CEVM |
| Custom OFDM | OFDM |
| Digital Demod | DDEMod |
| Disturbance Analyzer | DANalyzer |
| EDR In-band Spurious Emissions | IBSPurious |
| EVM | EEVM |
| Fast Capture | FCAPture |
| Fast Spectrum | FSPectrum |
| FM | FM |
| FM Deviation | FMDeviation |
| FM Stereo | FMStereo |
| Frequency Counter | FCOunter |
| Frequency Scan | FSCan |
| GMSK Phase & Freq Error | PFERror |
| Group Delay | GDELay |
| Harmonics | HARMonics |
| HRP UWB Demodulation | HUWB |
| Instrument Landing System | ILS |
| IQ Waveform | WAVEform |
| LE In-band Emissions | IBEMissions |
| List Power Step | LPSTep |

| Measurement Name | SCPI ID |
|-----------------------------|-------------|
| List Sequencer | LSEQuencer |
| List Sweep | LIST |
| Log Plot | LPLot |
| LoRa (CSS) Demodulation | LORA |
| Marker Beacon | MBE |
| Mod Accuracy | RHO |
| Modulation Analysis | EVM |
| Modulation Distortion | MODDist |
| Modulation Rate | MODRate |
| Modulation SINAD | MODSinad |
| Monitor Spectrum | MONitor |
| Noise Figure | NFIGure |
| Occupied BW / | OBWidth |
| Output Spectrum BW | |
| Output RF Spectrum | EORFspectr |
| Phase and Amplitude vs Time | PAVTime |
| PM | PM |
| PM Deviation | PMDeviation |
| Power Amplifier | PAMplifier |
| Power Control | PCONtrol |
| Power Stat CCDF | PStatistic |
| Power vs Time | EPVTime |
| Pulse | PULSe |
| QPSK EVM | EVMQpsk |
| Real Time Scan | RTSC |
| RF Power | RFPower |
| SEM | SEMask |
| Spectral Flatness | FLATness |
| Spectrum & PvT | RTSA |
| Spot Frequency | SFRequency |
| Spurious Emissions | SPURious |
| Streaming | STReaming |
| Strip Chart | SCHart |
| Swept SA | SANalyzer |
| TOI | TOI |

| Measurement Name | SCPI ID |
|---------------------------------|----------|
| Transmit Analysis | TX |
| Transmit On/Off Power | PVTime |
| Transmit Power (Burst Power) | TXPower |
| Tuned RF Level | TRFLevel |
| Tuned RF Level with Tracking | TTRF |
| Tx Band Spur | ETSPur |
| VHF Omni-Directional Range | VOR |

Examples:

- The User View file for the Swept SA measurement is [SA.SANalyzer.layout](#)
- The User View file for the ACP measurement in the WCDMA mode is [WCDMA.ACPower.layout](#)

Copy the desired file to a thumb drive or to your network. Then go to the target instrument and copy the file into the [D:\Users\Instrument\My Documents\UserViews](#) directory on that instrument (again, assuming you are logged in as Instrument).

Note that copying this file to another instrument will overwrite the file already in that instrument, if any, and will destroy any User Views that might have been created on that instrument.

Note that when you delete the last User View for a measurement, the file is removed.

2.17.5 To Rename a User View

You can rename a User View by selecting that View and tapping “Rename User View.” You can also re-edit a User View; if you do this, an asterisk will appear next to the User View’s name. You can then tap “Re-Save User View to save it back to its existing name, or “Save Layout as New View” to add another, new User View.

2.17.6 To Delete a User View

You can delete a User View by doing the following:

1. From the ["Mode/Meas/View Dialog"](#) on [page 89](#), or from the **View** menu, select the User View that you want to delete
2. Switch to the **Display** menu

3. Select the **View** tab
4. Tap **Delete User View**

2.17.7 To Delete All User Views

You can delete all User Views by tapping “Delete All User Views.” The default view becomes the current view for the Measurement if a User View was the current view when this control was pressed.

2.17.8 Use Case: Displaying Marker and Peak Tables

One common application for User Views is to create a View that allows the Spectrum Analyzer to display both a Marker Table and a Peak Table at the same time. To do this, simply add a Marker Table Window and a Peak Table window to the Spectrum window of the Swept SA measurement. The result is shown below; note that the new View has been named “Marker Table & Peak Table”:

NOTE: There are legacy displays like Marker Table, Peak Table, Measure at Marker and Gate View, which are not Views but special display modes. These are retained for backwards compatibility, however they are turned on and off with switches and do not use the View system. Turning on one of these switches does not create a modified View, it merely adds the specified window to the current View; turning the switch back off removes the window. While the switch is on, NO View shows as

selected in the View menu. These switches are grayed out if you are in a modified View or a User View. Since only one of these switches can be on at a time, and because these switches turn off on a Preset, User Views offer a superior way of adding windows than using the switches.

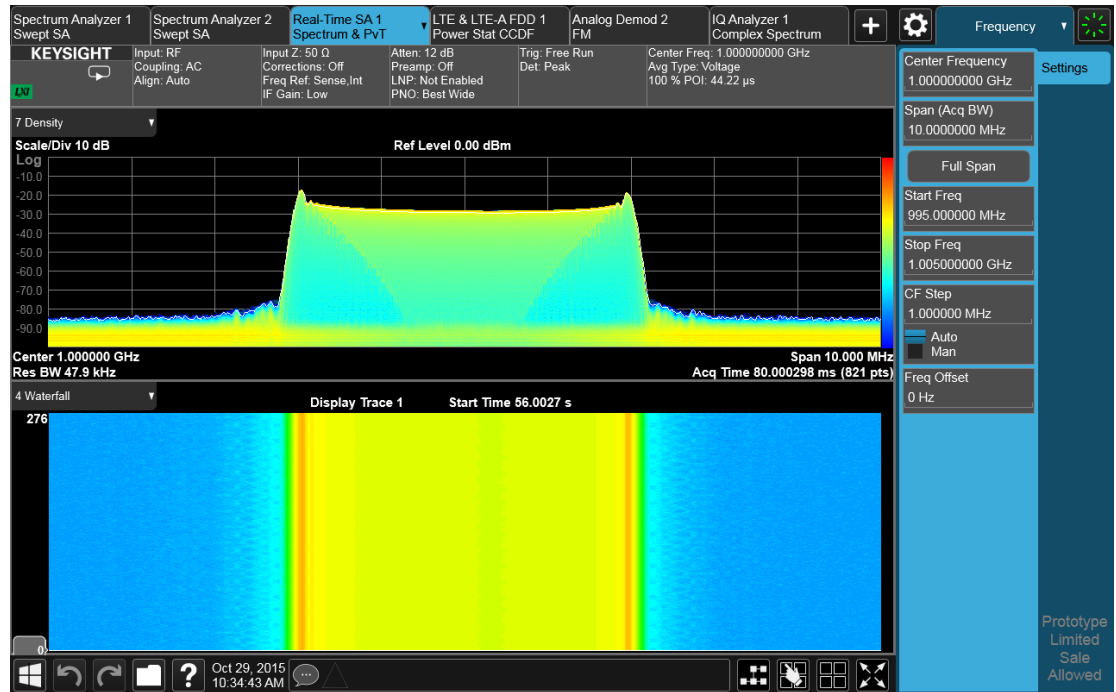

Some measurements do not support User Views; these do not allow adding, deleting or rearranging windows, however they do allow resizing windows. In these measurements you can get into the View Editor but the Add icons, Delete icons and Move icons will not appear. You can still resize the windows and in some cases (e.g. Noise Figure) you can still change window contents.

2.17.9 View Editor Remote Commands

Remote Commands for User Views can be found in the documentation for the **Display, View** tab.

2.18 Multiscreen

You can configure up to 16 different Screens at a time. Normally, you only see one Screen, and the set of configured screens is shown across the top of the display in a series of "Screen Tabs" on page 88. Touching any screen's tab brings it to the foreground, makes it the current Screen and starts it updating.

Multiscreen view lets you display all of the configured Screens at once.

You can switch to Multiscreen View by pressing this button in the "Control Bar" on page 138 at the bottom right of the screen:

Multiscreen View looks like this:

2 User Interface

2.18 Multiscreen

While in Multiscreen View, the button changes from a black background to a blue background:

To exit Multiscreen view, tap the button again.

Multiscreen View cannot be activated if only one screen is configured.

Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows arranged in Views. You can configure multiple instances of the same Mode along with any combination of other Modes.

In Multiscreen View, just as in Single Screen View, only one screen is active.

You switch Screens by tapping the Screen Tab you want, or when in Multiscreen View, you can tap the Screen itself. When you switch Screens, the current Screen's state and measurement results are preserved, the new Screen's previous state and data are loaded, and the new Screen starts running its Mode.

In Multiscreen View:

- The Meas Bar does not display
- The Screens are presented in an array of equal size boxes, except where the number of Screens means some have to be different sizes (as when you have 3 Screens, 5 Screens, etc.).

- Each Screen has a tab that contains the name of the Mode and Measurement in the box and a number associated with the instance of that Mode. You can enter a custom Screen name that replaces the Mode name, by going into the Mode/Meas dialog
- There is always one and only one selected Screen. It is indicated by a blue tab. Only the selected Screen is actually running a measurement and updating its display
- The selected window in the selected screen is the context for the current menus. It is the only window on the display with a blue border
- As you go from screen to screen, each screen remembers the last menu that was active in that screen and restores it as the active menu

In Multiscreen View, as in Single Screen View, tapping the blue tab or pressing the Mode/Meas front panel key opens the ["Mode/Meas/View Dialog" on page 89](#) which allows you to change the Mode (or Measurement or View) being displayed in that Screen.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument:SCReen:MuLTiple[:STATe] OFF ON 0 1</code> <code>:INSTrument:SCReen:MuLTiple?</code> |
| Example | <code>:INST:SCR:MuLT ON</code> |
| Notes | If only one screen is configured, attempting to set Multi-Screen ON generates the error “-221, Settings conflict; Multi-Screen requires >1 screen” |
| Preset | OFF |

For more information, see the following:

- ["Select Screen" on page 179](#)
- ["Screen List \(Remote only command\)" on page 180](#)

2.18.1 Select Screen

You can select a screen by touching its tab or, in ["Multiscreen" on page 177](#) mode, touching the screen itself. Selecting the Screen activates the screen and suspends the previously selected screen (if any).

| | |
|----------------|---|
| Remote Command | <code>:INSTrument:SCReen:SElect <screen name></code> <code>:INSTrument:SCReen:SElect?</code> |
| Example | <code>:INST:SCR:SEL "Baseband"</code> |
| Notes | If the <screen name> is specified but not found in the list of Screens, the error message “-224, Illegal parameter value; Screen Name not found” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated |

| | |
|--------|---------------------------------------|
| Preset | Returns the name of the active screen |
|--------|---------------------------------------|

2.18.2 Screen List (Remote only command)

You can obtain a list of currently configured Screens. This permits your remote program to manage screens for selection, renaming, or deletion.

| | |
|----------------|--|
| Remote Command | <code>:INSTRument:SCReen:CATalog?</code> |
|----------------|--|

| | |
|---------|-----------------------------|
| Example | <code>:INST:SCR:CAT?</code> |
|---------|-----------------------------|

| | |
|-------|--|
| Notes | The query response is a comma separated list of Screen Names. If only 1 Screen is configured, there is no trailing comma |
|-------|--|

For R&S compatibility, the following query is also available:

`:INSTRument:SCReen:LIST?`

| | |
|--------|--|
| Preset | Returns list of currently configured Screens |
|--------|--|

2.19 Fullscreen

The Fullscreen button is in the "Control Bar" on page 138, at the lower right corner of the display.

When **Full Screen** is pressed the measurement window expands horizontally over the entire instrument display. The screen graticule area expands to fill the available display area.

It turns off the display of the menu panel, however the controls that drop down from the Meas Bar and on-screen annotation are still available, and you can still drag the trace and markers and perform a pinch zoom, so you can still operate the instrument.

Pressing **Full Screen** again while Full Screen is in effect cancels Full Screen.

You can get even more screen area for your data display by turning off the Meas Bar using the Annotation tab of the Display menu)

Full Screen is canceled by the **Preset** key.

| | |
|-------------------------------|---|
| Remote Command | <code>:DISPlay:FSCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:FSCReen[:STATe]?</code> |
| Notes | This was set to Off by :SYST:DEF MISC in MXA1, but not by Preset. It is no longer set Off by :SYST:DEF MISC, since it is now meas global instead of mode global |
| Preset | Unaffected by Preset but set to Off by Restore Misc Defaults or shutdown and restart |
| State Saved | Not saved in instrument state |
| Backwards Compatibility SCPI | <code>:DISPlay:MENU[:STATe] OFF ON 0 1</code> This emulates ESA full screen functionality, which is the same as the FSCReen command in PSA except that the sense of on/off is reversed (that is, OFF means the menus are OFF, so Fullscreen is ON) and the default is ON (meaning Fullscreen is OFF) |
| Backwards Compatibility Notes | In ESA/PSA, Full Screen was turned on with a softkey, so pressing any other key turned Full Screen off. In the X-Series, because a hardkey is provided to turn this function on and off, pressing any other key no longer turns off Full Screen |

3 WLAN Mode

WLAN Mode can be used to quickly ensure a product development conforms to regulatory requirements, as well as providing RF diagnostic and troubleshooting capability for a WLAN device.

The standards versions supported by WLAN Mode are:

- IEEE Std 802.11a-1999(R2003)
- IEEE Std 802.11b-1999(R2003)
- IEEE Std 802.11g-2003
- IEEE Std 802.11n-2009
- IEEE P802.11ac™/D1.1
- IEEE P802.11ah™/D0.2
- IEEE Std 802.11™-2012
- IEEE Std 802.11af™-2013
- IEEE Std 802.11ax™-2016
- IEEE Std 802.11ax™-2020
- IEEE P802.11be/D0.3 January 2021

| | |
|------------------------------|--|
| Example | <code>:INST:SEL WLAN</code> <code>:INST:NSEL 217</code> |
| Dependencies | The Mode must be installed and licensed in your instrument before it is available for use |
| Status Bits/OPC dependencies | Changing Modes resets all SCPI status registers and mask registers to their power-on defaults. Therefore, event or condition register masks must be re-established after a mode change |

The following table lists the required license options for different radio standards.

| | |
|--|-----------|
| WLAN 802.11a/b/g/j/p/n/af/ah Measurement Application | N9077EM0E |
| WLAN 802.11ac/ax Measurement Application | N9077EM1E |
| WLAN 802.11be Measurement Application | N9077EM2E |

Baseband I/Q Input functionality is available when the hardware Option BBA is installed. It provides the ability to analyze baseband I/Q signal characteristics of mobile and base station transmitters.

The following measurements are available for use with the Baseband I/Q inputs.

3 WLAN Mode

- CCDF
- Modulation Analysis
- Spectral Flatness
- IQ Waveform

The following measurements are *not* available for use with Baseband I/Q Inputs.

- Spectrum Emission Mask
- Spurious Emissions
- Monitor Spectrum
- Channel Power
- Occupied BW
- Power vs Time

For unavailable measurements, the menu keys are not grayed out when Select Input > I/Q key is selected. When in a measurement that does not support I/Q, it generates an advisory message, and an error message will be displayed at the bottom: “No result; Meas invalid with I/Q inputs”.

3.1 Measurement Commands

Commands to select each measurement are shown below. Commands relating to the views and windows for each measurement are described in the documentation for each measurement.

| Example | Measurement Selected | Command |
|-------------|--------------------------|-----------------------|
| | Channel Power | :CONFigure:CHPower |
| | Spectrum Emissions Mask | :CONFigure:SEMask |
| | Spurious Emissions | :CONFigure:SPURious |
| | Occupied Bandwidth | :CONFigure:OBWidth |
| | Power Stat CCDF | :CONFigure:PSTatistic |
| | Modulation Analysis | :CONFigure:EVM |
| | MIMO Modulation Analysis | :CONFigure:EVMMimo |
| | Power vs Time | :CONFigure:PVTime |
| | Spectral Flatness | :CONFigure:FLATness |
| | Monitor Spectrum | :CONFigure:MONitor |
| | IQ Waveform | :CONFigure:WAVEform |
| Preset | MONitor | |
| State Saved | Instrument State | |

3.2 Channel Power Measurement

This measurement is used to find the total power present in a specified bandwidth. Power Spectral Density (signal power normalized to 1 Hz) is also reported.

When in WLAN Mode, or when WLAN radio standard is selected in SA Mode, the peak Power Spectral Density for 1 MHz is reported.

Measurement Commands

The general functionality of "CONFigure" on page 2568, "INITiate" on page 2569, "FETCh" on page 2569, "MEASure" on page 2571, and "READ" on page 2570 are described in the section SCPI Operation and Results Query in the topic Programming the Instrument.

Note that, in general, :CONF : <Measurement> resets the specified measurement settings to their defaults. X-Series permits the addition of the NDEFault node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

| Command | Function |
|-----------------------------|---|
| :INITiate:CHPower | Initiates a trigger cycle for the CHP measurement, but does not return any data. You must then use :FETC:CHP[n]? to retrieve data |
| | Does not change any measurement settings |
| :CONFigure? | Returns the long form name of current measurement, in this case, CHPower |
| :CONFigure:CHPower | Selects CHP measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 276 |
| :CONFigure:CHPower:NDEFault | Selects CHP measurement <i>without</i> affecting settings |

The following queries are used to retrieve data. The type of data returned depends on the value of n.

| Query | Function |
|----------------------|--|
| :FETCh:CHPower[n]? | Retrieves the data defined by n |
| :MEASure:CHPower[n]? | Switches to CHP measurement, restores default values, starts the measurement, then retrieves the data defined by n |
| :READ:CHPower[n]? | Starts the measurement, then retrieves the data defined by n |

Backwards Compatibility Queries

| Query | Return Value |
|---------------------------|---|
| :FETCh:CHPower:CHPower? | Returns the Channel Power (dBm) |
| :MEASure:CHPower:CHPower? | |
| :READ:CHPower:CHPower? | |
| :FETCh:CHPower:DENSity? | Returns the Power Spectral Density (dBm/Hz) |
| :MEASure:CHPower:DENSity? | |
| :READ:CHPower:DENSity? | |

The results returned by the queries depend on the currently-selected Mode and the value of *n* (where required). The sections below provide mode-specific details for each Mode.

SA Mode Measurement Results

| n | Results Returned | | | | | | |
|--------------------|--|---|------------------|---|--|---|---|
| 1 or not specified | Returns scalar results: <table border="1" data-bbox="357 966 1315 1144"> <thead> <tr> <th>n</th> <th>Results Returned</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Channel Power A floating-point number representing the total channel power in the specified integration bandwidth</td> </tr> <tr> <td>2</td> <td>PSD (Power Spectral Density) The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 272; either dBm/Hz or dBm/MHz</td> </tr> </tbody> </table> | n | Results Returned | 1 | Channel Power A floating-point number representing the total channel power in the specified integration bandwidth | 2 | PSD (Power Spectral Density) The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 272; either dBm/Hz or dBm/MHz |
| n | Results Returned | | | | | | |
| 1 | Channel Power A floating-point number representing the total channel power in the specified integration bandwidth | | | | | | |
| 2 | PSD (Power Spectral Density) The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 272; either dBm/Hz or dBm/MHz | | | | | | |
| 2 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 258 | | | | | | |
| 3 | n/a | | | | | | |
| 4 | n/a | | | | | | |
| 5 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by Span | | | | | | |
| 6 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by Span | | | | | | |
| 7 | Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table | | | | | | |

MSR Mode Measurement Results

| n | Results Returned |
|--------------------|-------------------------|
| 1 or not specified | Returns scalar results: |

3 WLAN Mode
3.2 Channel Power Measurement

n Results Returned

- 1 Channel Power A floating-point number representing the total channel power in the specified integration bandwidth
- 2 PSD (Power Spectral Density) The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 272; either dBm/Hz or dBm/MHz
- 2 Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 258
- 3 Returns [Carriers] comma-separated scalar results, in the following order

| # | Item | Unit |
|------------|-----------------------------------|------|
| 1 | Total Power of Carrier 1 | dBm |
| 2 | Total Power of Carrier 2 | dBm |
| ... | ... | |
| [Carriers] | Total Power of Carrier [Carriers] | dBm |

If the result is not available, NaN (9.91E+37) is returned. Number of returned values might be changed in future releases

- 4 Returns comma-separated scalar results, in the following order

| # | Item | Unit |
|---|----------------------------------|------|
| 1 | Total Power of LTE FDD carriers | dBm |
| 2 | Total Power of W-CDMA carriers | dBm |
| 3 | Total Power of GSM/EDGE carriers | dBm |
| 4 | Total Power of cdma2000 carriers | dBm |
| 5 | Total Power of 1xEV-DO carriers | dBm |
| 6 | ... | |

The number of results is incremented by one when a new format is supported

If the result is not available, NaN (9.91E+37) is returned. Number of returned values will be changed in future releases if the number of supported radio format is increased

- 5 Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
- 6 Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control
- 7 Returns Marker Table data as a series of comma separated values in the following format:
<Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved>
Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table

LTE-Advanced FDD/TDD Mode Measurement Results

| n | Results Returned | | | | | | | | | | | | | | | | | | |
|--------------------|---|---|---------------|---|---|---|---|---|---|----------|---|---|----------|---|---|----------|---|---|----------|
| 1 or not specified | Returns scalar results: <table border="1"> <tr> <td>1</td> <td>Channel Power</td> <td>A floating-point number representing the total channel power in the specified integration bandwidth</td> </tr> <tr> <td>2</td> <td>PSD (Power Spectral Density)</td> <td>The power in the specified unit bandwidth. | 6 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by Span | | | | | | | | | | | | | | | | | | |
| 7 | Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table | | | | | | | | | | | | | | | | | | |

WLAN Channel Power Measurement Results

| n | Results Returned |
|--------------------|---|
| 1 or not specified | <p>Returns scalar results:</p> <p>When the radio standard is <i>not</i> 802.11ac 80 + 80 MHz or 802.11ax 80 + 80 MHz:</p> <p>Channel Power A floating-point number representing the total channel power in the specified integration bandwidth</p> <p>Peak PSD (Power Spectral Density) The peak PSD over the integration bandwidth. The unit bandwidth is selected by "PSD Unit" on page 272 in either dBm/Hz or dBm/MHz</p> <p>Mean PSD (Power Spectral Density) The mean PSD over the integration bandwidth. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz</p> <p>When the radio standard is 802.11ac 80 + 80 MHz or 802.11ax 80 + 80 MHz:</p> <p>Channel Power of the carrier of which the center frequency is indicated by Freq Segment 1 A floating-point number representing the total channel power of the first segment in the specified integration bandwidth</p> <p>Peak PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 1 The power in the specified unit bandwidth of the first segment. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz</p> <p>Channel Power of the carrier of which the center frequency is indicated by Freq Segment 2 A floating-point number representing the total channel power of the second segment in the specified integration bandwidth</p> <p>Peak PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 2 The power in the specified unit bandwidth of the second segment. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz</p> <p>Mean PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 1 The power in the specified unit bandwidth of the first segment. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz</p> <p>Mean PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 2 The power in the specified unit bandwidth of the second segment. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz</p> |
| 2 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by " Span " on page 258 |
| 3 | n/a |
| 4 | n/a |

| n | Results Returned |
|---|--|
| 5 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by Span |
| 6 | Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by Span |
| 7 | Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table |

Additionally, WLAN Mode supports an **n** parameter for the following queries:

```
:FETCh:CHPower:DENSity[n]?
:MEASure:CHPower:DENSity[n]?
:READ:CHPower:DENSity[n]?
```

For these queries *in WLAN Mode only*, the results returned depend on the value of **n** as follows:

| n | Radio Standard | Results Returned |
|--------------------|---|--|
| 1 or not specified | Not 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz | Peak PSD (Power Spectral Density) The Peak PSD over the integration bandwidth. The unit bandwidth is selected by " PSD Unit " on page 272 in either dBm/Hz or dBm/MHz |
| | 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz | The first value is the peak PSD for segment 1, the second value is the peak PSD for segment 2 |
| 2 | Not 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz | Mean PSD (Power Spectral Density) The Mean PSD over the integration bandwidth. The unit bandwidth is selected by PSD Unit in either dBm/Hz or dBm/MHz |
| | 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz | The first value is the mean PSD for segment 1, the second value is the mean PSD for segment 2 |

3.2.1 Views

In SA, WCDMA, WLAN, SRCOMMS, and VMA Modes, there is only one predefined view, the "**Normal**" on page 191 view.

3.2.1.1 Normal

Windows: "**Graph**" on page 192, "**Metrics**" on page 193

Dual window view: Channel Power graph and Channel Power metrics.

Example `:DISP:CHP:VIEW PRES`

3.2.1.2 Carrier Info

Windows: ["Graph" on page 192](#), ["Metrics" on page 193](#)

Dual window view: Channel Power graph and Carrier Info table.

| | |
|--------------|--|
| Example | <code>:DISP:CHP:VIEW CINF</code> |
| Dependencies | Only available in MSR, LTE-A FDD/TDD and 5G NR Modes |

3.2.2 Windows

This section describes the windows that are available in the Channel Power measurement:

| Window | Number |
|--|--------|
| "Graph" on page 192 | 1 |
| "Metrics" on page 193 | 2 |
| "Gate" on page 197 | 3 |
| "Marker Table" on page 197 | 4 |

3.2.2.1 Graph

Window #1

Used to display the spectrum trace and power bars.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace. The Bar Graph appears between the markers that indicate the measured output power level. The bar graph is activated when the "Bar Graph" control is set to ON under the Display menu. The Graph window appears in the following views.

| View | Size | Position |
|-----------|------------------------|----------|
| Normal | Two thirds, full width | Top |
| Gate View | One third, full width | Middle |

Spectrum View with Bar Graph Off

3 WLAN Mode
 3.2 Channel Power Measurement

Spectrum View with Bar Graph On

This is the same as the **Spectrum** view, but has a blue bar between the markers that indicates the measured output power level. The bar graph is activated when the “Bar Graph” control is set to **ON** under the **Display** hardkey. The actual measured output power level is displayed on the display at the top of the bar.

If the current Mode is WLAN and the format is WLAN 802.11ac 80+80 MHz, Spectrum View is slightly different so that the results of both carrier segments can be displayed.

3.2.2.2 Metrics

Window #2

The actual measured output power level is displayed in the Metrics window

The **Metrics** window appears in the following Views.

| View | Size | Position |
|-----------|-----------------------|----------|
| Normal | One third, full width | Bottom |
| Gate View | One third, full width | Bottom |

| 2 Metrics | | Component Carrier | |
|------------------------------|------------------------|-------------------|------------------------|
| Total Channel Power | -13.69 dBm/100.000 MHz | Carrier Power | |
| Total Power Spectral Density | -93.69 dBm/Hz | CC0 | -13.69 dBm/100.000 MHz |
| Measure Trace | Trace 1 | | |

Measure Trace

See: "[Measure Trace](#)" on page 825.

Power Results

Total carrier power, total PSD and total format carrier power are displayed in the lower window. Total format carrier power is total power of carriers of the same Radio Format. If there is no carrier of the corresponding format, it is not displayed. Thus, items in the total format power table changes depending on the carrier configuration. Since the metrics window of MSR, LTE-Advanced FDD/TDD and 5G NR is slightly denser than that for common CHP, the vertical positions of total power and power spectral density are raised.

Carrier Info: LTE-Advanced FDD/TDD and 5G NR Modes

The following diagram shows the Metrics Window in the Carrier Info view for LTE-Advanced FDD/TDD and 5G NR. The Power Results window is replaced by the carrier info table.

| 2 Carrier Info | | | | | | |
|----------------|-----------------------|---------------|-------------|--------|-------------|---------|
| Total Car Pwr | -6.70 dBm/500.000 MHz | | | | | |
| Total PSD | -93.69 dBm/Hz | | | | | |
| RF-BW | 99.970 MHz | | | | | |
| | Carrier Power | Carrier PSD | Integ BW | Filter | Offset Freq | Measure |
| CC0 | -13.69 dBm | -93.69 dBm/Hz | 100.000 MHz | OFF | 0.0 Hz | On |
| CC1 | -13.69 dBm | -93.69 dBm/Hz | 100.000 MHz | OFF | 0.0 Hz | On |
| CC2 | -13.69 dBm | -93.69 dBm/Hz | 100.000 MHz | OFF | 0.0 Hz | On |
| CC3 | -13.69 dBm | -93.69 dBm/Hz | 100.000 MHz | OFF | 0.0 Hz | On |
| CC4 | -13.69 dBm | -93.69 dBm/Hz | 100.000 MHz | OFF | 0.0 Hz | On |

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier}$

3 WLAN Mode

3.2 Channel Power Measurement

Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block (LTE-Advanced FDD/TDD Modes only)

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes as either Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Carrier Info: MSR Mode

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier Integ Bw})$ multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes according to whether Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Parameter Set

Displays which format parameter set is selected.

3.2.2.3 Gate

Window #3

Turning on **Gate** View displays the **Gate** Window, which allows you to see your gating signal at the same time as the measured data. See the description under "[Gate View On/Off](#)" on page 2494 in **Trigger, Gate Settings**.

| View | Size | Position |
|-----------|-----------------------|----------|
| Gate View | One third, full width | Top |

3.2.2.4 Marker Table

Window #4

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.2.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.2.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "[Ref Position](#)" on page 199.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:RLEV 10 dBm</code> <code>:DISP:CHP:WIND:TRAC:Y:RLEV?</code> |
| Couplings | When "Auto Scaling" on page 199 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to Ref Value |
| Preset | 10.00 dBm |
| State Saved | Saved in instrument state |
| Min/Max | -/+250.00 dBm |
| Annotation | Ref <value> top left of graph |
| Backwards Compatibility SCPI | <code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code> |

Scale/Div

Sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

| | |
|------------------------------|---|
| Remote Command | <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_amp1></code> <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:CHP:WIND:TRAC:Y:PDIV?</code> |
| Couplings | Coupled to "Scale Range" on page 681 as follows: Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 199 is ON, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to OFF |
| Preset | 10.00 dB / Div |
| State Saved | Saved in instrument state |
| Min | 0.10 dB |
| Max | 20 dB |
| Annotation | <value> dB/ left upper of graph |
| Backwards Compatibility SCPI | <code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code> |

Scale Range

Sets the Y-Axis scale range.

| | |
|----------------|---|
| Remote Command | Replace <code><meas></code> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_amp1></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code> |
| Couplings | Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF |
| Preset | 100 dB |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 200 |

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

| | |
|---------------------------------|---|
| Remote Command | <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTOm</code> <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:CHP:WIND:TRAC:Y:RPOS?</code> |
| Preset | TOP |
| State Saved | Saved in instrument state |
| Range | TOP CENTer BOTTOm |
| Annotation | The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position |
| Backwards Compatibility SCPI | <code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition</code> |

Auto Scaling

Toggles **Auto Scaling** On or Off.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:CHP:WIND:TRAC:Y:COUP?</code> |
| Couplings | When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of Scale/Div , Ref Value , or Scale Range , Auto Scaling automatically changes to OFF |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Range | OFF ON |
| Backwards Compatibility SCPI | <code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle</code> |

3.2.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 201](#)
- See ["Single-Attenuator Configuration" on page 201](#)

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

| | |
|--------------|--|
| Dependencies | In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case |
|--------------|--|

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:FRATten <rel_ampl></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code> |
| Example | <code>:POW:FRAT 14</code> <code>:POW:FRAT?</code> |
| Notes | When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value |
| Dependencies | Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists |
| Couplings | This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1753 command descriptions |
| Preset | 20 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Only valid values are 0, 6, 14, 20 dB |
| Annotation | When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: |

3 WLAN Mode

3.2 Channel Power Measurement

On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, **"Y Scale"** on page 1745 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, **"Internal Preamplifier"** on page 1775 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See **"Attenuator Configurations and Auto/Man"** on page 205

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code> |
| Example | <code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual |
| Dependencies | Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of |

| | | | | | | | |
|-----------------------|---|-----------------------|-------|-----|-------|------------------|-------|
| | <p>Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1756</p> <p>See "Attenuator Configurations and Auto/Man" on page 205 for more information on the Auto/Man functionality</p> | | | | | | |
| Couplings | <p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1752 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p> | | | | | | |
| Preset | <p>Auto</p> <p>The Auto value is 10 dB</p> | | | | | | |
| State Saved | Saved in instrument state | | | | | | |
| Min | <p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p> | | | | | | |
| Max | <table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p> | CXA Option 503 or 507 | 50 dB | EXA | 60 dB | All other models | 70 dB |
| CXA Option 503 or 507 | 50 dB | | | | | | |
| EXA | 60 dB | | | | | | |
| All other models | 70 dB | | | | | | |
| Annotation | <p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> | | | | | | |

For example:
 Dual-Attenuator configuration:
Atten: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB
 Single-Attenuator configuration:
A: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)
 When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code> |
| Example | Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code> |
| Dependencies | <code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA |
| Preset | <code>ON</code> |

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1750, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 203 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1756 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 208

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code> |
| Example | <code>:POW:EATT 10</code> <code>:POW:EATT?</code> |
| Notes | Electronic Attenuation's specification is defined only when Mech Atten is 6 dB |
| Dependencies | Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code> , and affects the total attenuation displayed on the Attenuation |

3 WLAN Mode
 3.2 Channel Power Measurement

control and the Meas Bar

The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If "**Internal Preamp**" on page 1775 is **ON** (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned

If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1777 is **ON**, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

| | |
|-------------|---|
| Couplings | Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 208 |
| Preset | 0 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB |
| Annotation | See Annotation under the Mech Atten control description |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation:STATE OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATE?</code> |
| Example | <code>:POW:EATT:STAT ON</code> |

| | |
|--------|---|
| | :POW:EATT:STAT? |
| Preset | OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator |

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 209](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1755](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

3 WLAN Mode

3.2 Channel Power Measurement

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1760.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Example | <code>:POW:RANG:OPT IMM</code> |
| Notes | Executing Adjust Atten for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code> |
| Example | <code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code> |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | <code>COMBined</code> |
| State Saved | Saved in instrument state |

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1759 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 212

| Selection | SCPI | Note |
|-----------------|-------------------|--|
| Off | OFF | This is the default setting |
| On | ON | Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined |
| Elec Atten Only | ELECTrical | Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster |
| Elec+Mech Atten | COMBined | In Dual-Attenuator models, this selects both attenuators to participate in the autoranging |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Example | <code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code> |
| Notes | The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined |
| Dependencies | Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1756 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 211 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | OFF when Elec Atten is Disabled at preset, otherwise ELEC |
| State Saved | Saved in instrument state |

| | | |
|-------|---------------------------|---|
| Range | Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten |
| | Single-Attenuator models: | Off On |

Backwards Compatibility Command

| | |
|------------------------------------|--|
| Notes | ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF |
| Backwards Compatibility SCPI | [:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO? |

Adjustment Algorithm

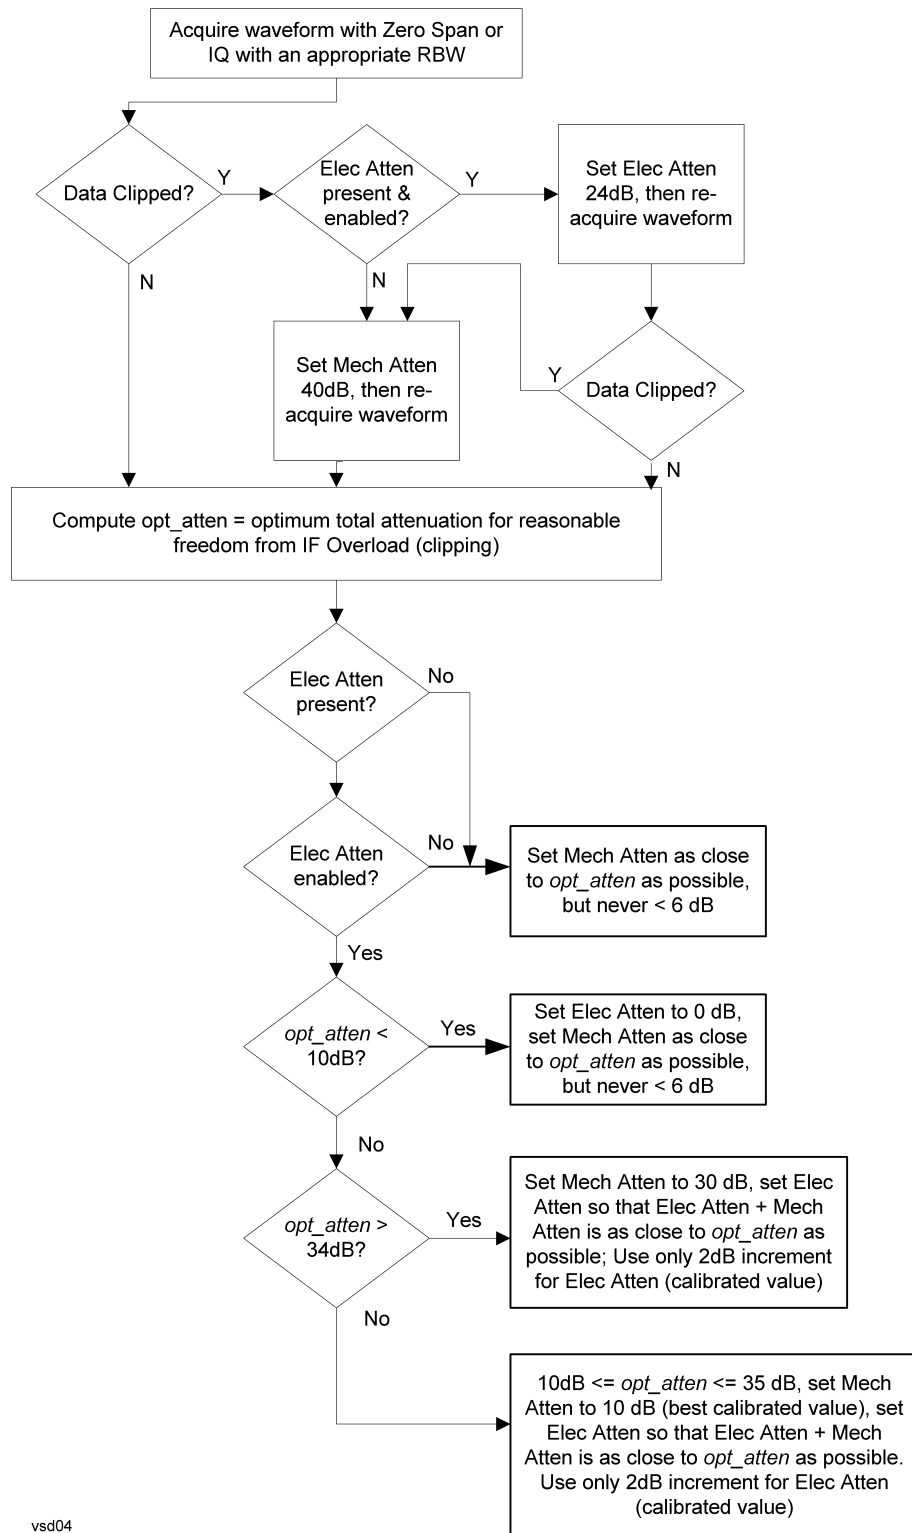

The algorithms for the adjustment are documented below:

Single-Attenuator Models

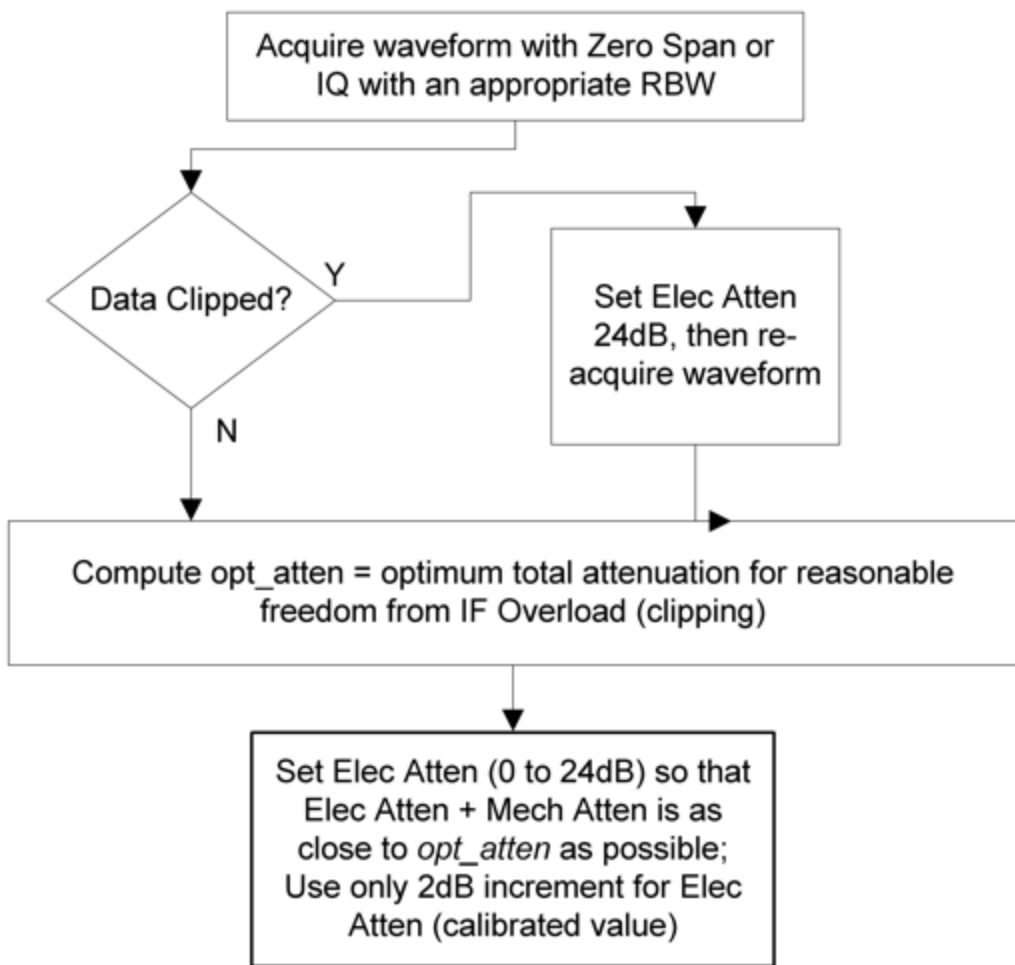

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1759 or "Pre-Adjust for Min Clipping" on page 211 selection is Mech + Elec Atten:

"Pre-Adjust for Min Clipping" on page 211 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

| | |
|--------------|---|
| | <code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code> |
| Example | <code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code> |
| Notes | Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10 |
| Dependencies | Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error |
| Couplings | When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB |
| Preset | EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB |
| State Saved | Saved in instrument state |

3.2.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

| | |
|-------------|----|
| State Saved | No |
|-------------|----|

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code> |
| Example | <code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code> |
| Notes | The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting |
| Preset | 0 dBm |
| State Saved | Yes |
| Min/Max | -/+100 |
| Annotation | Meas Bar |

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Notes | Executing Adjust Range for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |

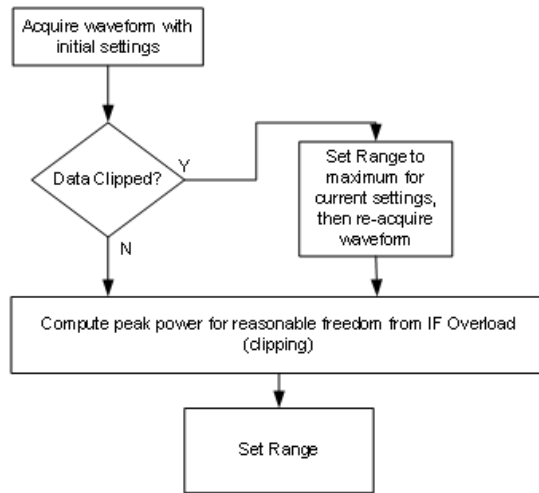

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Notes | Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |
| Preset | OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping |
| State Saved | Saved in instrument state |

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1769 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

| | | |
|----------------|--|-------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code> | |
| Example | <code>:POW:RANG:PAR 12 dB</code> | |
| Notes | In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated | |
| Dependencies | Does not appear in Spectrum Analyzer Mode | |
| Preset | VXT Models M9410A/11A | 0 dB |
| | All Others | 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB | |
| Max | VXT Models M9410A/11A | 50 dB |
| | All Others | 20 dB |

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1771. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

| | | |
|----------------|--|--------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code> | |
| Example | <code>:POW:RANG:MIX:OFFS -5 dB</code> | |
| Preset | 0 dB | |
| State Saved | Saved in instrument state | |
| Min | VXT Models M9410A/11A | -34 dB |
| | All Others | -35 dB |
| Max | 30 dB | |

3.2.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1788 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 1774 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "[Proper Preselector Operation](#)" on page 220.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe] :POWer [:RF] :PCENter</code> |
| Example | <code>:POW:PCEN</code> |
| Notes | The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command |
| Dependencies | Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Couplings | The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1774 |
| Status Bits/OPC dependencies | When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed |

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1773 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code> |
| Example | <code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code> |
| Notes | The value on the control is displayed to 0.1 MHz resolution |
| Dependencies | <ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Preset | 0 MHz |

| | |
|------------------------------|---|
| State Saved | The Preselector Adjust value set by " Presel Center " on page 1773, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle |
| Min/Max | -/+500 MHz |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command |
| Notes | The command has no effect, and the query always returns MWAVE |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code> |

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

| Selection | Example | Note |
|------------|---|---|
| Off | <code>:POW:GAIN OFF</code> | |
| Low Band | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code> | Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown |
| Full Range | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code> | Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear |

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code> |
| Example | <code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code> |
| Dependencies | Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled |
| Preset | LOW |
| State Saved | Saved in instrument state |
| Annotation | When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp) |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code> |
| Example | <code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code> |
| Preset | OFF |

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to **"Internal Preamp"** on page 1775. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with **"Internal Preamp"** on page 1775, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see **"More Information"** on page 224

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code> |
| Example | <code>:POW:GAIN:LNA ON</code> |
| Dependencies | Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled |
| Preset | OFF |
| State Saved | Saved in State |

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

| Path | Example | Note |
|-----------------------|----------------------|--|
| Standard Path | :POW:MW:PATH STD | Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled |
| Low Noise Path Enable | :POW:MW:PATH LNP | See " Low Noise Path Enable " on page 229 |
| μW Preselector Bypass | :POW:MW:PATH MPB | See " μW Preselector Bypass " on page 231 |
| Full Bypass Enable | :POW:MW:PATH FULL | See " Full Bypass Enable " on page 232 |

| Remote Command | <code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code> | | | | | | | | | | | | | | |
|-----------------|--|------|-------|-------------|---|-------|---|------|--|----------|--|-----------------|------------|---|--|
| Example | <code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code> | | | | | | | | | | | | | | |
| Notes | <p>When "Presel Center" on page 1773 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p> | | | | | | | | | | | | | | |
| Dependencies | <p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</p> | | | | | | | | | | | | | | |

3 WLAN Mode

3.2 Channel Power Measurement

Annotation In the Meas Bar, if the Standard path is chosen:
 μW Path: Standard
 If Low Noise Path is enabled but the LNP switch is not thrown:
 μW Path: LNP,Off
 If the Low Noise Path is enabled and the LNP switch is thrown:
 μW Path: LNP,On
 If the preselector is bypassed:
 μW Path: Bypass
 If Full Bypass Enable is selected but the LNP switch is not thrown:
 μW Path: FByp,Off
 If Full Bypass Enable is selected and the LNP switch is thrown:
 μW Path: FByp,On

μW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **μW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

| Measurement | μW Path Control Auto behavior |
|------------------|---|
| Digital Demod | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Custom OFDM | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |

| Measurement | μ W Path Control Auto behavior |
|--------------------|------------------------------------|
| ACP | Always Presel Bypass |
| SEM | Always Presel Bypass |
| Spurious Emissions | Always Standard Path |

WLAN Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|--|
| Modulation Analysis | Always Presel Bypass |
| Spectral Flatness | Always Presel Bypass |
| Power vs Time | Always Presel Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Always Presel Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Always Presel Bypass |

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and **"Y Scale"** on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

| | |
|------------------------------|--|
| Example | Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code> |
| Notes | Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>) |
| Preset | ON |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code> |

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

| Type | ID | |
|---|-----|---|
|  | 159 | Settings Alert - DETECTED;Presel/Meas BW conflict |

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1778.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1778 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code> |
| Example | <code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code> |
| Dependencies | Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements |
| Couplings | Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state |
| Preset | N9041B OFF N9042B+V3050A ON M9410A/11A ON |
| State Saved | Saved in instrument state |

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

3 WLAN Mode
 3.2 Channel Power Measurement

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code> |
| Example | <code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1788 is OFF . The grayout message is “Unavailable unless SW Presel enabled” |
| Preset | N9041B ADVanced N9042B+V3050A NORMa1 |
| State Saved | Saved in instrument state |

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code> |
| Example | <code>:POW:SWPR:BW NARR</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept |

| | | |

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

| | | |
|----------------|---|--|
| Remote Command | <code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code> | |

3.2.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.2.4.1 Settings

Contains the basic bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW (Auto)** selects automatic coupling of **Res BW** to "**Span**" on page 258, using the ratio set by **Span:3 dB RBW** (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Res BW**, or simply enter a different value for **Res BW**.

When **Res BW** is manually selected, you can return it to the coupled state by pressing the **Auto/Man** toggle on **Res BW**. This may also be done by pressing "**Auto Couple**" on page 1833 or by performing a **Preset**.

For more details, see "**More Information**" on page 241

| | |
|-------------------------------|---|
| Remote Command | <code>[:SENSe]:CHPower:BANDwidth[:RESolution] <bandwidth></code> <code>[:SENSe]:CHPower:BANDwidth[:RESolution]?</code> |
| Example | <code>:CHP:BAND 5 MHz</code> <code>:CHP:BAND?</code> |
| Notes | For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type |
| Couplings | Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When Res BW is set to Auto , the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings |
| Preset | See " RBW Presets " on page 241 |
| State Saved | Saved in instrument state |
| Min | 1 Hz |
| Max | 8 MHz is the max equivalent -3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than -3 dB Gaussian |
| Annotation | A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling |
| Backwards Compatibility Notes | For backwards compatibility, this command supports both the BANDwidth and BWIDth forms |
| | Auto Function |
| Remote | <code>[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO ON OFF 1 0</code> |

3 WLAN Mode

Command `[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO?`

Example `:CHP:BAND:AUTO ON`
`:CHP:BAND:AUTO?`

RBW Presets

| Mode | Preset Value |
|---------|--------------|
| LTEAFDD | Auto |
| LTEATDD | Auto |
| MSR | 100 kHz |
| NR5G | Auto |
| SA | Auto |
| SRCOMMS | 3.9 kHz |
| VMA | 240 kHz |
| WCDMA | 240 kHz |
| WLAN | 100 kHz |

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "[RBW Filter Type](#)" on page 244.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some PowerSuite measurements, in the LTE-Advanced (both FDD and TDD) and 5G NR modes, when **Res BW** is in **Auto**, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, as shown in the table below. In the Multi-carrier case, the narrowest RBW among the active carriers is used.

LTE-A FDD/TDD Modes

| Carrier BW | Auto RBW, kHz |
|-------------------------|---------------|
| 1.4 MHz | 20 |
| 3 MHz | 43 |
| 5 MHz | 68 |
| 10 MHz | 150 |
| 15 MHz | 220 |
| 20 MHz | 270 |
| 200 kHz (NB-IoT in FDD) | 10 |

5G NR Mode

| Bandwidth | Auto RBW, kHz |
|-----------|---------------|
| 5 MHz | 68 |
| 10 MHz | 150 |
| 15 MHz | 220 |
| 20 MHz | 270 |
| 25 MHz | 360 |
| 30 MHz | 430 |
| 35 MHz | 510 |
| 40 MHz | 560 |
| 45 MHz | 620 |
| 50 MHz | 680 |
| 60 MHz | 820 |
| 70 MHz | 1000 |
| 80 MHz | 1100 |
| 90 MHz | 1300 |
| 100 MHz | 1500 |
| 200 MHz | 2700 |
| 400 MHz | 3000 |
| 800 MHz | 3000 |
| 1600 MHz | 3000 |
| 2000 MHz | 3000 |

Video BW

Lets you change the instrument post-detection filter (VBW or “Video Bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by **VBW:3 dB RBW**. To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Video BW**, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing **"Auto Couple"** on page 1833 or by performing a **Preset**.

Remote Command `[:SENSe]:CHPower:BANDwidth:VIDeo <bandwidth>`
 `[:SENSe]:CHPower:BANDwidth:VIDeo?`

Example `:CHP:BAND:VID 2.4 MHz`

3 WLAN Mode
3.2 Channel Power Measurement

| :CHP:BAND:VID? | |
|-------------------------------|--|
| Notes | For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean "wide open" The values shown in this table reflect the conditions after a Mode Preset |
| Dependencies | Sometimes the displayed Video BW is not actually used to process the trace data: When the Average Detector is selected and Sweep Type is set to Swept , the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, VBW still acts to change the Sweep Time, if " Sweep Time " on page 1717 is in Auto , and still affects the data on other traces for which this is not the case |
| Couplings | Video bandwidth (VBW) is normally coupled to " Res BW " on page 240. If VBW is set to Auto , then VBW is changed as RBW changes, to maintain the ratio set by VBW:3 dB RBW (usually 10:1 for measurements that do not have a VBW:3 dB RBW control) |
| Preset | Auto (unless noted in table below) |
| State Saved | Saved in instrument state |
| Min | 1 Hz |
| Max | 50 MHz |
| Annunciation | A "#" mark appears before "VBW" in the annotation when it is not coupled |
| Annotation | In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above) |
| Backwards Compatibility Notes | For backwards compatibility, this command supports both the BANDwidth and BWIDth forms |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :CHPower :BANDwidth :VIDeo :AUTO ON OFF 1 0</code> <code>[:SENSe] :CHPower :BANDwidth :VIDeo :AUTO?</code> |
| Example | <code>:CHP:BAND:VID:AUTO OFF</code> <code>:CHP:BAND:VID:AUTO?</code> |
| Preset | ON |

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

| Mode | Preset Value |
|-------|--------------|
| WCDMA | 2.40 MHz |

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum instruments were Gaussian filters, specified using the -3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its -3 dB points 10 MHz apart. In X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

| | Filter Type | SCPI Example | | | | | | | | | | | | | | |
|------------------------------|--|------------------------------|--------------------------|---------------|-----------------|-----------------------|-----------------|-----------------------|-------------------|-------------------------|-----------------|-----------------------|---------------|--------------------|---------------------|-------------------------|
| | Gaussian | <code>:BAND:SHAP GAUS</code> | | | | | | | | | | | | | | |
| | Flattop | <code>:BAND:SHAP FLAT</code> | | | | | | | | | | | | | | |
| Remote Command | <code>[:SENSe]:CHPower:BANDwidth:SHAPE GAUSSian FLATtop</code> | | | | | | | | | | | | | | | |
| | <code>[:SENSe]:CHPower:BANDwidth:SHAPE?</code> | | | | | | | | | | | | | | | |
| Example | <code>:CHP:BAND:SHAP GAUS</code> | | | | | | | | | | | | | | | |
| | <code>:CHP:BAND:SHAP?</code> | | | | | | | | | | | | | | | |
| Notes | <p><code>GAUSSian</code> = Gaussian</p> <p><code>FLATtop</code> = Flattop</p> <p>We use <code>SHAPE</code> instead of <code>TYPE</code> (even though the control name uses Type) because <code>TYPE</code> is used for backwards compatibility</p> | | | | | | | | | | | | | | | |
| Preset | "Auto Couple" on page 1833 selects the preset value | | | | | | | | | | | | | | | |
| State Saved | Saved in instrument state | | | | | | | | | | | | | | | |
| Annotation | <p>The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:</p> <table border="1"> <tbody> <tr> <td>-3 dB (Normal) filter BW</td> <td>Res BW 300 Hz</td> </tr> <tr> <td>-6 dB filter BW</td> <td>Res BW (-6 dB) 422 Hz</td> </tr> <tr> <td>Noise filter BW</td> <td>Res BW (Noise) 317 Hz</td> </tr> <tr> <td>Impulse filter BW</td> <td>Res BW (Impulse) 444 Hz</td> </tr> <tr> <td>CISPR filter BW</td> <td>Res BW (CISPR) 200 Hz</td> </tr> <tr> <td>MIL filter BW</td> <td>Res BW (MIL) 1 kHz</td> </tr> <tr> <td>Flattop filter type</td> <td>Res BW (Flattop) 300 Hz</td> </tr> </tbody> </table> | | -3 dB (Normal) filter BW | Res BW 300 Hz | -6 dB filter BW | Res BW (-6 dB) 422 Hz | Noise filter BW | Res BW (Noise) 317 Hz | Impulse filter BW | Res BW (Impulse) 444 Hz | CISPR filter BW | Res BW (CISPR) 200 Hz | MIL filter BW | Res BW (MIL) 1 kHz | Flattop filter type | Res BW (Flattop) 300 Hz |
| -3 dB (Normal) filter BW | Res BW 300 Hz | | | | | | | | | | | | | | | |
| -6 dB filter BW | Res BW (-6 dB) 422 Hz | | | | | | | | | | | | | | | |
| Noise filter BW | Res BW (Noise) 317 Hz | | | | | | | | | | | | | | | |
| Impulse filter BW | Res BW (Impulse) 444 Hz | | | | | | | | | | | | | | | |
| CISPR filter BW | Res BW (CISPR) 200 Hz | | | | | | | | | | | | | | | |
| MIL filter BW | Res BW (MIL) 1 kHz | | | | | | | | | | | | | | | |
| Flattop filter type | Res BW (Flattop) 300 Hz | | | | | | | | | | | | | | | |
| Backwards Compatibility SCPI | <code>[:SENSe]:CHPower:BWIDth:SHAPE</code> | | | | | | | | | | | | | | | |

3.2.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.2.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

| | |
|---------------------------------|--|
| Remote Command | <code>:DISPlay:CHPower:WINDow[1]:BGRaph ON OFF 1 0</code> <code>:DISPlay:CHPower:WINDow[1]:BGRaph?</code> |
| Example | <code>:DISP:CHP:WIND:BGR ON</code> <code>:DISP:CHP:WIND:BGR?</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | ON OFF |
| Backwards Compatibility SCPI | <code>:DISPlay:CHPower:VIEW[1]:WINDow[1]:BGRaph</code> |

3.2.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code> |
| Example | <code>:DISP:GRAT OFF</code> |
| Notes | The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and |

| | |
|---------------------------------|--|
| | Y-Axis |
| Preset | ON |
| State Saved | Saved in instrument state |
| Backwards Compatibility SCPI | <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored |

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code> |
| Example | <code>:DISP:ANN:SCR OFF</code> |
| Dependencies | Grayed-out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> |
|----------------|---|

3 WLAN Mode
3.2 Channel Power Measurement

| | |
|-------------|---|
| | <code>:DISPlay:ANNotation:TRACe[:STATe]?</code> |
| Example | <code>:DISP:ANN:TRAC OFF</code> |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code> |
| Example | <code>:DISP:ACT OFF</code> |
| Dependencies | Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code> |
| Preset | <code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code> |
| State Saved | Saved in instrument state |

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code> |
| Example | <code>:DISP:ANN:MBAR OFF</code> |
| Dependencies | Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code> |
| Preset | <code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code> |
| State Saved | Saved in instrument state |

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

| Name | Command |
|----------------------------|--|
| Select User View | <code>:DISPlay:VIEW:ADVanced:SElect</code> |
| Rename User View | <code>:DISPlay:VIEW:ADVanced:REName</code> |
| Delete User View | <code>:DISPlay:VIEW:ADVanced:DELeTe</code> |
| Create User View | <code>:DISPlay:VIEW:ADVanced:NAME</code> |
| Select Screen | <code>:INSTrument:SCReen:SElect</code> |
| Delete Screen | <code>:INSTrument:SCReen:DELeTe</code> |
| Delete All But This Screen | <code>:INSTrument:SCReen:DELeTe:ALL</code> |
| Add Screen | <code>:INSTrument:SCReen:CREate</code> |
| Rename Screen | <code>:INSTrument:SCReen:REName</code> |
| Sequencer On/Off | <code>:SYSTem:SEQuencer</code> |

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:ENABle OFF ON 0 1</code> |
| Example | <code>:DISP:ENAB OFF</code> |
| Couplings | <code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code> |
| Preset | ON |

| | |
|-------------------------------|---|
| | Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code> |
| State Saved | Not saved in instrument state |
| Backwards Compatibility Notes | <code>:SYST:PRES</code> no longer turns on <code>:DISPlay:ENABle</code> as it did in legacy analyzers |

3.2.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 191.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code> |
| Example | Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code> |
| Notes | <p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOom</code>) with</p> <pre><code>:DISP:VIEW:ADV:SEL</code></pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <pre><code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

| | |
|------------------------------|--|
| Backwards Compatibility SCPI | The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views |
|------------------------------|--|

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code> |
| Example | <code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View |
| Notes | <code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated |

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code> |
| Example | <code>:DISP:VIEW:ADV:REN "Baseband"</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DElete</code> |
| Example | <code>:DISP:VIEW:ADV:DEL</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DElete:ALL</code> |
|----------------|--|

| | |
|---------|-------------------------------------|
| Example | <code>:DISP:VIEW:ADV:DEL:ALL</code> |
| Notes | Disabled if there are no User Views |

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:CAT?</code> |
| Notes | <p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p> |

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:USER:CAT?</code> |
| Notes | <p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1804), then query the list of available Views, the result is undefined</p> |

3.2.6 Frequency

Contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by "[Meas Preset](#)" on page 276. For example, **Center Frequency** is the same for all measurements – it does not change as you change measurements.

3.2.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, "[Span](#)" on page 258 is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global Center Frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz, and when you go back to the RF Input, **Center Frequency** will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

- "[RF Center Freq](#)" on page 256
- "[Ext Mix Center Freq](#)" on page 257

- "I/Q Center Freq" on page 258
- "Center Frequency Presets" on page 254
- "VXT Models with Radio Heads/CIU Frequency Range" on page 256

| | |
|------------------------------|--|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer?</code> |
| Example | Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment the Center Frequency by the value of CF Step: <code>:FREQ:CENT UP</code> Return the current value of Center Frequency: <code>:FREQ:CENT?</code> |
| Notes | Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> - For RF input, equivalent to <code>:FREQ:RF:CENT</code> - For I/Q input, equivalent to <code>:FREQ:IQ:CENT</code> - For External Mixer, equivalent to <code>:FREQ:EMIX:CENT</code> Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated |
| Dependencies | Not available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes |
| Preset | Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 254 and "RF Center Freq" on page 256 and "Ext Mix Center Freq" on page 257 and "I/Q Center Freq" on page 258 and "VXT Models with Radio Heads/CIU Frequency Range" on page 256 |
| State Saved | Saved in instrument state |
| Min/Max | Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 254 and "RF Center Freq" on page 256 and "I/Q Center Freq" on page 258 and "VXT Models with Radio Heads/CIU Frequency Range" on page 256 |
| Annotation | Center <value> appears in the lower left corner of the display |
| Status Bits/OPC dependencies | Non-overlapped |

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

3 WLAN Mode
3.2 Channel Power Measurement

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------------------|-----------------------------|------------------------------------|------------------------------------|
| 503 (all but CXA) | 1.805 GHz | 3.6 GHz | 3.7 GHz |
| 503 (CXA) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| 507 (all but CXA) | 3.505 GHz | 7.0 GHz | 7.1 GHz |
| 507 (CXA) | 3.755 GHz | 7.5 GHz | 7.58 GHz |
| 508 (all but MXE) | 1.805 GHz | 3.6 GHz | 8.5 GHz |
| 508 (MXE) | 4.205 GHz | 8.4 GHz | 8.5 GHz |
| 513 | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| 526 (except CXA and MXE) | 13.255 GHz | 26.5 GHz | 27.0 GHz* |
| 526 (CXA) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 526 (MXE) | 1.805 GHz | 3.6 GHz | 27.0 GHz |
| 532 | 16.005 GHz | 32.0 GHz | 32.5 GHz |
| 540 | 20.005 GHz | 40.0 GHz | 40.5 GHz |
| 543 | 21.505 GHz | 43.0 GHz | 43.0 GHz |
| 544 | 22.005 GHz | 44.0 GHz | 45.0 GHz |
| 550 | 25.005 GHz | 50.0 GHz | 52 GHz |
| F03 (CXA-m) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| F07 (CXA-m) | 3.755 GHz | 7.5 GHz | 7.575 GHz |
| F13 (CXA-m) | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| F26 (CXA-m) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 504 (M9421A, M8920A) | 2.145 GHz | 3.88GHz | 3.88 GHz |
| 506 (M9421A, M8920A) | 3.245 GHz | 6.08GHz | 6.08 GHz |
| F06 (M9410A/11A) | 1.0 GHz | 6.08 GHz | 6.08 GHz |
| F06 (M9415A) | 1 GHz | 1.08 GHz | 6.6 GHz |
| F08 (M9415A) | 1 GHz | 1.08 GHz | 8.6 GHz |
| F12 (M9415A) | 1 GHz | 1.08 GHz | 12.9 GHz |

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

| Input | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|---------------------|-----------------------------|------------------------------------|------------------------------------|
| Input 1, all models | 25.005 GHz | 50.0 GHz | 52 GHz |
| Input 2, opt 585 | 42.505 GHz | 85.0 GHz | 86 GHz |
| Input 2, opt 590 | 45.005 GHz | 90.0 GHz | 92 GHz |
| Input 2, opt 5CX | 55.005 GHz | 110.0 GHz | 110 GHz |

Input 2, CXA and MXE

| Model | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|-------------|----------------------|-----------------------------|-----------------------------|
| CXA opt C75 | 0.7505 GHz | 1.5 GHz | 1.58 GHz |
| MXE | 505 MHz | 1 GHz | 1.000025 GHz |

Tracking Generator Frequency Limits (CXA only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 9 kHz | 3.0 GHz | 3.08 GHz |
| T06 | 9 kHz | 6.0 GHz | 6.05 GHz |

Tracking Generator Frequency Limits(CXA-m only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 2 MHz | 3.08 GHz | 3.08 GHz |
| T07 | 2 MHz | 7.575 GHz | 7.575 GHz |
| T13 | 2 MHz | 13.8 GHz | 13.8 GHz |
| T26 | 2 MHz | 26.55 GHz | 26.55 GHz |

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

| Products with Radio Heads/CIU | Preset | Start frequency | Stop frequency |
|-------------------------------|--------|-----------------|----------------|
| M9421A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU + RRH | 25 GHz | 24.25 GHz | 43.5 GHz |

RF Center Freq

Sets the **Center Frequency** to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command [:SENSe]:FREQuency:RF:CENTer <freq>

3 WLAN Mode
3.2 Channel Power Measurement

| | |
|--------------|---|
| | <code>[:SENSe] :FREQuency:RF:CENTer?</code> |
| Example | <code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode |
| Dependencies | If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning |
| Preset | See table above |
| State Saved | Saved in instrument state |
| Min | -79.999995 MHz |
| Max | 26.99999995 GHz See " Center Frequency Presets " on page 254. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on " Span " on page 258 |

Ext Mix Center Freq

Sets the **Center Frequency** to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel *always* applies to the currently selected input.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code> |
| Example | <code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all measurements in the Mode |
| Couplings | When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing, so you will return to the band you were in, with the Center Frequency that you had. However, " Span " on page 258 is not an input-dependent parameter, so you will retain the span from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup |
| Preset | When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span = Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets Center Frequency to the midpoint of the Start and Stop Freq values |

| | |
|---|---|
| | <p>in the Harmonic Table</p> <p>When Restore Input/Output Defaults is performed, the mixer presets to the 11970A values, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz</p> <p>Therefore, following Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz</p> |
| State Saved | Yes |
| Min | <p>The minimum frequency in the currently selected mixer band + 5 Hz</p> <p>If the knob or step keys are being used, also depends on Span</p> |
| Max | <p>The maximum frequency in the currently selected mixer band – 5 Hz</p> <p>If the knob or step keys are being used, also depends on Span</p> |
| <h3>I/Q Center Freq</h3> <p>Sets the Center Frequency to use when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that Center Frequency in the Frequency menu on the front panel always applies to the currently selected input.</p> | |
| Remote Command | <p><code>[:SENSe] :FREQuency :IQ :CENTer <freq></code></p> <p><code>[:SENSe] :FREQuency :IQ :CENTer ?</code></p> |
| Example | <code>:FREQ:IQ:CENT 30 MHz</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all measurements in the Mode |
| Preset | 0 Hz |
| State Saved | Saved in instrument state |
| Min/Max | -/+40.049995 MHz |

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting **Span**, **Center Frequency** is held constant, which means that both Start Frequency and Stop Frequency will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) **Span** is calculated using the number of carriers and the carrier width where;

$$\text{Span} = (\text{Upper Carrier Freq} + (\text{max offset IBW} * (1 + \alpha)) / 2) - (\text{Lower Carrier Freq} - (\text{max offset IBW} * (1 + \alpha)) / 2)$$

3 WLAN Mode
 3.2 Channel Power Measurement

If the RRC Filter is on, then span is increased by a factor of 1 + Filter Alpha.

See "[Span Presets](#)" on page 260

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :CHPower :FREQuency :SPAN <freq></code> <code>[:SENSe] :CHPower :FREQuency :SPAN?</code> |
| Example | <code>:CHP :FREQ :SPAN 10 MHz</code> <code>:CHP :FREQ :SPAN?</code> |
| Dependencies | <p>If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error</p> <p>In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz. See the Stop Frequency control description for details of this limitation</p> <p>For MSR Mode, this control is not shown</p> <p>For WLAN 802.11ac (80 MHz + 80 MHz), the control is not enabled, and its value is coupled with the spacing between the center frequencies of the two carriers</p> <p>Span = Center Frequency 1 – Center Frequency 2 + Integ BW + 40 MHz Margin</p> <p>When the calculated span is over 1 GHz, it is still coupled to its maximum value, which is 1 GHz</p> |
| Couplings | <p>Span affects "Res BW" on page 240, Sweep Time, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings)</p> <p>Any value of Center Frequency or Span that is within the frequency range of the instrument is allowed <i>when</i> the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range</p> <p>When using the knob or the step up/down keys or the UP DOWN keywords in SCPI, the value that is being changed, that is, Center Frequency or Span, is limited so that the other parameter is not forced to a new value</p> <p>When Res BW is set to Auto, the resolution bandwidth is auto-coupled to span. The ratio of span /RBW is approximately 106:1. When Res BW is set to Man, bandwidths are entered by the user, and these bandwidths are used regardless of other instrument settings</p> <p>Since Span is coupled to Integ BW in the factory default condition, if you change the Integ BW setting, the span setting changes by a proportional amount until a limit value is reached. However, the span can be individually set. The minimum value of the span is coupled with the integration bandwidth</p> <p>Span cannot be set less than the Integ BW value. When Span is changed, the ratio of Span/Integ BW is set, and retained when Integ BW is changed</p> |
| Preset | <p>Depends on instrument maximum frequency, mode, measurement, and selected input</p> <p>See "Span Presets" on page 260</p> |
| State Saved | Saved in instrument state |
| Min | <p>100 Hz</p> <p>In 5G NR, LTEAFDD, and LTEATDD Modes, this value is the minimum value required for the measurement, which depends on the Component Carrier configuration</p> |
| Max | <p>Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 260</p> |

| | |
|------------------------|--|
| | If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency |
| Annunciation | Data out of range, value clipped to upper limit |
| Annotation | Span <value> appears on the first line of the annotation in the lower right corner of display |
| LTE, 5G NR Modes only: | |
| Remote Command | <code>[:SENSe]:CHPower:FREQuency:SPAN:AUTO ON OFF 1 0</code> <code>[:SENSe]:CHPower:FREQuency:SPAN:AUTO?</code> |
| Example | <code>:CHP:FREQ:SPAN:AUTO OFF</code> <code>:CHP:FREQ:SPAN:AUTO?</code> |
| Notes | The span value is adjusted when the relevant carrier parameters such as bandwidth, integration bandwidth, number of component carriers etc., are changed, whatever the span state (Auto or Man) When in Man state, if the input value is less than the required sum of total integration bandwidths and gaps of the multi-carriers, the required span value is set |
| Dependencies | Only available in LTE/LTE-Advanced FDD/TDD Modes and 5G NR Mode, CHP measurement |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | Auto Man |

Span Presets

The following table provides the Max Span, for the various frequency options:

| Freq Option | Max Span (can't set higher than this) |
|------------------------------|--|
| 503 (all but CXA) | 3.7 GHz |
| 503, F03 (CXA, CXA-m) | 3.08 GHz |
| 507 (all but CXA) | 7.1 GHz |
| 507 (CXA, CXA-m) | 7.575 GHz |
| 508 (all but MXE) | 8.5 GHz |
| 508 (MXE) | 8.5 GHz |
| 513, F13 | 13.8 GHz |
| 526 (all but CXA and MXE) | 27.0 GHz |
| 526 | 27.0 GHz |

3 WLAN Mode
3.2 Channel Power Measurement

| Freq Option | Max Span (can't set higher than this) |
|--|--|
| (MXE) | |
| 526, F26 (CXA, CXA-m) | 26.55 GHz |
| 544 | 44.5 GHz |
| 550 | 52 GHz |
| F06 (VXT models M9410A/11A) | 5.75 GHz |
| F06 & EP6 (VXT models M9410A/11A) | 6.27 GHz |
| F06 & LFE & EP6 (VXT models M9411A) | 6.5999935 GHz |
| M9415A-F06 | 6.27 GHz |
| M9415A-F08 | 8.27 GHz |
| M9415A-F12 | 12.57 GHz |

Input 2:

| Model | Max Span (can't set higher than this) |
|--------------|--|
| CXA opt C75 | 1.58 GHz |
| MXE | 1.000025 GHz |

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

| Mode | Radio Std | Preset Value |
|-------------|------------------|---------------------|
| SA | | 3 MHz |
| WCDMA | | 7.5 MHz |
| LTE | | 7.5 MHz |
| LTETDD | | 7.5 MHz |
| 5G NR | | 150 MHz |

| Mode | Radio Std | Preset Value |
|------|----------------------------------|--------------|
| WLAN | 802.11a/g(OFDM/DSSS-OFDM) | 30 MHz |
| | 802.11b | 37.5 MHz |
| | 802.11n/ac/ax/be 20MHz | 30 MHz |
| | 802.11n/ac/ax/be 40MHz | 60 MHz |
| | 802.11n/ac/ax/be 80 MHz | 120 MHz |
| | 802.11n/ac/ax/be 160 MHz | 240 MHz |
| | 802.11n/ac/ax/be 80 MHz + 80 MHz | 360 MHz |
| | 802.11be 320 MHz | 480MHz |
| | 802.11be 160MHz + 160MHz | 440MHz |

CF Step

Changes the step size for **Center Frequency** and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code> |
| Example | Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> |
| Notes | Preset and Max values depend on Hardware Options |
| Dependencies | If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning Not available in the MSR, LTE-A FDD/TDD and 5G NR Modes |
| Couplings | When auto-coupled, the center frequency step size is set to 10% of the span |
| Preset | Auto |
| State Saved | Saved in instrument state |
| Min/Max | -/+ (the maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band |
| Status Bits/OPC dependencies | non-overlapped |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> |
| Example | <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code> |

Full Span (Remote Command Only)

Changes the span to show the full frequency range of the instrument. It maximizes the span within a range not changing the center frequency.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :CHPower:FREQuency:SPAN:FULL</code> |
| Example | <code>:CHP:FREQ:SPAN:FULL</code> |
| Couplings | Selecting full span changes the measurement span value |

3.2.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.2.7.1 Select Marker

Specifies the *selected marker*. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. If you select a tab whose controls do *not* depend on the selected marker (for example, Counter), then this control is blanked.

For any menu that includes **Select Marker**, the first control is always **Marker Frequency**.

| | |
|--------------|---|
| Notes | The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak |
| Preset | Marker 1 |
| State Saved | The number of the selected marker is saved in instrument state |
| Annunciation | Appears in the marker results block label for Normal , Delta and Fixed markers |

3.2.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X?</code> |
| Example | <code>:CALC:CHP:MARK3:X 0</code> <code>:CALC:CHP:MARK3:X?</code> |
| Notes | If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time |
| Preset | After a preset, all markers are turned OFF , so Marker X-Axis Value query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min/Max | -/+9.9E+37 |
| Annotation | Mkr # <X value> and <Marker value> upper right on graph |

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta**, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X:POSiTion <real></code> <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:X:POSiTion?</code> |
| Example | <code>:CALC:CHP:MARK10:X:POS 0</code> <code>:CALC:CHP:MARK10:X:POS?</code> |
| Notes | The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to |

3 WLAN Mode
3.2 Channel Power Measurement

| | |
|-------------|--|
| | trace points . When a marker is turned on, it is placed at the center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is Off , the response is Not A Number |
| Preset | After a preset, all markers are turned Off , so the query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min/Max | -/+9.9E+37 |

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y-Axis unit.

| | |
|------------------------------|--|
| Remote Command | :CALCulate:CHPower:MARKer[1] 2 ... 12:Y? |
| Example | :CALC:CHP:MARK11:Y? |
| Notes | Returns the marker Y-Axis result if the control mode is Normal or Delta If the marker is Off , then the response is Not A Number |
| Preset | Result dependent on Markers setup and signal source |
| State Saved | No |
| Backwards Compatibility SCPI | :CALCulate:CHPower:MARKer[1] 2 ... 12:FUNCTION:RESult? |

Marker Mode

Sets the marker control mode to **POSITION** (**Normal**), **DELTA**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **POSITION** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

| | |
|----------------|--|
| Remote Command | :CALCulate:CHPower:MARKer[1] 2 ... 12:MODE POSITION DELTA OFF :CALCulate:CHPower:MARKer[1] 2 ... 12:MODE? |
| Example | :CALC:CHP:MARK3:MODE POS :CALC:CHP:MARK3:MODE? |
| Preset | OFF |
| State Saved | Saved in instrument state |

| | |
|------------|---|
| Range | POSition DELTA OFF |
| Annotation | Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph |

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it in **POSition (Normal)** mode and places it at the center of the screen.

| | |
|------------------------------|--|
| Example | :CALC:CHP:MARK3:STAT ON :CALC:CHP:MARK3:STAT? |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | OFF ON |
| Backwards Compatibility SCPI | :CALCulate:CHPower:MARKer[1] 2 ... 12:STATE OFF ON 0 1 :CALCulate:CHPower:MARKer[1] 2 ... 12:STATE? |

Delta Marker (Reset Delta)

This control has the same effect as pressing **Delta** in "**Marker Mode**" on page 265. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

| | |
|----------------|--------------------------------|
| Remote Command | :CALCulate:CHPower:MARKer:AOFF |
| Example | :CALC:CHP:MARK:AOFF |

3.2.7.3 Peak Search

The controls on this tab let you move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "[Marker Delta](#)" on page 267.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on page 264 in the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum Y-Axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

| | |
|----------------|---|
| Remote Command | :CALCulate:CHPower:MARKer[1] 2 ... 12:MAXimum |
|----------------|---|

| | |
|---------|-----------------------------------|
| Example | :CALC:CHP:MARK2:MAX :SYST:ERR? |
|---------|-----------------------------------|

can be used to query the errors to determine if a peak is found. Following an unsuccessful search, the message "No peak found" is returned

| | |
|-------|---|
| Notes | Sending this command selects the subopcoded marker In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored |
|-------|---|

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "[Marker Mode](#)" on page 265 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.2.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on page 264 in the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

| | |
|----------------|--|
| Remote Command | :CALCulate:CHPower:MARKer[1] 2 ... 12:REference <integer> :CALCulate:CHPower:MARKer[1] 2 ... 12:REference? |
| Example | :CALC:CHP:MARK:REF 5 :CALC:CHP:MARK:REF? |
| Notes | Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker) |
| Couplings | If the reference marker is Off , it is turned on in Normal mode at the delta marker location |
| Preset | The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . Not reset by Marker Off , All Markers Off , or Preset |
| State Saved | Saved in instrument state. Not affected by Marker Off, and hence not affected by Preset or power cycle |
| Min | 1 |
| Max | 12 |
| Annunciation | Appears in the marker label of a Delta marker |

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves the marker from the trace it was on to the new trace. If the marker is **Off**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:CHPower:MARKer[1] 2 ... 12:TRACe?</code> |
| Example | <code>:CALC:CHP:MARK2:TRAC 2</code> <code>:CALC:CHP:MARK2:TRAC?</code> |
| Notes | A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number |
| Couplings | The state of Marker Trace is not affected by " Auto Couple " on page 1833 Sending the remote command causes the addressed marker to become selected |
| Preset | 1 |
| State Saved | Saved in instrument state |

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "[Marker Settings Diagram](#)" on page 266 in the **Settings** tab.

3.2.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.2.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:CHPower:AVERage:COUNT <integer></code> <code>[:SENSe]:CHPower:AVERage:COUNT?</code> |
| Example | <code>:CHP:AVER:COUN 15</code> <code>:CHP:AVER:COUN?</code> |
| Preset | SA, WLAN: 10 WCDMA, LTEAFDD, LTEATDD, 5G NR, MSR: 200 |
| State Saved | Saved in instrument state |
| Min/Max | 1 / 10000 |
| Annotation | The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format <code>n/N</code> where <code>n</code> is the current average and <code>N</code> is the average count |

Averaging On/Off

Turns averaging on or off for this measurement.

NOTE

In this measurement, the **Average Type** is preset to the [Log-Pwr Avg \(Video\)](#) method. Other averaging methods are not available.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CHPower:AVERage[:STATe]?</code> |
| Example | <code>:CHP:AVER ON</code> <code>:CHP:AVER?</code> |
| Preset | ON |
| State Saved | Yes |
| Range | ON OFF |

Avg Mode

Allows you to select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. Options are:

3 WLAN Mode
3.2 Channel Power Measurement

- **EXPonential**: The measurement averaging continues using the specified number of averages to compute each exponentially-weighted averaged value. The average is displayed at the end of each sweep
- **REPeat**: The measurement resets the average counter each time the specified number of averages is reached

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:AVERage:TCONtrol EXPonential REPeat</code> <code>[:SENSe]:CHPower:AVERage:TCONtrol?</code> |
| Example | <code>:CHP:AVER:TCON EXP</code> <code>:CHP:AVER:TCON?</code> |
| Preset | <code>EXP</code> |
| State Saved | Yes |
| Range | <code>EXPonential REPeat</code> |

Integ BW

Specifies the range of integration used in calculating the power in the channel. The integration bandwidth (IBW) is displayed on the trace as two markers connected by an arrow.

| Remote Command | <code>[:SENSe]:CHPower:BANDwidth:INTEgration <bandwidth></code> <code>[:SENSe]:CHPower:BANDwidth:INTEgration?</code> | | | | | | | | | | | | |
|------------------|--|----------|-----------|----------|----|--|-------|-------|--|-------|------------------|--|-------|
| Example | <code>:CHP:BAND:INT 10MHz</code> <code>:CHP:BAND:INT?</code> | | | | | | | | | | | | |
| Dependencies | For LTE-Advanced FDD/TDD, 5G NR and MSR Modes, this control is not shown | | | | | | | | | | | | |
| Couplings | The minimum value of the span is coupled with Integ BW When you change Integ BW, the span changes accordingly by keeping the same ratio of Span/Integ BW | | | | | | | | | | | | |
| Preset | <table border="1"> <thead> <tr> <th>Mode</th> <th>Radio Std</th> <th>Integ BW</th> </tr> </thead> <tbody> <tr> <td>SA</td> <td></td> <td>2 MHz</td> </tr> <tr> <td>WCDMA</td> <td></td> <td>5 MHz</td> </tr> <tr> <td>LTEAFDD, LTEATDD</td> <td></td> <td>5 MHz</td> </tr> </tbody> </table> | Mode | Radio Std | Integ BW | SA | | 2 MHz | WCDMA | | 5 MHz | LTEAFDD, LTEATDD | | 5 MHz |
| Mode | Radio Std | Integ BW | | | | | | | | | | | |
| SA | | 2 MHz | | | | | | | | | | | |
| WCDMA | | 5 MHz | | | | | | | | | | | |
| LTEAFDD, LTEATDD | | 5 MHz | | | | | | | | | | | |

| Mode | Radio Std | Integ BW |
|------|-------------------------------|----------|
| WLAN | 802.11a/g(OFDM/DSSS-OFDM) | 20 MHz |
| | 802.11b | 25 MHz |
| | 802.11n/ac/ax/be (20MHz) | 20 MHz |
| | 802.11n/ac/ax/be (40MHz) | 40 MHz |
| | 802.11n/ac/ax/be (80MHz) | 80 MHz |
| | 802.11ax/be (80 MHz + 80 MHz) | 80 MHz |
| | 802.11ac/ax/be (160 MHz) | 160 MHz |
| | 802.11be (160 MHz + 160MHz) | 160 MHz |
| | 802.11be (320MHz) | 320 MHz |

| | |
|------------------------------|---|
| State Saved | Saved in instrument state |
| Min/Max | 100 Hz / Hardware Maximum Span |
| Backwards Compatibility SCPI | <code>[:SENSe] :CHPower:BWIDth:INTEgration</code> |

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz (**DBMHZ**) and dBm/MHz (**DBMMHZ**).

| | |
|----------------|---|
| Remote Command | <code>:UNIT:CHPower:POWer:PSD DBMHZ DBMMHZ</code> <code>:UNIT:CHPower:POWer:PSD?</code> |
| Example | <code>:UNIT:CHP:POW:PSD DBMMHZ</code> <code>:UNIT:CHP:POW:PSD?</code> |
| Couplings | When the PSD unit is changed, the response to <code>:MEAS READ FETCH:CHP1?</code> also changes by the PSD unit basis (either dBm/Hz or dBm/MHz) |
| Preset | WLAN mode or SA mode with WLAN radio standard: DBMMHZ Otherwise: DBMHZ |
| State Saved | Saved in instrument state |
| Range | dBm/Hz dBm/MHz |

IF Gain

Sets **IF Gain** to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :CHPower:IF:GAIN[:STATe] ON OFF 1 0</code> |
|----------------|---|

| | |
|----------------|---|
| | <code>[:SENSe]:CHPower:IF:GAIN[:STATe]?</code> |
| Example | <code>:CHP:IF:GAIN ON</code> <code>:CHP:IF:GAIN?</code> |
| Notes | ON = high gain OFF = low gain |
| Dependencies | The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamp-lifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls Not available in VXT model M9421A |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | Low Gain High Gain Auto Function |
| Remote Command | <code>[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe]?</code> |
| Example | <code>:CHP:IF:GAIN:AUTO ON</code> <code>:CHP:IF:GAIN:AUTO?</code> |
| Couplings | Auto sets IF Gain to High Gain if the input attenuator is set to 0 dB, or if the preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low Gain |
| Preset | OFF |

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is **Enabled** (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to **Disabled (OFF)**.

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be negatively impacted.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:SAVoid[:STATe] ON OFF 0 1</code> <code>[:SENSe]:CHPower:SAVoid[:STATe]?</code> |
| Example | <code>:CHP:SAV ON</code> <code>:CHP:SAV?</code> |
| Dependencies | Only appears in VXT models M9410A/11A/15A |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |
| Range | <code>ON OFF</code> |

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 275 below.

| | |
|-------------------------------|--|
| Remote Command | <code>:COUPle ALL</code> |
| Example | <code>:COUP ALL</code> |
| Backwards Compatibility SCPI | <code>:COUPLE ALL NONE</code> |
| Backwards Compatibility Notes | <code>:COUP:NONE</code> puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs |

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW**

while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

| | |
|----------------|--------------------|
| Remote Command | :CONFigure:CHPower |
|----------------|--------------------|

|---------|-----------|
| Example | :CONF:CHP |
|---------|-----------|

3.2.8.2 Radio

Contains controls to select Radio Standard and settings.

Radio Std

In this menu, 7 groups of WLAN standards can be selected:

1. 802.11a/b/g/j/p includes 802.11a/g/j/p, 802.11b/g, 802.11g DSSS-OFDM, 802.11j/p 10M, 802.11p 5M
2. 802.11n includes 802.11n 20MHz and 802.11n 40MHz
3. 802.11ac includes 802.11ac 20MHz, 802.11ac 40MHz, 802.11ac 80MHz, 802.11ac 80+80MHz and 802.11ac 160MHz
4. 802.11ah includes 802.11ah1MHz, 802.11ah2MHz, 802.11ah4MHz, 802.11ah 8MHz, and 802.11ah16MHz
5. 802.11af includes 802.11af 6MHz, 802.11af 7MHz and 802.11af 8MHz
6. 802.11ax includes 802.11ax 20MHz, 802.11ax 40MHz, 802.11ax 80MHz, 802.11ax 80+80MHz and 802.11ax 160MHz
7. 802.11be includes 802.11be 20MHz, 802.11be 40MHz, 802.11be 80MHz, 802.11be 160MHz and 802.11be 320MHz

Below each standard, parameters related to demodulation can be set, such as Modulation Format, Guard Interval, and so on.

3 WLAN Mode

3.2 Channel Power Measurement

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:RADio:STANdard[:WLAN] AG BG GDO N20 N40 AC20 AC40 AC80 ACT80 AC160 AH1 AH2 AH4 AH8 AH16 JP10 P5 AF6 AF7 AF8 AX20 AX40 AX80 AXT80 AX160 BE20 BE40 BE80 BE160 BE320</code> <code>[:SENSe]:RADio:STANdard[:WLAN]?</code> |
| Example | <code>:RAD:STAN AG</code> <code>:RAD:STAN?</code> |
| Notes | If the command is sent with unsupported parameters, an error is generated “Settings conflict; option not installed” For IQ measurements (CCDF, Power vs Time, Spectral Flatness, IQ Waveform or Modulation Accuracy), they are also limited by BW Option installed. when any radio standard is selected in an IQ measurement which maximum BW could not meet this radio standard request, the “Invalid result; Wider BW required” message will be displayed, and the measurement should return invalid data: Enum value ACT80 means “AC Two 80MHz” (802.11ac 80+80 MHz) Enum value AXT80 means “AX Two 80MHz” (802.11ax 80+80 MHz) |
| Preset | AG |
| State Saved | Saved in instrument state |
| Range | 802.11a/g/j/p (OFDM 20M) 802.11b/g (DSSS/CCK/PBCC) 802.11g (DSSS-OFDM) 802.11n (20 MHz) 802.11n (40 MHz) 802.11ac (20 MHz) 802.11ac (40 MHz) 802.11ac (80 MHz) 802.11ac (80 + 80MHz) 802.11ac (160MHz) 802.11ah(1MHz) 802.11ah(2MHz) 802.11ah(4MHz) 802.11ah(8MHz) 802.11ah(16MHz) 802.11j/p (OFDM 10M) 802.11p (OFDM 5M) 802.11af (6MHz) 802.11af (7Mhz) 802.11af (8MHz) 802.11ax (20 MHz) 802.11ax (40 MHz) 802.11ax (80 MHz) 802.11ax (80 + 80MHz) 802.11ax (160MHz) 802.11be (20 MHz) 802.11be (40 MHz) 802.11be (80 MHz) 802.11be (160MHz) 802.11be (320MHz) |

3.2.8.3 Meas Method

Allows you to choose between Integration Bandwidth and RRC Weighted methods of making the measurement, and to set certain other relevant parameters.

In MSR, LTE-A FDD/TDD and 5G NR Modes, this feature is not supported.

Meas Method

Selects either the Integration BW (**OFF**) or RRC Weighted (**ON**) methods. Selecting the RRC Weighted method turns the Root Raised Cosine (RRC) filter on. The a value (roll off) for the filter is set to the value of "**RRC Filter Alpha**" on page 278, and the RRC filter bandwidth is set to "**RRC Filter BW**" on page 278.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:FILTer[:RRC][:STATe] OFF ON 0 1</code> <code>[:SENSe]:CHPower:FILTer[:RRC][:STATe]?</code> |
| Example | <code>:CHP:FILT OFF</code> <code>:CHP:FILT?</code> |

| | |
|--------------|---|
| Notes | This parameter is normally used when TETRA is selected as the Radio Std |
| Dependencies | For WLAN 802.11 ac (80 + 80 MHz), RRC Weighted is not supported |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | Integration BW RRC Weighted |

RRC Filter Alpha

Inputs the alpha value for the Root Raised Cosine (RRC) filter.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:FILTer[:RRC]:ALPha <real></code> <code>[:SENSe]:CHPower:FILTer[:RRC]:ALPha?</code> |
| Example | <code>:CHP:FILT:ALPH 0.5</code> <code>:CHP:FILT:ALPH?</code> |
| Notes | This parameter is normally used when TETRA is selected as the Radio Std |
| Preset | 0.22 |
| State Saved | Saved in instrument state |
| Min/Max | 0.01 / 1.00 |

RRC Filter BW

Sets the Root Raised Cosine (RRC) filter bandwidth. Normally, the filter bandwidth is the same as the symbol rate of the signal.

| Remote Command | <code>[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth <real></code> <code>[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth?</code> | | | | | | | | | | |
|----------------------------|---|-----------|-------|----------------------------|----------|---------|--------|-----------------|----------|-----------------|----------|
| Example | <code>:CHP:FILT:BAND 10MHz</code> <code>:CHP:FILT:BAND?</code> | | | | | | | | | | |
| Notes | This parameter is normally used when TETRA is selected as the Radio Std | | | | | | | | | | |
| Preset | SA, WCDMA, LTE, LTETDD Modes: 3.84 MHz WLAN Mode: | | | | | | | | | | |
| | <table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11a/g (OFDM/DSSS-OFDM)</td> <td>16.6 MHz</td> </tr> <tr> <td>802.11b</td> <td>22 MHz</td> </tr> <tr> <td>802.11n (20MHz)</td> <td>17.8 MHz</td> </tr> <tr> <td>802.11n (40MHz)</td> <td>36.6 MHz</td> </tr> </tbody> </table> | Radio Std | Value | 802.11a/g (OFDM/DSSS-OFDM) | 16.6 MHz | 802.11b | 22 MHz | 802.11n (20MHz) | 17.8 MHz | 802.11n (40MHz) | 36.6 MHz |
| Radio Std | Value | | | | | | | | | | |
| 802.11a/g (OFDM/DSSS-OFDM) | 16.6 MHz | | | | | | | | | | |
| 802.11b | 22 MHz | | | | | | | | | | |
| 802.11n (20MHz) | 17.8 MHz | | | | | | | | | | |
| 802.11n (40MHz) | 36.6 MHz | | | | | | | | | | |
| State Saved | Saved in instrument state | | | | | | | | | | |

| | |
|---------------------------------|--|
| Min/Max | 100 Hz / 100 MHz |
| Backwards Compatibility SCPI | [:SENSe] :CHPower :FILTer [:RRC] :BWIDth |

3.2.8.4 Limits

Lets you set up the test limit for channel power or power spectral density.

When DVB-T radio standard is selected in SA Mode, this functionality is disabled, and the input signal is instead compared against a pre-defined spectrum mask.

In LTE-A FDD/TDD and 5G NR Modes, this feature is not supported.

In MSR Mode, this feature is not supported, because the power of each carrier may be different.

Power Limit

If **Power Limit** state is **ON**, this setting is a threshold to determine whether the real measured channel power can be passed or not. If real measured channel power exceeds **Power Limit**, the channel power test fails, otherwise, it passes.

If **Power Limit** state is **OFF**, the channel power test always passes.

| | |
|----------------|---|
| Remote Command | :CALCulate:CHPower:LIMit:POWer <amp;l> :CALCulate:CHPower:LIMit:POWer? |
| Example | :CALC:CHP:LIM:POW 16.00 :CALC:CHP:LIM:POW? |

Notes This parameter and PSD Limit can determine Pass/Fail criteria

| Power Limit state | PSD Limit state | Result |
|-------------------|-----------------|---|
| ON | OFF | Pass if power test passes Fail if power test fails |
| ON | ON | Pass if both power test and PSD test pass Fail if either of power test or PSD test fails |
| OFF | ON | Pass if PSD test passes Fail if PSD test fails |
| OFF | OFF | Always Pass |

For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers, which means the power (or PSD) readouts of both carriers should be compared with the power (or PSD) limit individually, and the test passes only when *both* values are lower than the limit

| | |
|----------------|--|
| Preset | 16.00 |
| State Saved | Saved in instrument state |
| Min/Max | -/+200.0 |
| | Auto Function |
| Remote Command | :CALCulate:CHPower:LIMit:POWer:STATe OFF ON 0 1 :CALCulate:CHPower:LIMit:POWer:STATe? |
| Example | :CALC:CHP:LIM:POW:STAT ON :CALC:CHP:LIM:POW:STAT? |
| Preset | WLAN Mode: ON All other Modes: OFF |
| State Saved | Yes |
| Range | OFF ON |

PSD Limit

Power Spectral Density Limit.

If **PSD Limit** state is **ON**, **PSD Limit** is a threshold to determine whether the real measured PSD will pass or not. If real measured PSD exceeds PSD Limit, the test fails, otherwise, it passes.

If **PSD Limit** state is **OFF**, the test always passes.

| | |
|----------------|--|
| Remote Command | :CALCulate:CHPower:LIMit:PSDensity <real> :CALCulate:CHPower:LIMit:PSDensity? |
| Example | :CALC:CHP:LIM:PSD 4.00 :CALC:CHP:LIM:PSD? |

Notes This parameter and Power Limit can determine Pass/Fail criteria

| Power Limit state | PSD Limit state | Result |
|-------------------|-----------------|---|
| ON | OFF | Pass if power test passes Fail if power test fails |
| ON | ON | Pass if both power test and PSD test pass Fail if either of power test or PSD test fails |
| OFF | ON | Pass if PSD test passes Fail if PSD test fails |
| OFF | OFF | Always Pass |

For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers. Which means the PSD (or power) readouts of both carriers should be compared with the PSD

3 WLAN Mode
3.2 Channel Power Measurement

| | |
|----------------|--|
| | (or power) limit individually, and the test passes only when both values are lower than the limit |
| Couplings | The value is automatically converted when PSD Unit is changed |
| Preset | WLAN mode or SA mode with WLAN radio standard: 4.00 dBm/MHz Otherwise: 4.00 dBm/Hz |
| State Saved | Saved in instrument state |
| Min/Max | -/+200.0 |
| Auto Function | |
| Remote Command | <code>:CALCulate:CHPower:LIMit:PSDensity:STATe OFF ON 0 1</code> <code>:CALCulate:CHPower:LIMit:PSDensity:STATe?</code> |
| Example | <code>:CALC:CHP:LIM:POW:STAT ON</code> <code>:CALC:CHP:LIM:POW:STAT?</code> |
| Preset | WLAN Mode: ON All other Modes: OFF |
| State Saved | Yes |
| Range | OFF ON |

Power Limit Fail (Remote Query Only)

Queries whether a power test passes or fails. When DVB-T radio standard is selected in SA Mode, the result of this query has no meaning.

While implementing the scpi, don't try to remove the SCPI command from the SCPI tree when DVB-T is selected as current radio standard.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:CHPower:LIMit:POWer:FAIL?</code> |
| Example | <code>:CALC:CHP:LIM:POW:FAIL?</code> |
| Notes | Query only When " Power Limit " on page 279 state is OFF , the returned value is always 0 (pass) When Power Limit state is ON , the returned value is 0 (pass) if power test passes and 1 (fail) if power test fails |

PSD Limit Fail (Remote Query only)

Queries whether PSD test passes or fails. When DVB-T radio standard is selected in SA Mode, the result of this query has no meaning.

While implementing the scpi, don't try to remove the SCPI command from the SCPI tree when DVB-T is selected as current radio standard.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:CHPower:LIMit:PSD:FAIL?</code> |
| Example | <code>:CALC:CHP:LIM:PSD:FAIL?</code> |
| Notes | Query only When "PSD Limit" on page 280 state is OFF , the returned value is always 0 (pass) When PSD Limit state is ON , the returned value is 0 (pass) if PSD test passes and 1(fail) if PSD test fails |

3.2.8.5 Advanced

Contains controls for setting advanced functions of the instrument.

Does not appear in VXT.

Phase Noise Optimization

Lets you select the LO (local oscillator) phase noise behavior for various operating conditions. When in Auto, selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions.

For full details, see "[Parameter Options, Installed Options & Ranges](#)" on page 283 below.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe] 1 ... 5</code> For the meaning of each numeric option value, see " Parameter Options, Installed Options & Ranges " on page 283 below <code>[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe]?</code> |
| Example | <code>:CHP:FREQ:SYNT 1</code> <code>:CHP:FREQ:SYNT?</code> |

Parameter Options, Installed Options & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

| Option | # | Description |
|--------------------------------|---------|--|
| "Balanced" on page 284 | 1 | <ul style="list-style-type: none"> - In instruments with EPO, balances close-in phase noise with spur avoidance - In instruments without EPO optimizes phase noise for small frequency offsets from the carrier |
| "Best Wide-offset" on page 284 | 2 | Optimizes phase noise for wide frequency offsets from the carrier |
| "Fast Tuning" on page 285 | 3 | Optimizes LO for tuning speed |
| "Best Close-in" on page 283 | 4 or 1* | <ul style="list-style-type: none"> - In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance - In instruments without EPO, this setting is accepted but no action is taken |
| "Best Spurs" on page 284 | 5 | <ul style="list-style-type: none"> - In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance - In instruments without EPO, this setting is accepted but no action taken |
| Auto | - | Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions |

*Dependent on Option EPO installation. See "Best Close-in" on page 283 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 285 is identical in effect to "Best Close-in" on page 283.

Best Close-in

Without option EPO

:FREQ:SYNT 1

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

`:FREQ:SYNT 4`

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 284 setting, parameter 1 selects "Balanced" on page 284 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 283, which is usually not as good a choice as "Balanced" on page 284.

Balanced

`:FREQ:SYNT 1`

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 284 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 283 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 284 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "[Fast Tuning](#)" on page 285 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "[Best Spurs](#)" on page 284. It is available with the "[Fast Tuning](#)" on page 285 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "[Fast Tuning](#)" on page 285 option, the settings for "[Best Close-in](#)" on page 283 are used if "[Fast Tuning](#)" on page 285 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

| Models with Option | Conditions | Selection |
|--|---|--------------------------------|
| <p>EPO</p> <p>Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)</p> | Center frequency is < 699.9 kHz | "Balanced" on page 284 |
| | Span > 114.1 MHz, <i>or</i> RBW > 800 kHz | "Fast Tuning" on page 285 |
| | RBW > 290 kHz, <i>or</i> Span > 4.2 MHz | "Best Wide-offset" on page 284 |
| | Other conditions | "Balanced" on page 284 |
| <p>EP1</p> <p>Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)</p> | Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" | "Fast Tuning" on page 285 |
| | Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 1.3 MHz <i>and</i> RBW <= 75 kHz | "Best Close-in" on page 283 |
| | All other conditions | "Best Wide-offset" on page 284 |
| | | |
| <p>EP2</p> <p>Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 283; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)</p> | CF < 130 kHz, <i>or</i> CF > 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 40 kHz | "Best Close-in" on page 283 |
| | Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 23 kHz | "Fast Tuning" on page 285 |
| | All other conditions | "Best Wide-offset" on page 284 |
| | | |
| <p>EP4</p> <p>(available in CXA for improved phase noise)</p> | Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" | "Fast Tuning" on page 285 |
| | CF is < 109 kHz <i>or</i> CF >= 4.95 MHz <i>and</i> Span <= 666 kHz <i>and</i> RBW < 28 kHz | "Best Close-in" on page 283 |
| | All other conditions | "Best Wide-offset" on page 284 |
| | | |
| All Other Models | Span > 12.34 MHz, <i>or</i> RBW > 250 kHz, <i>or</i> | "Fast Tuning" on page 285 |

3 WLAN Mode
3.2 Channel Power Measurement

| Models with Option | Conditions | Selection |
|---|---|--------------------------------|
| Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 285 are actually the same as "Best Close-in" on page 283, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning | Source Mode is set to "Tracking" | |
| | Center frequency is < 25 kHz, or CF >= 1 MHz and Span <= 141.4 kHz and RBW <= 5 kHz | "Best Close-in" on page 283 |
| | All other conditions | "Best Wide-offset" on page 284 |

In all the above cases:

- The RBW to be used in the calculations is the equivalent -3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

| Option | Option # | Phase Noise Option | Range |
|---------------|----------|--------------------|-------------------------|
| No EPx Option | 1 | Best Close-in | [offset < 20 kHz] |
| | 2 | Best Wide-offset | [offset > 30 kHz] |
| | 3 | Fast Tuning | [same as Best Close-In] |
| EPO | 4 | Best Close-in | [offset < 600 kHz] |
| | 1 | Balanced | [offset < 600 kHz] |
| | 5 | Best Spurs | [offset < 600 kHz] |
| | 2 | Best Wide-offset | [offset > 800 kHz] |
| EP1 | 3 | Fast Tuning | [same as Best Close-In] |
| | 1 | Best Close-in | [offset < 140 kHz] |
| | 2 | Best Wide-offset | [offset > 160 kHz] |
| EP2, EP3, EP5 | 3 | Fast Tuning | [single loop] |
| | 1 | Best Close-in | [offset < 70 kHz] |
| | 2 | Best Wide-offset | [offset > 100 kHz] |
| EP4 | 3 | Fast Tuning | [medium loop bw] |
| | 1 | Best Close-in | [offset < 90 kHz] |
| | 2 | Best Wide-offset | [offset > 130 kHz] |
| | 3 | Fast Tuning | [same as Best Close-In] |

Noise Floor Extension

Lets you turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The **ON** state (in Modes which do not support Adaptive NFE) matches the **FULL** state (in Modes that *do* support Adaptive NFE).

In **ON** or **FULL** NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes which support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, so it does nothing when **External Mixing** is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive (**ON**). In Modes that do not support Adaptive NFE, the default state of NFE is **OFF**. Prior to

the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was **OFF** for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On|Off** to **Full|Adaptive|Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on or off was retained, and a new command was added to set the state to turn Adaptive On or Off:

- `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes that support Adaptive NFE
- `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = On
- **FULL** = `:CORRection:NOISe:FLOor ON` plus `:CORRection:NOISe:FLOor:ADAPtive ON`

See "[More Information](#)" on page 290

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOor ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor?</code> |
| Example | <code>:CORR:NOIS:FLO ON</code> |
| Dependencies | Only appears in instruments with the NFE or NF2 license installed. In all others, does not appear, but the SCPI command will be accepted without error but has no effect |
| Couplings | When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue |
| Preset | Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive |
| State Saved | No |
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?</code> |
| Example | Turn NFE ON (Full mode): <code>:CORR:NOIS:FLO ON</code> Set to Adaptive: <code>:CORR:NOIS:FLO:ADAP ON</code> |
| Dependencies | Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect) |
| Couplings | For backwards compatibility, sending <code>:CORR:NOIS:FLO ON</code> turns NFE Adaptive OFF . To turn Adaptive ON , you must issue the commands in the proper order, as shown in the example above |

| | |
|-------------|--|
| Preset | Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults |
| State Saved | No |

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus instrument noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the instrument noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with

the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

"This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week"

If you **Cancel**, you will be prompted again the next time you turn NFE **ON**. If you **Postpone**, you will be prompted again after a week passes and you then turn NFE **ON**.

3.2.8.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "**Global Center Freq**" on page 1850) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in

when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|------------------------------|--|
| Remote Command | <code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code> |
| Example | <code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code> |
| Preset | Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |
| Preset | OFF |
| Backwards Compatibility SCPI | <code>:GLOBa1:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBa1:FREQuency:CENTer[:STATe]?</code> |

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

3 WLAN Mode

3.2 Channel Power Measurement

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|----------------|--|
| Remote Command | <code>:INSTRument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPle:EMC:STANdard?</code> |
| Example | <code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code> |
| Dependencies | Only available if Option EMC is installed |
| Preset | Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

| | |
|---------------------------------|---|
| Remote Command | <code>:INSTRument:COUPle:DEFault</code> |
| Example | <code>:INST:COUP:DEF</code> |
| Backwards Compatibility SCPI | <code>:GLOBal:DEFault</code> |

3.2.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.2.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe] : <meas> : SWEep : TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command `[:SENSe] : <meas> : SWEep : TIME <time>`
`[:SENSe] : <meas> : SWEep : TIME ?`

Example Channel Power measurement:
`:CHP : SWE : TIME 25ms`
`:CHP : SWE : TIME ?`

Notes In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset

3 WLAN Mode
3.2 Channel Power Measurement

| | | | | | |
|------------------------------|---|------------|-----|------------|----|
| | <p>values are as follows:</p> <ul style="list-style-type: none"> - IBW: 29 ms - IBWR: 108 ms - FAST 7.5 ms | | | | |

| WCDMA Mode | OFF | | | | |
| All others | ON | | | | |

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

$$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$$

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

|----------------|---|
| Remote Command | <pre>[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time> [:SENSe]:<meas>:SWEep:ACQuisition:TIME? <meas> is the identifier for the current measurement; any one of CHPower- ACPower OBwidth MONitor</pre> |
| Example | <pre>Channel Power measurement :CHP:SWE:ACQ:TIME 500 ms :CHP:SWE:ACQ:TIME?</pre> |
| Dependencies | Available only on non-sweeping hardware |
| Couplings | Coupled to Span , RBW , and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man |
| Preset | Automatically calculated |
| State Saved | Saved in instrument state |
| Min | 100 ns |
| Max | 4.00 ks |
| | Auto Function |
| Remote Command | <pre>[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF ON 0 1 [:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO?</pre> |

| | |
|---------|---|
| | <code><meas></code> is the identifier for the current measurement; any one of <code>CHPower-</code> <code>ACPower</code> <code>OBWidth</code> <code>MONitor</code> |
| Example | Channel Power measurement: <code>:CHP:SWE:ACQ:TIME:AUTO OFF</code> |
| Preset | <code>ON</code> |

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 297

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code> |
| Example | Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code> |
| Preset | <code>ON</code> Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to <code>ON</code> , but <code>*RST</code> sets <code>:INIT:CONT</code> to <code>OFF</code> |
| State Saved | Saved in instrument state |
| Annunciation | The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous |
| Backwards Compatibility Notes | X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep |

More Information

| | |
|-----------------|---|
| Continuous Mode | The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument |
|-----------------|---|

| | |
|-------------|--|
| | keeps sweeping |
| | See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep |
| | The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold |
| Single Mode | The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num , then the count stops incrementing, and the instrument stops sweeping |
| | See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep |
| | The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold |

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1853 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/hold sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 299

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code> |
| Example | <code>:INIT:IMM</code> <code>:INIT:REST</code> |
| Notes | <code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function |
| Couplings | Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement |
| Status Bits/OPC dependencies | This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (<code>INTEgrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set |
| Backwards Compatibility Notes | For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well |

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

| Event | Trace Effect |
|---|----------------------|
| Clear/Write pressed (even if already in Clear/Write) | Set to mintracevalue |
| Max Hold pressed (even if already in Max Hold) | Set to mintracevalue |

| Event | Trace Effect |
|---|--|
| Min Hold pressed (even if already in Min Hold) | Set to maxtracevalue |
| Trace Average pressed (even if already in Trace Average) | Trace data unaffected but start new sweep/avg/hold |
| Restart pressed | Trace data unaffected but start new sweep/avg/hold |
| Parameter requiring restart changed (e.g., RBW) | Trace data unaffected but start new sweep/avg/hold |

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

| | |
|----------------|---|
| Remote Command | <code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code> |
| Example | <code>:INIT:PAUS</code> <code>:INIT:RES</code> |
| Dependencies | Not displayed in Modes that do not support pausing |
| Annotation | Only on control |

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when **:ABORT** is sent, the alignment finishes *before* the abort function is performed, so **:ABORT** does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an **:INIT:IMM** command is received.

| | |
|------------------------------|--|
| Remote Command | :ABORT |
| Example | :ABOR |
| Notes | <p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p> |
| Dependencies | <p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p> |
| Status Bits/OPC dependencies | <p>The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATUS:QUEStionable register bit 9 (INTegrity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p> |

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

| | |
|----------------|---|
| Remote Command | [:SENSe]:<meas>:SWEep:ETIMe? |
| | <meas> is the identifier for the current measurement; any one of CHPower- ACPower OBwidth MONitor |
| Example | Channel Power measurement |

| | |
|--------------|---|
| | <code>:CHP:SWE:ETIME?</code> |
| Dependencies | Available only on non-sweeping hardware |
| Preset | Automatically calculated |

3.2.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Time Rules

Switches the instrument between **NORMa1** and **ACCuracy** sweep states.

Setting **Auto Sweep Time** to **ACCuracy** results in slower sweep times (usually about three times as long) but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **ACCuracy**.

Additional amplitude errors that occur when **Auto Sweep Time** is set to **NORMa1** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **NORMa1** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **NORMa1** on a **Preset**. This means that in the **Preset** state, instrument amplitude accuracy specifications do not apply.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:CHPower:SWEEp:TIME:AUTO:RULEs NORMa1 ACCuracy</code> <code>[:SENSe]:CHPower:SWEEp:TIME:AUTO:RULEs?</code> |
| Example | <code>:CHP:SWE:TIME:AUTO:RUL NORM</code> <code>:CHP:SWE:TIME:AUTO:RUL?</code> |
| Dependencies | Does not appear in Spectrum Analyzer Mode in VXT model M9421A |
| Preset | NORMa1 |
| State Saved | Saved in instrument state |
| Range | NORMa1 ACCuracy |

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of **Points** is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement

speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **"Sweep/Measure" on page 1856** is **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CHPower:SWEp:POINTs <integer></code> <code>[:SENSe]:CHPower:SWEp:POINTs?</code> |
| Example | <code>:CHP:SWE:POIN 501</code> <code>:CHP:SWE:POIN?</code> |
| Dependencies | Not available when Signal ID is ON in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support Swept |
| Couplings | Whenever the number of sweep points change: <ul style="list-style-type: none"> - All trace data is erased - Any traces with Update Off also switch to Display Off (equivalent to switching from View to Blank in older instruments) - Sweep time is re-quantized - Any limit lines that are on will be updated - If averaging/hold is on, averaging/hold starts over <p>The resolution of setting the sweep time depends on the number of points selected</p> |
| Preset | 1001 |
| State Saved | Saved in instrument state |
| Min | 11 |
| Max | 20001 |
| Annotation | On second line of annotations, in lower right corner in parenthesis behind the sweep annotation |

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe]:SWEep:IF:DITHer?</code> |
| Dependencies | Only appears in Spectrum Analyzer Mode in VXT models |
| Preset | OFF |
| State Saved | Saved in instrument state |

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SWEep:IMAGeProt OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeProt?</code> |
| Dependencies | Only appears in Spectrum Analyzer Mode in VXT models |
| Preset | ON |
| State Saved | Saved in instrument state |

3.2.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

3.2.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

| | |
|--------------|---|
| Notes | The selected trace is remembered even when not in the Trace menu |
| Dependencies | For the Swept SA measurement: <ul style="list-style-type: none"> - In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View - When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled |
| Preset | Trace 1 |
| State Saved | Yes |

3.2.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1728 and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "View/Blank" on page 1734 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

| Option | Parameter | SCPI Example | Details |
|---------------|----------------|------------------|----------------------------------|
| Clear/Write | WRITE | :TRAC2:TYPE WRIT | See: "Clear/Write" on page 309 |
| Trace Average | AVERage | :TRAC2:TYPE AVER | See: "Trace Average" on page 310 |

| Option | Parameter | SCPI Example | Details |
|--------------|-----------|------------------|-----------------------------|
| Maximum Hold | MAXHold | :TRAC3:TYPE MAXH | See: "Max Hold" on page 311 |
| Minimum Hold | MINHold | :TRAC5:TYPE MINH | See: "Min Hold" on page 311 |

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "**View/Blank**" on page 1734 state must be set to **Active** (**Update: ON, Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "**Trace Mode Backwards Compatibility Commands**" on page 307

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre> |
| Couplings | <p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe] :<meas>:DETECTOR:AUTO?</code>), Detector (<code>[:SENSe] :<meas>:DETECTOR[:FUNCTION]?</code>) switches aligning with the switch of this parameter: "NORMAL" with WRITE (Clear Write), "AVERAGE" with AVERAGE, "POSITIVE (peak)" with MAXHold, and "NEGATIVE (peak)" with MINHold</p> |
| Preset | <p>Swept SA and Monitor Spectrum: WRITE</p> <p>All other measurements: AVERAGE</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p> |
| State Saved | The type of each trace is saved in instrument state |
| Annunciation | The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar |

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1734.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

| | |
|-------------------------------|---|
| Preset | <code>WRITE</code> |
| State Saved | The trace mode is an alias only |
| Backwards Compatibility SCPI | <code>:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK</code> <code>:TRACe[1] 2 ... 6:MODE?</code> |
| Backwards Compatibility Notes | <p>The legacy <code>:TRACe:MODE</code> command is retained for backwards compatibility. In conjunction with the legacy <code>:AVERage</code> command, it works as follows:</p> <ul style="list-style-type: none"> - <code>:AVERage ON OFF</code> sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the <code>[:SENSe]:AVERage[:STATe]</code> command description below - <code>:TRACe:MODE WRITE</code> sets <code>:TRACe:TYPE WRITE</code> (Clear/Write) unless average is true, in which case it sets it to <code>:TRACe:TYPE AVERage</code>. It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE MAXHold</code> sets <code>:TRACe:TYPE MAXHold</code> (Max Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE MINHold</code> sets <code>:TRACe:TYPE MINHold</code> (Min Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE VIEW</code> sets <code>:TRACe:UPDate OFF</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace |

3 WLAN Mode
3.2 Channel Power Measurement

- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

| | |
|-------------------------------|--|
| Preset | <code>OFF</code> |
| State Saved | The state of Average is saved in Instrument State for ghosting purposes |
| Backwards Compatibility SCPI | <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code> |
| Backwards Compatibility Notes | <p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p> |

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for **Trace Average** and **Hold**.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1728 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

| | |
|-------------------|---|
| Active | Update and Display both ON |
| View | Update OFF ; Display ON |
| Blank | Update OFF ; Display OFF |
| Background | Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past |

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "[More Information](#)" on page 314

| | |
|--------------|---|
| Notes | For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 313 and " Trace Display State On/Off " on page 313 below |
| Dependencies | When Signal ID is on, this key is grayed-out |

| | |
|-----------|---|
| Couplings | <p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending [:SENS] :DET :TRAC) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 815 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p> |
|-----------|---|

Trace Update State On/Off

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p> |
|----------------|--|

| | |
|---------|---|
| Example | <p>Make trace 2 inactive (stop updating):</p> <pre>:TRAC2:UPD 0</pre> |
|---------|---|

| | |
|-----------|--|
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
|-----------|--|

| | |
|--------|--|
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p> |
|--------|--|

| | |
|-------------|---------------------------|
| State Saved | Saved in instrument state |
|-------------|---------------------------|

Trace Display State On/Off

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p> |
|----------------|--|

| | |
|-------------|--|
| Example | <p>Make trace 1 visible: :TRAC2:DISP 1</p> <p>Blank trace 3: :TRAC3:DISP 3</p> |
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
| Preset | <p>For Swept SA Measurement (in SA Mode): 1 0 0 0 0 0</p> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements: 1 0 0</p> <p>ON for Trace 1; OFF for 2 & 3</p> |
| State Saved | Saved in instrument state |

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.2.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "[Operand 1 / Operand 2](#)" on page 821 controls.

- See "[How trace math is processed](#)" on page 319

Remote Command For option details, see "[Trace Math Options](#)" on page 317

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference |  
OFF, <trace_num>, <trace_num>, <real>,<real>  
:CALCulate:MATH? <trace_num>
```

where <trace_num> is any one of:

```
TRACE1|...|TRACE6
```

For all other measurements:

```
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset |  
LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>  
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

<meas> is the identifier for the current measurement, and

<trace_num> is any one of:

```
TRACe1|TRACe2|TRACe3
```

Note that the format of the **TRACe<n>** parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB

| | |
|------------------------------|--|
| | <p><code>:CALC:MATH TRACE3, LDIF, TRACE1, TRACE2, 0, -6.00</code></p> <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1, OFF, TRACE2, TRACE3, 0, 0</code></p> <p>Turns off trace math for trace 1</p> |
| Notes | <p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> - Set 2 defines the “function”: <code>PDifference PSUM LOFFset LDifference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p> |
| Dependencies | <p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p> |
| Couplings | <p>When a math function is changed for a trace, that trace is set to Display = ON; and Update = ON</p> |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <p><code>OFF, TRACE5, TRACE6, 0, 0 OFF, TRACE6, TRACE1, 0, 0 OFF, TRACE1, TRACE2, 0, 0 </code> <code>OFF, TRACE2, TRACE3, 0, 0 OFF, TRACE3, TRACE4, 0, 0 OFF, TRACE4, TRACE5, 0, 0</code></p> <p>For all other measurements:</p> <p><code>OFF, TRACE2, TRACE3, 0, 0 OFF, TRACE3, TRACE1, 0, 0 OFF, TRACE1, TRACE2, 0, 0</code></p> |
| State Saved | <p>The trace math function for each trace is saved in instrument state</p> |
| Annunciation | <p>An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on</p> |
| Status Bits/OPC dependencies | <p>*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep</p> |

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log_{10}(10^{(\text{FirstTrace}/10)} - 10^{(\text{SecondTrace}/10)})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log_{10}(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

For the current bucket, process Trace 1 completely, then Trace 2, then Trace 3, until all 6 traces have been processed. Then move on to the next bucket.

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

| | |
|--------------|---|
| Example | <p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre> |
| Notes | See " Math Function " on page 815 for how to specify Operands 1 and 2 using :CALCulate:MATH |
| Dependencies | The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown |
| Preset | Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace |

| | |
|-------------|---|
| | 5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5 |
| State Saved | Operands 1 and 2 for each trace are stored in instrument state |

Offset

Used by the Log Offset math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code> |
| State Saved | The Log Offset value for each trace is saved in Instrument State |
| Min | -100 dB |
| Max | 100 dB |

Reference

Used by the Log Diff math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code> |
| State Saved | The Log Difference reference value for each trace is saved in instrument state |
| Min/Max | Same as reference level |

3.2.10.4 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following choices are available:

| Option | Parameter | Detector Behavior |
|--------|-----------|--|
| Auto | n/a | The detector selected depends on marker functions, trace |

3 WLAN Mode
3.2 Channel Power Measurement

| Option | Parameter | Detector Behavior |
|--------------------|--------------------------|---|
| | | functions, average type, and the trace averaging function This option is set using " Detector Select Auto/Man " on page 324 |
| Normal | NORMa1 | The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection |
| Average | AVERage | The detector determines the average of the signal within the sweep points, using RMS averaging |
| Peak (Positive) | POSitive | The detector determines the maximum of the signal within the sweep points |
| Sample | SAMPle | The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point |
| Negative Peak | NEGative | The detector determines the minimum of the signal within the sweep points |
| RMS | RMS | Equivalent to Average . See Notes below |

Because they may not find a spectral component's true peak, neither **Average** nor **Sample** detectors measure amplitudes of CW signals as accurately as **Peak** or **Normal**, but they do measure noise without the biases of peak detection.

Remote Command `[[:SENSe]:CHPower:DETEctor[:FUNction] NORMa1 | AVERage | POSitive | SAMPle | NEGative | RMS
[:SENSe]:CHPower:DETEctor[:FUNction]?`

Example `:CHP:DET NORM`
`:CHP:DET?`

Set the detector to **Average**, which uses RMS averaging, so this is equivalent to selecting an **RMS** detector:
`:CHP:DET RMS`

Notes The query returns a name that corresponds to the detector type, as shown below
The **RMS** selection sets the detector type to **AVERage** with **RMS** averaging. Therefore, if **RMS** has been selected, the query returns **AVER**

| String Returned | Definition |
|----------------------|---------------|
| NORM | Normal |
| AVER | Average (RMS) |
| POS | Peak |
| SAMP | Sample |
| NEG | Negative Peak |

Couplings When the **Detector** setting is **Auto**, switches to align with "[Trace Type](#)" on page 1728:

- [NORMa1](#) with Clear Write
- [AVERage](#) with [AVERage](#)

| | |
|-------------|--|
| | <ul style="list-style-type: none"> - POSitive (peak) with MAXHold - NEGative (peak) with MINHold |
| Preset | AVERage |
| State Saved | Saved in instrument state |
| Range | NORMa1 AVERage POSitive SAMPlE NEGative RMS |

Detector Select Auto/Man

Sets the Detector mode to **Auto** or **Manual**. In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any detector explicitly, this setting switches automatically to **Man** (manual).

| | |
|----------------|---|
| Remote Command | [:SENSe] :CHPower:DETEctor:AUTO ON OFF 1 0 |
| Example | :CHP:DET:AUTO ON :CHP:DET:AUTO? |
| Couplings | When the Detector setting is Auto , switches to align with " Trace Type " on page 1728: <ul style="list-style-type: none"> - NORMa1 with Clear Write - AVERage with AVERage - POSitive (peak) with MAXHold - NEGative (peak) with MINHold |
| Preset | ON |
| State Saved | Yes |

3.2.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "[To Trace](#)" on page 823 when a "[Copy](#)" on page 823 or "[Exchange](#)" on page 824 is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 823** and **"To Trace" on page 823** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`
 For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
 where `<meas>` is the identifier for the current measurement
 Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1,TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>,<dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`
 For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the **"From Trace" on page 823** and **"To Trace" on page 823** parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

| | |
|----------------|---|
| Remote Command | <p>For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code></p> <p>For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code></p> <p>where <code><meas></code> is the identifier for the current measurement</p> <p>Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement</p> |
| Example | <p>Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1,TRACE2</code></p> |
| Notes | <p>The command is of the form: <code>:TRACe:EXCHange <trace_1>,<trace_2></code></p> |
| Couplings | Both traces are put in View (Update=Off, Display=On) after the exchange |

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

| | |
|----------------|---|
| Remote Command | <code>:TRACe[:<meas>]:PRESet:ALL</code> |
| Example | <code>:TRAC:PRES:ALL</code> |
| Dependencies | When Signal ID is on, this key is grayed-out |

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

| | |
|----------------|--|
| Remote Command | <code>:TRACe[:<meas>]:CLEar:ALL</code> |
| Example | <code>:TRAC:CLE:ALL</code> |
| Dependencies | When Signal ID is on, this key is grayed-out |

3.2.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

| | |
|----------------|--|
| Remote Command | <pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre> |
| Example | <pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre> |
| Dependencies | In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled |
| Preset | TRACe1 |
| State Saved | No |
| Range | Trace 1 Trace 2 Trace 3 |

3.3 Occupied BW Measurement

This measurement computes and displays the bandwidth occupied by a given percentage of the total mean power of a signal.

Measurement Commands

The general functionality of "CONFigure" on page 2568, "INITiate" on page 2569, "FETCh" on page 2569, "MEASure" on page 2571, and "READ" on page 2570 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF : <Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

| Command | Function |
|--|---|
| <code>:INITiate:OBwidth</code> | Initiates a trigger cycle for the OBW measurement, but does not return any data. You must then use <code>:FETC:OBW[n]?</code> to retrieve data |
| <code>:CONFigure?</code> | Does not change any measurement settings |
| <code>:CONFigure:OBwidth</code> | Returns the long form name of current measurement, in this case, OBwidth |
| <code>:CONFigure:OBwidth</code> | Selects OBW measurement with Meas Setup settings in preset state – same as Meas Preset |
| <code>:CONFigure:OBwidth:NDEFault</code> | Selects OBW measurement <i>without</i> affecting settings |

The following queries are used to retrieve data. The type of data returned depends on the value of `n`, as detailed in "Remote Command Results" on page 329.

| Command | Function |
|-----------------------------------|--|
| <code>:FETCh:OBwidth[n]?</code> | Retrieves the data defined by <code>n</code> |
| <code>:MEASure:OBwidth[n]?</code> | Switches to OBW measurement, restores default values, starts the measurement, then retrieves the data defined by <code>n</code> |
| <code>:READ:OBwidth[n]?</code> | Starts the measurement, then retrieves the data defined by <code>n</code> |

Backwards Compatibility Queries

| Command | Return Value |
|--|-------------------------------------|
| <code>:FETCh:OBwidth:OBwidth?</code> | Returns the Occupied Bandwidth (Hz) |
| <code>:MEASure:OBwidth:OBwidth?</code> | |
| <code>:READ:OBwidth:OBwidth?</code> | |

3 WLAN Mode
3.3 Occupied BW Measurement

| Command | Return Value |
|--------------------------|---|
| :FETCh:OBWidth:FERRor? | Returns the Transmit Frequency Error (Hz) |
| :MEASure:OBWidth:FERRor? | |
| :READ:OBWidth:FERRor? | |
| :FETCh:OBWidth:XDB? | Returns the xdB Bandwidth (Hz) |
| :MEASure:OBWidth:XDB? | |
| :READ:OBWidth:XDB? | |

Remote Command Results

The following table describes the results returned by the **FETCh**, **MEASure**, and **READ** queries listed above, according to the index value **n**.

| n | Results Returned | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|---|--------------|------|--------------|---|--------------------|----|---|--|-----|---|------|----|---|-----------------------|--------|---|--------|----|---|--------------------------|----|---|-------------------|----|
| 1, or not specified | Returns scalar results, in the following order: <table border="1"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Occupied Bandwidth</td> <td>Hz</td> </tr> <tr> <td>2</td> <td>Total Power <i>or</i> OBW Power Power reference type can be changed with "Power Ref" on page 408 in Meas Setup</td> <td>dBm</td> </tr> <tr> <td>3</td> <td>Span</td> <td>Hz</td> </tr> <tr> <td>4</td> <td>Spectrum Trace Points</td> <td>points</td> </tr> <tr> <td>5</td> <td>Res BW</td> <td>Hz</td> </tr> <tr> <td>6</td> <td>Transmit Frequency Error</td> <td>Hz</td> </tr> <tr> <td>7</td> <td>7. x dB Bandwidth</td> <td>Hz</td> </tr> </tbody> </table> | # | Item | Unit | 1 | Occupied Bandwidth | Hz | 2 | Total Power <i>or</i> OBW Power Power reference type can be changed with "Power Ref" on page 408 in Meas Setup | dBm | 3 | Span | Hz | 4 | Spectrum Trace Points | points | 5 | Res BW | Hz | 6 | Transmit Frequency Error | Hz | 7 | 7. x dB Bandwidth | Hz |
| # | Item | Unit | | | | | | | | | | | | | | | | | | | | | | | |
| 1 | Occupied Bandwidth | Hz | | | | | | | | | | | | | | | | | | | | | | | |
| 2 | Total Power <i>or</i> OBW Power Power reference type can be changed with "Power Ref" on page 408 in Meas Setup | dBm | | | | | | | | | | | | | | | | | | | | | | | |

| 5 | Res BW | Hz | | | | | | | | | | | | | | | | | | | | | | | |
| 6 | Transmit Frequency Error | Hz | | | | | | | | | | | | | | | | | | | | | | | |
| 7 | 7. x dB Bandwidth | Hz | | | | | | | | | | | | | | | | | | | | | | | |
| 2 | Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 1 | | | | | | | | | | | | | | | | | | | | | | | | |
| 3 | Only available in LTEAFDD, LTEATDD, 5GNR Modes 1. Number of active carriers Returns number of active carriers within Span in Auto detected mode, otherwise the command is out of scope | | | | | | | | | | | | | | | | | | | | | | | | |
| 4 | Returns OBW Boundaries table results in the following order: <table border="1"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit, if any</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Occupied bandwidth</td> <td>Hz</td> </tr> <tr> <td>2</td> <td>Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 408 in Meas Setup</td> <td>dBm</td> </tr> </tbody> </table> | # | Item | Unit, if any | 1 | Occupied bandwidth | Hz | 2 | Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 408 in Meas Setup | dBm | | | | | | | | | | | | | | | |
| # | Item | Unit, if any | | | | | | | | | | | | | | | | | | | | | | | |
| 1 | Occupied bandwidth | Hz | | | | | | | | | | | | | | | | | | | | | | | |
| 2 | Total Power or OBW Power Power reference type can be changed with "Power Ref" on page 408 in Meas Setup | dBm | | | | | | | | | | | | | | | | | | | | | | | |

| n Results Returned | | | |
|--------------------|--|--|--------------|
| # | Item | | Unit, if any |
| 3 | x dB Reference Power | | dBm |
| 4 | x dB Reference Power Frequency - offset frequency | | Hz |
| 5 | x dB Reference Power Frequency - absolute frequency | | Hz |
| 6 | NaN (9.91E+37) | | - |
| 7 | NaN (9.91E+37) | | - |
| 8 | NaN (9.91E+37) | | - |
| 9 | Lower OBW boundary - offset frequency | | Hz |
| 10 | Lower OBW boundary - absolute frequency | | Hz |
| 11 | Lower OBW boundary - absolute power | | dBm |
| 12 | Lower OBW boundary - relative power | | dBc |
| 13 | Upper OBW boundary - offset frequency | | Hz |
| 14 | Upper OBW boundary - absolute frequency | | Hz |
| 15 | Upper OBW boundary - absolute power | | dBm |
| 16 | Upper OBW boundary - relative power | | dBc |
| 17 | Lower x dB BW boundary - offset frequency | | Hz |
| 18 | Lower x dB BW boundary - absolute frequency | | Hz |
| 19 | Lower x dB BW boundary - absolute power | | dBm |
| 20 | NaN (9.91E+37) | | - |
| 21 | Upper x dB BW boundary - offset frequency | | Hz |
| 22 | Upper x dB BW boundary - absolute frequency | | Hz |
| 23 | Upper x dB BW boundary - absolute power | | dBm |
| 24 | NaN (9.91E+37) | | - |
| | Results 6, 7, 8, 20 and 24 always return NaN (9.91E+37) | | |
| 5 | Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 2 | | |
| 6 | Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 3 | | |

3.3.1 Views

This measurement has three predefined views:

| Name | SCPI Name | SCPI # |
|------------------------------|------------|--------|
| "OBW Results" on page 331 | OBWResults | 1 |
| "OBW Boundaries" on page 332 | BOUNDaries | 2 |

| Name | SCPI Name | SCPI # |
|--------------------|-------------------------------------|--------|
| "Gate" on page 332 | See "Gate View On/Off" on page 2494 | |

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the **View** changes, the default menu is **Frequency**, unless otherwise specified in the **View** description.

The following SCPI commands can be used to select any view other than **Gate**.

View Selection by Name

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:OBWidth:VIEW[:SElect] OBWResults BOUNdaries</code> <code>:DISPlay:OBWidth:VIEW[:SElect]?</code> |
| Example | <code>:DISP:OBW:VIEW OBWR</code> <code>:DISP:OBW:VIEW?</code> |
| Preset | <code>OBWResults</code> |
| State Saved | Saved in instrument state |
| Range | <code>OBWResults BOUNdaries</code> |

View Selection by Number

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:OBWidth:VIEW:NSElect <integer></code> <code>:DISPlay:OBWidth:VIEW:NSElect?</code> |
| Example | <code>:DISP:OBW:VIEW:NSEL 2</code> <code>:DISP:OBW:VIEW:NSEL?</code> |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Min/Max | 1/2 |

3.3.1.1 OBW Results

Windows: "Graph" on page 332, "Metrics - OBW Results" on page 333

The spectrum trace is displayed in the upper window. Measurement results such as Occupied Bandwidth or Power are displayed in the lower window.

| | |
|---------|----------------------------------|
| Example | <code>:DISP:OBW:VIEW OBWR</code> |
|---------|----------------------------------|

3.3.1.2 OBW Boundaries

Windows: "Graph" on page 332, "Metrics - OBW Boundaries" on page 335

The spectrum trace is displayed in the upper window. The lower window of OBW Results view is replaced by the OBW boundaries table in this view. Occupied bandwidth and X dB bandwidth for both lower and upper boundaries are displayed.

Example `:DISP:OBW:VIEW BOUN`

3.3.1.3 Gate

See "Gate View On/Off" on page 2494

3.3.2 Windows

There are four available window types. The **Gate** window is available only when "Gate View On/Off" on page 2494 is **ON** in the **Gate Settings** menu under **Trigger**.

| View | # |
|------------------------------|---|
| "Graph" on page 332 | 1 |
| "OBW Results" on page 331 | 2 |
| "OBW Boundaries" on page 332 | 3 |
| "Gate" on page 336 | 4 |

3.3.2.1 Graph

Window #1

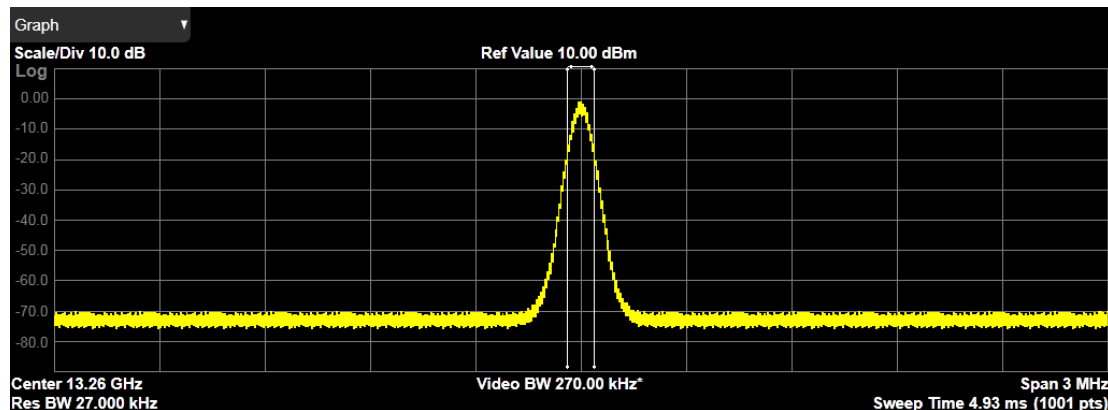

Appears in two Views, as follows:

| View | Size | Position |
|------------------------------|-------------------------|----------|
| "OBW Results" on page 331 | Three fifth, full width | Top |
| "OBW Boundaries" on page 332 | Half, full width | Top |

Spectrum View

For SA, WCDMA, WLAN mode:

3 WLAN Mode
 3.3 Occupied BW Measurement

For LTE-Advanced FDD/TDD mode only

3.3.2.2 Metrics - OBW Results

Window #2

Displays the textual results of the Occupied BW measurement.

| View | Size | Position |
|---------------------------|-----------------------|----------|
| "OBW Results" on page 331 | Two fifth, full width | Bottom |
| Gate | One third, full width | Bottom |

| Metrics | | | |
|---------------------|------------|----------------|-----------|
| Occupied Bandwidth | 2.9730 MHz | Total Power | 20.2 dBm |
| Transmit Freq Error | 0 Hz | % of OBW Power | 99.00 % |
| x dB Bandwidth | 3.000 MHz | x dB | -26.00 dB |

For the LTE-Advanced FDD/TDD and 5G NR modes, the metric result is shown as below:

| Metrics | | | |
|---------------------|------------|----------------|-----------|
| Occupied Bandwidth | 2.9730 MHz | Total Power | 20.2 dBm |
| Transmit Freq Error | 0 Hz | % of OBW Power | 99.00 % |
| x dB Bandwidth | 3.000 MHz | x dB | -26.00 dB |

Measure Trace Trace 1

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

The total power is the power integrated in the specified span setting. The OBW power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

Transmit Freq Error

The transmit freq error (transmit frequency error) result is calculated as the difference between $(f_2+f_1)/2$ and the tuned center frequency of the signal, where f_1 and f_2 are the lower and upper carrier boundary point.

x dB Bandwidth

The x dB result is a bandwidth measured between two points on the signal which are a certain number of dBs down from the highest signal point within the OBW Span. For example, If the 'x dB' parameter is set to -26 dB, and the 'Occupied BW Span' is set to 10 MHz, then the maximum signal power level is first determined from the 10 MHz wide trace sweep. Next, the two furthest frequencies below (xdb_{f_1}) and above (xdb_{f_2}) the frequency of the maximum level occurrence are found where the signal level is 26 dB below the peak level. This calculation also uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points).

The x dB bandwidth is calculated to be $xdb_{f_2} - xdb_{f_1}$.

% of OBW Power

3 WLAN Mode
3.3 Occupied BW Measurement

This is the setting parameter. See "[% of OBW Power](#)" on page 407

x dB

This is the setting parameter. See "[x dB](#)" on page 408.

Active Carriers

In the LTE-Advanced FDD/TDD and 5G NR modes, the number of active carriers is displayed to show how many carriers are identified as active in auto detected mode of span, otherwise “-” is displayed to indicate that it is out of scope. When there is one active carrier, Transmit Freq Error is displayed. Otherwise, “---“ is displayed.

Measure Trace

See "[Measure Trace](#)" on page 825.

3.3.2.3 Metrics - OBW Boundaries

Window #3

Displays occupied bandwidth and X dB bandwidth for both lower and upper boundaries.

| View | Size | Position |
|--|-----------------------|----------|
| "OBW Boundaries" on page 332 | Half, full width | Bottom |
| Gate | One third, full width | Bottom |

| Occupied Bandwidth | | | x dB Reference | | | |
|----------------------|----------------|-----------|------------------------------|----------------|-----------|-----------|
| 2.9730 MHz | | | -26.00 dB | | | |
| Total Power 20.2 dBm | | | Power 0.00 dBm | | | |
| | | | Offset Frequency -1.5000 MHz | | | |
| | Lower Boundary | | | Upper Boundary | | |
| | Offset Freq | Abs Power | Rel Power | Offset Freq | Abs Power | Rel Power |
| Occupied Bandwidth | -1.4865 MHz | 0.00 dBm | -20.2 dBc | 1.4865 MHz | 0.00 dBm | -20.2 dBc |
| x dB Bandwidth | -1.5000 MHz | -26.0 dBm | | 1.5000 MHz | -26.0 dBm | |

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

Total Power is the power integrated in the specified span setting. OBW Power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

x dB

This is the setting parameter. See "[x dB](#)" on page 408.

x dB Ref Pwr

The x dB reference power result shows the power of the highest signal point within the OBW Span.

x dB At Freq

The x dB reference power frequency result shows the frequency of the highest signal point within the OBW Span. The frequency display type, either Offset or Absolute, can be selected with the Boundary Frequency control under Display.

OBW Boundary Results

| Name | Unit | Corresponding Results |
|---|------|--|
| Lower OBW boundary - offset frequency | Hz | Offset frequency of the lower OBW boundary from center frequency |
| Lower OBW boundary - absolute power | dB | Absolute power on the point of lower OBW boundary |
| Lower OBW boundary - relative power | dBc | Relative power on the point of lower OBW boundary |
| Upper OBW boundary - offset frequency | Hz | Offset frequency of the upper OBW boundary from center frequency |
| Upper OBW boundary - absolute power | dB | Absolute power on the point of upper OBW boundary |
| Upper OBW boundary - relative power | dBc | Relative power on the point of upper OBW boundary |
| Lower x dB BW boundary - offset frequency | Hz | Offset frequency of the lower x dB BW boundary from center frequency |
| Lower x dB BW boundary - absolute power | dB | Absolute power on the point of lower x dB BW boundary |
| Upper x dB BW boundary - offset frequency | Hz | Offset frequency of the lower x dB BW boundary from center frequency |
| Upper x dB BW boundary - absolute power | dB | Absolute power on the point of lower x dB BW boundary |

3.3.2.4 Gate

Window #4

Turning on **Gate** View shows the **Gate** Window, which lets you see your Gating signal at the same time as the measured data. See the description in "[Gate View On/Off](#)" on page 2494 under **Trigger, Gate Settings**.

Views in which this window appears:

| View | Size | Position |
|------|-----------------------|----------|
| Gate | One third, full width | Top |

3.3.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.3.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code> |
| Example | <code>:DISP:OBW:WIND:TRAC:Y:RLEV 125</code> <code>:DISP:OBW:WIND:TRAC:Y:RLEV?</code> |
| Couplings | When " Auto Scaling " on page 339 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF " Attenuation " on page 1750 is not coupled to Ref Value |
| Preset | 10.00 dBm |
| State Saved | Saved in instrument state |
| Min/Max | -250.00 dBm / 250.00 dBm |
| Annotation | Ref <value> top left of graph |
| Backwards Compatibility SCPI | <code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code> |

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

| | |
|-------------------------|--|
| Remote Command | <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl></code> |
| Command | <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code> |
| Example | <code>:DISP:OBW:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:OBW:WIND:TRAC:Y:PDIV?</code> |
| Couplings | Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When the Auto Scaling is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off |
| Preset | 10.00 dB / Div |
| State Saved | Saved in instrument state |
| Min | 0.10 dB |
| Max | 20 dB |
| Annotation | <value> dB/ left upper of graph |
| Backwards Compatibility | <code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code> |
| SCPI | |

Scale Range

Sets the Y-Axis scale range.

| | |
|----------------|--|
| Remote Command | Replace <meas> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code> |
| Couplings | Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF |
| Preset | 100 dB |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 200 |

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

| | |
|------------------------------|---|
| Remote Command | <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTom</code> <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code> |
| Example | <code>:DISP:OBW:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:OBW:WIND:TRAC:Y:RPOS?</code> |
| Preset | TOP |
| State Saved | Saved in instrument state |
| Range | TOP CENTer BOTTom |
| Annotation | The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position |
| Backwards Compatibility SCPI | <code>:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition</code> |

Auto Scaling

Toggles **Auto Scaling** On or Off.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle?</code> |
| Example | <code>:DISP:OBW:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:OBW:WIND:TRAC:Y:COUP?</code> |

3.3.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 340
- See ["Single-Attenuator Configuration"](#) on page 341

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

3 WLAN Mode
 3.3 Occupied BW Measurement

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code> |
| Example | <code>:POW:FRAT 14</code> <code>:POW:FRAT?</code> |
| Notes | When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value |
| Dependencies | Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists |
| Couplings | This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1753 command descriptions |
| Preset | 20 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Only valid values are 0, 6, 14, 20 dB |
| Annotation | <p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1745 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB |

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1775 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 345

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code> |
| Example | <code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual |
| Dependencies | Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1756 See " Attenuator Configurations and Auto/Man " on page 345 for more information on the Auto/Man functionality |
| Couplings | If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1752 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto , but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below |

| | | |
|----------------|--|-------|
| | 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB | |
| Preset | Auto The Auto value is 10 dB | |
| State Saved | Saved in instrument state | |
| Min | 0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased | |
| Max | CXA Option 503 or 507 | 50 dB |
| | EXA | 60 dB |
| | All other models | 70 dB |
| | Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB | |
| Annotation | <p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p> | |
| | Auto Function | |
| Remote Command | [:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO? | |
| Example | Turn Auto Mech Atten ON: :POW:ATT:AUTO ON | |
| Dependencies | :POW:ATT:AUTO is only available in measurements that support Auto , such as Swept SA | |
| Preset | ON | |

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 1750, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 343 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 1756 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 347

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code> |
| Example | <code>:POW:EATT 10</code> <code>:POW:EATT?</code> |
| Notes | Electronic Attenuation's specification is defined only when Mech Atten is 6 dB |
| Dependencies | <p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1775 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1777 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p> |
| Couplings | Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator " |

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|----------------|---|
| | Transition Rules" on page 348 |
| Preset | 0 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB |
| Annotation | See Annotation under the Mech Atten control description |
| Auto Function | |
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code> |
| Example | <code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code> |
| Preset | OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator |

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 349](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1755](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1760.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Example | <code>:POW:RANG:OPT IMM</code> |
| Notes | Executing Adjust Atten for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code> |
| Example | <code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code> |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | <code>COMBined</code> |
| State Saved | Saved in instrument state |

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1759 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set `Elec+Mech Atten`, in which case both attenuators participate in the autoranging, or `Elec Atten Only`, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 351

| Selection | SCPI | Note |
|-----------------|-------------------------|--|
| Off | <code>OFF</code> | This is the default setting |
| On | <code>ON</code> | Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the <code>ON</code> parameter is supported and mapped to <code>COMBined</code> |
| Elec Atten Only | <code>ELECTrical</code> | Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster |
| Elec+Mech Atten | <code>COMBined</code> | In Dual-Attenuator models, this selects both attenuators to participate in the autoranging |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Example | <code>:POW:RANG:OPT:ATT OFF</code> |

3 WLAN Mode

| State Saved | Saved in instrument state | | | | |
| Range | <table border="1"> <tbody> <tr> <td>Dual-Attenuator models:</td> <td>Off Elec Atten Only Mech + Elec Atten</td> </tr> <tr> <td>Single-Attenuator models:</td> <td>Off On</td> </tr> </tbody> </table> | Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten | Single-Attenuator models: | Off On |
| Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten | | | | |
| Single-Attenuator models: | Off On | | | | |

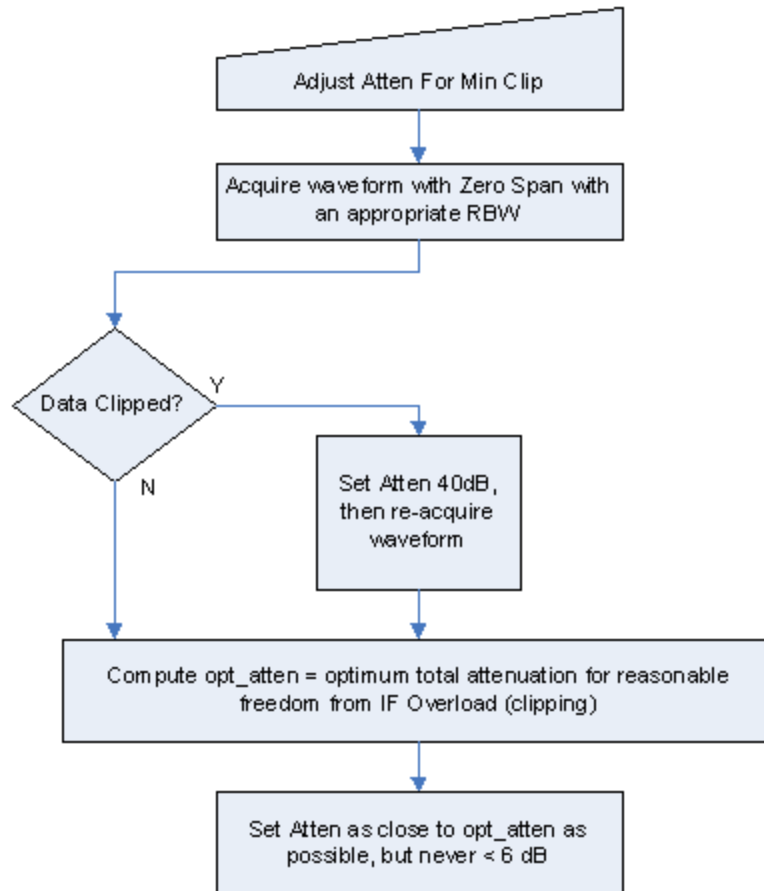

Backwards Compatibility Command

| | |
|------------------------------|--|
| Notes | <p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p> |
| Backwards Compatibility SCPI | <p>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</p> <p>[:SENSe]:POWer[:RF]:RANGe:AUTO?</p> |

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1759 or "Pre-Adjust for Min Clipping" on page 350 selection is Mech + Elec Atten:

3 WLAN Mode
 3.3 Occupied BW Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 350 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|--------------|---|
| | <code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code> |
| Example | <code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code> |
| Notes | Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10 |
| Dependencies | Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error |
| Couplings | When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB |
| Preset | EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB |
| State Saved | Saved in instrument state |

3.3.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

| | |
|-------------|----|
| State Saved | No |
|-------------|----|

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code> |
| Example | <code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code> |
| Notes | The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency The hardware compensates for frequency response and alters the Range setting |
| Preset | 0 dBm |
| State Saved | Yes |
| Min/Max | -/+100 |
| Annotation | Meas Bar |

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Notes | Executing Adjust Range for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Notes | Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |
| Preset | OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping |
| State Saved | Saved in instrument state |

Adjustment Algorithm

The algorithm for the adjustment is documented below:

3 WLAN Mode
3.3 Occupied BW Measurement

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1769 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

| | | |
|----------------|--|-------|
| Remote Command | [:SENSe]:POWer[:RF]:RANGe:PARatio <real> [:SENSe]:POWer[:RF]:RANGe:PARatio? | |
| Example | :POW:RANG:PAR 12 dB | |
| Notes | In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated | |
| Dependencies | Does not appear in Spectrum Analyzer Mode | |
| Preset | VXT Models M9410A/11A | 0 dB |
| | All Others | 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB | |
| Max | VXT Models M9410A/11A | 50 dB |
| | All Others | 20 dB |

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1771. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

| | | |
|----------------|--|--------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code> | |
| Example | <code>:POW:RANG:MIX:OFFS -5 dB</code> | |
| Preset | 0 dB | |
| State Saved | Saved in instrument state | |
| Min | VXT Models M9410A/11A | -34 dB |
| | All Others | -35 dB |
| Max | 30 dB | |

3.3.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1788 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

3 WLAN Mode
3.3 Occupied BW Measurement

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "**Preselector Adjust**" on page 1774 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "**Proper Preselector Operation**" on page 359.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe] :POWer [:RF] :PCENter</code> |
| Example | <code>:POW:PCEN</code> |
| Notes | The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command |
| Dependencies | Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Couplings | The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1774 |
| Status Bits/OPC dependencies | When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed |

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "**Presel Center**" on page 1773 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code> |
| Example | <code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code> |
| Notes | The value on the control is displayed to 0.1 MHz resolution |
| Dependencies | <ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Preset | 0 MHz |

| | |
|------------------------------|---|
| State Saved | The Preselector Adjust value set by " Presel Center " on page 1773, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle |
| Min/Max | -/+500 MHz |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command |
| Notes | The command has no effect, and the query always returns MWAVE |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXternal</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code> |

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

| Selection | Example | Note |
|------------|---|---|
| Off | <code>:POW:GAIN OFF</code> | |
| Low Band | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code> | Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown |
| Full Range | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code> | Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear |

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code> |
| Example | <code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code> |
| Dependencies | Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled |
| Preset | <code>LOW</code> |
| State Saved | Saved in instrument state |
| Annotation | When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp) |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code> |
| Example | <code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code> |
| Preset | <code>OFF</code> |

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

3 WLAN Mode
3.3 Occupied BW Measurement

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1775. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "Internal Preamp" on page 1775, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 363

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code> |
| Example | <code>:POW:GAIN:LNA ON</code> |
| Dependencies | Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled |
| Preset | OFF |
| State Saved | Saved in State |

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and Internal Preamp. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

| Path | Example | Note |
|-----------------------|----------------------|--|
| Standard Path | :POW:MW:PATH STD | Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled |
| Low Noise Path Enable | :POW:MW:PATH LNP | See " Low Noise Path Enable " on page 368 |
| μW Preselector Bypass | :POW:MW:PATH MPB | See " μW Preselector Bypass " on page 370 |
| Full Bypass Enable | :POW:MW:PATH FULL | See " Full Bypass Enable " on page 371 |

| Notes | <p>When "Presel Center" on page 1773 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p> | | | | | | | | | | | | | | |

 μ W Path: FByp,On

μ W Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to μ W Path Control:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

| Measurement | μ W Path Control Auto behavior |
|------------------|---|
| Digital Demod | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Custom OFDM | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |

3 WLAN Mode

3.3 Occupied BW Measurement

| Measurement | μ W Path Control Auto behavior |
|--------------------|------------------------------------|
| ACP | Always Presel Bypass |
| SEM | Always Presel Bypass |
| Spurious Emissions | Always Standard Path |

WLAN Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|--|
| Modulation Analysis | Always Presel Bypass |
| Spectral Flatness | Always Presel Bypass |
| Power vs Time | Always Presel Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Always Presel Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Always Presel Bypass |
| SEM | For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto μ W path is standard For other cases, auto μ W path is presel bypass if presel bypass is enabled, auto μ W path is standard if presel bypass is not enabled |
| Spurious Emissions | Always Standard Path |

5G NR Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|---|
| Modulation Analysis | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass |
| Monitor Spectrum | Always Standard Path |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass |
| Channel Power | Always Standard Path |
| Occupied BW | Always Standard Path |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |

| Couplings | See " μW Path Control Auto " on page 366 above |
| Preset | ON |
| Range | ON OFF |

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

3 WLAN Mode

3.3 Occupied BW Measurement

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

| | |
|------------------------------|--|
| Example | Bypass the microwave preselector: :POW:MW:PRES OFF |
| Notes | Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB) |
| Preset | ON |
| Backwards Compatibility SCPI | [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]? |

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

| Type | ID | |
|---|-----|--|
|  | 159 | Settings Alert - DETECTED; Presel/Meas BW conflict |

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1778.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1778 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command `[:SENSe]:POWer[:RF]:MW:PATH:AUTO:FULL ON | OFF | 1 | 0`
`[:SENSe]:POWer[:RF]:MW:PATH:AUTO:FULL?`

Example `:POW:MW:PATH:AUTO:FULL ON`
`:POW:MW:PATH:AUTO:FULL?`

Dependencies Only appears if Option FBP is installed, and in the following measurements

- 5GNRMode: Modulation Analysis and IQ Waveform
- WLAN Mode: IQ Waveform
- Channel Quality Mode: Group Delay and Noise Power Ratio

Preset **OFF**

State Saved Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

3 WLAN Mode
3.3 Occupied BW Measurement

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code> |
| Example | <code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code> |
| Dependencies | Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements |
| Couplings | Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state |
| Preset | N9041B OFF N9042B+V3050A ON M9410A/11A ON |
| State Saved | Saved in instrument state |

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code> |
| Example | <code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1788 is OFF. The grayout message is “Unavailable unless SW Presel enabled” |
| Preset | N9041B ADVanced N9042B+V3050A NORMa1 |
| State Saved | Saved in instrument state |

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code> |
| Example | <code>:POW:SWPR:BW NARR</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept |

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code> |
| Example | Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code> |
| Dependencies | Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz |
| Preset | See " Prefilter Presets " on page 377 below |
| State Saved | Saved in instrument state |

| HARM | SA | ON |

3.3.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for "[Res BW](#)" on page 379 and "[Video BW](#)" on page 380.

The **Resolution BW** functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.3.4.1 Settings

Contains the basic bandwidth functions. In this measurement, it is the only tab under **BW**.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the **Res BW** to "**Span**" on [page 397](#) using the ratio set by **Span:3 dB RBW** (some measurements do not have a **Span:3 dB RBW** control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing "**Auto Couple**" on [page 1833](#) or by performing a **Preset**.

When **Res BW** is set to **Auto**, the bandwidth selected depends on "**RBW Filter Type**" on [page 381](#).

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

| | |
|----------------|--|
| Remote Command | <pre>[:SENSe]:OBwidth:BANDwidth[:RESolution] <bandwidth> [:SENSe]:OBwidth:BANDwidth[:RESolution]? [:SENSe]:OBwidth:BANDwidth[:RESolution]:AUTO ON OFF 1 0 [:SENSe]:OBwidth:BANDwidth[:RESolution]:AUTO?</pre> |
| Example | <pre>:OBW:BAND 5 MHz :OBW:BAND? :OBW:BAND:AUTO ON :OBW:BAND:AUTO?</pre> |
| Notes | <p>For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered</p> <p>The setting and querying of values depend on the current bandwidth type</p> |
| Couplings | <p>Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration</p> <p>"Video BW" on page 380 is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1)</p> <p>When Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings</p> |
| Preset | <p>Auto, unless noted in "RBW Presets" on page 380 below</p> <p>See table below</p> |
| State Saved | Saved in instrument state |

| | |
|-------------------------------|--|
| Min | 1 Hz |
| Max | 8 MHz is the max equivalent -3 dB RBW, which means that the named RBW (the one shown on the control etc.) can exceed 8 MHz if using a filter other than -3 dB Gaussian |
| Annotation | A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling |
| Backwards Compatibility Notes | For backwards compatibility, this command supports both BANDwidth and BwIDth forms For ESA, the maximum Res BW was 5 MHz; for X-Series it is 8 MHz |

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

| Mode | Preset Value |
|--------------------------------------|--------------|
| WCDMA | 30 kHz |
| BT | 10 kHz |
| WLAN | 100 kHz |
| MSR | 30 kHz |
| LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR | 30 kHz |

Video BW

Lets you change the instrument post-detection filter (VBW or “video bandwidth”) from 1 Hz to 8 MHz, in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Video BW (Auto) selects automatic coupling of **Video BW** to **"Res BW"** on page 379. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing **"Auto Couple"** on page 1833 or by performing a **Preset**.

| | |
|----------------|---|
| Remote Command | <pre>[:SENSe]:OBwidth:BANDwidth:VIDeo <bandwidth> [:SENSe]:OBwidth:BANDwidth:VIDeo? [:SENSe]:OBwidth:BANDwidth:VIDeo:AUTO ON OFF 1 0 [:SENSe]:OBwidth:BANDwidth:VIDeo:AUTO?</pre> |
| Example | <pre>:OBW:BAND:VID 2.4 MHz :OBW:BAND:VID? :OBW:BAND:VID:AUTO ON :OBW:BAND:VID:AUTO?</pre> |

3 WLAN Mode

3.3 Occupied BW Measurement

| | |
|-------------------------------|---|
| Notes | For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset |
| Dependencies | Sometimes the displayed Video BW is not actually used to process the trace data: When the Average detector is selected, and Sweep Type is set to Swept , the video bandwidth filter cannot be used, because it uses the same hardware as the Average detector When the Quasi-Peak , EMI Average , or RMS Average detector is selected, Video BW is implemented by the digital IF as part of the detector In this case, Video BW still acts to change the Sweep Time, if Sweep Time is in Auto , and still affects the data on other traces for which this is not the case |
| Couplings | Normally coupled to Res BW . If Video BW is set to Auto , then video bandwidth is changed as Res BW changes, to maintain the preset ratio (normally 10:1) |
| Preset | Auto , unless noted in " Video BW Presets " on page 381 below ON |
| State Saved | Saved in instrument state |
| Min | 1 Hz |
| Max | 50 MHz |
| Annunciation | A “#” mark appears before “VBW” in the annotation when it is not coupled |
| Annotation | In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value used for VBW (see above) |
| Backwards Compatibility Notes | For backwards compatibility, this command supports both BANDwidth and BWIDTH forms |

Video BW Presets

Unless noted in the table below, the Preset value is **Auto**.

| Mode ID | Preset Value |
|---------|--------------|
| WCDMA | 300 kHz |
| BT | 30 kHz |

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the **Res BW** filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz **Res BW** filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, you can choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

| | Filter Type | SCPI |
|------------------------------|---|-------------------------|
| | Gaussian | GAUSSian |
| | Flattop | FLATtop |
| Remote Command | [:SENSe]:OBwidth:BANDwidth:SHAPE GAUSSian FLATtop [:SENSe]:OBwidth:BANDwidth:SHAPE? | |
| Example | :OBW:BAND:SHAP GAUS :OBW:BAND:SHAP? | |
| Preset | "Auto Couple" on page 1833 selects the preset value | |
| State Saved | Saved in instrument state | |
| Annotation | The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this: | |
| | -3 dB (Normal) filter BW | Res BW 300 Hz |
| | -6 dB filter BW | Res BW (-6 dB) 422 Hz |
| | Noise filter BW | Res BW (Noise) 317 Hz |
| | Impulse filter BW | Res BW (Impulse) 444 Hz |
| | CISPR filter BW | Res BW (CISPR) 200 Hz |
| | MIL filter BW | Res BW (MIL) 1 kHz |
| | Flattop filter type | Res BW (Flattop) 300 Hz |
| Backwards Compatibility SCPI | [:SENSe]:OBwidth:BWIDth:SHAPE | |

3.3.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.3.5.1 Meas Display

Contains controls for setting the display for the current Measurement, View or Window.

x dB BW Boundaries On/Off

Turns the x dB BW Boundaries On or Off.

| | |
|----------------|--|
| Remote Command | :DISPlay:OBwidth:WINDow[1]:XDB 0 1 OFF ON :DISPlay:OBwidth:WINDow[1]:XDB? |
|----------------|--|

| Backwards Compatibility SCPI | <code>:DISPlay:OBWidth:VIEW2:WINDow2:BOUNDaries:FREQuency</code> |

3.3.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

| | |
|-------------------|--|
| Remote Command | <code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code> |
| Example | <code>:DISP:GRAT OFF</code> |

| | |
|------------------------------|--|
| Notes | The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis |
| Preset | ON |
| State Saved | Saved in instrument state |
| Backwards Compatibility SCPI | <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored |

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code> |
| Example | <code>:DISP:ANN:SCR OFF</code> |
| Dependencies | Grayed-out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> |
|----------------|---|

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|-------------|---|
| | <code>:DISPlay:ANNotation:TRACe[:STATe]?</code> |
| Example | <code>:DISP:ANN:TRAC OFF</code> |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code> |
| Example | <code>:DISP:ACT OFF</code> |
| Dependencies | Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code> |
| Preset | <code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code> |
| State Saved | Saved in instrument state |

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code> |
| Example | <code>:DISP:ANN:MBAR OFF</code> |
| Dependencies | Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code> |
| Preset | <code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code> |
| State Saved | Saved in instrument state |

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

| Name | Command |
|----------------------------|--|
| Select User View | <code>:DISPlay:VIEW:ADVanced:SElect</code> |
| Rename User View | <code>:DISPlay:VIEW:ADVanced:REName</code> |
| Delete User View | <code>:DISPlay:VIEW:ADVanced:DELeTe</code> |
| Create User View | <code>:DISPlay:VIEW:ADVanced:NAME</code> |
| Select Screen | <code>:INSTrument:SCReen:SElect</code> |
| Delete Screen | <code>:INSTrument:SCReen:DELeTe</code> |
| Delete All But This Screen | <code>:INSTrument:SCReen:DELeTe:ALL</code> |
| Add Screen | <code>:INSTrument:SCReen:CREate</code> |
| Rename Screen | <code>:INSTrument:SCReen:REName</code> |
| Sequencer On/Off | <code>:SYSTem:SEQuencer</code> |

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:ENABle OFF ON 0 1</code> |
| Example | <code>:DISP:ENAB OFF</code> |
| Couplings | <code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code> |
| Preset | ON |

3 WLAN Mode
 3.3 Occupied BW Measurement

| | |
|-------------------------------|---|
| | Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code> |
| State Saved | Not saved in instrument state |
| Backwards Compatibility Notes | <code>:SYST:PRES</code> no longer turns on <code>:DISPlay:ENABle</code> as it did in legacy analyzers |

3.3.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 330

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code> |
| Example | Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code> |
| Notes | <p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOom</code>) with</p> <pre><code>:DISP:VIEW:ADV:SEL</code></pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></pre> <pre><code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

| | |
|------------------------------|--|
| Backwards Compatibility SCPI | The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views |
|------------------------------|--|

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code> |
| Example | <code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View |
| Notes | <code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated |

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code> |
| Example | <code>:DISP:VIEW:ADV:REN "Baseband"</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DElete</code> |
| Example | <code>:DISP:VIEW:ADV:DEL</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DElete:ALL</code> |
|----------------|--|

| | |
|---------|-------------------------------------|
| Example | <code>:DISP:VIEW:ADV:DEL:ALL</code> |
| Notes | Disabled if there are no User Views |

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:CAT?</code> |
| Notes | Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code> No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined |

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:USER:CAT?</code> |
| Notes | Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1804), then query the list of available Views, the result is undefined |

3.3.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.3.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule (when frequency Scale Type is set to linear). While adjusting **Center Frequency**, **Span** is held constant, which means that both **Start Freq** and **Stop Freq** will change.

In measurements that also have **Start Freq** and **Stop Freq** controls, pressing **Center Frequency** sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**. In the Start/Stop annotation mode, **Start Freq** and **Stop Freq** are displayed below the graticule instead of **Center Frequency** and **Span**.

Pressing **Center Frequency** also sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**.

When **Display Scale Type** is set to **LOG**, pressing **Center Frequency** sets the frequency that corresponds to the arithmetic mean of the start frequency and stop frequency, which is not at the horizontal center of the graticule.

The center frequency setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center**

Frequency changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input (see "**RF Center Frequency**" on page 395 and "**Ext Mix Center Freq**" on page 396).

Center Frequency is remembered as you go from input to input. Thus you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer?</code> |
| Example | Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of CF Step : <code>:FREQ:CENT UP</code> Return the current value of Center Frequency : <code>:FREQ:CENT?</code> |
| Notes | Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF :CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ :CENT</code> - For External Mixer it is equivalent to <code>:FREQ:EMIX :CENT</code> Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated |
| Dependencies | Center Frequency can be limited by Start Freq or Stop Freq limits, if Span is so large that start or stop reach their limits |
| Couplings | When operating in "swept span", any value of Center Frequency or Span that is within the frequency range of the instrument is allowed, <i>if</i> the value is being set through the front panel numeric key pad or the SCPI command. The other parameter is forced to a different value if needed, to keep Start and Stop Frequencies within the instrument's frequency range Coupling between center frequency and span: numeric (keypad) entries are treated differently than changing the value using the step keys (Up/Down Arrows) or the knob. Similarly, for remote operation, sending a numeric frequency value is treated differently than the UP DOWN keywords: <ul style="list-style-type: none"> - Numeric entries (keypad or remote): Any value of Center Frequency or Span (within the frequency range of the instrument) is allowed. The other parameter is changed, as necessary, to keep the Start Freq and Stop Freq within the instrument frequency range - Knob or Step keys (up/down arrows) or UP DOWN keywords: The value of the parameter being changed (Center Frequency or Span) is limited so the other parameter is not forced to a new value. Thus, if only the step keys and knob are used, you can return to the initial Center Frequency and Span by changing only the current parameter |

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|------------------------------|--|
| | Note that, since out-of-range Start Freq and Stop Freq are never allowed, markers and trace math work correctly without requiring any special handling for out-of-range conditions |
| Preset | Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 393 and "Ext Mix Center Freq" on page 396 |
| State Saved | Saved in instrument state |
| Min/Max | Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 393 and "Ext Mix Center Freq" on page 396 |
| Annotation | Center <value> appears in the lower left corner of the display |
| Status Bits/OPC dependencies | Non-overlapped |

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------------------|----------------------|-----------------------------|-----------------------------|
| 503 (all but CXA) | 1.805 GHz | 3.6 GHz | 3.7 GHz |
| 503 (CXA) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| 507 (all but CXA) | 3.505 GHz | 7.0 GHz | 7.1 GHz |
| 507 (CXA) | 3.755 GHz | 7.5 GHz | 7.58 GHz |
| 508 (all but MXE) | 1.805 GHz | 3.6 GHz | 8.5 GHz |
| 508 (MXE) | 4.205 GHz | 8.4 GHz | 8.5 GHz |
| 513 | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| 526 (except CXA and MXE) | 13.255 GHz | 26.5 GHz | 27.0 GHz* |
| 526 (CXA) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 526 (MXE) | 1.805 GHz | 3.6 GHz | 27.0 GHz |
| 532 | 16.005 GHz | 32.0 GHz | 32.5 GHz |
| 540 | 20.005 GHz | 40.0 GHz | 40.5 GHz |
| 543 | 21.505 GHz | 43.0 GHz | 43.0 GHz |
| 544 | 22.005 GHz | 44.0 GHz | 45.0 GHz |
| 550 | 25.005 GHz | 50.0 GHz | 52 GHz |
| F03 (CXA-m) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| F07 (CXA-m) | 3.755 GHz | 7.5 GHz | 7.575 GHz |
| F13 (CXA-m) | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| F26 (CXA-m) | 13.255 GHz | 26.5 GHz | 26.55 GHz |

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|----------------------|----------------------|-----------------------------|-----------------------------|
| 504 (M9421A, M8920A) | 2.145 GHz | 3.88GHz | 3.88 GHz |
| 506 (M9421A, M8920A) | 3.245 GHz | 6.08GHz | 6.08 GHz |
| F06 (M9410A/11A) | 1.0 GHz | 6.08 GHz | 6.08 GHz |
| F06 (M9415A) | 1 GHz | 1.08 GHz | 6.6 GHz |
| F08 (M9415A) | 1 GHz | 1.08 GHz | 8.6 GHz |
| F12 (M9415A) | 1 GHz | 1.08 GHz | 12.9 GHz |

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

| Input | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|---------------------|----------------------|-----------------------------|-----------------------------|
| Input 1, all models | 25.005 GHz | 50.0 GHz | 52 GHz |
| Input 2, opt 585 | 42.505 GHz | 85.0 GHz | 86 GHz |
| Input 2, opt 590 | 45.005 GHz | 90.0 GHz | 92 GHz |
| Input 2, opt 5CX | 55.005 GHz | 110.0 GHz | 110 GHz |

Input 2, CXA and MXE

| Model | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|-------------|----------------------|-----------------------------|-----------------------------|
| CXA opt C75 | 0.7505 GHz | 1.5 GHz | 1.58 GHz |
| MXE | 505 MHz | 1 GHz | 1.000025 GHz |

Tracking Generator Frequency Limits (CXA only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 9 kHz | 3.0 GHz | 3.08 GHz |
| T06 | 9 kHz | 6.0 GHz | 6.05 GHz |

Tracking Generator Frequency Limits(CXA-m only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 2 MHz | 3.08 GHz | 3.08 GHz |

3 WLAN Mode
3.3 Occupied BW Measurement

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T07 | 2 MHz | 7.575 GHz | 7.575 GHz |
| T13 | 2 MHz | 13.8 GHz | 13.8 GHz |
| T26 | 2 MHz | 26.55 GHz | 26.55 GHz |

RF Center Frequency

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code> |
| Example | <code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode |
| Dependencies | If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning If Source Mode is set to Tracking, and the Max or Min Center Frequency is therefore limited by the limits of the source, a warning message is generated, “Data out of range; clipped to source max/min” if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep |
| Preset | See " Center Frequency Presets " on page 393 |
| State Saved | Saved in instrument state |

| Min | Instrument Types | Value |
|-----|-----------------------|--|
| | VXT model M9421A | 55.000005 MHz |
| | VXT models M9410A/11A | 6.505 kHz with Option LFE 330.000005 MHz without Option LFE 330.000005 MHz |
| | VXT model M9415A | 330.000005 MHz |
| | M8920A | 80.005 kHz |
| | All other instruments | -79.999995 MHz |

| | Instrument Types | Value |
|----------------|---|-------|
| | <i>Unless Source Mode is set to Tracking, in which case it is limited by the minimum frequency of the Source</i> | |
| Max | See table above. Basically, instrument maximum frequency – 5 Hz. Note that, if the Source Mode is set to Tracking, the effective instrument maximum frequency may be limited by the source maximum frequency If the knob or step keys are being used, also depends on the value of the other three interdependent parameters: Span , Start Frequency and Stop Frequency | |
| | <p>Ext Mix Center Freq</p> <p>Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the Center Frequency function in the Frequency menu on the front panel always applies to the currently selected input.</p> | |
| Remote Command | [:SENSe]:FREQUency:EMIXer:CENTer <freq> [:SENSe]:FREQUency:EMIXer:CENTer? | |
| Example | :FREQ:EMIX:CENT 60 GHz :FREQ:EMIX:CENT? | |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode | |
| Couplings | When you return to External Mixing after using one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the Center Frequency that you had. However, Span is <i>not</i> an input-dependent parameter, so it does not change. Therefore, the instrument comes back with the Span from the previous input, limited as necessary by the current mixer setup | |
| Preset | <p>When Mode Preset is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min frequency of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max frequency of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies</p> <p>Note that, if the current measurement has a limited Span available to it, and cannot achieve the span shown in the table (Span = Stop Freq – Start Freq), the instrument uses the maximum span that the measurement allows, and still sets Center Frequency to the midpoint of the Start Freq and Stop Freq values in the Harmonic Table</p> <p>When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after Restore Input/Output Defaults, if you switch to External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz</p> | |

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|-------------|---|
| State Saved | Yes |
| Min | The minimum frequency in the currently selected mixer band + 5 Hz |
| Max | The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on the value of the other three interdependent parameters Span , Start Freq and Stop Freq |

Span

Set the frequency of the occupied bandwidth span for the current measurement.

| Remote Command | <pre>[:SENSe]:OBWidth:FREQuency:SPAN <freq> [:SENSe]:OBWidth:FREQuency:SPAN? [:SENSe]:OBWidth:FREQuency:SPAN:AUTO ON OFF 0 1 [:SENSe]:OBWidth:FREQuency:SPAN:AUTO?</pre> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------------|---|-----------|-------|---------|-------|------------------------------|--------|--------------------------|------------------|--------------------------|---------|-------------------------|---------|--------------------------|---------|--------|-----|--------|------|---|-----------|-------|---------|-------|------------------------------|--------|--------------------------|--------|--------------------------|---------|-------------------------|---------|-------------------|---------|
| Example | <pre>:OBW:FREQ:SPAN 2.4 MHz :OBW:FREQ:SPAN? :OBW:FREQ:SPAN:AUTO 0 :OBW:FREQ:SPAN:AUTO?</pre> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Notes | Span Auto Detector ([:SENSe]:OBWidth:FREQuency:SPAN:AUTO) is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Dependencies | The Auto Detect functionality is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Preset | <table border="1"> <thead> <tr> <th>Mode</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>SA</td> <td>3 MHz</td> </tr> <tr> <td>WCDMA</td> <td>10 MHz</td> </tr> <tr> <td>LTEAFDD, LTEATDD</td> <td>10 MHz</td> </tr> <tr> <td>BT</td> <td>2 MHz</td> </tr> <tr> <td>5GNR</td> <td>Automatically calculated</td> </tr> <tr> <td>RTS</td> <td>27 kHz</td> </tr> <tr> <td>MSR</td> <td>10 MHz</td> </tr> <tr> <td>WLAN</td> <td> <table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11b</td> <td>30MHz</td> </tr> <tr> <td>802.11a/g/n/ac/ax/be (20MHz)</td> <td>25 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (40MHz)</td> <td>50 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (80MHz)</td> <td>100 MHz</td> </tr> <tr> <td>802.11ac/ax/be (160MHz)</td> <td>200 MHz</td> </tr> <tr> <td>802.11be (320MHz)</td> <td>400 MHz</td> </tr> </tbody> </table> </td> </tr> </tbody> </table> | | Mode | Value | SA | 3 MHz | WCDMA | 10 MHz | LTEAFDD, LTEATDD | 10 MHz | BT | 2 MHz | 5GNR | Automatically calculated | RTS | 27 kHz | MSR | 10 MHz | WLAN | <table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11b</td> <td>30MHz</td> </tr> <tr> <td>802.11a/g/n/ac/ax/be (20MHz)</td> <td>25 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (40MHz)</td> <td>50 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (80MHz)</td> <td>100 MHz</td> </tr> <tr> <td>802.11ac/ax/be (160MHz)</td> <td>200 MHz</td> </tr> <tr> <td>802.11be (320MHz)</td> <td>400 MHz</td> </tr> </tbody> </table> | Radio Std | Value | 802.11b | 30MHz | 802.11a/g/n/ac/ax/be (20MHz) | 25 MHz | 802.11n/ac/ax/be (40MHz) | 50 MHz | 802.11n/ac/ax/be (80MHz) | 100 MHz | 802.11ac/ax/be (160MHz) | 200 MHz | 802.11be (320MHz) | 400 MHz |
| Mode | Value | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| SA | 3 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| WCDMA | 10 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| LTEAFDD, LTEATDD | 10 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| BT | 2 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 5GNR | Automatically calculated | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RTS | 27 kHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| MSR | 10 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| WLAN | <table border="1"> <thead> <tr> <th>Radio Std</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>802.11b</td> <td>30MHz</td> </tr> <tr> <td>802.11a/g/n/ac/ax/be (20MHz)</td> <td>25 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (40MHz)</td> <td>50 MHz</td> </tr> <tr> <td>802.11n/ac/ax/be (80MHz)</td> <td>100 MHz</td> </tr> <tr> <td>802.11ac/ax/be (160MHz)</td> <td>200 MHz</td> </tr> <tr> <td>802.11be (320MHz)</td> <td>400 MHz</td> </tr> </tbody> </table> | Radio Std | Value | 802.11b | 30MHz | 802.11a/g/n/ac/ax/be (20MHz) | 25 MHz | 802.11n/ac/ax/be (40MHz) | 50 MHz | 802.11n/ac/ax/be (80MHz) | 100 MHz | 802.11ac/ax/be (160MHz) | 200 MHz | 802.11be (320MHz) | 400 MHz | | | | | | | | | | | | | | | | | | | |
| Radio Std | Value | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 802.11b | 30MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 802.11a/g/n/ac/ax/be (20MHz) | 25 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 802.11n/ac/ax/be (40MHz) | 50 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 802.11n/ac/ax/be (80MHz) | 100 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 802.11ac/ax/be (160MHz) | 200 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 802.11be (320MHz) | 400 MHz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Mode | Value |
|------------------------------|--|
| State Saved | Yes |
| Min | 100 Hz |
| Max | Hardware Maximum Span |
| Backwards Compatibility SCPI | <code>[:SENSe] : EBWidth : FREQUENCY : SPAN</code> |

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected, and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that Start Frequency and Stop Frequency also step by the **CF Step** value.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] : FREQUENCY : CENTER : STEP [: INCRement] <freq></code> <code>[:SENSe] : FREQUENCY : CENTER : STEP [: INCRement] ?</code> <code>[:SENSe] : FREQUENCY : CENTER : STEP : AUTO OFF ON 0 1</code> <code>[:SENSe] : FREQUENCY : CENTER : STEP : AUTO ?</code> |
| Example | Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code> |
| Notes | Preset and Max values depend on Hardware Options |
| Dependencies | Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up Arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning |
| Couplings | When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value |
| Preset | Auto ON |

| | |
|------------------------------|---|
| State Saved | Saved in instrument state |
| Min | - /+(the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band |
| Status Bits/OPC dependencies | non-overlapped |

Full Span (Remote Command Only)

Changes the Occupied Bandwidth Span to show the full frequency range of the instrument. It maximizes the span within a range but does not change **Center Frequency**. When using external mixing, it changes the displayed frequency span to the frequency range specified for the selected external mixing band.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :OBWidth :FREQuency :SPAN :FULL</code> |
| Example | <code>:OBW :FREQ :SPAN :FULL</code> |
| Couplings | Selecting full span changes the measurement span value |

3.3.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** mode (see "[Marker Mode](#)" on page 401), and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed at the center of the screen, on the trace determined by the Marker Trace rules.

3.3.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

| | |
|-------|--|
| Notes | The selected marker is remembered even when not in the Marker menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak |
|-------|--|

| | |
|--------------|--|
| Preset | Marker 1 |
| State Saved | The number of the selected marker is saved in instrument state |
| Annunciation | Appears in the marker results block label for Normal and Delta markers |

3.3.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection for the marker control mode (**Normal/POsition**, **Delta** or **Off**; see "**Marker Mode**" on page 401) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode (see "**Marker Mode**" on page 401) is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:X?</code> |
| Example | <code>:CALC:OBW:MARK3:X 0</code> <code>:CALC:OBW:MARK3:X?</code> |
| Notes | If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time |
| Preset | After a preset, all markers are turned OFF , so Marker X Axis Value query returns Not a Number (NAN) |
| State Saved | Saved in instrument state |
| Min | -9.9E+37 |
| Max | 9.9E+37 |
| Annotation | Mkr # <X value> and <Marker value> upper right on graph |

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

| | |
|--------|--|
| Remote | <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:X:POsition <real></code> |
|--------|--|

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|-------------|--|
| Command | :CALCulate:OBWidth:MARKer[1] 2 ... 12:X:POSition? |
| Example | :CALC:OBW:MARK10:X:POS 0 :CALC:OBW:MARK10:X:POS? |
| Notes | The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition If the marker is Off , the query response is Not A Number |
| Preset | After a preset, all markers are turned Off , so the query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min | -9.9E+37 |
| Max | 9.9E+37 |

Marker Y Axis Value (Remote Query only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

| | |
|---------------------------------|--|
| Remote Command | :CALCulate:OBWidth:MARKer[1] 2 ... 12:Y? |
| Example | :CALC:OBW:MARK11:Y? |
| Notes | Returns the marker Y-Axis result, if the control mode is Normal or Delta If the marker is Off , the response is Not A Number |
| Preset | Result dependent on Markers setup and signal source |
| State Saved | No |
| Backwards Compatibility SCPI | :CALCulate:OBWidth:MARKer[1] 2 ... 12:FUNCTION:RESult? |

Marker Mode

Sets the marker control mode to **Normal (Position)**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **Off**, there is no active function, and the active function is turned off.

| | |
|----------------|--|
| Remote Command | :CALCulate:OBWidth:MARKer[1] 2 ... 12:MODE POSition DELTa OFF :CALCulate:OBWidth:MARKer[1] 2 ... 12:MODE? |
| Example | :CALC:OBW:MARK:MODE POS :CALC:OBW:MARK:MODE? |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | POSition DELTA OFF |

Annotation Mkr # <X value> and <Marker value> upper right on graph
When Marker Trace is Polar in WCDMA mode:
Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Command

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1), puts it in **Normal** mode, and places it at the center of the screen.

| | |
|------------------------------|--|
| Example | :CALC:OBW:MARK3:STAT ON :CALC:OBW:MARK3:STAT? |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | OFF ON |
| Backwards Compatibility SCPI | :CALCulate:OBWidth:MARKer[1] 2 ... 12:STATE OFF ON 0 1 :CALCulate:OBWidth:MARKer[1] 2 ... 12:STATE? |

Delta Marker (Reset Delta)

Pressing this button has the same effect as pressing **Delta** in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command :CALCulate:OBWidth:MARKer:AOff

Example :CALC:OBW:MARK:AOff

3.3.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with ["Marker Delta" on page 404](#).

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as ["Marker Frequency" on page 400](#) on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command :CALCulate:OBWidth:MARKer[1]|2|...|12:MAXimum

Example :CALC:OBW:MARK2:MAX
 :SYST:ERR?

can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search

Notes Sending this command selects the subopcoded marker
 In WCDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "**Marker Mode**" on [page 401](#) on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.3.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "**Marker Frequency**" on [page 400](#) on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:REference <integer></code> |
| Example | <code>:CALC:OBW:MARK:REF 2</code> <code>:CALC:OBW:MARK:REF?</code> |
| Notes | Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded, the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" The query returns a single value (the specified marker number's relative marker) |
| Couplings | The act of specifying the selected marker's reference marker makes the selected marker a Delta marker |

| | |
|--------------|--|
| | If the reference marker is Off , it is turned on in Normal mode at the Delta marker location |
| Preset | The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off , All Markers Off , or Preset |
| State Saved | Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle |
| Min | 1 |
| Max | 12 |
| Annunciation | Appears in the marker label of a Delta marker |

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers (see "[Marker Mode](#)" on page 401).

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves from the trace it was on to the new trace. If the marker is **Off**, it stays off, but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:OBWidth:MARKer[1] 2 ... 12:TRACe?</code> |
| Example | <code>:CALC:OBW:MARK2:TRAC 2</code> <code>:CALC:OBW:MARK2:TRAC?</code> |
| Notes | A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number |
| Couplings | The state of Marker Trace is not affected by " Auto Couple " on page 1833 Sending the remote command causes the addressed marker to become selected |
| Preset | 1 |
| State Saved | Saved in instrument state |

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "[Marker Settings Diagram](#)" on page 402 on the **Settings** tab.

3.3.8 Meas Setup

Contains functions for setting up the measurement parameters and contains functions for setting up parameters global to all measurements in the mode.

3.3.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

Initiates an averaging routine that averages the sweep points in several successive sweeps, resulting in trace smoothing.

After the specified number of average counts, "[Average Mode](#)" on page 407 (termination control) determines the average action.

| | |
|------------------------------|--|
| Remote Command | <code>[:SENSe]:OBwidth:AVERage:COUNT <integer></code> |
| Example | <code>:OBW:AVER:COUN 1500</code> <code>:OBW:AVER:COUN?</code> |
| Preset | 10 |
| State Saved | Yes |
| Min/Max | 1/10000 |
| Annotation | The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count |
| Backwards Compatibility SCPI | <code>[:SENSe]:EBwidth:AVERage:COUNT</code> |

Averaging On/Off

Turns averaging on or off.

NOTE

In this measurement, **Average Type** is always preset to the [Log-Pwr Avg \(Video\)](#) method. Other averaging methods are not available.

3 WLAN Mode

3.3 Occupied BW Measurement

| | |
|---------------------------------|--|
| Remote Command | <code>[:SENSe]:OBWidth:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:OBWidth:AVERage[:STATe]?</code> |
| Example | <code>:OBW:AVER ON</code> <code>:OBW:AVER?</code> |
| Couplings | Averaging state is coupled to "Max Hold (Remote Command Only)" on page 412. If Max Hold is changed from OFF to ON , Averaging state is automatically set to ON |
| Preset | ON |
| State Saved | Yes |
| Range | ON OFF |
| Backwards Compatibility SCPI | <code>[:SENSe]:EBWidth:AVERage[:STATe]</code> |

Average Mode

Lets you set the averaging mode.

| | |
|--------------------|--|
| EXponential | Measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep |
| REPeat | The measurement resets the average counter each time the specified number of averages is reached |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:OBWidth:AVERage:TCONtrol EXponential REPeat</code> <code>[:SENSe]:OBWidth:AVERage:TCONtrol?</code> |
| Example | <code>:OBW:AVER:TCON REP</code> <code>:OBW:AVER:TCON?</code> |
| Preset | EXP |
| State Saved | Yes |
| Range | EXponential REPeat |

% of OBW Power

Assigns the percentage of the total power that is measured within the Occupied Bandwidth for the current measurement. The resulting Occupied Bandwidth limits are displayed by markers placed on the frequencies of the specified percentage.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:OBWidth:PERCent <real></code> <code>[:SENSe]:OBWidth:PERCent?</code> |
| Example | <code>:OBW:PERC 75</code> |

| | |
|-------------|-------------------------|
| | <code>:OBW:PERC?</code> |
| Preset | 99.00 |
| State Saved | Yes |
| Min/Max | 10/99.99 |

Power Ref

Lets you select Power Ref type:

| | | |
|-------------|-----------------------|--|
| Total Power | <code>TPOWer</code> | Total power in the current span is displayed |
| OBW Power | <code>OBWPower</code> | Occupied power is displayed |

When **Power Ref** type is changed, the annotation in the lower window and Remote Command SCPI Results also change.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:OBWidth:PREFERENCE OBWPower</code> <code>[:SENSe]:OBWidth:PREFERENCE?</code> |
| Example | <code>:OBW:PREF TPOW</code> <code>:OBW:PREF?</code> |
| Preset | <code>TPOWer</code> |
| State Saved | Saved in instrument state |
| Range | <code>TPOWer OBWPower</code> |

x dB

Sets the x dB value used for the "x dB bandwidth" result that measures the bandwidth between two points on the signal that is x dB down from the highest signal point within the OBW Span.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe]:OBWidth:XDB <rel_amp></code> <code>[:SENSe]:OBWidth:XDB?</code> |
| Example | <code>:OBW:XDB -20</code> <code>:OBW:XDB?</code> |
| Preset | BT Mode: -20.0 dB All other Modes: -26.0 dB |
| State Saved | Yes |
| Min/Max | -100.0 dB/-0.1 dB |
| Backwards Compatibility SCPI | <code>[:SENSe]:EBWidth:XDB</code> |

Power Integration Method

Selects the power integration method:

| | | |
|-------------|---------|---|
| Normal | NORMal | By integrating the linear power bucket values from the lower edge of the trace, and interpolating to find the point where the integrated power equals $(1 - [\text{Occ BW \% Pwr}]) / 2$ (0.5% if, for example, the 99% occupied bandwidth is to be found) of the total power, frequency f1 is obtained. This procedure is repeated from the upper trace edge to find frequency f2. This calculation uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points), f1 and f2 |
| From Center | ICENter | Measures the power spectrum distribution within two times or more frequency range over the requirement for Occupied Bandwidth specification centering on the current carrier frequency |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:OBwidth:INTEgration[:METHod] NORMal ICENter</code> <code>[:SENSe]:OBwidth:INTEgration[:METHod]?</code> |
| Example | <code>:OBW:INT NORM</code> <code>:OBW:INT?</code> |
| Preset | For 5GNR Mode, Uplink: ICENter All other Modes NORMal |
| State Saved | Yes |
| Range | NORMal ICENter |

Spur Avoidance

Because VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to “Disabled.”

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

The spur avoidance function is not available for:

- M9410A/11A with EP6 option at frequency above 6 GHz
- M9415A/16A at frequency below 380 MHz and above 12.3 GHz
- M9410E/11E/15E/16E at frequency below 380 MHz and above 25.9 GHz

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:OBWidth:SAVoid[:STATe] OFF ON 0 1</code> <code>[:SENSe]:OBWidth:SAVoid[:STATe]?</code> |
| Example | <code>:OBW:SAV ON</code> <code>:OBW:SAV?</code> |
| Dependencies | Only appears in VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |
| Range | <code>OFF ON</code> |

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 411 below.

| | |
|-------------------------------|---|
| Remote Command | :COUPle ALL |
| Example | :COUP ALL |
| Backwards Compatibility SCPI | :COUPLE ALL NONE |
| Backwards Compatibility Notes | :COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs |

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does *not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio

- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command `:CONFigure:OBwidth`

Example `:CONF:OBW`

Max Hold (Remote Command Only)

When **ON**, **Max Hold** displays and holds the maximum responses of the current measurement. Turn **Max HoldOFF** to disable the maximum hold feature.

Remote Command `[:SENSe]:OBwidth:MAXHold ON | OFF | 1 | 0`
`[:SENSe]:OBwidth:MAXHold?`

Example `:OBW:MAXH ON`
`:OBW:MAXH?`

Couplings **Max Hold** is coupled to "**Averaging On/Off**" on page 406. **Max Hold** is activated only if **Average** state is **ON**. If **Max Hold** is changed to **ON** when **Average** state is **OFF**, **Average** state is automatically set to **ON**

Preset **OFF**

3 WLAN Mode
3.3 Occupied BW Measurement

3.3.8.3 Radio

Contains controls to select Radio Standard and settings.

Radio Std

In this menu, 7 groups of WLAN standards can be selected:

1. 802.11a/b/g/j/p includes 802.11a/g/j/p, 802.11b/g, 802.11g DSSS-OFDM, 802.11j/p 10M, 802.11p 5M
2. 802.11n includes 802.11n 20MHz and 802.11n 40MHz
3. 802.11ac includes 802.11ac 20MHz, 802.11ac 40MHz, 802.11ac 80MHz, 802.11ac 80+80MHz and 802.11ac 160MHz
4. 802.11ah includes 802.11ah1MHz, 802.11ah2MHz, 802.11ah4MHz, 802.11ah 8MHz, and 802.11ah16MHz
5. 802.11af includes 802.11af 6MHz, 802.11af 7MHz and 802.11af 8MHz
6. 802.11ax includes 802.11ax 20MHz, 802.11ax 40MHz, 802.11ax 80MHz, 802.11ax 80+80MHz and 802.11ax 160MHz
7. 802.11be includes 802.11be 20MHz, 802.11be 40MHz, 802.11be 80MHz, 802.11be 160MHz and 802.11be 320MHz

Below each standard, parameters related to demodulation can be set, such as Modulation Format, Guard Interval, and so on.

3.3.8.4 Advanced

Contains controls for setting advanced functions of the instrument. This tab does not appear in EXM, nor in VXT models M9420A/10A/11A.

Noise Floor Extension

Lets you configure **Noise Floor Extension** (NFE). All Modes that support NFE let you set it on or off. Additionally, some Modes support two “on” states for NFE, **Full** and **Adaptive**, as described below.

Adaptive Option Support

At present (Release: X-Apps 2024), support for **Adaptive** NFE is as follows:

| Mode | Measurements | Supports Adaptive NFE? |
|------|-----------------|------------------------|
| BT | ACP, IBEM, IBSP | No |
| CQM | MON | Yes |

| Mode | Measurements | Supports Adaptive NFE? |
|----------|-------------------------------|------------------------|
| EDGE GSM | EORF, ETSP, MON | No |
| EMI | APD, DAN, FSC, MON, RTSC, SCH | Yes |
| LTEAFDD | PVT | No |
| LTEATDD | PVT | No |
| MSR | ACP, CHP, MON, OBW, SEM, SPUR | Yes |
| NR5G | PVT | No |
| PNOISE | LPL, MON, SFR | No |
| SA | SAN | Yes |
| SRCOMMS | ACP, CHP, MON, OBW, SEM, SPUR | Yes |
| VMA | ACP, CHP, OBW, SEM, SPUR | Yes |
| WCDMA | ACP, CHP, MON, OBW, SEM, SPUR | Yes |
| WLAN | CHP, MON, OBW, SEM, SPUR | Yes |

The menus and command options are as follows:

| NFE State | Modes with Adaptive NFE | Modes without Adaptive NFE | SCPI |
|-----------|-------------------------|----------------------------|--|
| Off | Off | Off | See "NFE On/Off Command" on page 418 |
| On | Full | On | |
| Adaptive | Adaptive | n/a | See "Adaptive NFE Command" on page 418 |

As shown in the table above, the **On** state (in Modes that do not support **Adaptive** NFE) matches the **Full** state in Modes that *do* support **Adaptive** NFE.

To maintain SCPI backwards compatibility, the existing command to turn NFE on or off is retained, and a new command is added to set the state to turn **AdaptiveON** or **OFF**:

- `[[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0]` is retained, with the default changed to **ON** for Modes that support **Adaptive** NFE
- `[[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0]` is added (for certain Modes), default = **ON**

When NFE is **On** or **Full**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

NFE works with any RBW, VBW, detector, any setting of **Average Type**, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the **Average** detector, results are better with long sweep times and fewer trace averages. When using the **Sample** detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, so when External Mixing is selected, it does nothing.

For more details, see ["Optimal Detector & Averaging Selections" on page 419](#) and ["Recalibration of Noise Floor" on page 420](#).

Pros & Cons of Adaptive NFE

Adaptive NFE provides an alternative to fully-on or fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the fully-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

In **Adaptive** NFE, there is not the same dramatic visual impact on the noise floor as there is in **Full** NFE. **Adaptive** NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the fully-off case; and when lots of averaging is being performed, the signal displays more like the **Full** NFE case.

Adaptive NFE is recommended for general-purpose use. For fully-ATE (automatic test equipment) applications, where possible distraction of the instrument user is not a risk, **Full** NFE is recommended.

NFE On/Off Command

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOOr ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOOr?</code> |
| Example | <code>:CORR:NOIS:FLO ON</code> |
| Dependencies | Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear. In those cases, the SCPI command is accepted without error, but has no effect |
| Couplings | When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed When NFE is enabled through SCPI, and a Characterize Noise Floor operation is needed, an error is entered in the system error queue |
| Preset | Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive . Turned OFF at startup and by Restore Mode Defaults in Modes that do <i>not</i> support Adaptive In Modes that support Adaptive NFE, the default (preset) state of NFE is Adaptive . In Modes that do not support Adaptive NFE, the default state of NFE is Off |
| State Saved | No |

Adaptive NFE Command

Only effective in instruments with the NFE or NF2 license installed, and in Modes that support **Adaptive** NFE. For coverage, see "[Adaptive Option Support](#)" on page 415 above.

For all other cases, the SCPI command below is accepted without error, but has no effect.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOOr:ADAPtive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOOr:ADAPtive?</code> |
| Example | First turn NFE on, this is Full mode <code>:CORR:NOIS:FLO ON</code> Then set it to Adaptive <code>:CORR:NOIS:FLO:ADAP ON</code> |
| Couplings | To maintain backwards compatibility, sending <code>:CORR:NOIS:FLO ON</code> turns NFE AdaptiveOFF . To turn Adaptive on, you must issue the commands in the proper order, as shown in the example above |
| Preset | Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults |
| State Saved | No |

Optimal Detector & Averaging Selections

Note that some measurements do not allow you to switch the **Detector** type (which is set by default to **Average**), so the discussion of detector types here is irrelevant for those measurements. Similarly, some measurements do not allow you to set **Average Type** (set by default to **LOG**), so that discussion here is irrelevant in those cases.

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to obtain the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when **Detector** is **Average** and **Average Type** is set to **Power (RMS)**.

For best operation, **AverageDetector** (default) and **Average Type. = Power** are recommended, as already stated. In other cases, operation is often not quite as good but still highly effective. Other **Detector** options, when available, behave as follows:

| | |
|----------------------|--|
| Positive Peak | The noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage Positive Peak is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise For pulsed-RF, Positive Peak can still give excellent effectiveness FFT analysis does not work well, and does not perform NFE well, with pulsed-RF signals, so this combination is <i>not</i> recommended |
| Negative Peak | Not very useful |
| Sample | Works well, but never better than Average , because it does not smooth as well |
| Normal | A combination of peak and negative peak behaviors, and works about as well as these |

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, **Average Type = Power (RMS)** is optimal (when this option is available). When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. Using NFE with **Average Type = Log-Power (LOG)** is not synergistic, though; NFE with **Average Type = Power (RMS)** works a little better than NFE with **LOG**.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that exceeds the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Recalibration of Noise Floor

In instruments with the NF2 license installed, the calibrated noise floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. To do this, use "**Characterize Noise Floor**" on page 1966, under **System, Alignments, Advanced**. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog stating:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

IF Gain

Sets the **IF Gain** function to one of:

| Setting | SCPI | Comments |
|---------|-------------------|-----------|
| Auto | AUTO = ON | Auto |
| Low | OFF | Low Gain |
| | AUTO = OFF | |
| High | ON | High Gain |
| | AUTO = OFF | |

3 WLAN Mode
3.3 Occupied BW Measurement

This setting affects sensitivity and IF overloads. It only applies to the RF input; not to the baseband I/Q input.

| | |
|----------------|---|
| Remote Command | <pre>[:SENSe]:OBWidth:IF:GAIN[:STATe] ON OFF 1 0 [:SENSe]:OBWidth:IF:GAIN[:STATe]? [:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe] ON OFF 1 0 [:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe]?</pre> |
| Example | <pre>:OBW:IF:GAIN ON :OBW:IF:GAIN? :OBW:IF:GAIN:AUTO OFF :OBW:IF:GAIN:AUTO?</pre> |
| Dependencies | <p>Has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed-out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control</p> <p>Not available in VXT models M9420A/10A/11A, EXM, or UXM</p> |
| Couplings | <p>Auto sets IF Gain to High (ON) under any of the following conditions:</p> <ul style="list-style-type: none"> - The input attenuator is set to 0 dB, or - The preamp is turned on and the frequency range is under 3.6 GHz <p>For other conditions, Auto sets IF Gain to Low (OFF)</p> |

| State Saved | Saved in instrument state |
| Range | Low Gain High Gain |

3.3.8.5 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 1850) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|------------------------------|--|
| Remote Command | <code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code> <code>:INSTrument:COUPle:FREQuency:CENTer?</code> |
| Example | <code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code> |
| Preset | Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |
| Preset | OFF |
| Backwards Compatibility SCPI | <code>:GLOBa1:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBa1:FREQuency:CENTer[:STATe]?</code> |

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTrument:COUPle:EMC:STANdard?</code> |
| Example | <code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code> |
| Dependencies | Only available if Option EMC is installed |
| Preset | Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

| | |

| Remote Command | <code>:INSTrument:COUPle:DEFault</code> |
| Example | <code>:INST:COUP:DEF</code> |
| Backwards Compatibility SCPI | <code>:GLOBal:DEFault</code> |

3.3.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.3.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE

Significantly faster sweep times are available with Option FS1.

NOTE

The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE

On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe] :<meas> :SWEep:TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command `[:SENSe] :<meas> :SWEep:TIME <time>`
`[:SENSe] :<meas> :SWEep:TIME?`

Example Channel Power measurement:
`:CHP:SWE:TIME 25ms`
`:CHP:SWE:TIME?`

Notes In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset values are as follows:

- IBW: 29 ms
- IBWR: 108 ms
- FAST 7.5 ms

Dependencies On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time
In those instruments, "[Minimum Acquisition Time](#)" on page 1719 is available

Couplings Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time**

3 WLAN Mode

| Min | Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when Meas Method is Fast Power , the minimum sweep time is span-dependent and automatically calculated |
| Max | Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A |
| Annotation | The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling |
| Status Bits/OPC dependencies | Meas Uncal is Bit 0 in the register: STATus:QUESTionable:INTEgrity:UNCalibrated |
| Auto Function | |
| Remote Command | [:SENSe]:<meas>:SWEep:TIME:AUTO OFF ON 0 1 [:SENSe]:<meas>:SWEep:TIME:AUTO? |
| Example | Channel Power measurement: :CHP:SWE:TIME:AUTO OFF :CHP:SWE:TIME:AUTO? |
| Preset | WCDMA Mode OFF All others ON |

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

$$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$$

When in Auto, this parameter's value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

| | |

| Preset | ON |

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

3 WLAN Mode
3.3 Occupied BW Measurement

See ["More Information" on page 427](#)

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code> |
| Example | Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code> |
| Preset | ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF |
| State Saved | Saved in instrument state |
| Annunciation | The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous |
| Backwards Compatibility Notes | X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep |

More Information

| | |
|-----------------|---|
| Continuous Mode | The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold |
| Single Mode | The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num , then the count stops incrementing, and the instrument stops sweeping See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold |

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "[Restart](#)" on page 1853 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 429

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|-------------------------------|---|
| Remote Command | :INITiate[:IMMEDIATE] :INITiate:REStart |
| Example | :INIT:IMM :INIT:REST |
| Notes | :INIT:REST and :INIT:IMM perform exactly the same function |
| Couplings | Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement |
| Status Bits/OPC dependencies | This is an Overlapped command The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUEStionable register bit 9 (INTegrity sum) is cleared The SWEEPING bit is set The MEASURING bit is set |
| Backwards Compatibility Notes | For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well |

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC: AVER: TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

| Event | Trace Effect |
|---|--|
| Clear/Write pressed (even if already in Clear/Write) | Set to mintracevalue |
| Max Hold pressed (even if already in Max Hold) | Set to mintracevalue |
| Min Hold pressed (even if already in Min Hold) | Set to maxtracevalue |
| Trace Average pressed (even if already in Trace Average) | Trace data unaffected but start new sweep/avg/hold |
| Restart pressed | Trace data unaffected but start new sweep/avg/hold |
| Parameter requiring restart changed (e.g., RBW) | Trace data unaffected but start new sweep/avg/hold |

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

| | |
|----------------|---|
| Remote Command | <code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code> |
| Example | <code>:INIT:PAUS</code> <code>:INIT:RES</code> |
| Dependencies | Not displayed in Modes that do not support pausing |
| Annotation | Only on control |

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

| | |
|----------------|---------------------|
| Remote Command | <code>:ABORT</code> |
| Example | <code>:ABOR</code> |

| | |
|------------------------------|---|
| Notes | <p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p> |
| Dependencies | <p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p> |
| Status Bits/OPC dependencies | <p>The STATUS:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATUS:QUEStionable register bit 9 (INTEGRity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p> |

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

| | |
|----------------|---|
| Remote Command | <p>[:SENSe] : <meas> : SWEep : ETIME?</p> <p><meas> is the identifier for the current measurement; any one of CHPower- ACPower OBWidth MONitor</p> |
| Example | <p>Channel Power measurement</p> <p>:CHP:SWE:ETIME?</p> |
| Dependencies | Available only on non-sweeping hardware |
| Preset | Automatically calculated |

3.3.9.2 Sweep Config

Accesses controls that let you configure the sweep and control functions of the instrument, such as "[Sweep Time Rules](#)" on page 432.

Sweep Time Rules

Switches the instrument between normal and accuracy sweep states:

| | |
|------|-----------------|
| Accy | ACCuracy |
| Norm | NORMal |

Setting **Auto Sweep Time** to **Accy** results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:OBWidth:SWEEp:TIME:AUTO:RULes NORMa1 ACCuracy</code> <code>[:SENSe]:OBWidth:SWEEp:TIME:AUTO:RULes?</code> |
| Example | <code>:OBW:SWE:TIME:AUTO:RUL NORM</code> <code>:OBW:SWE:TIME:AUTO:RUL?</code> |
| Dependencies | Does not appear in Spectrum Analyzer Mode in VXT model M9420A |
| Preset | <code>NORMa1</code> |
| State Saved | Saved in instrument state |
| Range | <code>NORMa1 ACCuracy</code> |

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys *cannot* be used to adjust the number of points.

When in a split-screen display, each window may have its own value for points.

When sweep **Points** is changed, an informational message "Sweep points changed, all traces cleared" is displayed, and in 5G NR Mode, **Auto Sweep Points** is set to **OFF** (0).

| Remote Command | <code>[:SENSe]:OBWidth:SWEep:POINTs <integer></code> <code>[:SENSe]:OBWidth:SWEep:POINTs?</code> | | | | | | | | |
|-----------------------|--|------|-------|-----------------------|------|------|--------------------------|------------|------|
| Example | <code>:OBW:SWE:POIN 501</code> <code>:OBW:SWE:POIN?</code> | | | | | | | | |
| Dependencies | Not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support Swept | | | | | | | | |
| Couplings | Whenever the number of sweep points change: <ul style="list-style-type: none"> - All trace data is erased - Any traces with Update Off will also go to Display OffSweep time is re-quantized - Any limit lines that are on will be updated - If averaging/hold is on, averaging/hold starts over - Auto Sweep Points is set to OFF (5G NR Mode only) <p>The resolution of setting the sweep time depends on the number of points selected</p> | | | | | | | | |
| Preset | <table border="1"> <thead> <tr> <th>Mode</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>MSR, LTEAFDD, LTEATDD</td> <td>2001</td> </tr> <tr> <td>5GNR</td> <td>Automatically calculated</td> </tr> <tr> <td>All Others</td> <td>1001</td> </tr> </tbody> </table> | Mode | Value | MSR, LTEAFDD, LTEATDD | 2001 | 5GNR | Automatically calculated | All Others | 1001 |
| Mode | Value | | | | | | | | |
| MSR, LTEAFDD, LTEATDD | 2001 | | | | | | | | |
| 5GNR | Automatically calculated | | | | | | | | |
| All Others | 1001 | | | | | | | | |
| State Saved | Saved in instrument state | | | | | | | | |
| Min | 101 | | | | | | | | |
| Max | 20001 | | | | | | | | |
| Annotation | On second line of annotations, in lower right corner in parenthesis behind the sweep annotation | | | | | | | | |

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe]:SWEep:IF:DITHer?</code> |
| Dependencies | Only appears in Spectrum Analyzer Mode in VXT models |

| | |
|-------------|---------------------------|
| Preset | OFF |
| State Saved | Saved in instrument state |

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :SWEep :IMAGeProt OFF ON 0 1</code> <code>[:SENSe] :SWEep :IMAGeProt?</code> |
| Dependencies | Only appears in Spectrum Analyzer Mode in VXT models |
| Preset | ON |
| State Saved | Saved in instrument state |

3.3.10 Trace

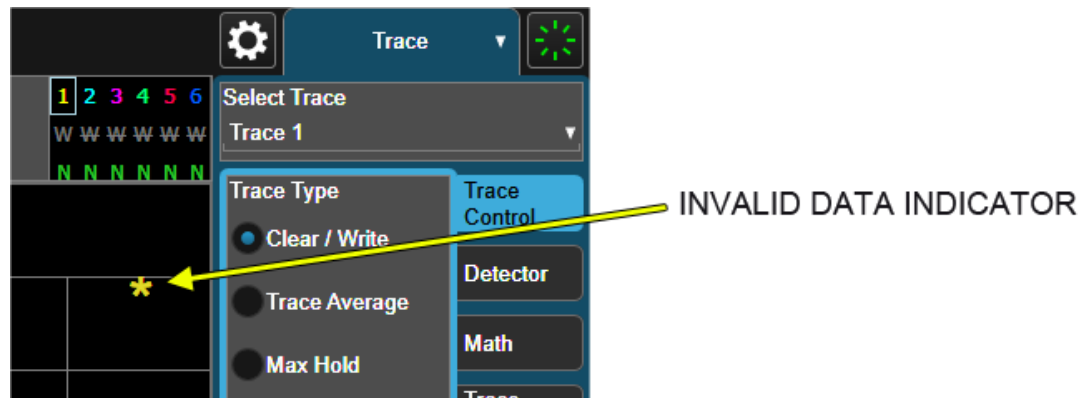

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The **"Trace Control"** on page 1728 tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points* - 1) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator

The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

The Invalid Data Indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE

The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.

Trace right-click menu

If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:

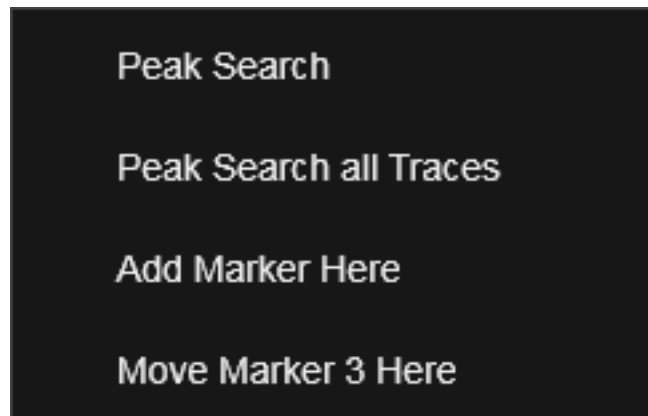

3 WLAN Mode
3.3 Occupied BW Measurement

If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on [page 1728](#). **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on [page 1734](#) type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:

In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT's, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^), which moves across the bottom of the graticule showing the current trace point.

Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:

3 WLAN Mode

3.3 Occupied BW Measurement

Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

| | |
|---|---------------|
| W | Clear/Write |
| A | Trace Average |
| M | Max Hold |
| m | Min Hold |

If the letter is white, it means the trace is being updated (**Update = ON**); if the letter is dimmed, it means the trace is not being updated (**Update = OFF**). A strikethrough indicates that the trace is blanked (**Display = OFF**). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

| | |
|---|---------------|
| N | Normal |
| A | Average |
| P | peak |
| p | negative peak |
| S | Sample |
| Q | Quasi Peak |
| E | EMI Average |
| R | RMS Average |
| f | math function |

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is **ON**, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the **"Math Function"** on page 815.

The detector labels are:

| | |
|----------------|---|
| NORM | Normal |
| PEAK | Peak |
| SAMP | Sample |
| NPEAK | Negative Peak |
| RMS | Average detector with Power Average (RMS) |
| LG AVG | Average detector with Log-Pwr Average |
| VAVG | Average detector with Voltage Average |
| QPEAK | Quasi Peak |
| EMI AVG | EMI Average |
| RMS AVG | RMS Average |

The trace math labels are:

| | |
|-------------|------------------|
| PDIF | Power Difference |
| PSUM | Power Sum |
| LOFF | Log Offset |
| LDIF | Log Difference |

3.3.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

| | |
|--------------|--|
| Notes | The selected trace is remembered even when not in the Trace menu |
| Dependencies | For the Swept SA measurement: <ul style="list-style-type: none">- In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View- When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled |
| Preset | Trace 1 |
| State Saved | Yes |

3.3.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1728 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "View/Blank" on page 1734 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

| Option | Parameter | SCPI Example | Details |
|---------------|-----------|------------------|--|
| Clear/Write | WRITE | :TRAC2:TYPE WRIT | See: " Clear/Write " on page 445 |
| Trace Average | AVERAge | :TRAC2:TYPE AVER | See: " Trace Average " on page 445 |
| Maximum Hold | MAXHold | :TRAC3:TYPE MAXH | See: " Max Hold " on page 446 |
| Minimum Hold | MINHold | :TRAC5:TYPE MINH | See: " Min Hold " on page 446 |

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "[View/Blank](#)" on page 1734 state must be set to **Active** (**Update: ON**, **Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "[Trace Mode Backwards Compatibility Commands](#)" on page 443

| | |
|----------------|---|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITe AVERAge MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre> |
| Couplings | <p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe]: <meas>:DETECTOR:AUTO?</code>), Detector (<code>[:SENSe]: <meas>:DETECTOR[:FUNCTION]?</code>) switches aligning with the switch of this parameter: "NORMAL" with WRITE (Clear Write), "AVERAGE" with AVERAge, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold</p> |
| Preset | <p>Swept SA and Monitor Spectrum: WRITE</p> <p>All other measurements: AVERAge</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p> |
| State Saved | The type of each trace is saved in instrument state |
| Annunciation | The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar |

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1734.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

| | |
|-------------------------------|---|
| Preset | <code>WRITE</code> |
| State Saved | The trace mode is an alias only |
| Backwards Compatibility SCPI | <code>:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK</code> <code>:TRACe[1] 2 ... 6:MODE?</code> |
| Backwards Compatibility Notes | <p>The legacy <code>:TRACe:MODE</code> command is retained for backwards compatibility. In conjunction with the legacy <code>:AVERage</code> command, it works as follows:</p> <ul style="list-style-type: none"> – <code>:AVERage ON OFF</code> sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the <code>[:SENSe]:AVERage[:STATe]</code> command description below – <code>:TRACe:MODE WRITE</code> sets <code>:TRACe:TYPE WRITE</code> (Clear/Write) unless average is true, in which case it sets it to <code>:TRACe:TYPE AVERage</code>. It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace – <code>:TRACe:MODE MAXHold</code> sets <code>:TRACe:TYPE MAXHold</code> (Max Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace |

- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

| | |
|-------------------------------|--|
| Preset | <code>OFF</code> |
| State Saved | The state of Average is saved in Instrument State for ghosting purposes |
| Backwards Compatibility SCPI | <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code> |
| Backwards Compatibility Notes | <p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p> |

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1728 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again

- the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

| | |
|-------------------|---|
| Active | Update and Display both ON |
| View | Update OFF ; Display ON |
| Blank | Update OFF ; Display OFF |
| Background | Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past |

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "[More Information](#)" on page 449

| | |
|--------------|---|
| Notes | For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 448 and " Trace Display State On/Off " on page 448 below |
| Dependencies | When Signal ID is on, this key is grayed-out |
| Couplings | <p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending [:SENS] :DET :TRAC) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 815 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p> |

Trace Update State On/Off

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <p>Make trace 2 inactive (stop updating):</p> <pre>:TRAC2:UPD 0</pre> |
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p> |
| State Saved | Saved in instrument state |

Trace Display State On/Off

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</pre> <p>For all other measurements:</p> |
|----------------|--|

| | |
|-------------|--|
| | <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <p>Make trace 1 visible:</p> <pre>:TRAC2:DISP 1</pre> <p>Blank trace 3:</p> <pre>:TRAC3:DISP 3</pre> |
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p> |
| State Saved | Saved in instrument state |

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.3.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "[Operand 1 / Operand 2](#)" on [page 821](#) controls.

- See "[How trace math is processed](#)" on [page 454](#)

Remote Command For option details, see "[Trace Math Options](#)" on [page 452](#)

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate:MATH? <trace_num>
```

where <trace_num> is any one of:

```
TRACE1|...|TRACE6
```

For all other measurements:

```
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

<meas> is the identifier for the current measurement, and

<trace_num> is any one of:

```
TRACe1|TRACe2|TRACe3
```

Note that the format of the **TRACe<n>** parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

3 WLAN Mode
3.3 Occupied BW Measurement

| | |
|--------------|---|
| | <p>Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB</p> <p><code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code></p> <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0</code></p> <p>Turns off trace math for trace 1</p> |
| Notes | <p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> -Set 2 defines the “function”: <code>PDIFference PSUM LOFFset LDIFference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p> |
| Dependencies | <p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p> |
| Couplings | When a math function is changed for a trace, that trace is set to Display = ON ; and Update = ON |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <p><code>OFF,TRACE5,TRACE6,0,0 OFF,TRACE6,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0 </code> <code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE4,0,0 OFF,TRACE4,TRACE5,0,0</code></p> <p>For all other measurements:</p> <p><code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0</code></p> |
| State Saved | The trace math function for each trace is saved in instrument state |
| Annunciation | An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; |

| | |
|------------------------------|---|
| | and the function is annotated on the trace if Trace Annotation is on |
| Status Bits/OPC dependencies | *OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep |

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log_{10}(1/10)(\text{FirstTrace}) - 10(1/10)(\text{SecondTrace})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

3 WLAN Mode
 3.3 Occupied BW Measurement

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

| | |
|--------------|---|
| Example | <p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre> |
| Notes | See " Math Function " on page 815 for how to specify Operands 1 and 2 using :CALCulate:MATH |
| Dependencies | The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown |
| Preset | Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace |

| | |
|-------------|---|
| | 5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5 |
| State Saved | Operands 1 and 2 for each trace are stored in instrument state |

Offset

Used by the Log Offset math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code> |
| State Saved | The Log Offset value for each trace is saved in Instrument State |
| Min | -100 dB |
| Max | 100 dB |

Reference

Used by the Log Diff math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code> |
| State Saved | The Log Difference reference value for each trace is saved in instrument state |
| Min/Max | Same as reference level |

3.3.10.4 Detector

Lets you select and configure detectors for the specified trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following selections are available:

| Option | Behavior |
|-------------------|---|
| <code>AUTO</code> | The detector selected depends on marker functions, trace functions, average type, |

| Option | Behavior |
|-------------------------|---|
| | and the trace averaging function For details, see "Detector Select Auto/Man" on page 459 |
| NORMal | The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection |
| AVERage | The detector determines the average of the signal within the sweep points, using RMS averaging |
| POSitive Peak | The detector determines the maximum of the signal within the sweep points |
| SAMPle | The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point |
| NEGative Peak | The detector determines the minimum of the signal within the sweep points |
| RMS | Equivalent to AVERage |

Because they may not find a spectral component's true peak, neither **AVERage** nor **SAMPle** detectors measure amplitudes of CW signals as accurately as **POSitivePeak** or **NORMal**, but they do measure noise without the biases of peak detection.

Remote Command `[[:SENSe]:OBWidth:DETEctor[:FUNction] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS
[:SENSe]:OBWidth:DETEctor[:FUNction]?`

Example `:OBW:DET NORM`
`:OBW:DET?`
Set the detector to **Average**. **Average** uses RMS averaging, so this is equivalent to selecting an **RMS** detector:
`:OBW:DET RMS`

Notes The query returns a name that corresponds to the detector type, as follows
The **RMS** selection sets the detector type to **AVERage**, with RMS averaging. Therefore, if **RMS** had been selected, the query returns **AVER**

| String Returned | Definition |
|-----------------|---------------|
| NORM | Normal |
| AVER | Average (RMS) |
| POS | Peak |
| SAMP | Sample |
| NEG | Negative Peak |

Couplings When ["Detector Select Auto/Man" on page 459](#) is **ON**, the values returned by the query depend on the setting of ["Trace Type" on page 1728](#) as follows:

| | Trace Type | Query Returns: |
|-------------|---|----------------|
| | WRITE | NORMAL |
| | AVERAGE | AVERAGE |
| | MAXHOLD | POSITIVE |
| | MINHOLD | NEGATIVE |
| Preset | AVERAGE | |
| State Saved | Saved in instrument state | |
| Range | NORMAL AVERAGE POSITIVE SAMPLE NEGATIVE RMS | |

Detector Select Auto/Man

Sets the Detector mode to **Auto (ON)** or **Man (OFF)**. In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any "Detector" on page 457 manually, this setting reverts automatically to **Man** (manual).

| | | |
|----------------|--|----------------|
| Remote Command | [:SENSe]:OBWidth:DETECTOR:AUTO ON OFF 1 0 | |
| | [:SENSe]:OBWidth:DETECTOR:AUTO? | |
| Example | :OBW:DET:AUTO ON | |
| | :OBW:DET:AUTO? | |
| Couplings | When ON , the query "Detector" on page 457 returns values that depend on the setting of "Trace Type" on page 1728 as follows: | |
| | Trace Type | Query Returns: |
| | WRITE | NORMAL |
| | AVERAGE | AVERAGE |
| | MAXHOLD | POSITIVE |
| | MINHOLD | NEGATIVE |
| Preset | ON | |
| State Saved | Yes | |

3.3.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **"To Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 823** and **"To Trace" on page 823** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`
 For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
 where `<meas>` is the identifier for the current measurement
 Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1, TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>, <dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`
 For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 823 and "To Trace" on page 823 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

| | |
|----------------|---|
| Remote Command | For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code> For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code> where <meas> is the identifier for the current measurement Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement |
| Example | Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1, TRACE2</code> |
| Notes | The command is of the form: <code>:TRACe:EXCHange <trace_1>,<trace_2></code> |
| Couplings | Both traces are put in View (Update=Off, Display=On) after the exchange |

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

| | |
|----------------|---|
| Remote Command | <code>:TRACe[:<meas>]:PRESet:ALL</code> |
| Example | <code>:TRAC:PRE:ALL</code> |
| Dependencies | When Signal ID is on, this key is grayed-out |

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

| | |
|----------------|--|
| Remote Command | <code>:TRACe[:<meas>]:CLEar:ALL</code> |
| Example | <code>:TRAC:CLE:ALL</code> |
| Dependencies | When Signal ID is on, this key is grayed-out |

3.3.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

| | |
|----------------|--|
| Remote Command | <pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre> |
| Example | <pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre> |
| Dependencies | In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled |
| Preset | TRACe1 |
| State Saved | No |
| Range | Trace 1 Trace 2 Trace 3 |

3.4 SEM Measurement

The Spectrum Emission Mask measurement analyzes spurious signal levels in up to six pairs of offset frequencies and relates them to the carrier power.

SEM Measurement Commands

The following commands and queries can be used to configure the measurement, then retrieve measurement results:

The general functionality of ["CONFigure" on page 2568](#), ["INITiate" on page 2569](#), ["FETCh" on page 2569](#), ["MEASure" on page 2571](#), and ["READ" on page 2570](#) are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF: <measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

```
:CONFigure:SEMask
:CONFigure:SEMask:NDEFault
:INITiate:SEMask
:FETCh:SEMask[n]?
:MEASure:SEMask[n]?
:READ:SEMask[n]?
```

Remote Command Results Overview

The following table provides an overview of the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`. For Mode-specific details, click on the appropriate link for each `n` value.

Offsets that are turned off (inactive) return -999.0 or `NAN` when their results are queried via SCPI. The value of `NAN` is 9.91E+37.

| n | Results |
|---|--|
| 1 | Result summary (Offsets A - F) Note that n = 1 returns results of 6 offsets (Offset A to F) See "Results for n = 1" on page 465 See "Results for n = 1 (WLAN Radio Standard 802.11ac/ax (80 MHz + 80 MHz))" on page 466 |
| 2 | Displayed frequency domain spectrum trace data for Trace 1 See "Results for n = 2-4" on page 468 |
| 3 | Displayed frequency domain absolute limit trace data See "Results for n = 2-4" on page 468 |

| n | Results |
|------|--|
| 4 | Displayed frequency domain relative limit trace data See "Results for n = 2-4" on page 468 |
| 5 | Offset abs power, Offset abs PSD, Offset abs peak power depending on "Measurement Type" on page 632 (Offset A- L) See "Results for n = 5" on page 468 |
| 6 | Offset rel power, Offset rel PSD, Offset rel peak power depending on "Measurement Type" on page 632 (Offset A- L) See "Results for n = 6" on page 469 |
| 7, 8 | Offset pass/fail (Offset A- L) See "Results for n = 7-11" on page 470 |
| 9 | Offset peak power freq (Offset A- L) See "Results for n = 7-11" on page 470 |
| 10 | Offset abs peak power (Offset A- L) See "Results for n = 7-11" on page 470 |
| 11 | Offset rel peak power (Offset A- L) See "Results for n = 7-11" on page 470 |
| 12 | Peak power of the signal in the ref channel when "Measurement Type" on page 632 is Spectrum Peak Reference See "Results for n = 12" on page 472 |
| 13 | Ref channel summary Available only in LTEAFDD, LTEATDD, MSR and 5GNR Modes |
| 14 | Offset result summary (Offset A- L) See "Results for n = 14" on page 472 |
| 15 | Offset limit margins (Offset A- L) See "Results for n = 15" on page 473 |
| 16 | Carrier powers Available only in LTEAFDD, LTEATDD, MSR, 5GNR, and WLAN Modes See "Results for n = 16" on page 474 |
| 17 | Displayed frequency domain combined limit trace data Available only in LTEAFDD, LTEATDD, MSR and 5GNR Modes |
| 18 | Displayed frequency domain spectrum trace data for Trace 2 See "Results for n = 18-20" on page 474 |
| 19 | Displayed frequency domain spectrum trace data for Trace 3 See "Results for n = 18-20" on page 474 |
| 20 | Displayed frequency domain absolute 2 limit trace data See "Results for n = 18-20" on page 474 |
| 21 | Result Summary (Offset A – L, Outer and Inner) Available only in LTEAFDD, LTEATDD, and 5GNR Modes |

| n | Results |
|----|--|
| 22 | Offset pass/fail (Offset A- L) Available only in LTEAFDD, LTEATDD, and 5GNR Modes |

3.4.1 Results for n = 1

For WLAN Mode, these results apply to all standards *except* 802.11ac/ax (80+80MHz).

Returns 82 comma-separated scalar results, in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 6 (A-F).

| # | Item | Unit, if any |
|--------------------|--|---|
| 1 | Reserved for future use, returns -999.0 | |
| 2 | Power ^(*) at the center frequency (reference) area | When "Measurement Type" on page 632 is PSD Ref: dBm/Hz Others: dBm |
| 3~4 | Reserved for future use, returns -999.0 | |
| 5 | Peak frequency in the center frequency (reference) area | Hz |
| 6~10 | Reserved for future use, returns -999.0 | |
| 11 | Relative integrated power on the negative offset A | When "Measurement Type" on page 632 is PSD Ref: dB |
| 10k + 11, k = 0 | Returns -999.0 when "Measurement Type" on page 632 is Spectrum Peak Ref | When Total Power Ref: dBc |
| 12 | Absolute integrated power on the negative offset A | When "Measurement Type" on page 632 is PSD Ref: dBm/Hz |
| 10k + 12, k = 0 | Returns -999.0 when "Measurement Type" on page 632 is Spectrum Peak Ref | When Total Power Ref: dBm |
| 13 | Relative peak power on the negative offset A | When "Measurement Type" on page 632 is Total Power Ref: dBc |
| 10k + 13, k = 0 | | Others: dB |
| 14 | Absolute peak power on the negative offset A | When "Measurement Type" on page 632 is PSD Ref: dBm/Hz |
| 10k + 14, k = 0 | | Others: dBm |
| 15 | Peak power offset frequency from the center or carrier edge frequency in the negative offset A | Hz |
| 10k + 15, k = 0 | Depends on the setting of "Offset Freq Define" on page 574 | |
| 16 | Relative integrated power on the positive offset A | When "Measurement Type" on page 632 is PSD Ref: dB |
| 10k + 16, k = 0 | Returns -999.0 when "Measurement Type" on page 632 is Spectrum Peak Ref | Others: dBc |
| 17 | Absolute integrated power on the positive offset A | When "Measurement Type" on page 632 is |

| # | Item | Unit, if any |
|--------------------------|--|---|
| 10k + 17, k = 0 | Returns -999.0 when "Measurement Type" on page 632 is Spectrum Peak Ref | PSD Ref: dBm/Hz Others: dBm |
| 18 10k + 18, k = 0 | Relative peak power on the positive offset A | When "Measurement Type" on page 632 is Total Power Ref: dBc Others: dB |
| 19 10k + 19, k = 0 | Absolute peak power on the positive offset A | When "Measurement Type" on page 632 is PSD Ref: dBm/Hz Others: dBm |
| 20 10k + 20, k = 0 | Peak power offset frequency from the center or carrier edge frequency in the positive offset A Depends on the setting of "Offset Freq Define" on page 574 | Hz |
| --- | | |
| 70 10k + 20, k = 5 | Peak power offset frequency from the center or carrier edge frequency in the positive offset F Depends on the setting of "Offset Freq Define" on page 574 | Hz |
| 71 2k + 71, k = 0 | Minimum margin from limit line on the negative offset A | dB |
| 72 2k + 72, k = 0 | Minimum margin from limit line on the positive offset A | dB |
| --- | | |
| 82 2k + 72, k = 5 | Minimum margin from limit line on the positive offset F | dB |

*1: Absolute power when "Measurement Type" on page 632 is Total Power Ref or PSD Ref; Peak power when "Measurement Type" on page 632 is Spectrum Peak Ref

3.4.2 Results for n = 1 (WLAN Radio Standard 802.11ac/ax (80 MHz + 80 MHz))

These results are for radio standard 802.11ac/ax (80 MHz + 80 MHz) *only*

Returns 82 comma-separated scalar results, in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc.
The number of offsets is 6 (A-F)

| # | Item | Unit |
|---|---|------|
| 1 | Reserved for future use, returns -999.0 | |

| $2k + 4, k = 13$ | |

| n | Data |
|---|---|
| | If the result is not available, -999.0 is returned The number of values returned is subject to change in future releases |

3.4.7 Results for n = 12

When "[Measurement Type](#)" on page 632 is Spectrum Peak reference, returns the peak power of the signal in the ref channel

Otherwise, the value returned is -999.0

3.4.8 Results for n = 14

Returns comma-separated scalar results, in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc.
The number of offsets is 14 (A-N)

| # | Item | Unit |
|----------------|--|---|
| 1 | Relative integrated power on the negative offset A | When " Measurement Type " on page 632 is Total Power Ref: dBc When PSD: dB |
| 10k + 1, k = 0 | Returns NaN when " Measurement Type " on page 632 is Spectrum Peak Ref | |
| 2 | Absolute integrated power on the negative offset A | When " Measurement Type " on page 632 is Total Power Ref: dBm When PSD: dBm/Hz |
| 10k + 2, k = 0 | Returns NaN when " Measurement Type " on page 632 is Spectrum Peak Ref | |
| 3 | Relative peak power on the negative offset A | When " Measurement Type " on page 632 is Total Power Ref PSD: dBc Others: dB |
| 10k + 3, k = 0 | | |
| 4 | Absolute peak power on the negative offset A | When " Measurement Type " on page 632 is PSD Ref: dBm/Hz Others: dBm |
| 10k + 4, k = 0 | | |
| 5 | Peak power offset frequency from the center or carrier edge frequency in the negative offset A | Hz |
| 10k + 5, k = 0 | Depends on the setting of " Offset Freq Define " on page 574 | |
| 6 | Relative integrated power on the positive offset A | When " Measurement Type " on page 632 is Total Power Ref: dBc When PSD: dB |
| 10k + 6, k = 0 | | |
| 7 | Absolute integrated power on the positive offset A | When " Measurement Type " on page 632 is Total Power Ref: dBm When PSD: dBm/Hz |
| 10k + 7, k = 0 | | |
| 8 | Relative peak power on the positive offset A | When " Measurement Type " on page 632 is Total Power Ref: dBc |
| 10k + 8, k | | |

3 WLAN Mode
3.4 SEM Measurement

| # | Item | Unit |
|------------------|--|--|
| = 0 | | Others: dB |
| 9 | Absolute peak power on the positive offset A | When "Measurement Type" on page 632 is PSD Ref: dBm/Hz |
| 10k + 9, k = 0 | | Others: dBm |
| 10 | Peak power offset frequency from the center or carrier edge frequency in the positive offset A | Hz |
| 10k + 10, k = 0 | Depends on the setting of "Offset Freq Define" on page 574 | |
| --- | | |
| 140 | Peak power offset frequency from the center or carrier edge frequency in the positive offset N | Hz |
| 10k + 10, k = 13 | Depends on the setting of "Offset Freq Define" on page 574 | |

If the result is not available, **NaN** (9.91E+37) is returned

The number of values returned is subject to change in future releases

3.4.9 Results for n = 15

Results available only when "Measurement Type" on page 632 is Total Power Reference.

Returns comma-separated scalar results, in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 14 (A-N).

| # | Item | Unit |
|----------------|---|------|
| 1 | Minimum margin from limit line on the negative offset A | dB |
| 2k + 1, k = 0 | | |
| 2 | Minimum margin from limit line on the positive offset A | dB |
| 2k + 2, k = 0 | | |
| 3 | Minimum margin from limit line on the negative offset B | dB |
| 2k + 1, k = 1 | | |
| 4 | Minimum margin from limit line on the positive offset B | dB |
| 2k + 2, k = 1 | | |
| --- | | |
| 28 | Minimum margin from limit line on the positive offset N | dB |
| 2k + 2, k = 13 | | |

If the result is not available, **NaN** (9.91E+37) is returned

The number of values returned is subject to change in future releases

3.4.10 Results for n = 16

If the result is not available, **NaN** (9.91E+37) is returned

Returns two carriers' comma-separated scalar results when the radio standard is 802.11ac 80+80 MHz. Returns **NaN** otherwise

1. Absolute power of carrier segment 1 (dBm)
2. Absolute power of carrier segment 2 (dBm)

3.4.11 Results for n = 18-20

| n | Return Value |
|----|--|
| 18 | Returns the displayed frequency domain spectrum trace data for Trace 2 separated by commas |
| 19 | Returns the displayed frequency domain spectrum trace data for Trace 3 separated by commas |
| 20 | Returns the displayed frequency domain absolute 2 limit trace data, separated by commas |

3.4.12 Number of Offsets

The number of available offsets varies depending on the mode and option as below.

| Mode | Number of available offsets |
|---|-----------------------------|
| MSR LTEAFDD, LTEATDD, 5G NR | 12 (Offset A to L) |
| WLAN | 14 (Offset A to N) |
| Other Modes with option: N9060A-7FP, N9060B-2FP, N9060C-2FP, N9060EM1D, N9060EM1E, or N90EMPSMB | 12 (Offset A to L) |
| Other Modes without option N9060A-7FP, N9060B-2FP, N9060C-2FP, N9060EM1D, N9060EM1E, or N90EMPSMB | 6 (Offset A to F) |

3.4.13 Views

All Modes provide three predefined views. In MSR, LTE-Advanced FDD/TDD and 5G NR Modes, there is also a fourth predefined view. The views are listed in the table below.

In the following table:

- The Enumerated ID is used with **:DISP:SEM:VIEW**
- The Numeric ID is used with **:DISP:SEM:VIEW:NSEL**

3 WLAN Mode
3.4 SEM Measurement

| View Name | Enumerated ID | Numeric ID | Details |
|--------------------------------|---------------|------------|--|
| "Abs Pwr Freq" on page 476 | APFReq | 1 | Displays the absolute power levels in dBm and the corresponding frequencies in the text window |
| "Rel Pwr Freq" on page 476 | RPFReq | 2 | Displays the relative power levels in dBc and the corresponding frequencies in the text window |
| "Integrated Power" on page 476 | IPOwer | 3 | Displays the absolute and relative power levels integrated throughout the bandwidths between the start and stop frequencies in the text window |

View Selection by Name

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:SEMask:VIEW[:SElect] APFReq RPFReq IPOwer CINformation</code> <code>:DISPlay:SEMask:VIEW[:SElect]?</code> |
| Example | <code>:DISP:SEM:VIEW IPOW</code> <code>:DISP:SEM:VIEW?</code> |
| Dependencies | In SA Mode, when Radio Standard is set to WLAN, IPOwer is not available CINformation is available only in MSR, LTE-Advanced FDD/TDD and 5G NR Modes |
| Preset | APFReq unless noted below RPFReq WLAN |
| State Saved | Saved in instrument state |
| Range | Abs Pwr Freq Rel Pwr Freq Integrated Power Carrier Info |

Views Selection by Number

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:SEMask:VIEW:NSElect <integer></code> <code>:DISPlay:SEMask:VIEW:NSElect?</code> |
| Example | <code>:DISP:SEM:VIEW:NSEL 2</code> <code>:DISP:SEM:VIEW:NSEL?</code> |
| Dependencies | In SA Mode, when Radio Standard is set to WLAN, Option 3 is not available Option 4 is available only in MSR, LTE-Advanced FDD/TDD and 5G NR Modes |
| Preset | 1 unless noted below: 2 WLAN |
| State Saved | Saved in instrument state |
| Min/Max | MSR, LTEAFDD, LTEATDD, 5G NR Modes 1/4 All other Modes 1/3 |

3.4.13.1 Abs Pwr Freq

Displays the absolute power levels in dBm and the corresponding frequencies in the text window.

Windows: "Graph" on page 476, "Table" on page 481

Example `:DISP:SEM:VIEW APFR`

3.4.13.2 Rel Pwr Freq

Displays the relative power levels in dBc and the corresponding frequencies in the text window.

Windows: "Graph" on page 476, "Table" on page 481

Example `:DISP:SEM:VIEW RPFR`

3.4.13.3 Integrated Power

Displays the absolute and relative power levels integrated throughout the bandwidths between the start and stop frequencies in the text window.

Windows: "Graph" on page 476, "Table" on page 481

Example `:DISP:SEM:VIEW IPOW`

3.4.14 Windows

There are four available window types:

- In all Modes, the "Graph" on page 476 and "Table" on page 481 windows are available
- When **Gate View** is on, the "Gate" on page 491 window is available

This section describes the windows.

3.4.14.1 Graph

Used to display the spectrum being measured by the SEM measurement.

This window appears in several Views, as follows:

3 WLAN Mode
 3.4 SEM Measurement

| View | Size | Position |
|------------------|-------------------------|----------|
| Abs Pwr Freq | Three fifth, full width | Top |
| Rel Pwr Freq | Three fifth, full width | Top |
| Integrated Power | Three fifth, full width | Top |
| Gate View | One third, full width | Middle |

The Graph differs depending on which View you are in. The views differ depending on the setting of the measurement type ("**Measurement Type**" on page 632) under the **Meas Setup** menu

Graph Window in Abs Pwr Freq View

Corresponding Trace yellow - Combined trace from carrier and each offset

Abs Peak Pwr & Freq (Total Pwr Ref)

Abs Peak Pwr & Freq (PSD Ref)

Abs Peak Pwr & Freq (Spectrum Pk Ref)

Graph Window in Rel Pwr Freq View

Corresponding Trace yellow - Combined trace from carrier and each offset

Rel Peak Pwr & Freq (Total Pwr Ref)

Rel Peak Pwr & Freq (PSD Ref)

Rel Peak Pwr & Freq (Spectrum Pk Ref)

3 WLAN Mode
3.4 SEM Measurement

Graph Window in Integrated Power View

Corresponding Trace yellow - Combined trace from carrier and each offset

Integrated Power (Total Pwr Ref)

Integrated Power (PSD Ref)

Integrated Power (Spectrum Pk Ref)

Graph Window in Carrier Info View

Sets the display to the carrier info view. The views differ depending on the setting of "Measurement Type" on page 632.

Spectrum trace (Total Pwr Ref)

Spectrum trace (PSD Ref)

3 WLAN Mode
 3.4 SEM Measurement

Spectrum trace (Spectrum Pk Ref)

3.4.14.2 Table

Displays textual results for the measurement. The Table differs depending on which View you are in.

The views differ depending on the setting of "Measurement Type" on page 632.

| View | Size | Position |
|------------------|-----------------------|----------|
| Abs Pwr Freq | Two fifth, full width | Bottom |
| Rel Pwr Freq | Two fifth, full width | Bottom |
| Integrated Power | Two fifth, full width | Bottom |
| Gate View | One third, full width | Bottom |

Table Window in Abs Pwr Freq View

| Name (Measurement Type) | Unit, if any | Corresponding Results |
|---|--------------|---|
| Power | | n = 1 2nd element Absolute power at the reference area |
| Reference | | In multi-carrier applications, this column displays which carrier is reference carrier |
| PSD Ref (PSD Ref) | | n = 5 1st element Power spectral density reference at the reference area |
| Spectrum Peak ref (Spectrum Pk Ref) | | n = 5 1st element Spectrum peak power reference at the reference area |
| Measure Trace | | See " Measure Trace " on page 825 |
| Start Freq | Hz | Start frequency for offset |
| Stop Freq | Hz | Stop frequency for offset |
| Integ BW | Hz | Measurement bandwidth for offset |
| Lower Peak (Total Power Ref, Spectrum Pk Ref) | dBm | Absolute peak power on minimum margin point of the negative offset |
| Lower (PSD Ref) | dBm/Hz | Absolute power spectrum density of the negative offset |
| Lower Δ lim | dB | Minimum margin from limit line which is decided by Fail Mask setting on the negative offset |
| Lower Freq | Hz | Frequency on minimum margin point of the negative offset |
| Upper Peak (Total Power Ref, Spectrum Pk Ref) | dBm | Absolute peak power on minimum margin point of the positive offset |
| Upper (PSD Ref) | dBm/Hz | Absolute power spectrum density of the positive offset |
| Upper Δ lim | dB | Minimum margin from limit line which is decided by Fail Mask setting on the positive offset |
| Upper Freq | Hz | Frequency on minimum margin point of the positive offset |

Table Window in Carrier Info View

Only available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes. Carrier center frequency can be displayed in either offset or absolute frequency depending on Carrier Freq.

LTE-Advanced FDD/TDD has a different carrier info table from that in MSR in this view, which displays with measured component carrier powers and its power spectral density in the order of component carrier index in one of the view windows.

| Name | Unit, if any | Corresponding Results |
|-----------------------|--------------|--|
| Total Carrier Power | | The total power of all the carriers with carrier measure state set to yes. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier Integ Bw})$ multiplied by the number of carriers with carrier measure state set to yes |
| RF-BW | | Displays the total bandwidth from the lowest carrier to uppermost carrier |
| Carrier Power | dBm | The power in all the currently defined carriers with measure state is on. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier Integ Bw})$ |
| Integration Bandwidth | Hz | Shows carrier transmission bandwidth |
| Filter | | Displays whether RRC filter is used or not |
| Offset Frequency | Hz | Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type |

3 WLAN Mode
3.4 SEM Measurement

| Name | Unit, if any | Corresponding Results |
|-----------|--------------|--|
| | | determines whether the relative frequency or absolute frequency will be displayed |
| Sub-block | | Displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column will be displayed when Carrier Allocation is Non-contiguous |
| Measure | | Indicates whether the carrier power is present or not |

MSR

| 2 Carrier Info | | | | | | |
|----------------|-------------------------|-----------|--------------------|------------------------|---------|---------------|
| Total Car Pwr | -66.71 dBm / 22.575 MHz | | Ref Carrier Power | | | |

| CC4 | -60.62 dBm | 100.000 MHz | OFF | 0.0 Hz | 1 | On |
| CC5 | -60.62 dBm | 100.000 MHz | OFF | 0.0 Hz | 1 | On |

3.4.14.3 Gate

Allows you to see your Gating signal at the same time as the measured data. See the description under "[Gate View On/Off](#)" on page 2494 in **Trigger, Gate Settings**.

Views in which the **Gate** window appears:

| View | Size | Position |
|-----------|-----------------------|----------|
| Gate View | One third, full width | Top |

3.4.15 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.4.15.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "[Ref Position](#)" on [page 494](#).

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:RLEVel <real></code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:RLEVel?</code> |
| Example | <code>:DISP:SEM:WIND:TRAC:Y:RLEV 100</code> <code>:DISP:SEM:WIND:TRAC:Y:RLEV?</code> |
| Couplings | When " Auto Scaling " on page 494 is ON (default), this value is automatically determined by the measurement result. If you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to Ref Value |
| Preset | 0.00 dBm |
| State Saved | Saved in instrument state |
| Min/Max | -250.00 dBm / 250.00 dBm |
| Annotation | Ref <value> top left of graph |
| Backwards Compatibility SCPI | <code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RLEVel</code> |

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

3 WLAN Mode
3.4 SEM Measurement

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

| | |
|---------------------------------|---|
| Remote Command | <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_amp1></code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code> |
| Example | <code>:DISP:SEM:WIND:TRAC:Y:PDIV 15dB</code> <code>:DISP:SEM:WIND:TRAC:Y:PDIV?</code> |
| Couplings | When "Auto Scaling" on page 494 is ON, this value is automatically determined by the measurement result. If you set a value manually, "Auto Scaling" on page 494 automatically changes to OFF |
| Preset | 10.00 dB / Div |
| State Saved | Saved in instrument state |
| Min | 0.10 dB |
| Max | 20 dB |
| Annotation | <value> dB/ left upper of graph |
| Backwards Compatibility SCPI | <code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code> |

Scale Range

Sets the Y-Axis scale range.

| | |
|----------------|--|
| Remote Command | Replace <meas> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_amp1></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code> |
| Couplings | Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF |
| Preset | 100 dB |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 200 |

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change "Ref Value" on page 492.

| | |
|---------------------------------|---|
| Remote Command | <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:RPOsition TOP CENTer BOTTom</code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:RPOsition?</code> |
| Example | <code>:DISP:SEM:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:SEM:WIND:TRAC:Y:RPOS?</code> |
| Preset | TOP |
| State Saved | Saved in instrument state |
| Range | TOP CENTer BOTTom |
| Annotation | The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position |
| Backwards Compatibility SCPI | <code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RPOsition</code> |

Auto Scaling

Toggles **Auto Scaling** On or Off.

| | |
|---------------------------------|--|
| Remote Command | <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:COUPle 0 1 OFF ON</code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:COUPle?</code> |
| Example | <code>:DISP:SEM:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:SEM:WIND:TRAC:Y:COUP?</code> |
| Couplings | When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you set the value of either Scale/Div , Ref Value , or Scale Range manually, Auto Scaling automatically changes to OFF |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Range | OFF ON |
| Backwards Compatibility SCPI | <code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:COUPle</code> |

3.4.15.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 495
- See ["Single-Attenuator Configuration"](#) on page 496

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code> |
| Example | <code>:POW:FRAT 14</code> <code>:POW:FRAT?</code> |
| Notes | When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value |
| Dependencies | Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists |
| Couplings | This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1753 command descriptions |
| Preset | 20 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Only valid values are 0, 6, 14, 20 dB |
| Annotation | <p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1745 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB |

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1775 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 500

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code> |
| Example | <code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual |
| Dependencies | Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1756 See " Attenuator Configurations and Auto/Man " on page 500 for more information on the Auto/Man functionality |
| Couplings | If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1752 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below</p> |

3 WLAN Mode
3.4 SEM Measurement

| | | |
|-------------|--|-------------------------|
| | 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB | |
| Preset | Auto | The Auto value is 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased | |
| Max | CXA Option 503 or 507 | 50 dB |
| | EXA | 60 dB |
| | All other models | 70 dB |
| | Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB | |
| Annotation | <p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p> | |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code> |
| Example | Turn Auto Mech AttenON : <code>:POW:ATT:AUTO ON</code> |
| Dependencies | <code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA |
| Preset | ON |

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1750, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 498 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1756 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

3 WLAN Mode
 3.4 SEM Measurement

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 502](#)

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code> |
| Example | <code>:POW:EATT 10</code> <code>:POW:EATT?</code> |
| Notes | Electronic Attenuation's specification is defined only when Mech Atten is 6 dB |
| Dependencies | <p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1775 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1777 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p> |
| Couplings | Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator |

| | |
|----------------|---|
| | Transition Rules" on page 503 |
| Preset | 0 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB |
| Annotation | See Annotation under the Mech Atten control description |
| Auto Function | |
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code> |
| Example | <code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code> |
| Preset | OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator |

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 504](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1755](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1760.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Example | <code>:POW:RANG:OPT IMM</code> |
| Notes | Executing Adjust Atten for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code> |
| Example | <code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code> |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | <code>COMBined</code> |
| State Saved | Saved in instrument state |

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1759 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 506

| Selection | SCPI | Note |
|-----------------|-------------------------|--|
| Off | <code>OFF</code> | This is the default setting |
| On | <code>ON</code> | Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to <code>COMBined</code> |
| Elec Atten Only | <code>ELECTrical</code> | Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster |
| Elec+Mech Atten | <code>COMBined</code> | In Dual-Attenuator models, this selects both attenuators to participate in the autoranging |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Example | <code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code> |

| | | | | | |
|---------------------------|--|-------------------------|---|---------------------------|----------|
| Notes | <p>The parameter option ELECTRICAL sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBINED is mapped to ELECTRICAL in Single-Attenuator models. If you send COMBINED, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBINED</p> | | | | |
| Dependencies | <p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 1756 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 505 is grayed-out</p> <p>Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>Appears in the Waveform measurement in BASIC and 5G NR Modes</p> | | | | |
| Preset | OFF when Elec Atten is Disabled at preset, otherwise ELEC | | | | |
| State Saved | Saved in instrument state | | | | |
| Range | <table border="1"> <tr> <td>Dual-Attenuator models:</td> <td>Off Elec Atten Only Mech + Elec Atten</td> </tr> <tr> <td>Single-Attenuator models:</td> <td>Off On</td> </tr> </table> | Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten | Single-Attenuator models: | Off On |
| Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten | | | | |
| Single-Attenuator models: | Off On | | | | |

Backwards Compatibility Command

| | |
|------------------------------|--|
| Notes | <p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p> |
| Backwards Compatibility SCPI | <pre>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</pre> <pre>[:SENSe]:POWer[:RF]:RANGe:AUTO?</pre> |

Adjustment Algorithm

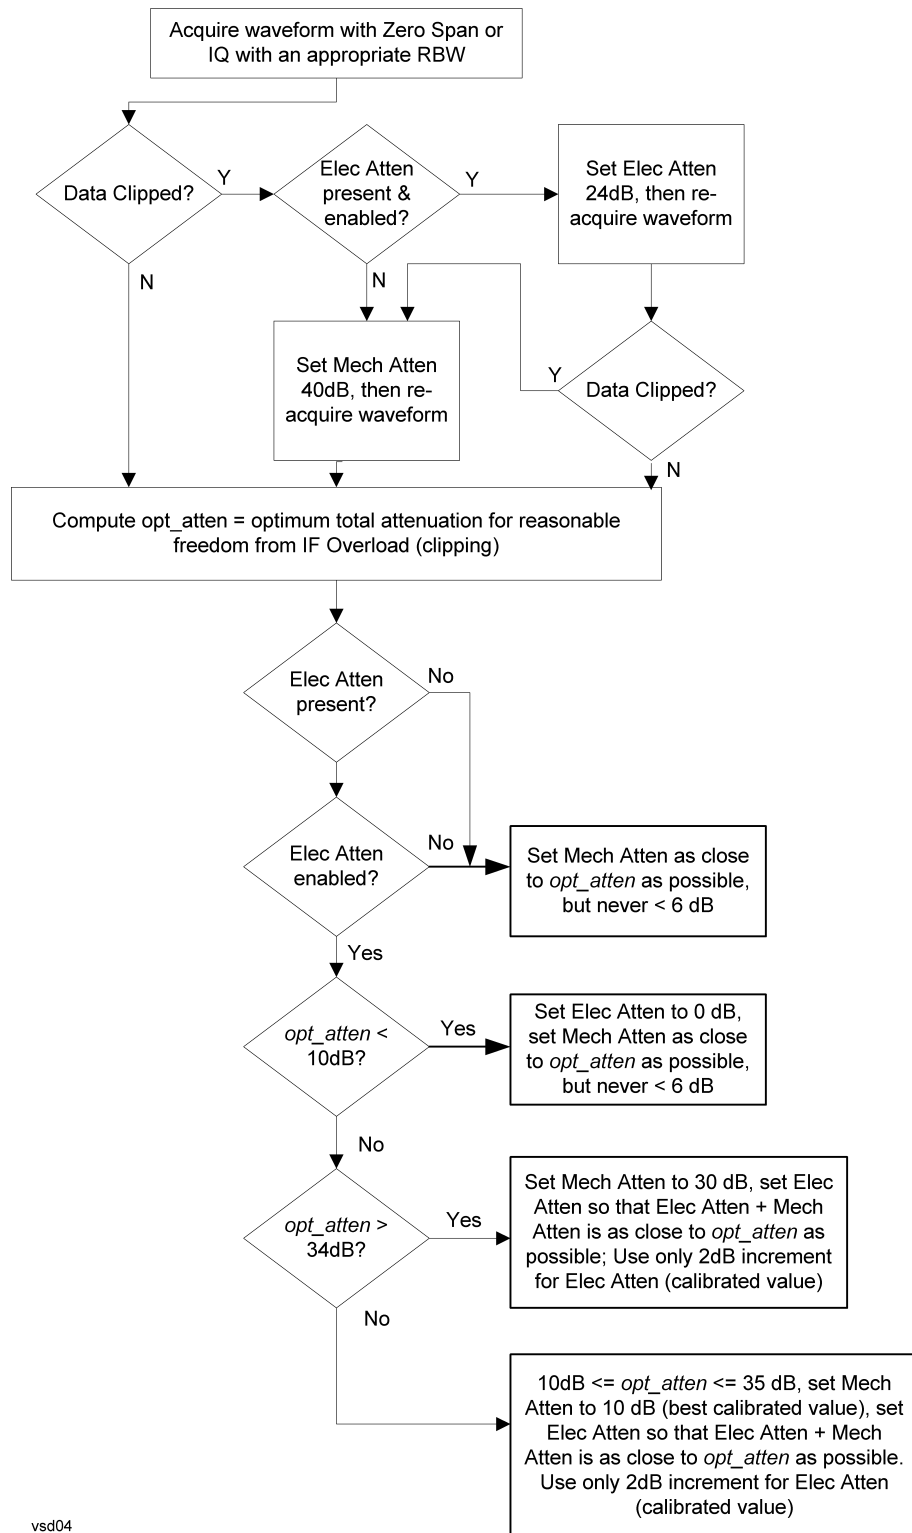

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1759 or "Pre-Adjust for Min Clipping" on page 505 selection is Mech + Elec Atten:

"Pre-Adjust for Min Clipping" on page 505 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

| | |
|--------------|---|
| | <code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code> |
| Example | <code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code> |
| Notes | Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10 |
| Dependencies | Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error |
| Couplings | When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB |
| Preset | EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB |
| State Saved | Saved in instrument state |

3.4.15.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

| | |
|-------------|----|
| State Saved | No |
|-------------|----|

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGE <real></code> <code>[:SENSe]:POWer[:RF]:RANGE?</code> |
| Example | <code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code> |
| Notes | The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting |
| Preset | 0 dBm |
| State Saved | Yes |
| Min/Max | -/+100 |
| Annotation | Meas Bar |

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Notes | Executing Adjust Range for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |

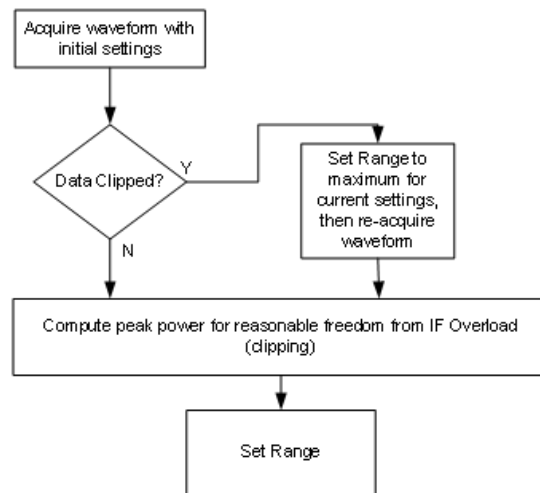

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Notes | Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |
| Preset | OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping |
| State Saved | Saved in instrument state |

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1769 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

| | | |
|----------------|--|-------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code> | |
| Example | <code>:POW:RANG:PAR 12 dB</code> | |
| Notes | In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated | |
| Dependencies | Does not appear in Spectrum Analyzer Mode | |
| Preset | VXT Models M9410A/11A | 0 dB |
| | All Others | 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB | |
| Max | VXT Models M9410A/11A | 50 dB |
| | All Others | 20 dB |

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1771. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

| | | |
|----------------|--|--------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code> | |
| Example | <code>:POW:RANG:MIX:OFFS -5 dB</code> | |
| Preset | 0 dB | |
| State Saved | Saved in instrument state | |
| Min | VXT Models M9410A/11A | -34 dB |
| | All Others | -35 dB |
| Max | 30 dB | |

3.4.15.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1788 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 1774 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "[Proper Preselector Operation](#)" on page 514.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe] :POWer [:RF] :PCENter</code> |
| Example | <code>:POW:PCEN</code> |
| Notes | The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command |
| Dependencies | Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Couplings | The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1774 |
| Status Bits/OPC dependencies | When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed |

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1773 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

| Selection | Example | Note |
|------------|---|---|
| Off | <code>:POW:GAIN OFF</code> | |
| Low Band | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code> | Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown |
| Full Range | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code> | Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear |

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code> |
| Example | <code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code> |
| Dependencies | Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled |
| Preset | LOW |
| State Saved | Saved in instrument state |
| Annotation | When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp) |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code> |
| Example | <code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code> |
| Preset | OFF |

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to **"Internal Preamp"** on page 1775. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with **"Internal Preamp"** on page 1775, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see **"More Information"** on page 518

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATE] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATE]?</code> |
| Example | <code>:POW:GAIN:LNA ON</code> |
| Dependencies | Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled |
| Preset | OFF |
| State Saved | Saved in State |

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

| Path | Example | Note |

| Notes | <p>When "Presel Center" on page 1773 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p> | | | | | | | | | | | | | | |
| Dependencies | <p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</p> | | | | | | | | | | | | | | |

μ W Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to μ W Path Control:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

| Measurement | μ W Path Control Auto behavior |
|------------------|---|
| Digital Demod | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Custom OFDM | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |

| Measurement | μ W Path Control Auto behavior |
|--------------------|------------------------------------|
| ACP | Always Presel Bypass |
| SEM | Always Presel Bypass |
| Spurious Emissions | Always Standard Path |

WLAN Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|--|
| Modulation Analysis | Always Presel Bypass |
| Spectral Flatness | Always Presel Bypass |
| Power vs Time | Always Presel Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Always Presel Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Always Presel Bypass |
| SEM | For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto μ W path is standard For other cases, auto μ W path is presel bypass if presel bypass is enabled, auto μ W path is standard if presel bypass is not enabled |
| Spurious Emissions | Always Standard Path |

5G NR Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|---|
| Modulation Analysis | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass |
| Monitor Spectrum | Always Standard Path |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass |
| Channel Power | Always Standard Path |
| Occupied BW | Always Standard Path |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| ACP | Always Standard Path |

| Range | ON OFF |

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μ W Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

| | |
|------------------------------|--|
| Example | Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code> |
| Notes | Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>) |
| Preset | ON |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code> |

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

| Type | ID | |
|---|-----|---|
|  | 159 | Settings Alert - DETECTED;Presel/Meas BW conflict |

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1778.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1778 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ON OFF 1 0</code> <code>[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ?</code> |

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPreSel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:STAT?</code> |
| Example | <code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code> |
| Dependencies | Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements |
| Couplings | Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state |
| Preset | N9041B OFF N9042B+V3050A ON M9410A/11A ON |
| State Saved | Saved in instrument state |

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

3 WLAN Mode
3.4 SEM Measurement

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code> |
| Example | <code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1788 is OFF. The grayout message is “Unavailable unless SW Presel enabled” |
| Preset | N9041B ADVanced N9042B+V3050A NORMa1 |
| State Saved | Saved in instrument state |

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code> |
| Example | <code>:POW:SWPR:BW NARR</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept |

| | | |
|-------------|--|---------------|
| | method | |
| | Grayed-out when " Software Preselection " on page 1788 is OFF . The grayout message is "Unavailable unless SW Presel enabled" | |
| | For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled | |
| Preset | N9041B | NORMa1 |
| | N9042B+V3050A | NARRow |
| State Saved | Saved in instrument state | |

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

| | | |
|----------------|---|--|
| Remote Command | <code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code> | |
| Example | Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code> | |
| Dependencies | Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz | |
| Preset | See " Prefilter Presets " on page 532 below | |
| State Saved | Saved in instrument state | |

| OFDM | VMA | OFF |
| SAN | SA | ON |
| HARM | SA | ON |

3.4.16 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth functions of the instrument.

The Resolution BW functions control filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.4.16.1 Settings

Contains basic Bandwidth functions. The only tab under **BW**.

RBW Filter Type

Selects the type of bandwidth filter that is used in Carriers and Offsets:

| Option | SCPI | Behavior |
|----------------|---|--|
| Gaussian | GAUSSian | The selected filter is applied to carriers and all offsets |
| Flattop | FLATtop | |
| Auto Sense | ASENSE | The filter type is automatically selected for each carrier and offset in a way such that measurement speed and accuracy are optimized Filter Auto Sense Rules: <ul style="list-style-type: none"> - Flattop is selected when "Enable Wideband IF for FFT" on page 641 is ON - Flattop is selected for offsets close to the reference carrier - For all other cases, Gaussian is selected |
| Remote Command | [:SENSe]:SEMAsk:BANDwidth:SHAPE ASENse GAUSSian FLATtop [:SENSe]:SEMAsk:BANDwidth:SHAPE? | |
| Example | :SEM:BAND:SHAP GAUS :SEM:BAND:SHAP? | |
| Preset | ASENSE | |
| State Saved | Saved in instrument state | |
| Range | Auto Sense (each offset and carrier) Gaussian (all offsets and carriers) Flattop (all offsets and carriers) | |

3.4.17 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.4.17.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Limit Lines

Toggles Limit Lines display for this measurement On or Off.

| | |
|----------------|--|
| Remote Command | :CALCulate:SEMAsk:LLINe:STATe ON OFF 1 0 :CALCulate:SEMAsk:LLINe:STATe? |
| Example | :CALC:SEM:LLIN:STAT OFF :CALC:SEM:LLIN:STAT? |

| | |
|-------------|---------------------------|
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | ON OFF |

3.4.17.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

| | |
|------------------------------|--|
| Remote Command | :DISPlay:GRATicule[:STATe] OFF ON 0 1 :DISPlay:GRATicule[:STATe]? |
| Example | :DISP:GRAT OFF |
| Notes | The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis |
| Preset | ON |
| State Saved | Saved in instrument state |
| Backwards Compatibility SCPI | :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? |
| | This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored |

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

| | |
|----------------|--|
| Remote Command | :DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1 :DISPlay:ANNotation:SCReen[:STATe]? |
|----------------|--|

| | |
|--------------|--|
| Example | <code>:DISP:ANN:SCR OFF</code> |
| Dependencies | Grayed-out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code> |
| Example | <code>:DISP:ANN:TRAC OFF</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code> |
| Example | <code>:DISP:ACT OFF</code> |
| Dependencies | Grayed out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code> |
| Example | <code>:DISP:ANN:MBAR OFF</code> |
| Dependencies | Grayed out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

| Name | Command |
|----------------------------|-------------------------------|
| Select User View | :DISPlay:VIEW:ADVanced:SElect |
| Rename User View | :DISPlay:VIEW:ADVanced:REName |
| Delete User View | :DISPlay:VIEW:ADVanced:DELeTe |
| Create User View | :DISPlay:VIEW:ADVanced:NAME |
| Select Screen | :INSTrument:SCReen:SElect |
| Delete Screen | :INSTrument:SCReen:DELeTe |
| Delete All But This Screen | :INSTrument:SCReen:DELeTe:ALL |
| Add Screen | :INSTrument:SCReen:CREate |
| Rename Screen | :INSTrument:SCReen:REName |
| Sequencer On/Off | :SYSTem:SEQuencer |

| | |
|-------------------------------|---|
| Remote Command | :DISPlay:ENABle OFF ON 0 1 |
| Example | :DISP:ENAB OFF |
| Couplings | :DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB |
| Preset | ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet |
| State Saved | Not saved in instrument state |
| Backwards Compatibility Notes | :SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers |

3.4.17.3 View

See "[Views](#)" on page 474

3.4.18 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the **Center Freq** setting is the same for all measurements – it does not change as you change measurements.

3.4.18.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed, and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

This setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global Center Frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you go back to the RF Input, **Center Frequency** returns to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

| F03 (CXA-m) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| F07 (CXA-m) | 3.755 GHz | 7.5 GHz | 7.575 GHz |
| F13 (CXA-m) | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| F26 (CXA-m) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 504 (M9421A, M8920A) | 2.145 GHz | 3.88GHz | 3.88 GHz |
| 506 (M9421A, M8920A) | 3.245 GHz | 6.08GHz | 6.08 GHz |
| F06 (M9410A/11A) | 1.0 GHz | 6.08 GHz | 6.08 GHz |
| F06 (M9415A) | 1 GHz | 1.08 GHz | 6.6 GHz |
| F08 (M9415A) | 1 GHz | 1.08 GHz | 8.6 GHz |
| F12 (M9415A) | 1 GHz | 1.08 GHz | 12.9 GHz |

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

| Input | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|---------------------|-----------------------------|------------------------------------|------------------------------------|
| Input 1, all models | 25.005 GHz | 50.0 GHz | 52 GHz |
| Input 2, opt 585 | 42.505 GHz | 85.0 GHz | 86 GHz |
| Input 2, opt 590 | 45.005 GHz | 90.0 GHz | 92 GHz |
| Input 2, opt 5CX | 55.005 GHz | 110.0 GHz | 110 GHz |

Input 2, CXA and MXE

| Model | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------|-----------------------------|------------------------------------|------------------------------------|
| CXA opt C75 | 0.7505 GHz | 1.5 GHz | 1.58 GHz |
| MXE | 505 MHz | 1 GHz | 1.000025 GHz |

Tracking Generator Frequency Limits (CXA only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 9 kHz | 3.0 GHz | 3.08 GHz |
| T06 | 9 kHz | 6.0 GHz | 6.05 GHz |

Tracking Generator Frequency Limits(CXA-m only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 2 MHz | 3.08 GHz | 3.08 GHz |
| T07 | 2 MHz | 7.575 GHz | 7.575 GHz |
| T13 | 2 MHz | 13.8 GHz | 13.8 GHz |
| T26 | 2 MHz | 26.55 GHz | 26.55 GHz |

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

| Products with Radio Heads/CIU | Preset | Start frequency | Stop frequency |
|-------------------------------|--------|-----------------|----------------|
| M9421A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU + RRH | 25 GHz | 24.25 GHz | 43.5 GHz |

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the selected input at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently-selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency :RF :CENTer <freq></code> <code>[:SENSe] :FREQuency :RF :CENTer?</code> |
| Example | <code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Dependencies | If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning |

3 WLAN Mode
3.4 SEM Measurement

| | |
|-------------|--|
| Preset | See "Center Frequency Presets" on page 540 above |
| State Saved | Saved in instrument state |
| Min | -79.999995 MHz |
| Max | See "Center Frequency Presets" on page 540 above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on Span |

Ext Mix Center Freq

Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the selected input at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code> |
| Example | <code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Couplings | When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing, so you will return to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, so the Span setting from the other input will be retained. Therefore, the instrument retains the Span from the previous input, limited as necessary by the current mixer setup |
| Preset | When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table ($\text{Span} = \text{Stop Freq} - \text{Start Freq}$), the instrument uses the maximum Span the measurement allows, and still sets Center Frequency to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after Restore Input/Output Defaults , if you switch to External Mixing and do a Mode Preset while in Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz |
| State Saved | Yes |
| Min | The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span |
| Max | The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span |

I/Q Center Freq

Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the selected input at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency:IQ:CENTer <freq></code> <code>[:SENSe] :FREQuency:IQ:CENTer?</code> |
| Example | <code>:FREQ:IQ:CENT 30 MHz</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Preset | 0 Hz |
| State Saved | Saved in instrument state |
| Min | -40.049995 MHz |
| Max | 40.049995 MHz |

CF Step

Changes the step size for "**Center Frequency**" on page 539, and start and stop frequency functions. Once a step size has been selected and the **Center Frequency** function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency:CENTer:STEP[:INCRement] <freq></code> <code>[:SENSe] :FREQuency:CENTer:STEP[:INCRement]?</code> <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO?</code> |
| Example | <code>:FREQ:CENT:STEP 500 MHz</code> increases the current center frequency value by 500 MHz <code>:FREQ:CENT UP</code> <code>:FREQ:CENT:STEP?</code> <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code> |
| Notes | Preset and Max values depend on Hardware Options |
| Dependencies | Not available in the MSR, LTE-A FDD/TDD and 5G NR Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the Center Frequency |

3 WLAN Mode
3.4 SEM Measurement

| | |
|------------------------------|---|
| | >3.6 GHz by pressing the Up -arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning |
| Couplings | When auto-coupled, the center frequency step size is set to 10% of the span |
| Preset | Auto ON |
| State Saved | Saved in instrument state |
| Min/Max | -/+ (The maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band |
| Status Bits/OPC dependencies | non-overlapped |

Center Frequency Segment1

Only available when **Radio Standard** is 802.11ac 80+80MHz, or 802.11ax 80+80MHz, and when the active Measurement is SEM, CHP or Modulation Analysis.

Sets the center frequency of Segment 1.

Note that the SCPI command sets this center frequency even if Radio Standard is *not* 802.11ac/ax 80+80MHz.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency:CENTer:SEGMENT1 <freq></code> <code>[:SENSe] :FREQuency:CENTer:SEGMENT1?</code> |
| Example | <code>:FREQ:CENTer:SEGM1 5.53 GHz</code> <code>:FREQ:CENTer:SEGM1?</code> |
| Notes | For an 80+80 MHz channel, Segment1 will be the lower or upper segment. The center frequency of Segment1 is independent from the center frequency of Segment2 The measurement rearranges Segment1 and Segment2 based on their center frequency, and generates a “setting conflict” error message if the spacing between the two segments is less than 80 MHz |
| Preset | 5.21 GHz |
| State Saved | Saved in instrument state |
| Min/Max | Depends on instrument minimum/maximum center frequency Same as Center Frequency |

Center Frequency Segment2

Only available when **Radio Standard** is 802.11ac 80+80MHz, or 802.11ax 80+80MHz, and when the active measurement is SEM, CHP or Modulation Analysis.

Sets the center frequency of Segment 2.

Note that the SCPI command sets this center frequency even if Radio Standard is *not* 802.11ac/ax 80+80MHz.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer :SEGMENT2 <freq></code> <code>[:SENSe] :FREQuency :CENTer :SEGMENT2?</code> |
| Example | <code>:FREQ:CENTer:SEGM2 5.53 GHz</code> <code>:FREQ:CENTer:SEGM2?</code> |
| Notes | For an 80+80 MHz channel, Segment2 will be the lower or upper segment. The center frequency of Segment2 is independent from the center frequency of Segment1 The measurement rearranges Segment1 and Segment2 based on their center frequency, and generates a "setting conflict" error message if the spacing between the two segments is less than 80 MHz |
| Preset | 5.45 GHz |
| State Saved | Saved in instrument state |
| Min/Max | Depends on instrument minimum/maximum center frequency Same as Center Frequency |

3.4.19 Marker

Enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects Marker 1, sets it to **Normal (POsition)** and places it at the center of the display. If the selected marker is **OFF**, it is set to **Normal** and placed at the center of the screen, on the trace determined by the **Marker Trace** rules.

3.4.19.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

In any menu that includes **Select Marker**, the first control is always **Marker Frequency|Time**.

| | |
|--------------|--|
| Notes | The selected marker is remembered even when not in the Marker menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak |
| Preset | Marker 1 |
| State Saved | The number of the selected marker is saved in instrument state |
| Annunciation | Appears in the marker results block label for Normal marker |

3.4.19.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. Has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal**.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X?</code> |
| Example | <code>:CALC:SEM:MARK3:X 1.0 GHz</code> <code>:CALC:SEM:MARK3:X?</code> |
| Notes | If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X-Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X-Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time |
| Preset | After a preset, all markers are turned OFF , so the query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min | -9.9E+37 |
| Max | 9.9E+37 |
| Annotation | Mkr # <X value> and <Marker value> upper right on graph |

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X:POStion <real></code> <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X:POStion?</code> |
| Example | <code>:CALC:SEM:MARK10:X:POS 1001</code> <code>:CALC:SEM:MARK10:X:POS?</code> |
| Notes | The query returns the marker's absolute X Axis value in trace points if the control mode is Normal , or the |

| | |
|-------------|---|
| | offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is Off , the response is Not A Number |
| Preset | After a preset, all markers are turned OFF , so the query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min | -9.9E+37 |
| Max | 9.9E+37 |

Marker Y Axis Value (Remote Command only)

Returns the marker Y-Axis value in the current marker Y Axis unit.

| | |
|---------------------------------|---|
| Remote Command | <code>:CALCulate:SEMAsk:MARKer[1] 2 ... 12:Y?</code> |
| Example | <code>:CALC:SEM:MARK11:Y?</code> |
| Notes | The query returns the marker Y-Axis result, if the control mode is Normal . If the marker is Off , the response is Not A Number |
| Preset | Result depends on Markers setup and signal source |
| State Saved | No |
| Backwards Compatibility SCPI | <code>:CALCulate:SEMAsk:MARKer[1] 2 ... 12:FUNction:RESult?</code> |

Marker Mode

Sets the marker control mode to **POSition** (**Normal**) or **OFF**.

If the selected marker is **OFF**, pressing **Marker** sets it to **POSition** and places it at the center of the screen, on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area. If the current control mode for the measurement is **OFF**, there is no active function, and the active function is turned off.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:SEMAsk:MARKer[1] 2 ... 12:MODE POSition OFF</code> <code>:CALCulate:SEMAsk:MARKer[1] 2 ... 12:MODE?</code> |
| Example | <code>:CALC:SEM:MARK:MODE POS</code> <code>:CALC:SEM:MARK:MODE?</code> |
| Notes | Default Active Function: the active function for the selected marker's current control mode. If the current control mode is OFF , there is no active function, and the active function is turned off |
| Preset | <code>OFF OFF OFF OFF OFF OFF OFF OFF OFF OFF OFF OFF</code> |

| | |
|-------------|--|
| State Saved | Saved in instrument state |
| Range | <code>POsition OFF</code> |
| Annotation | Mkr# <X value> and <Marker value> upper right of graph |

All Markers Off

Turns off all markers.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SEMAsk:MARKer:AOff</code> |
| Example | <code>:CALC:SEM:MARK:AOff</code> |

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By “equal X-Axis movement” we mean that we preserve the difference between each marker’s X-Axis value (in the fundamental X-Axis units of the trace that marker is on) and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SEMAsk:MARKer:COUPle[:STATe] ON OFF 1 0</code> <code>:CALCulate:SEMAsk:MARKer:COUPle[:STATe]?</code> |
| Example | <code>:CALC:SEM:MARK:COUP ON</code> <code>:CALC:SEM:MARK:COUP?</code> |
| Preset | OFF Preset by Mode Preset and All Markers Off |
| State Saved | Saved in instrument state |

3.4.19.3 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as **"Marker Frequency" on page 547** in the **Settings** tab.

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not **OFF**, it moves the marker from the trace it was on to the new trace. If the marker is **OFF** it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SEMAsk:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:SEMAsk:MARKer[1] 2 ... 12:TRACe?</code> |
| Example | <code>:CALC:SEM:MARK2:TRAC 2</code> <code>:CALC:SEM:MARK2:TRAC?</code> |
| Notes | A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number |
| Couplings | The state of Marker Trace is not affected by " Auto Couple " on page 1833 Sending the remote command causes the addressed marker to become selected |
| Preset | 1 |
| State Saved | Saved in instrument state |

3.4.20 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.4.20.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Toggles averaging On or Off, in addition to enabling you to set the number of measurement averages used to calculate the measurement result. The average is

displayed at the end of each sweep. After the specified number of average counts, the average mode (termination control) setting determines the average action.

In the remote mode, use "[Averaging On/Off](#)" on page 551 to turn Averaging on or off.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:AVERage:COUNT <integer></code> <code>[:SENSe]:SEMAsk:AVERage:COUNT?</code> |
| Example | <code>:SEM:AVER:COUN 100</code> <code>:SEM:AVER:COUN?</code> |
| Preset | 10 |
| State Saved | Saved in instrument state |
| Min/Max | 1/10000 |

Averaging On/Off

Turns Averaging on or off.

NOTE

In this measurement, **Average Type** is preset to the [Log-Pwr Avg \(Video\)](#) method. Other averaging methods are not available.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:SEMAsk:AVERage[:STATe]?</code> |
| Example | <code>:SEM:AVER ON</code> <code>:SEM:AVER?</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | ON OFF |

Meas Method

Sets the measurement method:

| Method | Option | Description |
|----------------|--------|--|
| Integration BW | 0 OFF | Enables you to set the channel integration bandwidth |
| RRC Weighted | 1 ON | Selects Root Raised Cosine (RRC) filtering of the carriers. The a value (rolloff) for the filter is set to the value of the Filter Alpha parameter |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:FILTer[:RRC][:STATe] OFF ON 0 1</code> <code>[:SENSe]:SEMAsk:FILTer[:RRC][:STATe]?</code> |
|----------------|--|

| | |
|--------------|---|
| Example | <code>:SEM:FILT ON</code> <code>:SEM:FILT?</code> |
| Dependencies | WLAN: RRC Weight is not supported when the radio standard is WLAN 802.11ac (80+80MHz) |
| Preset | SA, LTEAFDD, LTEATDD, 5G NR, WLAN, MSR Modes OFF WCDMA Mode ON |
| State Saved | Saved in instrument state |
| Range | Integration BW RRC Weighted |

RRC Filter Alpha

Sets the alpha value for the RRC Filter.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:FILTer[:RRC]:ALPHa <real></code> <code>[:SENSe]:SEMAsk:FILTer[:RRC]:ALPHa?</code> |
| Example | <code>:SEM:FILT:ALPH 0.3</code> <code>:SEM:FILT:ALPH?</code> |
| Preset | 0.22 |
| State Saved | Saved in instrument state |
| Min/Max | 0.01/1.0 |

Non-Contiguous Meas Region

Selects the region to measure for the non-contiguous frequency allocation.

| Option | SCPI | Comments |
|---------------|---------------------|--|
| Outer | <code>OUTer</code> | |
| Inner | <code>INNer</code> | |
| Outer & Inner | <code>OINNer</code> | Available only in 5G NR and LTE-Advanced FDD/TDD Modes |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:NCONtiguous:REGion INNer OUTer OINNer</code> <code>[:SENSe]:SEMAsk:NCONtiguous:REGion?</code> |
| Example | <code>:SEM:NCON:REG INN</code> <code>:SEM:NCON:REG?</code> |
| Dependencies | Available only in MSR, 5G NR and LTE-Advanced FDD/TDD Modes <code>OINNer</code> is available only in 5G NR and LTE-Advanced FDD/TDD Modes |
| Preset | <code>INNer</code> |
| State Saved | Yes |
| Range | Inner Outer Outer & Inner |

Sweep Type Rules

Selects which set of rules will be used for automatic selection of "Sweep Type" on page 578 when Sweep Type mode is Auto.

| Rule | Option | Description |
|--------------------|--------|---|
| Best Dynamic Range | DRANge | The instrument selects either swept or FFT analysis with the primary goal of dynamic range optimization. If the dynamic range of swept and FFT is very close, then it chooses the faster one. In determining the Swept or FFT setting, the auto rules use the following approach: <ul style="list-style-type: none"> - If the RBW > 210 Hz, use swept; for the RBW <= 210 Hz, use FFT - If Sweep Time Mode is Man, the Sweep Type is always Swept for backwards compatibility |
| Best Speed | SPEed | The instrument selects either FFT or swept analysis based on the fastest instrument speed |

| | |
|----------------|---|
| Remote Command | [:SENSe] :SEMAsk:SWEEp:TYPE:AUTO:RULEs SPEed DRANge [:SENSe] :SEMAsk:SWEEp:TYPE:AUTO:RULEs? |
| Dependencies | In modular products such as VXT, the value is always set to Best Dynamic Range and this control does not appear |
| Preset | DRANge |
| State Saved | Saved in instrument state |

Mask State

Only appears in WLAN Mode.

The mask lines can be drawn in two different ways, according to the WLAN standard when the control's value is **Standard (STD)**; or by the user-defined specifications listed in the **Offset/Limits** menu.

| | |
|----------------|---|
| Remote Command | [:SENSe] :SEMAsk:MASK[:STATe] STD MAN [:SENSe] :SEMAsk:MASK[:STATe]? |
| Example | :SEM:MASK:STATe STD :SEM:MASK:STATe? |
| Couplings | When the value is STD , the parameters displayed on the Offset/Limits menu are automatically changed according to WLAN standard If you manually modify any parameter in the Offset/Limits menu, then Limit State will be coupled to Manual (MAN) If you recall a mask file or state file, Limit State will be coupled to MAN |

| | |
|---------------------------------|---|
| | <p>If WLAN radio standard is changed, Limit State will be preset to STD</p> <p>When the value of Limit State is STD, and Radio Standard is 11ac 80+80 MHz, the channel span will be set to the value satisfying the equation below if its previous value is less than the value calculated through the equation</p> <p>Chan Span = spacing between the two carriers + Chan IntegBW</p> |
| Preset | STD |
| State Saved | Saved in instrument state |
| Range | STD MAN |
| Backwards Compatibility SCPI | [:SENSe]:SEMAsk:LIMits STD MAN |
| Notes | <p>ON aliases to STD</p> <p>OFF aliases to MAN</p> |
| Range | Auto Man |
| Backwards Compatibility SCPI | <p>[:SENSe]:SEMAsk:T80Mask:AUTO ON OFF 1 0</p> <p>[:SENSe]:SEMAsk:T80Mask:AUTO?</p> |

Mask Standard

Allows you to select various masks according to region-specific standards. Only appears in WLAN Mode.

| Mask Selected | Example | Mask used as auto standard mask |
|----------------------|--------------------------------|---|
| IEEE | :SEM:LIM:STAN IEEE | Mask defined in IEEE 802.11-2012 standard |
| FCC Class A | :SEM:LIM:STAN FCA | Mask defined in FCC 11p standard for STA transmit power class A |
| FCC Class B | :SEM:LIM:STAN FCB | Mask defined in FCC 11p standard for STA transmit power class B |
| FCC Class C | :SEM:LIM:STAN FCC | Mask defined in FCC 11p standard for STA transmit power class C |
| FCC Class D | :SEM:LIM:STAN FCD | Mask defined in FCC 11p standard for STA transmit power class D |
| ETSI CCH SCH1/5/6 | :SEM:LIM:STAN ESCH1 | Mask defined in ETSI 11p standard for G5-CCH, G5-SCH1, G5-SCH5 and G5-SCH6 channels |
| ETSI SCH2/3 | :SEM:LIM:STAN ESCH2 | Mask defined in ETSI 11p standard for G5-SCH2 and G5-SCH3 channels |
| ETSI SCH4 | :SEM:LIM:STAN ESCH4 | Mask defined in ETSI 11p standard for G5-SCH4 channel |

3 WLAN Mode
3.4 SEM Measurement

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:LIMits:STANdard IEEE FCA FCB FCC FCD ESCH1 ESCH2 ESCH4</code> <code>[:SENSe]:SEMAsk:LIMits:STANdard?</code> |
| Example | <code>:SEM:LIM:STAN IEEE</code> |
| Dependencies | Only available in WLAN Mode Grayed-out if Radio Standard is <i>not</i> 802.11a/g/j/p 20MHz, 802.11j/p 10MHz, 802.11p 5MHz The ETSI masks are grayed-out if Radio Standard is <i>not</i> 802.11j/p 10M |
| Preset | <code>IEEE</code> |
| State Saved | Saved in instrument state |

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the Center Frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed. For Spur Avoidance, the instrument uses a software algorithm to remove this spur from the displayed measurement data.

Some measurements allow you to turn off **Spur Avoidance**, but in this measurement it is always enabled. Therefore, the **Spur Avoidance** switch is unavailable (grayed-out) and set to `ON`.

If you press the grayed-out switch, a popup message appears stating:

Always enabled in this measurement. See manual for details

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:SAVoid[:STATe]?</code> |
| Example | <code>:SEM:SAV?</code> Always returns <code>ON</code> |
| Dependencies | Only appears in VXT models M9410A/11A/15A |
| Preset | <code>ON</code> |
| State Saved | Saved in instrument state |
| Range | <code>ON</code> |

Offset/Limits Config Table

Enables you to set up the measurement parameters for offset pairs and to set the power limits for start and stop frequencies of the selected offsets. For example, you can assign the start and stop frequencies, select the resolution bandwidth, and set the sweep time.

Before UE, the LTE-Advanced FDD/TDD standards gave the test specification requirements for BS intra-band contiguous aggregation and intra-band non-contiguous aggregation modes. However, for UE, only the requirements of intra-band contiguous aggregation modes are defined. So, the standards don't support making the measurement in UE intra-band non-contiguous aggregation mode for LTE-Advanced FDD/TDD. As a result, the preset values of Inner Offset/Limits are temporarily set as those of Outer Offset/Limits for UE.

Limits for Inner Offsets

Since inner offsets are defined from the sub-block edges to the gap, limits from two sub-blocks overlap each other. Therefore, the limit used for inner offsets are the cumulative sum of limits from both sub-blocks. Offsets can have different RBWs, which must be compensated when accumulated.

For example, when offset A and D overlap, the limit of offset A is calculated as follows.

$$\text{Cumulated Limit of Offset A} = 10^{\frac{[\text{Offset A Limit in dBm}]}{10}} + \frac{\text{Offset A RBW}}{\text{Offset D RBW}} 10^{\frac{[\text{Offset D Limit in dBm}]}{10}}$$

The diagram below depicts what inner offset limits look like.

Offset (Bandwidth)

Enables you to set up the bandwidth measurement parameters for offset pairs. For example, you can assign the start and stop frequencies, and select the resolution bandwidth.

Offset Freq Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “Carrier Center to Meas BW Edge” definition. LTE conformance test requires “Carrier Edge to Meas BW Center” and/or “Carrier Edge to Meas BW Edge” definition. The MSR standard requires “RF BW Edge to Meas BW Center” and/or “RF BW Edge to Meas Edge” definition.

“Meas BW Edge” means the edge frequency of resolution bandwidth closer to the carrier that is represented by Meas BW and Res BW settings. Actual center frequency of Meas BW and the limit line have $\frac{1}{2}$ Meas BW offset when the Meas BW Edge is selected.

Note that the outermost (lowermost, uppermost) carrier at each side is determined by which carrier edge frequency is located outermost within the RF BW or each sub-block bandwidth, instead of which carrier center frequency is located outermost.

See also "[Diagrams for Offset Freq Define](#)" on page 559.

Modes other than MSR, LTE-A, 5G NR

Options:

| | |
|------------------|---|
| CTOCenter | From carrier center to the center of offset measuring filter* |
| CTOEdge | From carrier center to the nominal -3 dB point of the offset measuring filter* closer to the carrier |
| ETOCenter | From Center Frequency - Span of Ref Channel / 2 (for lower offset), Center Frequency + Span of Ref Channel / 2 (for upper offset) of the carrier closest to each offset to the center of offset measuring filter * |
| ETOEdge | From Center Frequency - Span of Ref Channel / 2 (for lower offset), Center Frequency + Span of Ref Channel / 2 (for upper offset) of the carrier closest to each offset to the nominal -3 dB point of the offset measuring filter * closer to the carrier |

*Measuring filter = Meas BW (N) x Res BW

** RF BW = $BW_{\text{channel,CA}}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or

Disabled. When **Number of Component Carriers** = 1, $RF\ BW = BW_{channel} = 2 \times F_{offset,RAT}$

Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagrams for Modes other than MSR, LTEAFDD/LTEATDD, 5G NR

Note:
• $MeasBW = N \times RBW$

Diagrams for MSR, LTEAFDD/LTEATDD, 5G NR

Notes:

- $MeasBW = N \times RBW$
- RF BW Edge and Outermost Carrier Edge are not always same. e.g.) 5G NR (3GPP) defines $BW_{channel,CA}$ which calculates $F_{offset,high}$ and $F_{offset,low}$ asymmetrically with SCS shift. (*) For MSR, $F_{offset,high (or ,low)} = F_{offset,RAT,high (or ,low)}$

Offset Detector

Enables you to control the detector for offsets. The following choices are available:

- AUTO** The detector selected depends on marker functions, trace functions, average type, and the trace averaging function
- NORMa1** The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
- AVERage** The detector determines the average of the signal within the sweep points. The

| | |
|-------------------------|--|
| | averaging method depends upon the Average Type selection (voltage, power or log scales) |
| POSitive Peak | The detector determines the maximum of the signal within the sweep points |
| SAMPle | The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point |
| NEGative Peak | The detector determines the minimum of the signal within the sweep points |

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:DETEctor:OFFSet[:FUNction] AVERage NEGative NORMal POSitive SAMPle</code> <code>[:SENSe]:SEMAsk:DETEctor:OFFSet[:FUNction]?</code> <code>[:SENSe]:SEMAsk:DETEctor:OFFSet:AUTO ON OFF 1 0</code> <code>[:SENSe]:SEMAsk:DETEctor:OFFSet:AUTO?</code> |

| Preset | <code>RMS</code> |
| State Saved | Saved in instrument state |

Start Freq

Specifies the start frequency for the currently selected offset. Also enables you to toggle that offset between On and Off.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

| 802.11af (6 MHz/ 7 MHz/ 8 MHz) | ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF |

For E6630A, E6640A, and M90XA:

| Radio Std | Presets |
|---|--|
| 802.11a/g(OFDM/DSSS-OFDM) | ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF |
| 802.11n(20MHz/40MHz) | |
| 802.11ac/ax/be (20 MHz/ 40 MHz/ 80 MHz/ 160 MHz) | ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF |
| 802.11be (320 MHz) | ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF |
| 802.11ac/ax (80 MHz + 80 MHz) | ON, ON, ON, OFF, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF |
| 802.11af (6 MHz/ 7 MHz/ 8 MHz) | ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF |

Stop Freq

Specifies the stop frequency for the currently selected offset.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

| | |
|----------------|---|
| Remote Command | <code>[:SENSE]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:FREQuency:STOP <freq>, ...</code> <code>[:SENSE]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:FREQuency:STOP?</code> |
| Example | <code>:SEM:OFFS:LIST:FREQ:STOP 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz, 15.0 MHz</code> <code>:SEM:OFFS:LIST:FREQ:STOP?</code> |
| Notes | Comma separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS If the offset is outside of the frequency range, the result spectrum will be invalid |
| Couplings | Coupled to Start Freq. When Stop Freq goes below Start Freq, Start Freq is automatically adjusted to Stop Freq minus 100 Hz |
| Preset | When the max number of offsets is 6: |

| Mode | Values |
|-------|---|
| SA | 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz, 15.0 MHz |
| WCDMA | 2.715 MHz, 3.515 MHz, 4.000 MHz, 8.000 MHz, 12.50 MHz, 15.0 MHz 3.485 MHz, 7.500 MHz, 8.500 MHz, 12.00 MHz, 15.00 MHz, 18.0 MHz |

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

| Mode | Values |
|------------------|---|
| MSR | 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz |
| LTEAFDD, LTEATDD | 5.05 MHz, 10.05 MHz, 15 MHz, 30 MHz, 40 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz 985.0 kHz, 4.50 MHz, 5.5001 MHz, 9.50 MHz, 20 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz |
| 5G NR | 5.05 MHz, 10.05 MHz, 40 MHz, 100 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz 985.0 kHz, 4.50 MHz, 99.500 MHz, 104.5 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz |

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as

| | |
|-------------|--|
| | the Offset F value |
| | WLAN Mode: See table of " WLAN Mode Presets " on page 568 below |
| State Saved | Saved in instrument state |
| Min/Max | 100 Hz/Depends on instrument maximum frequency. Same as the Max Span in Swept SA Measurement |

Res BW

Specifies which Resolution BW filter to use when measuring the currently selected offset.

Offset Res BW Mode allows the instrument to determine the optimum Resolution BW filter to use when measuring the currently selected offset.. When changing the Meas BW parameter, if the Res BW needs to be changed to adhere to the rule:

$(N \times \text{Res BW}) \leq (\text{Stop freq of the offset} - \text{Start freq of the offset})$,

where N is the multiplier, this setting will automatically be changed to manual.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer number. It shows a ratio between Integration BW and Resolution BW of the measurement result.

$$\text{Integ BW} = \text{Meas BW} * \text{Resolution BW}$$

Integration BW is desired resolution bandwidth and Resolution BW is actual bandwidth for sweep. Measurement sweeps with Resolution BW and Meas BW compensates sweep resolution bandwidth to Integration BW.

If you set this value greater than 1, you can set Resolution BW narrower to avoid carrier power leakage effect to the offset power integration.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Offset (Sweep)

Accesses a menu that enables you to set up the sweep measurement parameters for offset pairs.

Offset Freq Define

Same as "[Offset Freq Define](#)" on page 557 under Offset (Bandwidth).

Offset Detector

Same as "Offset Detector" on page 561 under Offset (Bandwidth).

Start Freq

Same as "Start Freq" on page 563 under Offset (Bandwidth).

Stop Freq

Same as "Stop Freq" on page 567 under Offset (Bandwidth).

Sweep Time

Specifies the **Sweep Time** for the currently selected offset and enables you to toggle the Sweep Time mode between Auto and Man.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

NOTE

On non-sweeping hardware, this column is grayed out. The value shown on this column is an estimate. It is the turnaround time to complete the measurement of the entire offset span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEp:TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using **Minimum Acquisition Time**, which provides better control.

| | |
|----------------|---|
| Remote Command | <pre>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME <time>, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME? [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME:AUTO ON OFF 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME:AUTO?</pre> |
| Example | <pre>:SEM:OFFS2:LIST:SWE:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms :SEM:OFFS2:LIST:SWE:TIME? :SEM:OFFS2:LIST:SWE:TIME:AUTO ON, ON, ON, ON, OFF, OFF :SEM:OFFS2:LIST:SWE:TIME:AUTO?</pre> |

| | |
|------------------------------|--|
| Notes | Comma separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS |
| Dependencies | On non-sweeping hardware, this column is grayed out and the Auto/Man checkbox is invisible. The read-only value shows the estimated sweep time In those instruments, " Minimum Acquisition Time " on page 576 is available |
| Couplings | When you manually set a value when in the Auto state, the state automatically changes to Man |
| Preset | Automatically calculated Modes other than LTEAFDD, LTEATDD, 5G NR, MSR, WLAN: When the max number of offsets is 6: ON, ON, ON, ON, ON, ON When the max number of offsets is 12: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON Modes LTEAFDD, LTEATDD, 5G NR, MSR: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON When the max number of offsets is 14: Mode WLAN: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON |
| State Saved | Saved in instrument state Saved in instrument state |
| Range | Auto Man |
| Min | Other than non-sweeping hardware Depends on Sweep Type: – Sweep Type "Swept": 1 ms – Sweep Type "FFT": 100 ns Non-sweeping hardware: N/A |
| Max | Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A |
| Backwards Compatibility SCPI | [:SENSe] :SEMAsk :OFFSet [1] 2 :LIST :SWEEp [:TIME] [:SENSe] :SEMAsk :OFFSet [1] 2 :LIST :SWEEp [:TIME] :AUTO |

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides Span into multiple chunks if needed.

3 WLAN Mode
3.4 SEM Measurement

Therefore, the total signal acquisition time for the entire offset span is $\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$.

When in Auto, this parameter's value is determined by other parameters, such as Offset Start, Offset Stop, RBW and VBW.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on Detector settings.

Note that the actual acquisition time for each chunk may exceed the Minimum Acquisition Time value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

| | |
|----------------|--|
| Remote Command | <pre>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME <time>, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME? [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME:AUTO ON OFF 1 0, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME:AUTO?</pre> |
| Example | <pre>:SEM:OFFS2:LIST:SWE:ACQ:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms :SEM:OFFS2:LIST:SWE:ACQ:TIME? :SEM:OFFS2:LIST:SWE:ACQ:TIME:AUTO ON, ON, ON, ON, OFF, OFF :SEM:OFFS2:LIST:SWE:ACQ:TIME:AUTO?</pre> |
| Dependencies | Available only on non-sweeping hardware |
| Couplings | Coupled to Offset Start Freq, Offset Stop Freq, RBW, and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man |
| Preset | Automatically calculated ON |
| State Saved | Saved in instrument state |
| Min | 100 ns |
| Max | 4000 s |

Sweep Time Annotation (Remote Query Only)

Returns the Sweep Time Annotation value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire offset span of each measurement cycle.

| | |
|----------------|--|
| Remote Command | <pre>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:ETIME?</pre> |
|----------------|--|

| | |
|--------------|---|
| Example | <code>:SEM:OFFS2:LIST:SWE:ETIM?</code> |
| Dependencies | Available only on non-sweeping hardware |
| Preset | Automatically calculated |

Sweep Type

Specifies the **Sweep Type** for the currently selected offset, and enables you to toggle the **Sweep Type** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

How to define Sweep Time and Sweep Type:

| Sweep Type mode | Behavior |
|-----------------|--|
| Auto | Sweep Type is automatically selected according to "Sweep Type Rules" on page 553 Sweep Time is automatically calculated according to the selected Sweep Type |
| Man | Sweep Type is user-selected |
| – | |

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE SWEep FFT, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE?</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE:AUTO ON OFF 1 0, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE:AUTO?</code> |
| Example | <code>:SEM:OFFS2:LIST:SWE:TYPE FFT,FFT,SWE</code> <code>:SEM:OFFS2:LIST:SWE:TYPE?</code> <code>:SEM:OFFS2:LIST:SWE:TYPE:AUTO ON, ON, ON, ON, OFF, OFF</code> <code>:SEM:OFFS2:LIST:SWE:TYPE:AUTO?</code> |
| Notes | Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes In SA Mode, Offset sub op code 1 is used for both BTS and MS |
| Dependencies | Not available in modular products, such as VXT |
| Couplings | When Sweep Type is set manually, Sweep Type mode is set to OFF (Manual) When Sweep Type mode is Auto , Sweep Type is automatically selected according to Sweep Type Rules |

3 WLAN Mode
3.4 SEM Measurement

| | |
|-------------|---|
| Preset | <p>Automatically calculated</p> <p>LTEAFDD, LTEATDD, 5G NR, MSR Modes: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</p> <p>When the max number of offsets is 14: WLAN Mode: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</p> <p>All Other Modes:</p> <p>When the max number of offsets is 6: ON, ON, ON, ON, ON, ON</p> <p>When the max number of offsets is 12: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</p> |
| State Saved | Saved in instrument state |

Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe] :SEMAsk :OFFSet [n] [:OUTer] :LIST :STATe`.

- BOTH** Both of the negative (lower) and positive (upper) sidebands
- NEGative** Negative (lower) sideband only
- POSitive** Positive (upper) sideband only

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, and 12 values for other Modes.

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes.

| | |
|----------------|--|
| Remote Command | <code>[:SENSE]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SIDE BOTH NEGative POSitive, ...</code> <code>[:SENSE]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SIDE?</code> |
| Example | <code>:SEM:OFFS:LIST:SIDE BOTH, NEG, NEG, POS, POS, POS</code> <code>:SEM:OFFS:LIST:SIDE?</code> |
| Notes | Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS |
| Preset | Modes LTEAFDD,LTEATDD, 5G NR, MSR: <code>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH </code> <code>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH</code> When the max number of offsets is 14: Mode WLAN: <code>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH,</code> <code>BOTH</code> All Other Modes: When the max number of offsets is 6: <code>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH</code> When the max number of offsets is 12: <code>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH</code> |
| State Saved | Saved in instrument state |
| Range | <code>BOTH NEGative POSitive</code> |

Limits

Enables you to set the power limits for start and stop frequencies of the selected offsets.

Start Freq

Same as "[Start Freq](#)" on page 563 under **Offset (Bandwidth)**.

Stop Freq

Same as "Stop Freq" on page 567 under **Offset (Bandwidth)**.

Abs Start

Sets the absolute power level limit at the start frequency for the selected offset. The absolute power level limit ranges from -200 to +50 dBm.

The fail condition for each offset channel is set remotely by
`[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:TEST.`

You can turn off (not use) specific offset channels remotely with
`[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:STATe.`

The query returns values currently set to the absolute power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:START:ABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:START:ABSolute?</code> |
| Example | <code>:SEM:OFFS2:LIST:STAR:ABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS2:LIST:STAR:ABS?</code> |
| Notes | Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS |

Preset When the max number of offsets is 6:

| Mode | Values |
|-------------|---|
| SA | -14.00 dBm, -14.00 dBm, -26.00 dBm, -13.00 dBm, -13.00 dBm, -13.00 dBm |
| WCDMA | -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm -69.6 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm |
| LTE, LTETDD | -5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm |

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

| Radio Std | Presets |

| 802.11af (8MHz) | 16.00 dBm, -4.00 dBm, -12.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm, -66.00 dBm |

Abs Stop

Sets the absolute power level limit at the stop frequency for the selected offset. The absolute power level limit ranges from -200 to +50 dBm. You can also toggle this function between **Couple** (**COUPle = ON**) and **Manual** (**COUPle = OFF**). If set to **Couple**, the **Abs Stop** power level limit is coupled to **Abs Start** to result in a flat limit line. If set to **Man**, **Abs Start** and **Abs Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop absolute power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Rel Start

Sets a relative power level limit at the start frequency for the selected offset. The relative power level limit ranges from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet[n]
[:OUTer]:LIST:TEST` for each offset channel test.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns values currently set to the relative power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:START:RCARrier <rel_amp1>, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:START:RCARrier?</code> | | | | | | |
|----------------|--|------|--------|----|--|-------|---|
| Example | <code>:SEM:OFFS:LIST:STAR:RCAR -30, -30, -30, -30, -30, -30 :SEM:OFFS:LIST:STAR:RCAR?</code> | | | | | | |
| Notes | Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA mode, Offset sub op code 1 is used for both BTS and MS | | | | | | |
| Preset | When the max number of offsets is 6: <table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>SA</td> <td>-30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB</td> </tr> <tr> <td>WCDMA</td> <td>-30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB -33.73 dB, -34.00 dB, -37.50 dB, -47.50 dB, -47.50 dB, -47.50 dB</td> </tr> </tbody> </table> | Mode | Values | SA | -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB | WCDMA | -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB -33.73 dB, -34.00 dB, -37.50 dB, -47.50 dB, -47.50 dB, -47.50 dB |

Rel Stop

Sets a relative power level limit at the stop frequency for the selected offset. The relative power level limit ranges from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet[n] [:OUTer]:LIST:TEST` for each offset channel.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:STATE`.

The query returns values currently set to the offset stop relative power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

| Remote Command | <pre>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:RCARrier <rel_ampl>, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:RCARrier? Fail Mask

Selects one of the logics for fail conditions between the measurement results and the test limits:

- **ABSolute** and **RELative** both check the results against the respective limit
- **OR** checks against both limits, failing if either of the limits is broken
- **AND** only displays a fail if both of the limits are broken

The absolute or relative power limit value for each offset channel can be set remotely with `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:ABSolute` or `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:STATE`.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Show Abs2 Limit

Shows or hides Abs2 limit parameters.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:SEMask:OFFSet:SABSolute ON OFF 1 0</code> <code>:DISPlay:SEMask:OFFSet:SABSolute?</code> |
| Example | <code>:DISP:SEM:OFFS:SABS 1</code> <code>:DISP:SEM:OFFS:SABS?</code> |
| Preset | 0 |
| State Saved | Yes |
| Range | ON OFF |

Abs2 Start

Sets the 2nd absolute power level limit at the start frequency for the selected offset, ranging from -200 to +50 dBm.

The fail condition for each offset channel is set remotely using:

`[:SENSe] :SEMask:OFFSet[n] [:OUTer] :LIST:TEST:SABSolute`

You can turn off (not use) specific offset channels remotely using:

`[:SENSe] :SEMask:OFFSet[n] [:OUTer] :LIST:STATe`

The query returns values currently set to the 2nd absolute power test limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STARt:SABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STARt:SABSolute?</code> |
| Example | <code>:SEM:OFFS:LIST:STAR:SABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS:LIST:STAR:SABS?</code> |
| Notes | Comma-separated list of values <code>OFFSet1</code> is for BTS, 2 for MS. Default is BTS |
| Preset | For WLAN Mode: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For other Modes: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm |
| State Saved | Saved in instrument state |
| Min | -200 dBm |
| Max | 50 dBm |

Abs2 Stop

Sets the 2nd absolute power level limit at the stop frequency for the selected offset, ranging from -200 to +50 dBm. You can also toggle this function between **Couple** and **Manual**. If **Couple = ON**, the **Abs2 Stop** power level limit is coupled to "**Abs2 Start**" on page 593, resulting in a flat limit line. If set to **Man (Couple = OFF)**, **Abs2 Start** and **Abs2 Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop absolute2 power limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute?</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute:COUPlE ON OFF 1 0, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute:COUPlE?</code> |
| Example | <code>:SEM:OFFS:LIST:STOP:SABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> |

3 WLAN Mode
3.4 SEM Measurement

| | |
|-------------|---|
| | <code>:SEM:OFFS:LIST:STOP:SABS?</code> |
| | <code>:SEM:OFFS:LIST:STOP:SABS:COUP ON, ON, ON, ON, ON, ON</code> |
| | <code>:SEM:OFFS:LIST:STOP:SABS:COUP?</code> |
| Notes | Comma separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS |
| Couplings | Coupled to Abs2 Start if Auto is selected, that is, the Stop value is equal to the Start value |
| Preset | For WLAN Mode: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For other Modes: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For WLAN Mode: <code>ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</code> For other Modes: <code>ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</code> |
| State Saved | Saved in instrument state Saved in instrument state |
| Range | Auto Man |
| Min | -200 dBm |
| Max | 50 dBm |

Fail Mask2

Selects the logic operation for fail conditions between the measurement results and the test limits:

| | | |
|--|------------|---|
| (Primary Fail Mask selection) OR Abs2 | OR | Checks against both Primary and Abs2 limits. The test fails if either of the limits is broken |
| (Primary Fail Mask selection) AND Abs2 | AND | Checks against both Primary and Abs2 limits. The test fails if both of the limits are broken |
| Abs2 Disabled | OFF | Fail Mask2 is disabled |

Note that the Primary Fail Mask selection is set by ["Fail Mask" on page 591](#).

Examples:

- when Fail Mask is Abs **AND** Rel and Fail Mask2 is **OR** Abs2, “(Abs AND Rel) OR Abs2” is displayed in the column
- when Fail Mask is Absolute and Fail Mask2 is And Abs2, “(Absolute) AND Abs2” is displayed in the column

You can turn off (not use) specific offset channels remotely using:

```
[ :SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATE
```

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Offset Freq Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “Carrier Center to Meas BW Edge” definition, and LTE conformance test requires “Carrier Edge to Meas BW Center” and/or “Carrier Edge to Meas BW Edge” definition. MSR standard requires “RF BW Edge to Meas BW Center” and/or “RF BW Edge to Meas Edge” definition.

“Meas BW Edge” means the edge frequency of resolution bandwidth closer to the carrier that is represented by Meas BW and Res BW settings. Actual center frequency of Meas BW and the limit line have ½ Meas BW offset when the Meas BW Edge is selected.

| Option | SCPI | Definition |
|----------------------------------|---------------------------|--|
| Carrier Center to Meas BW Center | CTOCenter | From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center of offset measuring filter* |
| Carrier Center to Meas BW Edge | CTOEdge | From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier |

3 WLAN Mode
3.4 SEM Measurement

| Option | SCPI | Definition |
|---|----------------------------|--|
| Carrier Edge to Meas BW Center | ETOCenter | From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of offset measuring filter* |
| Carrier Edge to Meas BW Edge | ETOEdge | From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier |
| Sub-block Edge to Meas BW Center | STOCenter | From either the lower or upper sub-block edge frequency to the center frequency of offset measuring filter* |
| Sub-block Edge to Meas BW Edge | STOEdge | From either the lower or upper sub-block edge frequency to the nominal -3 dB point of the offset measuring filter* closer to the carrier |
| Sub-block Center to Meas BW Center 5G NR Mode only | SCTOCenter | From the center frequency of sub-block to the center frequency of offset measuring filter* |

*Measuring filter = Meas BW (N) x Res BW

** sub-block (bandwidth) = $BW_{\text{channel,block}}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the **Number of Component Carriers** within each sub-block = 1, sub-block (bandwidth) = $BW_{\text{channel}} = 2 \times F_{\text{offset,RAT}}$.

See "[Diagrams for Offset Freq Define](#)" on page 599.

Mode: MSR, LTEAFDD, LTEATDD

Diagrams for Offset Freq Define

Notes:

- $MeasBW = N \times RBW$
- Sub-block Edge and Outermost Carrier Edge in the Sub-block are not always same. e.g.) 5G NR (3GPP) defines $BW_{channel,block}$ which calculates $F_{offset,high}$ and $F_{offset,low}$ asymmetrically with SCS shift.
 (*) For MSR, $F_{offset,high (or,low)} = F_{offset,RAT,high (or,low)}$

Offset Detector

See "Offset Detector" on page 561.

Cumulate Mask

Selects whether inner offset limit masks are cumulated or not.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASK[:STATe] ON OFF 0 1</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASK[:STATe]?</code> |
| Example | <code>:SEM:OFFS:INN:CMAS 0</code> <code>:SEM:OFFS:INN:CMAS?</code> |
| Notes | OFFSet 1 is for BTS, 2 for MS. Default is BTS |
| Preset | 1 0 |
| State Saved | Yes |
| Range | ON OFF |

Cumulate Mask Stop Frequency

Specifies stop frequency of summing limit masks. For outside of the stop frequency, the limit masks are not cumulated.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASk:FREQuency:STOP <freq></code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASk:FREQuency:STOP?</code> |
| Example | <code>:SEM:OFFS:INN:CMAS:FREQ:STOP 500E6</code> <code>:SEM:OFFS:INN:CMAS:FREQ:STOP?</code> |
| Notes | OFFSet 1 is for BTS, 2 for MS. Default is BTS |
| Dependencies | Valid only when " Cumulate Mask " on page 599 is ON |
| Preset | 10.5 MHz |
| State Saved | Yes |
| Min/Max | 0 Hz/10 GHz |

Start Freq

Specifies the start frequency for the currently selected offset. Also, enables you to toggle that offset between On and Off. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:FREQuency:STARt <freq>, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:FREQuency:STARt?</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STATe ON OFF 1 0, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STATe?</code> |
| Example | <code>:SEM:OFFS2:INN:LIST:FREQ:STAR 2.515 MHz, 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz</code> <code>:SEM:OFFS2:INN:LIST:FREQ:STAR?</code> |

Res BW

Specifies which Resolution BW filter to use when measuring the currently selected offset.

Offset Res BW Mode allows the instrument to determine the optimum Resolution BW filter to use when measuring the currently selected offset. using front panel and all the offsets using SCPI. When changing the Meas BW parameter, if the Res BW needs to be changed to adhere to the rule:

$$(N \times \text{Res BW}) \leq (\text{Stop freq of the offset} - \text{Start freq of the offset}),$$

where N is the multiplier, this setting will automatically be changed to manual.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer, which defines a ratio between Integration BW and **Res BW** of the measurement result:

Integration BW = Meas BW * "Res BW" on page 602

Integration BW is the desired resolution bandwidth, and **Res BW** is the actual bandwidth for sweep. Measurement sweeps with **Res BW**, and **Meas BW** compensates sweep resolution bandwidth to Integration BW.

If you set this parameter greater than 1, you can set **Res BW** narrower to avoid carrier power leakage effect to the offset power integration.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNer:LIST:BANDwidth:IMULti <integer>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNer:LIST:BANDwidth:IMULti?</code> | | | | | | |
|-------------------------|--|------|--------|-----|---|-------------------------|---|
| Example | <code>:SEM:OFFS2:INN:LIST:BAND:IMUL 1,1,1,1,1,1</code> <code>:SEM:OFFS2:INN:LIST:BAND:IMUL?</code> | | | | | | |
| Notes | Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS | | | | | | |
| Couplings | This parameter must adhere to the rule: (N x Res BW) <= (Stop freq of the offset - Start freq of the offset), where N is the multiplier If Res BW is changed, the multiplier changes to conform to the rule | | | | | | |

Stop Freq

Same as ["Stop Freq" on page 601](#), under **Inner Offset (BW)**

Sweep Time

Specifies the sweep time for the currently selected offset and enables you to toggle the **Sweep Time** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

NOTE

On non-sweeping hardware, this column is grayed-out. The value shown on this column is an estimate of the turnaround time to complete the measurement of the entire offset span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same **Sweep Time** as you would for sweeping hardware, send `[:SENSe]:SEMask:OFFSet [1] | 2:INNeR:LIST:SWEp:TIME <time>`. The measurement emulates the **Sweep Time** effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using "**Minimum Acquisition Time**" on page 607, which provides better control.

| Remote Command | <code>[:SENSe]:SEMask:OFFSet [1] 2:INNeR:LIST:SWEp:TIME <time>, ...</code> <code>[:SENSe]:SEMask:OFFSet [1] 2:INNeR:LIST:SWEp:TIME?</code> <code>[:SENSe]:SEMask:OFFSet [1] 2:INNeR:LIST:SWEp:TIME:AUTO ON OFF 1 0, ...</code> <code>[:SENSe]:SEMask:OFFSet [1] 2:INNeR:LIST:SWEp:TIME:AUTO?</code> | | | | | | |

| Sweep Type | Min/Max | | | | | | |
| Swept | 1ms/10 s | | | | | | |
| FFT | 100ns/10 s | | | | | | |

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides **Span** into multiple chunks if needed. Therefore, the total signal acquisition time for the entire offset span is:

$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks}).$

When in **Auto**, this parameter's value is determined by other parameters, such as **Offset Start**, **Offset Stop**, **RBW** and **VBW**.

You can manually increase this parameter value from this **Auto** value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

| | |
|----------------|--|
| Remote Command | <pre>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEEp:ACQuisition:TIME <time>, ... [:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEEp:ACQuisition:TIME? | Min | 100 ns |
| Max | 4000 s |

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire offset span of each measurement cycle.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :SEMAsk:OFFSet[1] 2 :INNer:LIST:SWEep:ETIME?</code> |
| Example | <code>:SEM:OFFS2:INN:LIST:SWE:ETIM?</code> |
| Dependencies | Available only on non-sweeping hardware |
| Preset | Automatically calculated |

Sweep Type

Specifies the **Sweep Type** for the currently selected offset and enables you to toggle **Sweep Type** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

How to define Sweep Time and Sweep Type

| Sweep Type Mode | Behavior |
|-----------------|--|
| Auto | Sweep Type is automatically selected depending on Rules Sweep Time is automatically calculated, according to the selected Sweep Type |
| Man | Sweep Type is user-selected |

| Couplings | When Sweep Type is set manually, Sweep Type Mode is set to MANual When Sweep Type Mode is Auto , Sweep Type is automatically selected according to " Sweep Type Rules " on page 553 |
| Preset | Automatically calculated <code>ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON</code> |
| State Saved | Saved in instrument state |
| Range | Auto Man |

Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:SEMAsk:OFFSet [n]:INNeR:LIST:STATe`.

| | |
|-----------------|---|
| BOTH | Both sides in the sub-block gap are enabled. |
| NEGative | The upper side in the sub-block gap only (i.e., negative sideband of the upper sub-block) is enabled |
| POSitive | The lower side in the sub-block gap only (i.e., positive sideband of the lower sub-block) is enabled. |

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Modes.

| Remote Command | <code>[:SENSE] :SEMAsk:OFFSet[1] 2:INNer:LIST:SIDE BOTH NEGative POSitive, ...</code> <code>[:SENSE] :SEMAsk:OFFSet[1] 2:INNer:LIST:SIDE?</code> | | | | | | |
|------------------------|--|------|--------|-----|--|------------------------|---|
| Example | <code>:SEM:OFFS:INN:LIST:SIDE BOTH, NEG, NEG, POS, POS, POS</code> <code>:SEM:OFFS:INN:LIST:SIDE?</code> | | | | | | |
| Notes | Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS | | | | | | |
| Preset | <table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>MSR</td> <td>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH</td> </tr> <tr> <td>LTEAFDD, LTEATDD, 5GNR</td> <td>BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH</td> </tr> </tbody> </table> | Mode | Values | MSR | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | LTEAFDD, LTEATDD, 5GNR | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH |

| State Saved | Saved in instrument state | | | | | | |
| Range | <code>BOTH NEGative POSitive</code> | | | | | | |

Start Freq

Same as "Start Freq" on page 600 under Inner Offset (BW)

Stop Freq

Same as "Stop Freq" on page 601 under Inner Offset (BW)

Abs Start

Sets the absolute power level limit at the start frequency for the selected inner offset, ranging from -200 to +50 dBm.

The fail condition for each inner offset channel is set remotely by `[:SENSE] :SEMAsk:OFFSet[n] :INNer:LIST:TEST`.

3 WLAN Mode
3.4 SEM Measurement

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNER:LIST:STATe`.

The query returns values currently set to the absolute power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNER:LIST:START:ABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNER:LIST:START:ABSolute?</code> | | | | | | | | |
|------------------|---|------|--------|-----|---|-------|---|------------------|--|
| Example | <code>:SEM:OFFS2:INN:LIST:STAR:ABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS2:INN:LIST:STAR:ABS?</code> | | | | | | | | |
| Notes | Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS | | | | | | | | |
| Preset | <table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>MSR</td> <td>-12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm</td> </tr> <tr> <td>5G NR</td> <td>-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -22.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm</td> </tr> <tr> <td>LTEAFDD, LTEATDD</td> <td>-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm</td> </tr> </tbody> </table> | Mode | Values | MSR | -12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm | 5G NR | -5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -22.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm | LTEAFDD, LTEATDD | -5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm |

| State Saved | Saved in instrument state | | | | | | | | |
| Min/Max | -200 dBm/50 dBm | | | | | | | | |

Abs Stop

Sets the absolute power level limit at the stop frequency for the selected inner offset, ranging from -200 to +50 dBm. You can also toggle this function between **Couple** (`COUPle = ON`) and **Manual** (`COUPle = OFF`). If set to **Couple**, the Abs Stop power level limit is coupled to Abs Start to result in a flat limit line. If set to **Man**, Abs Start and Abs Stop take different values to result in a sloped limit line.

The query returns values currently set to the inner offset stop absolute power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| Remote Command | <pre>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:ABSolute <real>, ... [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:ABSolute? | Min/Max | -200 dBm/50 dBm | | | | | | | | | | | | | | |

Rel Start

Sets a relative power level limit at the start frequency for the selected inner offset, ranging from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet [n]:INNeR:LIST:TEST` for each inner offset channel test.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:STATe`.

The query returns values currently set to the relative power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:START:RCARrier <rel_ampl>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:START:RCARrier?</code> |
| Example | <code>:SEM:OFFS:INN:LIST:STAR:RCAR -30, -30, -30, -30, -30, -30</code> <code>:SEM:OFFS:INN:LIST:STAR:RCAR?</code> |
| Notes | Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS |
| Preset | 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB |
| State Saved | Saved in instrument state |
| Min/Max | -200 dB/50 dB |

Rel Stop

Sets a relative power level limit at the stop frequency for the selected inner offset, ranging from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet [n]:INNeR:LIST:TEST` for each inner offset channel.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:STATe`.

The query returns values currently set to the inner offset stop relative power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| State Saved | Saved in instrument state Saved in instrument state |
| Range | Auto Man |
| Min/Max | -200 dB/50 dB |

Fail Mask

Selects one of the logics for fail conditions between the measurement results and the test limits:

- **ABSolute** and **RELative** both check the results against the respective limit
- **OR** checks against both limits, failing if either of the limits is broken
- **AND** only displays a fail if both of the limits are broken

The absolute or relative power limit value for each inner offset channel can be set remotely with `[:SENSe]:SEMask:OFFSet[n]:INNeR:LIST:ABSolute` or `[:SENSe]:SEMask:OFFSet[n]:INNeR:LIST:RCARrier`.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMask:OFFSet[n]:INNeR:LIST:STATE`.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:TEST ABSolute AND OR RELative, ...</code> |
|----------------|---|

| | |
|-------------|--|
| | <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNER:LIST:TEST?</code> |
| Example | <code>:SEM:OFFS:INN:LIST:TEST ABS, ABS, ABS, ABS, ABS, ABS</code> <code>:SEM:OFFS:INN:LIST:TEST?</code> |
| Notes | Comma-separated list of values |
| Preset | <code>ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS</code> |
| State Saved | Saved in instrument state |
| Range | Absolute Relative Abs AND Rel Abs OR Rel |

Show Abs2 Limit

Same as ["Show Abs2 Limit" on page 615](#) under Limits.

Abs2 Start

Sets the 2nd absolute power level limit at the start frequency for the selected inner offset, ranging from -200 to +50 dBm.

The fail condition for each inner offset channel is set remotely using:

```
[ :SENSe ]:SEMAsk:OFFSet[n]:INNER:LIST:TEST:SABSolute
```

You can turn off (not use) specific inner offset channels remotely using:

```
[ :SENSe ]:SEMAsk:OFFSet[n]:INNER:LIST:STATe
```

The query returns values currently set to the 2nd absolute power test limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

| Example | <code>:SEM:OFFS:INN:LIST:STAR:SABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS:INN:LIST:STAR:SABS?</code> |
| Notes | Comma-separated list of values <code>OFFSet 1</code> is for BTS, 2 for MS. Default is BTS |
| Preset | 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm |
| State Saved | Saved in instrument state |
| Min | -200 dBm |
| Max | 50 dBm |

Abs2 Stop

Sets the 2nd absolute power level limit at the stop frequency for the selected inner offset, ranging from -200 to +50 dBm. You can also toggle this function between **Couple** and **Manual**. If set to **Couple = ON**, the **Abs2 Stop** power level limit is coupled to "[Abs2 Start](#)" on page 615, resulting in a flat limit line. If set to **Man (Couple = OFF)**, **Abs2 Start** and **Abs2 Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop 2nd absolute power limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

| | |
|----------------|--|
| Remote Command | <pre>[:SENSE]:SEMask:OFFSet[1] 2:INNER:LIST:STOP:SABSolute <real>, ... [:SENSE]:SEMask:OFFSet[1] 2:INNER:LIST:STOP:SABSolute? [:SENSE]:SEMask:OFFSet[1] 2:INNER:LIST:STOP:SABSolute:COUple ON OFF 1 0, ... [:SENSE]:SEMask:OFFSet[1] 2:INNER:LIST:STOP:SABSolute:COUple?</pre> |
| Example | <pre>:SEM:OFFS:INN:LIST:STOP:SABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm :SEM:OFFS:INN:LIST:STOP:SABS? :SEM:OFFS:INN:LIST:STOP:SABS:COUP ON, ON, ON, ON, ON, ON :SEM:OFFS:INN:LIST:STOP:SABS:COUP?</pre> |
| Notes | <p>Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS</p> |
| Couplings | Coupled to Abs Start if Auto is selected, that is, the Stop value is equal to the Start value |
| Preset | <pre>0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</pre> |

| Min | -200 dBm |
| Max | 50 dBm |

Fail Mask2

Selects one of the logical operations for fail conditions between the measurement results and the test limits:

3 WLAN Mode
3.4 SEM Measurement

| | | |
|--|------------|---|
| (Primary Fail Mask selection) OR Abs2 | OR | Checks against both Primary and Abs2 limits. The test fails if either of the limits is broken |
| (Primary Fail Mask selection) AND Abs2 | AND | Checks against both Primary and Abs2 limits. The test fails if both of the limits are broken |
| Abs2 Disabled | OFF | Fail Mask2 is disabled |

For examples, see "[Fail Mask2](#)" on page 595.

Note that the Primary Fail Mask selection is set by "[Fail Mask](#)" on page 614.

You can turn off (not use) specific inner offset channels remotely using:

`[:SENSe]:SEMAsk:OFFSet[n]:INNER:LIST:STATE`

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNER:LIST:TEST:SABSolute AND OR OFF, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNER:LIST:TEST:SABSolute?</code> |

| State Saved | Saved in instrument state |
| Range | OR Abs2 AND Abs2 Abs2 Disabled |

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 618 below.

| | |
|-------------------------------|---|
| Remote Command | :COUPl ^e ALL |
| Example | :COUP ALL |
| Backwards Compatibility SCPI | :COUPLE ALL NONE |
| Backwards Compatibility Notes | :COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs |

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth

3 WLAN Mode
3.4 SEM Measurement

- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

| | |
|----------------|---|
| Remote Command | <code>:CONFigure:SEMask</code> |
| Example | <code>:CONF:SEM</code> |
| Couplings | Restores all measurement parameters to their default values |

3.4.20.2 Carrier

Used to set up parameters that define how the reference channel is measured.

Integ BW

Specifies the integration bandwidth used to calculate the power in the reference channel.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMask:BANDwidth[1] 2:INTEgration <bandwidth></code> |
|----------------|--|

| | <code>[:SENSe]:SEMAsk:Bandwidth[1] 2:INtegration?</code> | | | | | | | | |
|------------------------------|---|------|-------|----|----------|-------|-------------------|------|--|
| Example | <code>:SEM:Band:INT 10 MHz</code> <code>:SEM:Band:INT?</code> | | | | | | | | |
| Notes | 10% . 100% of Channel Span Parameter Value Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Bandwidth sub op code 2 is supported only in non-SA Modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS If the ref channel is outside the frequency range, the result spectrum will be invalid | | | | | | | | |
| Dependencies | Not shown in MSR, LTE-Advanced FDD/TDD and 5G NR Modes In order to maintain backwards compatible with legacy LTE FDD/TDD Modes, the remote command is supported in LTE & LTE-A converged application | | | | | | | | |
| Couplings | Cannot be higher than the channel Span . If lower than 1/10 of channel Span , then the channel Span is reduced to be 10 times the Integ BW | | | | | | | | |
| Preset | <table border="1"> <thead> <tr> <th>Mode</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>SA</td> <td>3.84 MHz</td> </tr> <tr> <td>WCDMA</td> <td>3.84 MHz 3.84 MHz</td> </tr> <tr> <td>WLAN</td> <td>See the table of "WLAN Mode Presets" on page 620 below</td> </tr> </tbody> </table> | Mode | Value | SA | 3.84 MHz | WCDMA | 3.84 MHz 3.84 MHz | WLAN | See the table of " WLAN Mode Presets " on page 620 below |

WLAN Mode Presets

| Radio Std | Presets |
|------------------------------------|---------|
| 802.11a/g (OFDM/DSSS-OFDM) | 18 MHz |
| 802.11n/ac (20 MHz) | |
| 802.11b/g (DSSS/CCK/PBCC) | 22 MHz |
| 802.11n (40MHz)/ 802.11ac (40 MHz) | 38 MHz |
| 802.11ac (80 MHz) | 78 MHz |
| 802.11ac (160 MHz) | 158 MHz |
| 802.11ac (80 MHz + 80 MHz) | 78 MHz |
| 802.11ah (1 MHz) | 0.9 MHz |
| 802.11ah (2 MHz) | 1.8 MHz |
| 802.11ah (4 MHz) | 3.8 MHz |
| 802.11ah (8 MHz) | 7.8 MHz |

3 WLAN Mode
3.4 SEM Measurement

| Radio Std | Presets |
|----------------------------|-----------|
| 802.11ah (16 MHz) | 15.8 MHz |
| 802.11j/p (20 MHz) | 18 MHz |
| 802.11j/p (10 MHz) | 9 MHz |
| 802.11p (5 MHz) | 4.5 MHz |
| 802.11ax/be (20 MHz) | 19.5 MHz |
| 802.11ax/be (40 MHz) | 39.0 MHz |
| 802.11ax/be (80 MHz) | 79.0 MHz |
| 802.11ax/be (160 MHz) | 159.0 MHz |
| 802.11be (320 MHz) | 319.0 MHz |
| 802.11ax (80 MHz + 80 MHz) | 79.0 MHz |
| 802.11af (6 MHz) | 5.7 MHz |
| 802.11af (7 MHz) | 6.65 MHz |
| 802.11af (8 MHz) | 7.6 MHz |

Span

Specifies the span used to calculate the power in the reference channel.

| | |
|----------------|---|
| Remote Command | <pre>[:SENSe]:SEMAsk:FREQuency[1] 2:SPAN <freq> [:SENSe]:SEMAsk:FREQuency[1] 2:SPAN? [:SENSe]:SEMAsk:FREQuency[1] 2:SPAN:AUTO ON OFF 1 0 [:SENSe]:SEMAsk:FREQuency[1] 2:SPAN:AUTO?</pre> |
| Example | <pre>:SEM:FREQ:SPAN 3MHz :SEM:FREQ:SPAN? :SEM:FREQ:SPAN:AUTO OFF :SEM:FREQ:SPAN:AUTO?</pre> |
| Notes | <p>Frequency sub op code, 1 is for BTS, 2 for MS. Default is BTS</p> <p>Note that Frequency sub op code 2 is supported only in non-SA Modes. In SA Mode, Frequency sub op code 1 is used for both BTS and MS</p> <p>If the ref channel is outside the frequency range, the result spectrum will be invalid</p> |
| Dependencies | <p>Not shown in MSR Mode</p> <p>In order to maintain backwards compatible with legacy LTE FDD/TDD Modes, the channel span key is supported in LTE & LTE-A converged application. The Auto/Man toggle is added to this key. This key is enabled and can be changed only in single carrier. The span state is always Auto in Multi-carriers</p> <p>Span Auto/Man state is only available in LTE/LTE-Advanced FDD/TDD and 5G NR Modes</p> |
| Couplings | <p>Range 1 kHz to 50 MHz (although restricted by Chan Integ BW). If you set the channel Span lower than channel Integ BW, they will both track each other. As you increase the channel Span, Integ BW also increases if it is less than 1/10 of the channel Span</p> |

For WLAN 802.11ac (80 + 80 MHz), the channel span is coupled with the difference between the center frequencies of the two carriers. When the difference is either less than 80 MHz, or greater than 565 MHz, a “setting conflict” error message is displayed

Chan Span = Carrier Spacing + Chan IntegBW

When the state of Span is **Auto**, the span value is automatically determined by multi-carrier configuration. Otherwise, the span value depends on user input

When the span value is set manually, the state of span is automatically changes to **Man**

This key is enabled and can be changed only in single carrier. The span state is always **Auto** in Multi-carriers

| | | |
|-------------|---|--|
| Preset | Mode | Value |
| | SA | 5.0 MHz |
| | WCDMA | 5.0 MHz 5.0 MHz |
| | LTEAFDD, LTEATDD | 5 MHz |
| | 5GNR | Automatically calculated |
| | WLAN | See the table of "WLAN Mode Presets" on page 622 below |
| | ON | |
| State Saved | Saved in instrument state Yes | |
| Range | Auto Man | |
| Min/Max | 1 kHz Depends on instrument maximum frequency | |

WLAN Mode Presets

| Radio Std | Presets |
|----------------------------|----------|
| 802.11a/g (OFDM/DSSS-OFDM) | 18 MHz |
| 802.11n/ac (20 MHz) | |
| 802.11b/g (DSSS/CCK/PBCC) | 22 MHz |
| 802.11n/ac (40 MHz) | 38 MHz |
| 802.11ac (80 MHz) | 78 MHz |
| 802.11ac (160 MHz) | 158 MHz |
| 802.11ac (80 MHz + 80 MHz) | 320 MHz |
| 802.11ah (1 MHz) | 0.9 MHz |
| 802.11ah (2 MHz) | 1.8 MHz |
| 802.11ah (4 MHz) | 3.8 MHz |
| 802.11ah (8 MHz) | 7.8 MHz |
| 802.11ah (16 MHz) | 15.8 MHz |
| 802.11j/p (20 MHz) | 18 MHz |

| Radio Std | Presets |
|----------------------------|-----------|
| 802.11j/p (10 MHz) | 9 MHz |
| 802.11p (5 MHz) | 4.5 MHz |
| 802.11ax/be (20 MHz) | 19.5 MHz |
| 802.11ax/be (40 MHz) | 39.0 MHz |
| 802.11ax/be (80 MHz) | 79.0 MHz |
| 802.11ax/be (160 MHz) | 159.0 MHz |
| 802.11be (320 MHz) | 319.0 MHz |
| 802.11ax (80 MHz + 80 MHz) | 320.0 MHz |
| 802.11af (6 MHz) | 5.7 MHz |
| 802.11af (7 MHz) | 6.65 MHz |
| 802.11af (8 MHz) | 7.6 MHz |

Sweep Time

Used to calculate the power in the reference channel. **Sweep Time** can be set manually or put into **Auto** mode.

For instruments with non-sweeping acquisitions, such as VXT, the time value is the acquisition time for an individual FFT segment, not the cumulated time for all FFT segments in the channel.

NOTE

On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate, which is the turnaround time to complete the measurement of the entire carrier span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same **Sweep Time** as you would for sweeping hardware, send `[:SENSe]:SEMAsk:SWEp [1] | 2:TIME <time>`. The measurement emulates the **Sweep Time** effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using "**Minimum Acquisition Time**" on page 624, which provides better control.

Remote Command `[:SENSe]:SEMAsk:SWEp[1] | 2:TIME <time>`
`[:SENSe]:SEMAsk:SWEp[1] | 2:TIME?`
`[:SENSe]:SEMAsk:SWEp[1] | 2:TIME:AUTO OFF | 0 | ON | 1`
`[:SENSe]:SEMAsk:SWEp[1] | 2:TIME:AUTO?`

Example `:SEM:SWE:TIME 9ms`
`:SEM:SWE:TIME?`
`:SEM:SWE:TIME:AUTO OFF`
`:SEM:SWE:TIME:AUTO?`

| Notes | Sub op code 1 is for BTS, 2 for MS. Default is BTS Note that Sweep sub op code 2 is supported only in non-SA Modes. In SA Mode, Sweep sub op code 1 is used for both BTS and MS | | | | | | |
|------------------------------|--|------------|-----|-------|------|-----|--------|
| Dependencies | On non-sweeping hardware, this control is grayed out and the Auto/Man checkbox is invisible. The read-only value shows the estimated sweep time In those instruments, " Minimum Acquisition Time " on page 624 is available | | | | | | |
| Couplings | When the time is set manually, Auto is set to OFF If state is Auto , coupled with Channel Detector selection, Channel Resolution BW , Channel Video BW When set to Auto , the Time is automatically calculated | | | | | | |
| Preset | Automatically calculated ON | | | | | | |
| State Saved | Saved in instrument state Yes | | | | | | |
| Range | OFF ON | | | | | | |
| Min | Sweeping hardware Depends on Channel " Sweep Type " on page 626: <table border="1" data-bbox="407 940 1406 1066"> <thead> <tr> <th>Sweep Type</th> <th>Min</th> </tr> </thead> <tbody> <tr> <td>Swept</td> <td>1 ms</td> </tr> <tr> <td>FFT</td> <td>100 ns</td> </tr> </tbody> </table> Non-sweeping hardware: N/A | Sweep Type | Min | Swept | 1 ms | FFT | 100 ns |
| Sweep Type | Min | | | | | | |
| Swept | 1 ms | | | | | | |
| FFT | 100 ns | | | | | | |
| Max | Sweeping hardware: 4000 s Non-sweeping hardware: N/A | | | | | | |
| Backwards Compatibility SCPI | <code>[:SENSe] : SEMask : SWEep [1] 2 [: TIME]</code> <code>[:SENSe] : SEMask : SWEep [1] 2 [: TIME] : AUTO</code> | | | | | | |

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides **Span** into multiple chunks if needed. Therefore, the total signal acquisition time for the entire carrier span is:

$$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$$

When in **Auto**, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this **Auto** value.

3 WLAN Mode
3.4 SEM Measurement

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:SWEEp:ACQuisition:TIME <time></code> <code>[:SENSe]:SEMAsk:SWEEp:ACQuisition:TIME?</code> <code>[:SENSe]:SEMAsk:SWEEp:ACQuisition:TIME:AUTO OFF ON 0 1</code> <code>[:SENSe]:SEMAsk:SWEEp:ACQuisition:TIME:AUTO?</code> |
| Example | <code>:SEM:SWE:ACQ:TIME 500 ms</code> <code>:SEM:SWE:ACQ:TIME?</code> <code>:SEM:SWE:ACQ:TIME:AUTO OFF</code> <code>:SEM:SWE:ACQ:TIME:AUTO?</code> |
| Dependencies | Available only on non-sweeping hardware |
| Couplings | Coupled to Span , RBW , and VBW when in the Auto state If you manually set a value when in the Auto state, the state automatically changes to Man |
| Preset | Automatically calculated ON |
| State Saved | Saved in instrument state |
| Min | 100 ns |
| Max | 4.00 ks |

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire carrier span of each measurement cycle.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:SWEEp:ETIME?</code> |
| Example | <code>:SEM:SWE:ETIM?</code> |
| Dependencies | Available only on non-sweeping hardware |
| Preset | Automatically calculated |

Sweep Type

Sets the **Sweep Type** used to calculate the power in the reference channel. **Sweep Type** can be set manually or put into **Auto** mode.

How to define Channel Sweep Time and Channel Sweep Type:

| Channel Sweep Type Mode | Behavior |
|-------------------------|---|
| Auto | Channel Sweep Type is automatically selected depending on Sweep Type Rules Channel Sweep Time is automatically calculated depending on the selected sweep type |
| Man | Channel Sweep Type is user-selected |
| – | |

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE SWEEp FFT</code> <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE?</code> <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE:AUTO OFF 0 ON 1</code> <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE:AUTO?</code> |
| Example | <code>:SEM:SWE:TYPE FFT</code> <code>:SEM:SWE:TYPE?</code> <code>:SEM:SWE:TYPE:AUTO OFF</code> <code>:SEM:SWE:TYPE:AUTO?</code> |
| Notes | Sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Sweep sub op code 2 is supported only in non-SA Modes. In SA Mode, Sweep sub op code 1 is used for both BTS and MS |
| Dependencies | Grayed-out in VXT models M9410A/11A |
| Couplings | If Sweep Type is set manually, Sweep Type mode is set to MANua1 When Channel Sweep Type mode is Auto , Sweep Type is automatically selected according to Sweep Type Rules |
| Preset | Automatically calculated ON |
| State Saved | Saved in instrument state Yes |
| Range | OFF ON |

Res BW

Sets the resolution bandwidth used to calculate the power in the reference channel. The Channel Resolution BW can be set manually or put into auto mode.

MSR Auto RBW:

In the MSR Mode, resolution bandwidth is predefined for each radio format. When carriers are configured with multiple radio formats, the narrowest RBW is selected.

| Radio Format | | RBW (kHz) |
|--------------|---|-----------|
| LTE | 1.4 MHz | 13 kHz |
| | 3 MHz | 27 kHz |
| | 5 MHz | 47 kHz |
| | 10 MHz | 91 kHz |
| | 15 MHz | 150 kHz |
| | 20 MHz | 180 kHz |
| | 200 kHz (NB-IoT, only available in FDD) | 10 kHz |
| W-CDMA | | 75 kHz |

5G NR Auto RBW:

| Radio Format | | RBW |
|--------------|---------|---------|
| 5G NR | 5 MHz | 47 kHz |
| | 10 MHz | 91 kHz |
| | 15 MHz | 150 kHz |
| | 20 MHz | 180 kHz |
| | 25 MHz | 240 kHz |
| | 30 MHz | 270 kHz |
| | 35 MHz | 330 kHz |
| | 40 MHz | 390 kHz |
| | 45 MHz | 430 kHz |
| | 50 MHz | 470 kHz |
| | 60 MHz | 560 kHz |
| | 70 MHz | 680 kHz |
| | 80 MHz | 750 kHz |
| | 90 MHz | 820 kHz |
| | 100 MHz | 910 kHz |
| 200MHz | 1.8 MHz | |
| 400 MHz | 3 MHz | |

| Radio Format | RBW |
|--------------|-------|
| 800 MHz | 3 MHz |
| 1600 MHz | 3 MHz |
| 2000 MHz | 3 MHz |

In the LTE-Advanced (both FDD and TDD) and 5G NR modes, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, which is listed above. When **Res BW** mode is **Auto**, the narrowest RBW is selected.

| Remote Command | <pre>[:SENSe]:SEMask:BANDwidth[1] 2[:RESolution] <bandwidth> [:SENSe]:SEMask:BANDwidth[1] 2[:RESolution]? [:SENSe]:SEMask:BANDwidth[1] 2[:RESolution]:AUTO OFF ON 1 0 [:SENSe]:SEMask:BANDwidth[1] 2[:RESolution]:AUTO?</pre> | | | | | | | | | | | | |
|------------------------------------|---|------|--------|----|---------|-------|--------|------------------------------------|---------------|-------|------|------|---------|
| Example | <pre>:SEM:BAND 100 kHz :SEM:BAND? :SEM:BAND:AUTO ON :SEM:BAND:AUTO?</pre> | | | | | | | | | | | | |
| Notes | <p>Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS</p> <p>Note that Bandwidth sub op code 2 is supported only in non-SA modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS</p> | | | | | | | | | | | | |
| Couplings | <p>If Res BW is set manually, Channel Resolution BW mode is set to MANua1</p> <p>Coupled with Channel Detector selection, Channel Sweep Time and Channel Video BW</p> <p>When set to Auto, the resolution bandwidth is automatically calculated</p> | | | | | | | | | | | | |

SCPI `[:SENSe]:SEMAsk:BWIDth[1] | 2[:RESolution]:AUTO`

Video BW

Sets the video bandwidth used to calculate the power in the reference channel. The **Channel Video BW** can be set manually or put into **Auto** mode.

Remote Command `[:SENSe]:SEMAsk:BAWdwidth[1] | 2:VIDeo <bandwidth>`
`[:SENSe]:SEMAsk:BAWdwidth[1] | 2:VIDeo?`
`[:SENSe]:SEMAsk:BAWdwidth[1] | 2:VIDeo:AUTO OFF | ON | 1 | 0`
`[:SENSe]:SEMAsk:BAWdwidth[1] | 2:VIDeo:AUTO?`

Example `:SEM:BAWd:VID 100 kHz`
`:SEM:BAWd:VID?`
`:SEM:BAWd:VID:AUTO ON`
`:SEM:BAWd:VID:AUTO?`

Notes Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS
 Note that Bandwidth sub op code 2 is supported only in non-SA Modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS

Couplings If **Video BW** is set manually, **Channel Video BW** mode is set to **MANua1**
 Coupled with **Channel Detector** selection, **Channel Sweep Time** and **Channel Resolution BW**
 When set to **Auto**, the video bandwidth is automatically calculated

| Preset | Mode | Values |
|--------|---|---------|
| | SA | 100 kHz |
| | WCDMA | 75 kHz |
| | LTE, LTEAFDD, LTETDD, LTEATDD, 5G NR, WLAN, MSR | Auto |
| | ON | |

Channel Detector

Accesses a menu of functions that enable you to control the detectors for reference channel. The following choices are available:

| | |
|----------------------|---|
| AUTO | The detector selected depends on marker functions, trace functions, average type, and the trace averaging function |
| NORMa1 | The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection |
| AVERAge | The detector determines the average of the signal within the sweep points. The averaging method depends upon the Average Type selection (voltage, power or log scales) |
| POSitive Peak | The detector determines the maximum of the signal within the sweep points |

3 WLAN Mode
3.4 SEM Measurement

| | |
|----------------------|--|
| SAMPLE | The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point |
| NEGative Peak | The detector determines the minimum of the signal within the sweep points |

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:DETECTOR:CARRier[:FUNCTION] AVERage NEGative NORMAl POSitive SAMPle</code> <code>[:SENSe]:SEMAsk:DETECTOR:CARRier[:FUNCTION]?</code> <code>[:SENSe]:SEMAsk:DETECTOR:CARRier:AUTO ON OFF 1 0</code> <code>[:SENSe]:SEMAsk:DETECTOR:CARRier:AUTO?</code> |
| Example | <code>:SEM:DET:CARR NEG</code> <code>:SEM:DET:CARR?</code> <code>:SEM:DET:CARR:AUTO OFF</code> <code>:SEM:DET:CARR:AUTO?</code> |
| Notes | When you manually select a detector (instead of selecting Auto), that detector is used regardless of other instrument settings Note: This detector setting affects the reference channel. There is no per-trace detector |
| Couplings | See Couplings in " Trace Type " on page 1728 |
| Preset | <code>AVERage</code> <code>ON</code> |
| State Saved | Saved in instrument state |
| Range | <code>AVERage NEGative NORMAl POSitive SAMPle</code> |

Reference Carrier Average Type (Remote Command Only)

Select trace average type for the reference carrier.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:AVERage:CARRier:TYPE RMS LOG</code> <code>[:SENSe]:SEMAsk:AVERage:CARRier:TYPE?</code> |
| Example | <code>:SEM:AVER:CARR:TYPE LOG</code> <code>:SEM:AVER:CARR:TYPE?</code> |
| Preset | <code>RMS</code> |
| State Saved | Saved in instrument state |

Offset/Limits Config Table

This function is the same as "[Offset/Limits Config Table](#)" on page 555 under the "[Settings](#)" on page 550 tab.

Sets the power reference in the carrier that will be used to compute the relative values for the offsets.

3.4.20.3 Reference

Lets you set the Reference Power and parameters related to the Reference Power for SEM measurements.

Measurement Type

Accesses a menu that enables you to select one of the following measurement reference types:

| | | |
|--------------------------|---------------|--|
| Total Pwr Ref | TPRef | Sets the reference to the total carrier power and the measured data is shown in dBc and dBm |
| PSD Ref | PSDRef | Sets the reference to the mean power spectral density of the carrier and the measured data is shown in dB and dBm/Hz |
| Spectrum Peak Ref | SPRef | Sets the reference to the spectrum peak power of the carrier and the measured data is shown in dB and dBm |

Remote Command `[:SENSe]:SEMAsk:TYPE PSDRef | TPRef | SPRef`
`[:SENSe]:SEMAsk:TYPE?`

Example `:SEM:TYPE PSDR`
`:SEM:TYPE?`

Preset WLAN Mode: **SPRef**
All other Modes: **TPRef**

State Saved Saved in instrument state

Range Total Pwr Reference | PSD Reference | Spectrum Peak Reference

Reference Power

Toggles between Measured Power (**ON**) and Manual Power (**OFF**) for Total Power Ref, PSD Ref, and Spectrum Peak Ref.

Remote Command `[:SENSe]:SEMAsk:CARRier:AUTO[:STATe] OFF | ON | 1 | 0`
`[:SENSe]:SEMAsk:CARRier:AUTO[:STATe]?`

Example Set to Manual:
`:SEM:CARR:AUTO OFF`

Set to Measured:
`:SEM:CARR:AUTO ON`
`:SEM:CARR:AUTO?`

3 WLAN Mode
3.4 SEM Measurement

| | |
|--------------|---|
| Notes | Available for all " Measurement Type " on page 632s |
| Dependencies | Not available in MSR, LTEAFDD, LTEATDD, and 5G NR Modes |
| Preset | ON |
| State Saved | Saved in instrument state Saved in instrument state |
| Range | Auto Man |

Total Power Ref

Sets the power in the carrier (ref channel) that is used to compute the relative power values for the offsets. For modes other than MSR, LTEAFDD, LTEATDD, and 5G NR, when "[Reference Power](#)" on page 632 is set to Measured, this value is set to the measured carrier reference power. When set to Manual, the result takes on the last measured value, or can be manually entered.

For WLAN 802.11ac (80 MHz + 80 MHz), the higher of the power readouts of the two carriers is used for computing the relative power values for the offset.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:CARRier[:POWer] <real></code> <code>[:SENSe]:SEMAsk:CARRier[:POWer]?</code> |
| Example | <code>:SEM:CARR 100dBm</code> <code>:SEM:CARR?</code> |
| Notes | The min and max values given are for " Measurement Type " on page 632 = Total Pwr Ref |
| Couplings | Coupled with Measurement Type . Active when Measurement Type is set to Total Power Ref. Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, the control is active when Measurement Type is set to Total Power and Power Ref is set to Manual |
| Preset | Measured carrier reference power |
| State Saved | Saved in instrument state |
| Min/Max | -200 dBm/200 dBm |
| Annotation | Value is displayed on the left top of the Results window with the Channel Integ BW |

PSD Ref

Sets the power spectral density in the carrier that is used to compute the relative power spectral density values for the offsets when "[Measurement Type](#)" on page 632 is set to PSD Ref. When the state is set to **Auto**, this will be set to the measured carrier power spectral density.

For WLAN 802.11ac (80 MHz + 80 MHz), the higher of the power density readouts of the two carriers is used for computing the relative PSD values for the offset.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMask:CARRier:CPSD <real></code> <code>[:SENSe]:SEMask:CARRier:CPSD?</code> |
| Example | <code>:SEM:CARR:CPSD -80</code> <code>:SEM:CARR:CPSD?</code> |
| Notes | Although the default value is defined, the value is recalculated by the measurement result just after completing the measurement Carrier sub op code. 1 for BTS, 2 for MS. Default is BTS |
| Couplings | Coupled with " Measurement Type " on page 632. Active if Measurement Type is PSD. Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, active when Measurement Type is PSD and Power Ref is Manual |
| Preset | Measured carrier PSD reference power |
| State Saved | Saved in instrument state |
| Min/Max | -200/200 |
| Annotation | Value is displayed on the right top of the Results window. If Meas Type selection is PSD Ref, the string is "PSD Ref" with BOLD font, otherwise, hide annotation |

Spectrum Pk Ref

Sets the spectrum peak power in the carrier that is used to compute the relative power spectral density values for the offsets when "**Measurement Type**" on page 632 is Spectrum Peak. When the state is set to **Auto**, this is set to the measured carrier spectrum peak power. When set to **Manual**, the result takes on the last measured value, or can be manually entered

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMask:CARRier:PEAK[:POWer] <real></code> <code>[:SENSe]:SEMask:CARRier:PEAK[:POWer]?</code> |
| Example | <code>:SEM:CARR:PEAK -80</code> <code>:SEM:CARR:PEAK:POWER?</code> |
| Notes | Although the default value is defined, the value is recalculated by the measurement result just after completing the measurement Carrier sub op code. 1 for BTS, 2 for MS. Default is BTS |
| Couplings | Coupled with " Measurement Type " on page 632. Active when Measurement Type is "Spectrum Peak Ref". Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, active when Measurement Type is Spectrum Peak Ref and Power Ref is Manual |
| Preset | Measured carrier Spectrum Peak reference power |
| State Saved | Saved in instrument state |
| Min/Max | -200/200 |
| Annotation | Value is displayed on the right top of the Results window. If Meas Type selection is Spectrum Peak Ref, the string is "Spectrum Peak Ref" with BOLD font, otherwise, hide annotation |

Offset/Limits Config Table

This function is the same as "Offset/Limits Config Table" on page 555 under the "Settings" on page 550 tab.

Sets the power reference in the carrier that will be used to compute the relative values for the offsets.

3.4.20.4 Radio

Contains controls to select Radio Standard and settings.

Radio Std

In this menu, 7 groups of WLAN standards can be selected:

1. 802.11a/b/g/j/p includes 802.11a/g/j/p, 802.11b/g, 802.11g DSSS-OFDM, 802.11j/p 10M, 802.11p 5M
2. 802.11n includes 802.11n 20MHz and 802.11n 40MHz
3. 802.11ac includes 802.11ac 20MHz, 802.11ac 40MHz, 802.11ac 80MHz, 802.11ac 80+80MHz and 802.11ac 160MHz
4. 802.11ah includes 802.11ah1MHz, 802.11ah2MHz, 802.11ah4MHz, 802.11ah 8MHz, and 802.11ah16MHz
5. 802.11af includes 802.11af 6MHz, 802.11af 7MHz and 802.11af 8MHz
6. 802.11ax includes 802.11ax 20MHz, 802.11ax 40MHz, 802.11ax 80MHz, 802.11ax 80+80MHz and 802.11ax 160MHz
7. 802.11be includes 802.11be 20MHz, 802.11be 40MHz, 802.11be 80MHz, 802.11be 160MHz and 802.11be 320MHz

Below each standard, parameters related to demodulation can be set, such as Modulation Format, Guard Interval, and so on.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:RADio:STANdard[:WLAN] AG BG GDO N20 N40 AC20 AC40 AC80 ACT80 AC160 AH1 AH2 AH4 AH8 AH16 JP10 P5 AF6 AF7 AF8 AX20 AX40 AX80 AXT80 AX160 BE20 BE40 BE80 BE160 BE320</code> <code>[:SENSe]:RADio:STANdard[:WLAN]?</code> |
| Example | <code>:RAD:STAN AG</code> <code>:RAD:STAN?</code> |
| Notes | If the command is sent with unsupported parameters, an error is generated "Settings conflict; option not installed" |

| | |
|-------------|---|
| | For IQ measurements (CCDF, Power vs Time, Spectral Flatness, IQ Waveform or Modulation Accuracy), they are also limited by BW Option installed. when any radio standard is selected in an IQ measurement which maximum BW could not meet this radio standard request, the “Invalid result; Wider BW required” message will be displayed, and the measurement should return invalid data: Enum value ACT80 means “AC Two 80MHz” (802.11ac 80+80 MHz) Enum value AXT80 means “AX Two 80MHz” (802.11ax 80+80 MHz) |
| Preset | AG |
| State Saved | Saved in instrument state |
| Range | 802.11a/g/j/p (OFDM 20M) 802.11b/g (DSSS/CCK/PBCC) 802.11g (DSSS-OFDM) 802.11n (20 MHz) 802.11n (40 MHz) 802.11ac (20 MHz) 802.11ac (40 MHz) 802.11ac (80 MHz) 802.11ac (80 + 80MHz) 802.11ac (160MHz) 802.11ah(1MHz) 802.11ah(2MHz) 802.11ah(4MHz) 802.11ah(8MHz) 802.11ah(16MHz) 802.11j/p (OFDM 10M) 802.11p (OFDM 5M) 802.11af (6MHz) 802.11af (7MHz) 802.11af (8MHz) 802.11ax (20 MHz) 802.11ax (40 MHz) 802.11ax (80 MHz) 802.11ax (80 + 80MHz) 802.11ax (160MHz) 802.11be (20 MHz) 802.11be (40 MHz) 802.11be (80 MHz) 802.11be (160MHz) 802.11be (320MHz) |

Preamble Puncture

Indicates whether its preamble is punctured for 11be 80M/160M/320M and 11ax 80M/160M.

| | |
|----------------|--|
| Remote Command | [:SENSe]:SEMAsk:SIGNal:PPUNcture[:STATe] OFF ON 0 1 [:SENSe]:SEMAsk:SIGNal:PPUNcture[:STATe]? |
| Example | :SEM:SIGN:PPUN 1 :SEM:SIGN:PPUN? |
| Dependencies | Available only for 11be 80M/160M/320M and 11ax 80M/160M |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

PPDU Format

Indicates the SEM additional restriction limit. Differs between EHT PPDU and non-HT PPDU.

| | |
|----------------|---|
| Remote Command | [:SENSe]:SEMAsk:SIGNal:PPDU EHT NHT [:SENSe]:SEMAsk:SIGNal:PPDU? |
| Example | :SEM:SIGN:PPDU EHT :SEM:SIGN:PPDU? |
| Dependencies | Available only for 11be 80M/160M/320M |

| | |
|-------------|---------------------------|
| Preset | EHT |
| State Saved | Saved in instrument state |
| Range | EHT Non-HT |

Puncture Pattern

Indicates which 20M is punctured:

- 1110 for 11be/ax 80M: the last 20M is punctured
- 11110011 for 11be/ax 160M: the fifth and sixth 20M are punctured
- 1111111111110000 for 11be 320M: the last 4 20M are punctured

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SEMAsk:SIGNal:PPUNcture:PATTern <string></code> <code>[:SENSe]:SEMAsk:SIGNal:PPUNcture:PATTern?</code> |
| Example | <code>:SEM:SIGN:PPUN:PATT "111x"</code> <code>:SEM:SIGN:PPUN:PATT?</code> |
| Dependencies | Available only for 11be 80M/160M/320M and 11ax 80M/160M |
| State Saved | Saved in instrument state |

3.4.20.5 Advanced

Contains controls for setting advanced instrument functions.

This tab does not appear in EXM, VXT.

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The **ON** state (in Modes that do not support Adaptive NFE) matches the FULL state (in Modes that *do* support Adaptive NFE).

In **ON** or FULL NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This usually reduces the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when

not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with Average Type set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** ON.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, therefore it does nothing when External Mixing is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive. In Modes that do not support Adaptive NFE, the default state of NFE is OFF. Prior to the introduction of Adaptive NFE (firmware version A. 18.00), the default state of NFE was OFF for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from On|Off to Full|Adaptive|Off. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes which support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON plus
:CORRection:NOISe:FLOor:ADAPtive ON`

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOor ON OFF 1 0</code> |
| | <code>[:SENSe]:CORRection:NOISe:FLOor?</code> |

3 WLAN Mode
3.4 SEM Measurement

| | |
|----------------|--|
| Example | <code>:CORR:NOIS:FLO ON</code> |
| Dependencies | Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the remote command will be accepted without error (but has no effect) |
| Couplings | When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled via SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue |
| Preset | Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive |
| State Saved | No |
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOor:ADApTive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor:ADApTive?</code> |
| Example | First turn NFE on, this is FULL mode: <code>:CORR:NOIS:FLO ON</code> Then set it to Adaptive: <code>:CORR:NOIS:FLO:ADAP ON</code> |
| Dependencies | Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the remote command is accepted without error (but has no effect) |
| Couplings | Sending <code>:CORR:NOIS:FLO ON</code> turns NFE Adaptive OFF for backwards compatibility. To turn Adaptive ON , you must issue the commands in the proper order, as shown in the example above |
| Preset | Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults |
| State Saved | No |

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving

just the signal power. This is the operation when the detector is **Average**, and the Average Type is set to **Power**.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. **Peak** detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. **Negative peak** detection is not very useful, either. **Sample** detection works well but is never better than the average detector because it does not smooth as well. The **Normal** detector is a combination of peak and negative peak behaviors and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, the power scale (Average Type = **Power**) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement — those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-

off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you **Cancel**, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Enable Wideband IF for FFT

When **OFF**, the maximum FFT BW is limited to 40 MHz. When **ON**, FFT with more wideband IF is supported depending on the instrument. For example, the max FFT BW is 510 MHz with option B5X. When ON for R10/R20/R40, the max FFT BW is 1GHz.

When this parameter is on and the following conditions are met, the measurement is performed with a single I/Q acquisition.

- Stop Freq of the outermost Offset range is within the available IQ acquisition BW
- Same RBW, VBW, Detector Type settings across all Offset ranges and Carrier
- Sweep Type = FFT and Sweep Time = Auto across all Offset ranges and Carrier

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMAsk:WBFFt:ENABle ON OFF 1 0</code> <code>[:SENSe]:SEMAsk:WBFFt:ENABle?</code> |
| Example | <code>:SEM:WBFF:ENAB 1</code> <code>:SEM:WBFF:ENAB?</code> |
| Dependencies | The maximum FFT BW depends on the μ W preselector and the current frequency. In hi-band, the μ W preselector must be disabled to apply the FFT with wideband IF. Otherwise, the maximum FFT BW is limited to 40 MHz |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | ON OFF |

3.4.20.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 1850) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "[Restore Defaults](#)" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|------------------------------|--|
| Remote Command | <code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code> <code>:INSTrument:COUPle:FREQuency:CENTer?</code> |
| Example | <code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code> |
| Preset | Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |
| Preset | OFF |
| Backwards Compatibility SCPI | <code>:GLOBa1:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBa1:FREQuency:CENTer[:STATe]?</code> |

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|----------------|--|
| Remote Command | <code>:INSTrument:COUPlE:EMC:STANdard ALL NONE</code> <code>:INSTrument:COUPlE:EMC:STANdard?</code> |
| Example | <code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code> |
| Dependencies | Only available if Option EMC is installed |
| Preset | Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

| | |
|---------------------------------|---|
| Remote Command | <code>:INSTrument:COUPlE:DEFault</code> |
| Example | <code>:INST:COUP:DEF</code> |
| Backwards Compatibility SCPI | <code>:GLOBal:DEFault</code> |

3.4.21 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.4.21.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 644

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code> |
| Example | Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code> |
| Preset | ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF |
| State Saved | Saved in instrument state |
| Annunciation | The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none">- A line with an arrow is Single- A loop with an arrow is Continuous |
| Backwards Compatibility Notes | X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep |

More Information

| | |
|-----------------|--|
| Continuous Mode | The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping |
|-----------------|--|

3 WLAN Mode

3.4 SEM Measurement

| | |
|-------------|---|
| | <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p> |
| Single Mode | <p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p> |

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1853 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 646

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code> |
| Example | <code>:INIT:IMM</code> <code>:INIT:REST</code> |
| Notes | <code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function |
| Couplings | Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement |
| Status Bits/OPC dependencies | This is an Overlapped command The <code>STATus:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUEStionable</code> register bit 9 (<code>INTegrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set |
| Backwards Compatibility Notes | For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well |

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

| Event | Trace Effect |
|---|----------------------|
| Clear/Write pressed (even if already in Clear/Write) | Set to mintracevalue |
| Max Hold pressed (even if already in Max Hold) | Set to mintracevalue |

| Event | Trace Effect |
|---|--|
| Min Hold pressed (even if already in Min Hold) | Set to maxtracevalue |
| Trace Average pressed (even if already in Trace Average) | Trace data unaffected but start new sweep/avg/hold |
| Restart pressed | Trace data unaffected but start new sweep/avg/hold |
| Parameter requiring restart changed (e.g., RBW) | Trace data unaffected but start new sweep/avg/hold |

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

| | |
|----------------|---|
| Remote Command | <code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code> |
| Example | <code>:INIT:PAUS</code> <code>:INIT:RES</code> |
| Dependencies | Not displayed in Modes that do not support pausing |
| Annotation | Only on control |

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

| | |
|------------------------------|---|
| Remote Command | <code>:ABORT</code> |
| Example | <code>:ABOR</code> |
| Notes | <p>If <code>:INIT:CONT</code> is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If <code>:INIT:CONT</code> is OFF, then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p> |
| Dependencies | <p>For continuous measurement, <code>:ABORT</code> is equivalent to the Restart key</p> <p>Not all measurements support this command</p> |
| Status Bits/OPC dependencies | <p>The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The <code>STATUS:QUESTionable</code> register bit 9 (INTEgrity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by <code>:ABORT</code>, the Abort command will cause the <code>*OPC</code> query to return true</p> |

3.4.21.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the X reference value.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:SEMAsk:WINDow[1]:TRACe:X[:SCALE]:RLEVe1 <freq></code> |
| Example | <code>:DISP:SEM:WIND:TRAC:X:RLEV 10</code> <code>:DISP:SEM:WIND:TRAC:X:RLEV?</code> |
| Couplings | If " Auto Scaling " on page 494 is ON , this value is automatically determined by the measurement result. |

| | |
|------------------------------|---|
| | If you set this value manually, Auto Scaling automatically changes to OFF |
| Preset | 1.0 GHz |
| State Saved | Saved in instrument state |
| Min | -1000 GHz |
| Max | 1000 GHz |
| Backwards Compatibility SCPI | :DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALE]:RLeve1 |

Scale/Div

Sets the horizontal scale.

| | |
|------------------------------|---|
| Remote Command | :DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:PDIVision <freq> :DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:PDIVision? |
| Example | :DISP:SEM:WIND:TRAC:X:PDIV 500 :DISP:SEM:WIND:TRAC:X:PDIV? |
| Couplings | If Auto Scaling is ON , this value is automatically determined by the measurement result. When you set this value manually, Auto Scaling automatically changes to OFF |
| Preset | Automatically Calculated |
| State Saved | Yes Saved in instrument state |
| Min | 1 Hz |
| Max | 100 GHz |
| Backwards Compatibility SCPI | :DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALE]:PDIVision |

Ref Position

Sets the reference position for the X axis to Left, Center or Right.

| | |
|----------------|---|
| Remote Command | :DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:RPOsition LEFT CENTer RIGHT :DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:RPOsition? |
| Example | :DISP:SEM:WIND:TRAC:X:RPOS LEFT :DISP:SEM:WIND:TRAC:X:RPOS? |
| Preset | CENTer |
| State Saved | Saved in instrument state |
| Range | Left Center Right |
| Backwards | :DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALE]:RPOsition |

Compatibility
SCPI

Auto Scaling

Toggles the scale coupling function On or Off.

| | |
|---------------------------------|---|
| Remote Command | <code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:COUPle 0 1 OFF ON</code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:COUPle?</code> |
| Example | <code>:DISP:SEM:WIND:TRAC:X:COUP ON</code> <code>:DISP:SEM:WIND:TRAC:X:COUP?</code> |
| Couplings | When Auto Scaling is ON and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set a value to either " Scale/Div " on page 650 or " Ref Value " on page 649 manually, Auto Scaling automatically changes to OFF |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | OFF ON |
| Backwards Compatibility SCPI | <code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle</code> |

3.4.21.3 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Points

Sets the number of points displayed in the traces. The current value of points is displayed in the bottom-right corner of the display.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SEMask:SWEEp:POINts <integer></code> <code>[:SENSe]:SEMask:SWEEp:POINts?</code> |
| Example | <code>:SEM:SWE:POIN 4001</code> <code>:SEM:SWE:POIN?</code> |
| Preset | 2001 |
| State Saved | Saved in instrument state |
| Min | 201 |

| | |
|------------|--|
| Max | 10001 |
| Annotation | On second line of annotations in bottom right corner |

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe]:SWEep:IF:DITHer?</code> |
| Dependencies | Only appears in Spectrum Analyzer Mode in VXT models |
| Preset | OFF |
| State Saved | Saved in instrument state |

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SWEep:IMAGeProt OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeProt?</code> |
| Dependencies | Only appears in Spectrum Analyzer Mode in VXT model M9421A |
| Preset | ON |
| State Saved | Saved in instrument state |

3.4.22 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

3.4.22.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

| | |
|--------------|---|
| Notes | The selected trace is remembered even when not in the Trace menu |
| Dependencies | For the Swept SA measurement: <ul style="list-style-type: none"> - In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View - When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled |
| Preset | Trace 1 |
| State Saved | Yes |

3.4.22.2 Trace Control

The controls on this tab allow you to set the "**Trace Type**" on page 1728 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "**View/Blank**" on page 1734 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

| Option | Parameter | SCPI Example | Details |
|---------------|----------------|-------------------------|---|
| Clear/Write | WRITE | :TRAC2:TYPE WRIT | See: " Clear/Write " on page 656 |
| Trace Average | AVERage | :TRAC2:TYPE AVER | See: " Trace Average " on page 657 |

| Option | Parameter | SCPI Example | Details |
|--------------|-----------|------------------|-----------------------------|
| Maximum Hold | MAXHold | :TRAC3:TYPE MAXH | See: "Max Hold" on page 658 |
| Minimum Hold | MINHold | :TRAC5:TYPE MINH | See: "Min Hold" on page 658 |

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "[View/Blank" on page 1734](#) state must be set to **Active** (**Update: ON, Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "[Trace Mode Backwards Compatibility Commands](#)" on page 654

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITE AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITE AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre> |
| Couplings | <p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe] :<meas>:DETECTOR:AUTO?</code>), Detector (<code>[:SENSe] :<meas>:DETECTOR[:FUNCTION]?</code>) switches aligning with the switch of this parameter: "NORMal" with WRITE (Clear Write), "AVERage" with AVERage, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold</p> |
| Preset | <p>Swept SA and Monitor Spectrum: WRITE</p> <p>All other measurements: AVERage</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p> |
| State Saved | The type of each trace is saved in instrument state |
| Annunciation | The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar |

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

3 WLAN Mode
3.4 SEM Measurement

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1734.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPly` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPly`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

| | |
|-------------------------------|---|
| Preset | <code>WRITE</code> |
| State Saved | The trace mode is an alias only |
| Backwards Compatibility SCPI | <code>:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK</code> <code>:TRACe[1] 2 ... 6:MODE?</code> |
| Backwards Compatibility Notes | <p>The legacy <code>:TRACe:MODE</code> command is retained for backwards compatibility. In conjunction with the legacy <code>:AVERage</code> command, it works as follows:</p> <ul style="list-style-type: none"> - <code>:AVERage ON OFF</code> sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the <code>[:SENSe]:AVERage[:STATe]</code> command description below - <code>:TRACe:MODE WRITE</code> sets <code>:TRACe:TYPE WRITE</code> (Clear/Write) unless average is true, in which case it sets it to <code>:TRACe:TYPE AVERage</code>. It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPly ON</code>, for the selected trace - <code>:TRACe:MODE MAXHold</code> sets <code>:TRACe:TYPE MAXHold</code> (Max Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPly ON</code>, for the selected trace - <code>:TRACe:MODE MINHold</code> sets <code>:TRACe:TYPE MINHold</code> (Min Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPly ON</code>, for the selected trace - <code>:TRACe:MODE VIEW</code> sets <code>:TRACe:UPDate OFF</code>, <code>:TRACe:DISPly ON</code>, for the selected trace |

- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

| | |
|-------------------------------|--|
| Preset | <code>OFF</code> |
| State Saved | The state of Average is saved in Instrument State for ghosting purposes |
| Backwards Compatibility SCPI | <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code> |
| Backwards Compatibility Notes | <p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p> |

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1728 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

| | |
|-------------------|---|
| Active | Update and Display both ON |
| View | Update OFF ; Display ON |
| Blank | Update OFF ; Display OFF |
| Background | Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past |

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "[More Information](#)" on page 661

| | |
|--------------|---|
| Notes | For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 660 and " Trace Display State On/Off " on page 660 below |
| Dependencies | When Signal ID is on, this key is grayed-out |

Couplings

Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update **ON** and Display **ON**), even if that trace type was already selected

Selecting a detector for a trace (pressing the key or sending [:SENS] :DET :TRAC) puts the trace in **Active** (Update**ON** and Display**ON**), even if that detector was already selected

Selecting a "Math Function" on page 815 other than **OFF** for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update**ON** and Display**ON**), even if that Math Mode was already selected

Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command

For Swept SA Measurement (in SA Mode):
`:TRACe[1]|2|...|6:UPDate[:STATe] ON | OFF | 1 | 0`
`:TRACe[1]|2|...|6:UPDate[:STATe]?`

For all other measurements:
`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`

where <meas> is the identifier for the current measurement

Example

Make trace 2 inactive (stop updating):
`:TRAC2:UPD 0`

Couplings

Whenever you set **Update** to **ON** for any trace, the **Display** is set to **ON** for that trace

Preset

For Swept SA Measurement (in SA Mode):
`1|0|0|0|0|0`

ON for Trace 1; **OFF** for 2–6

For all other measurements:
`1|0|0`

ON for Trace 1; **OFF** for 2 & 3

State Saved

Saved in instrument state

Trace Display State On/Off

Remote Command

For Swept SA Measurement (in SA Mode):
`:TRACe[1]|2|...|6:DISPlay[:STATe] ON | OFF | 1 | 0`
`:TRACe[1]|2|...|6:DISPlay[:STATe]?`

For all other measurements:
`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`

where <meas> is the identifier for the current measurement

| | |
|-------------|--|
| Example | <p>Make trace 1 visible: :TRAC2:DISP 1</p> <p>Blank trace 3: :TRAC3:DISP 3</p> |
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
| Preset | <p>For Swept SA Measurement (in SA Mode): 1 0 0 0 0 0</p> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements: 1 0 0</p> <p>ON for Trace 1; OFF for 2 & 3</p> |
| State Saved | Saved in instrument state |

More Information

When a trace becomes inactive, any update from the :SENSe system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.4.22.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 821 controls.

- See "How trace math is processed" on page 666

Remote Command For option details, see "[Trace Math Options](#)" on page 664

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate:MATH? <trace_num>
```

where <trace_num> is any one of:

```
TRACE1|...|TRACE6
```

For all other measurements:

```
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

<meas> is the identifier for the current measurement, and

<trace_num> is any one of:

```
TRACe1|TRACe2|TRACe3
```

Note that the format of the **TRACe<n>** parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB

```
:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00
```

3 WLAN Mode
3.4 SEM Measurement

| | |
|------------------------------|---|
| | <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0</code></p> <p>Turns off trace math for trace 1</p> |
| Notes | <p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> - Set 2 defines the “function”: <code>PDIFference PSUM LOFFset LDIFference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p> |
| Dependencies | <p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p> |
| Couplings | <p>When a math function is changed for a trace, that trace is set to Display = ON; and Update = ON</p> |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <p><code>OFF,TRACE5,TRACE6,0,0 OFF,TRACE6,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0 </code> <code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE4,0,0 OFF,TRACE4,TRACE5,0,0</code></p> <p>For all other measurements:</p> <p><code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0</code></p> |
| State Saved | <p>The trace math function for each trace is saved in instrument state</p> |
| Annunciation | <p>An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on</p> |
| Status Bits/OPC dependencies | <p>*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep</p> |

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log_{10}(1/10)(\text{FirstTrace}) - 10(1/10)(\text{SecondTrace})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log_{10}(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

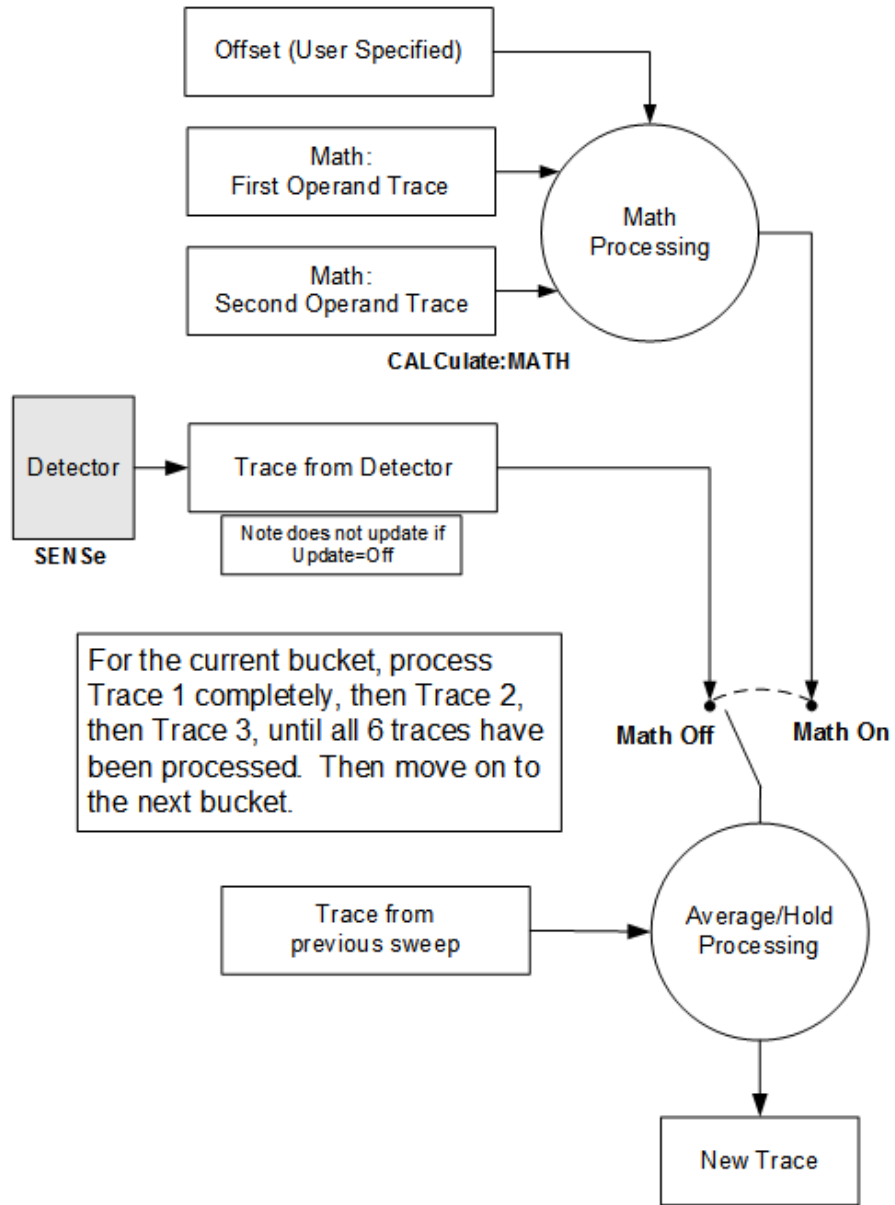

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

3 WLAN Mode
 3.4 SEM Measurement

For the current bucket, process Trace 1 completely, then Trace 2, then Trace 3, until all 6 traces have been processed. Then move on to the next bucket.

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

| | |
|--------------|---|
| Example | <p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre> |
| Notes | See " Math Function " on page 815 for how to specify Operands 1 and 2 using :CALCulate:MATH |
| Dependencies | The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown |
| Preset | Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace |

| | |
|-------------|---|
| | 5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5 |
| State Saved | Operands 1 and 2 for each trace are stored in instrument state |

Offset

Used by the Log Offset math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code> |
| State Saved | The Log Offset value for each trace is saved in Instrument State |
| Min | -100 dB |
| Max | 100 dB |

Reference

Used by the Log Diff math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code> |
| State Saved | The Log Difference reference value for each trace is saved in instrument state |
| Min/Max | Same as reference level |

3.4.22.4 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **"To Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 823** and **"To Trace" on page 823** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`
 For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
 where `<meas>` is the identifier for the current measurement
 Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1, TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>, <dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`
 For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 823 and "To Trace" on page 823 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

| | |
|----------------|---|
| Remote Command | <p>For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code></p> <p>For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code></p> <p>where <code><meas></code> is the identifier for the current measurement</p> <p>Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement</p> |
| Example | <p>Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1, TRACE2</code></p> |
| Notes | <p>The command is of the form: <code>:TRACe:EXCHange <trace_1>, <trace_2></code></p> |
| Couplings | Both traces are put in View (Update=Off, Display=On) after the exchange |

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

| | |
|----------------|---|
| Remote Command | <code>:TRACe[:<meas>]:PRESet:ALL</code> |
| Example | <code>:TRAC:PRE:ALL</code> |
| Dependencies | When Signal ID is on, this key is grayed-out |

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

| | |
|----------------|--|
| Remote Command | <code>:TRACe[:<meas>]:CLEAr:ALL</code> |
| Example | <code>:TRAC:CLE:ALL</code> |
| Dependencies | When Signal ID is on, this key is grayed-out |

3.4.22.5 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCH** query:

- Trace 1
- Trace 2
- Trace 3

| | |
|----------------|--|
| Remote Command | <pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre> |
| Example | <pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre> |
| Dependencies | In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled |
| Preset | TRACe1 |
| State Saved | No |
| Range | Trace 1 Trace 2 Trace 3 |

3.5 Spurious Emissions Measurement

The Spurious Emissions measurement identifies and determines the power level of spurious emissions in certain frequency bands.

Measurement Commands

The general functionality of "CONFigure" on page 2568, "INITiate" on page 2569, "FETCh" on page 2569, "MEASure" on page 2571, and "READ" on page 2570 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the **NDEFault** node to the command, which prevents a measurement preset after a measurement switch.

The tables below list measurement commands for this measurement.

| Command | Function |
|---|---|
| <code>:INITiate:SPURious</code> | Initiates a trigger cycle for the SPUR measurement, but does not return any data. You must then use <code>:FETC:SPUR[n]?</code> to retrieve data |
| <code>:CONFigure?</code> | Does not change any measurement settings |
| <code>:CONFigure:SPURious</code> | Returns the long form name of current measurement, in this case, SPURious |
| <code>:CONFigure:SPURious</code> | Selects SPUR measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 785 |
| <code>:CONFigure:SPURious:NDEFault</code> | Selects SPUR measurement <i>without</i> affecting settings |

The following queries are used to retrieve data. The type of data returned depends on the value of **n**.

| Command | Function |
|------------------------------------|---|
| <code>:FETCh:SPURious[n]?</code> | Retrieves the data defined by n |
| <code>:MEASure:SPURious[n]?</code> | Switches to SPUR measurement, restores default values, starts the measurement, then retrieves the data defined by n |
| <code>:READ:SPURious[n]?</code> | Starts the measurement, then retrieves the data defined by n |

Remote Command Results

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value **n**. Note that these queries are *not* available when viewing the Range Table.

The value of the constant **SCPI_NAN**, mentioned below, is 9.91E37.

| n | Return Value |
|------------------------------|--|
| 1 or omitted | Returns a variable-length (1 + 6 * Spurs – up to 1201 entries) comma-separated list containing detailed information in the following format: Number of spurs in following list (Integer) <i>[Repeat the following for each spur]</i> <ul style="list-style-type: none"> - Spur # - Range # Spur was located (Integer) - Frequency of Spur (Hz, Float64) - Amplitude of Spur (dBm, Float32) - Absolute Limit (dBm, Float32) - Pass or Fail (1 0, Boolean) |
| 2 – 21 (Average Trace) | Regardless of the Trace selection, returns a comma-separated list of the average trace data for the selected range (where range number = n – 1) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element |
| 22 | Returns the number of spurs found for the selected Measured Trace |
| 23 – 42 (Average Trace) | Regardless of the Trace selection, returns a comma-separated list of the average trace data for the selected range (where range number = n – 22) using Detector 2. If selected range is not active or Detector 2 selection is off, SCPI_NAN is returned for each trace data element |
| 43 – 62 (Maximum Hold Trace) | Regardless of the Trace selection, returns a comma-separated list of the maximum hold trace data for the selected range (where range number = n – 42) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element |
| 63 – 82 (Minimum Hold Trace) | Regardless of the Trace selection, returns a comma-separated list of the minimum hold trace data for the selected range (where range number = n – 62) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element |
| 83-102 | Reserved |
| 103-122 | Reserved |
| 123-142 (Clear/Write Trace) | Regardless of the Trace selection, returns a comma-separated list of the clear/write trace data for the selected range (where range number = n – 122) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element |
| 143-162 (Clear/Write Trace) | Regardless of the Trace selection, returns a comma-separated list of the clear/write trace data for the selected range (where range number = n – 142) using Detector 2. If selected range is not active or Detector 2 selection is off, SCPI_NAN is returned for each trace data element |
| 163-182 (Trace 1) | Returns a comma-separated list of the trace data of Trace 1 for the selected range (where range number = n – 162). If selected range is not active, SCPI_NAN is returned for each trace data element |
| 183-202 (Trace 2) | Returns a comma-separated list of the trace data of Trace 2 for the selected range (where range number = n – 182). If selected range is not active, SCPI_NAN is returned for each trace data element |
| 203-222 (Trace 3) | Returns a comma-separated list of the trace data of Trace 3 for the selected range (where range number = n – 202). If selected range is not active, SCPI_NAN is returned for each trace data element |
| 223 | Returns " Marker Table " on page 679 data as a series of comma separated values in the following form: |

| n | Return Value |
|---|---|
| | <Marker Number>, <Marker Trace>, <X>, <Y>, <Reserved>, <Reserved> |
| | Only markers that are enabled are included. <Reserved> items are returned as SCPI_NAN |
| | The data is returned in the current sort order as displayed in the Marker Table |

3.5.1 Views

This measurement has two predefined views:

| # | Name | SCPI |
|---|-------------------------------|--------|
| 1 | "Graph + Metrics" on page 726 | RESult |
| 2 | "All Ranges" on page 726 | ALL |

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change, depending on which window is selected.

| | |
|----------------|--|
| Remote Command | :DISPlay:SPURious:VIEW[:SElect] RESult ALL :DISPlay:SPURious:VIEW[:SElect]? |
| Example | :DISP:SPUR:VIEW RANG :DISP:SPUR:VIEW? |
| Preset | RESult |
| State Saved | No |
| Range | Graph + Metrics All Ranges |

3.5.1.1 Graph + Metrics

Windows: "Graph" on page 676, "Table" on page 677

Select Graph + Metrics to view measurement results.

- The upper window displays a trace of the range that contains the currently selected spur
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

| | |
|---------|---------------------|
| Example | :DISP:SPUR:VIEW RES |
|---------|---------------------|

3.5.1.2 All Ranges

Windows: ["Graph" on page 676](#),

Select All Ranges to view measurement results for all the ranges.

- The upper window displays a merged trace of all the ranges
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example `:DISP:SPUR:VIEW ALL`

3.5.2 Windows

The following windows are available in this measurement:

1. ["Graph" on page 676](#)
2. ["Table" on page 677](#)
3. ["All Range Table" on page 678](#)
4. ["Gate" on page 679](#)
5. ["Marker Table" on page 679](#)

The **Gate** Window is available only when ["Gate View On/Off" on page 2494](#) is **ON** in **Gate Settings** under **Trigger**.

3.5.2.1 Graph

Window #1 & #3

Appears in several Views, as follows:

| View | Size | Position |
|-----------------|-------------------------|----------|
| Graph + Metrics | Three fifth, full width | Top |
| All Ranges | Three fifth, full width | Top |
| Gate View | One third, full width | Middle |

When Graph + Metrics is selected

3 WLAN Mode
3.5 Spurious Emissions Measurement

When All Ranges is selected

3.5.2.2 Table

Window #2

The spurs listed are within the current value of the Marker Peak Excursion setting of the absolute limit. All the spurs listed passed. Any spur that has failed the absolute limit has an 'F' beside it.

| Result | Units | Min | Max |
|----------------|-------|---------------------|--------------|
| Spur | N/A | 0 | 200 |
| Range | N/A | 1 | 20 |
| Frequency | Hz | Analyzer Min | Analyzer Max |
| Amplitude | dBm | Analyzer Min | Analyzer Max |
| Limit | dBm | -200 | 50 |
| Δ Limit | dBm | (Limit - Amplitude) | |

Views in which the **Table** window appears:

| View | Size | Position |
|-----------------|-----------------------|----------|
| Graph + Metrics | Two fifth, full width | Bottom |
| Gate View | One third, full width | Bottom |

| Spur | Range | Frequency | Amplitude | Limit | ΔLimit |
|------|-------|-----------|------------|------------|-----------|
| 1 | 1 | 1.966 GHz | -77.10 dBm | -50.00 dBm | -27.10 dB |
| 2 | 1 | 1.946 GHz | -77.23 dBm | -50.00 dBm | -27.23 dB |
| 3 | 1 | 1.935 GHz | -77.29 dBm | -50.00 dBm | -27.29 dB |
| 4 | 1 | 1.950 GHz | -77.43 dBm | -50.00 dBm | -27.43 dB |
| 5 | 1 | 1.958 GHz | -77.50 dBm | -50.00 dBm | -27.50 dB |
| 6 | 1 | 1.973 GHz | -77.60 dBm | -50.00 dBm | -27.60 dB |
| 7 | 1 | 1.948 GHz | -77.82 dBm | -50.00 dBm | -27.82 dB |

Measure Trace

See "[Measure Trace](#)" on page 825.

Trace Type

This is the trace type (and view/blank parameter) of a trace specified by Measure Trace.

3.5.2.3 All Range Table

Window #4

The spurs listed are within the current value of the Marker Peak Excursion setting of the absolute limit. All the spurs listed passed. Any spur that has failed the absolute limit displays 'F' beside it.

| Result | Units | Min | Max |
|------------|---|---------------------|--------------|
| Spur | N/A | 0 | 200 |
| Range | N/A | 1 | 20 |
| Start Freq | See " Start Freq " on page 752 under Meas Setup | | |
| Stop Freq | See " Stop Freq " on page 753 under Meas Setup | | |
| RBW | See " Res BW " on page 759 under Meas Setup | | |
| Frequency | Hz | Analyzer Min | Analyzer Max |
| Amplitude | dBm | Analyzer Min | Analyzer Max |
| Limit | dBm | -200 | 50 |
| Δ Limit | dBm | (Limit - Amplitude) | |

Views in which the **All Range Table** window appears:

| View | Size | Position |
|------------|-----------------------|----------|
| All Ranges | Two fifth, full width | Bottom |
| Gate View | One third, full width | Bottom |

3 WLAN Mode
3.5 Spurious Emissions Measurement

4 All Range Table

| | | | | | | | | Measure Trace | Trace 1 |
|------|-------|------------|------------|-----------|-----------------|------------|-----------|---------------|------------------------|
| | | | | | | | | Trace Type | Trace Average (Active) |
| Spur | Range | Start Freq | Stop Freq | RBW | Frequency | Amplitude | ΔLimit | | |
| 1 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.965500000 GHz | -77.10 dBm | -27.10 dB | | |
| 2 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.945600000 GHz | -77.23 dBm | -27.23 dB | | |
| 3 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.934900000 GHz | -77.29 dBm | -27.29 dB | | |
| 4 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.949800000 GHz | -77.43 dBm | -27.43 dB | | |
| 5 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.958000000 GHz | -77.50 dBm | -27.50 dB | | |
| 6 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.972500000 GHz | -77.60 dBm | -27.60 dB | | |
| 7 | 1 | 1.9200 GHz | 1.9800 GHz | 1.200 MHz | 1.947600000 GHz | -77.82 dBm | -27.82 dB | | |

3.5.2.4 Gate

Window #5

Turning on "[Gate View On/Off](#)" on page 2494 displays the **Gate** Window, which allows you to see your gating signal at the same time as the measured data.

Views in which the **Gate** window appears:

| View | Size | Position |
|-----------|-----------------------|----------|
| Gate View | One third, full width | Top |

3.5.2.5 Marker Table

Window# 6

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.5.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.5.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

| | |
|------------------------------|---|
| Remote Command | <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code> |
| Example | <code>:DISP:SPUR:WIND:TRAC:Y:RLEV 10 dBm</code> <code>:DISP:SPUR:WIND:TRAC:Y:RLEV?</code> |
| Couplings | When "Auto Scaling" on page 681 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to "Ref Value" on page 680 |
| Preset | 10.00 dBm |
| State Saved | Saved in instrument state |
| Min/Max | -/+250.00 dBm |
| Annotation | Ref <value> top left of graph |
| Backwards Compatibility SCPI | <code>[:SENSe]:SPURious:POWer[:RF]:LEVel</code> <code>:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code> |

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl></code> <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code> |
| Example | <code>:DISP:SPUR:WIND:TRAC:Y:PDIV 10 dB</code> <code>:DISP:SPUR:WIND:TRAC:Y:PDIV?</code> |
| Couplings | Coupled to "Scale Range" on page 681 as follows Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 681 is ON , this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to OFF |

3 WLAN Mode
3.5 Spurious Emissions Measurement

| | |
|---------------------------------|--|
| Preset | Automatically calculated |
| State Saved | Saved in instrument state |
| Min | 0.10 dB |
| Max | 20 dB |
| Annotation | <value> dB/ left upper of graph |
| Backwards Compatibility SCPI | <code>:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:PDIVision</code> |

Scale Range

Sets the Y-Axis scale range.

| | |
|----------------|--|
| Remote Command | Replace <meas> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALE]:RANGe <rel_amp1></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALE]:RANGe?</code> |
| Example | <code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code> |
| Couplings | Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF |
| Preset | 100 dB |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 200 |

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

| | |
|-------------|--|
| Preset | TOP |
| State Saved | Saved in instrument state |
| Range | Top Center Bottom |
| Annotation | The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position |

Auto Scaling

Toggles **Auto Scaling** On or Off.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:COUPLe 0 1 OFF ON</code> |
| Example | <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:COUPLe?</code> <code>:DISP:SPUR:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:SPUR:WIND:TRAC:Y:COUP?</code> |
| Couplings | When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of " Scale/Div " on page 680, " Ref Value " on page 680 or " Scale Range " on page 681, Auto Scaling automatically changes to OFF When Auto Scaling is OFF , the measurement uses the current reference level settings When Auto Scaling is ON , the instrument automatically sets the reference level such that the absolute limit is positioned two divisions down from the top of the display. This is the most useful setting when searching for spurs. The algorithm used for determining the ref level is $\text{Ref Level} = \text{Absolute Limit} + (2 * \text{Scale/Div})$. All other reference level settings are left as the current base instrument settings |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Range | OFF ON |
| Backwards Compatibility SCPI | <code>[:SENSe] :SPURious:POWer[:RF] :RANGe:AUTO</code> <code>:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPLe</code> |

3.5.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "[Dual-Attenuator Configurations](#)" on page 683
- See "[Single-Attenuator Configuration](#)" on page 683

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:FRATten <rel_ampl></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code> |
| Example | <code>:POW:FRAT 14</code> <code>:POW:FRAT?</code> |
| Notes | When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value |
| Dependencies | Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists |
| Couplings | This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1753 command descriptions |

| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Only valid values are 0, 6, 14, 20 dB |
| Annotation | When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: |

3 WLAN Mode

3.5 Spurious Emissions Measurement

On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, **"Y Scale"** on page 1745 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, **"Internal Preamplifier"** on page 1775 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See **"Attenuator Configurations and Auto/Man"** on page 687

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code> |
| Example | <code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual |
| Dependencies | Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of |

| | | | | | | | |
|-----------------------|---|-----------------------|-------|-----|-------|------------------|-------|
| | <p>Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1756</p> <p>See "Attenuator Configurations and Auto/Man" on page 687 for more information on the Auto/Man functionality</p> | | | | | | |
| Couplings | <p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1752 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p> | | | | | | |
| Preset | <p>Auto</p> <p>The Auto value is 10 dB</p> | | | | | | |
| State Saved | Saved in instrument state | | | | | | |
| Min | <p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p> | | | | | | |
| Max | <table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p> | CXA Option 503 or 507 | 50 dB | EXA | 60 dB | All other models | 70 dB |
| CXA Option 503 or 507 | 50 dB | | | | | | |
| EXA | 60 dB | | | | | | |
| All other models | 70 dB | | | | | | |
| Annotation | <p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> | | | | | | |

For example:
 Dual-Attenuator configuration:
Atten: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB
 Single-Attenuator configuration:
A: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)
 When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code> |
| Example | Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code> |
| Dependencies | <code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA |
| Preset | <code>ON</code> |

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1750, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 685 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1756 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 690

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code> |
| Example | <code>:POW:EATT 10</code> <code>:POW:EATT?</code> |
| Notes | Electronic Attenuation's specification is defined only when Mech Atten is 6 dB |
| Dependencies | Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code> , and affects the total attenuation displayed on the Attenuation |

3 WLAN Mode
 3.5 Spurious Emissions Measurement

control and the Meas Bar

The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If "**Internal Preamp**" on page 1775 is **ON** (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned

If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1777 is **ON**, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

| | |
|-------------|---|
| Couplings | Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 690 |
| Preset | 0 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB |
| Annotation | See Annotation under the Mech Atten control description |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation:STATE OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATE?</code> |
| Example | <code>:POW:EATT:STAT ON</code> |

| | |
|--------|---|
| | <code>:POW:EATT:STAT?</code> |
| Preset | <code>OFF</code> (Disabled) for Swept SA measurement <code>ON</code> (Enabled) for all other measurements that support the electronic attenuator |

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 691](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1755](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

3 WLAN Mode

3.5 Spurious Emissions Measurement

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1760.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Example | <code>:POW:RANG:OPT IMM</code> |
| Notes | Executing Adjust Atten for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code> |
| Example | <code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code> |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | <code>COMBined</code> |
| State Saved | Saved in instrument state |

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1759 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 694

| Selection | SCPI | Note |
|-----------------|-------------------|--|
| Off | OFF | This is the default setting |
| On | ON | Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined |
| Elec Atten Only | ELECTrical | Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster |
| Elec+Mech Atten | COMBined | In Dual-Attenuator models, this selects both attenuators to participate in the autoranging |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Example | <code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code> |
| Notes | The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined |
| Dependencies | Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1756 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 693 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | OFF when Elec Atten is Disabled at preset, otherwise ELEC |
| State Saved | Saved in instrument state |

| | | |
|-------|---------------------------|---|
| Range | Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten |
| | Single-Attenuator models: | Off On |

Backwards Compatibility Command

| | |
|------------------------------|---|
| Notes | <p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p> |
| Backwards Compatibility SCPI | <p>[:SENSe] :POWer [:RF] :RANGe :AUTO ON OFF 1 0</p> <p>[:SENSe] :POWer [:RF] :RANGe :AUTO?</p> |

Adjustment Algorithm

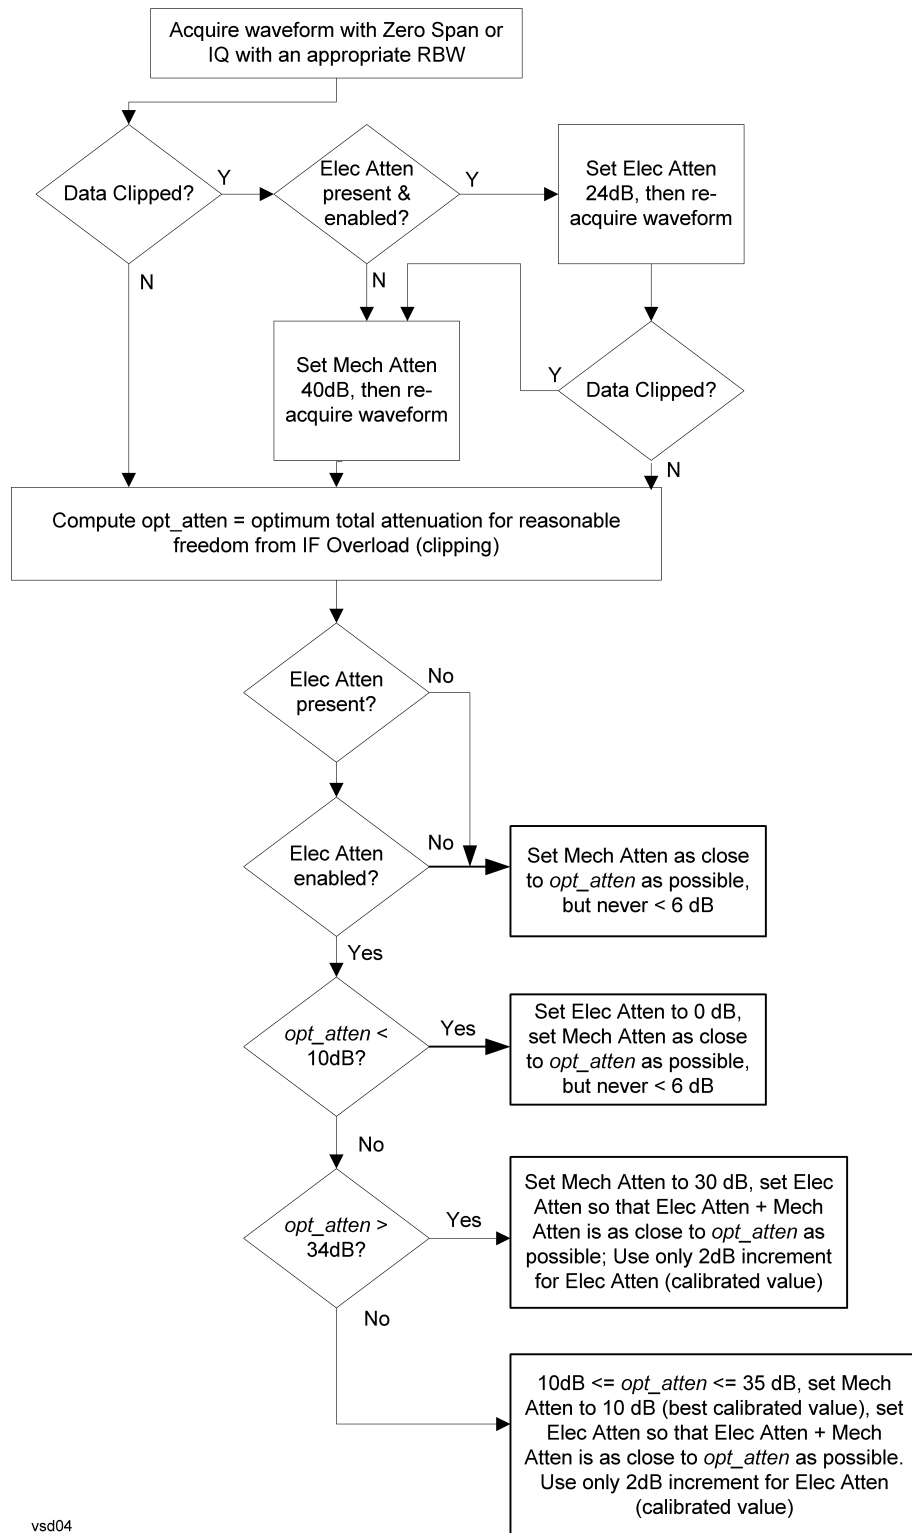

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1759 or "Pre-Adjust for Min Clipping" on page 693 selection is Mech + Elec Atten:

"Pre-Adjust for Min Clipping" on page 693 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

| | |
|--------------|---|
| | <code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code> |
| Example | <code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code> |
| Notes | Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10 |
| Dependencies | Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error |
| Couplings | When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB |
| Preset | EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB |
| State Saved | Saved in instrument state |

3.5.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

| | |
|-------------|----|
| State Saved | No |
|-------------|----|

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code> |
| Example | <code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code> |
| Notes | The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting |
| Preset | 0 dBm |
| State Saved | Yes |
| Min/Max | -/+100 |
| Annotation | Meas Bar |

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Notes | Executing Adjust Range for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |

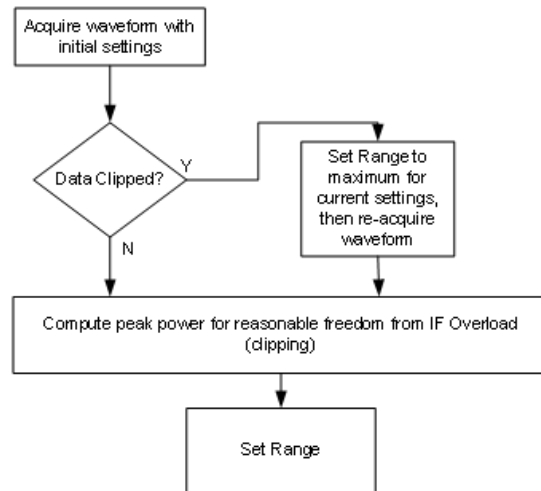

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Notes | Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |
| Preset | OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping |
| State Saved | Saved in instrument state |

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1769 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

| | | |
|----------------|--|-------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code> | |
| Example | <code>:POW:RANG:PAR 12 dB</code> | |
| Notes | In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated | |
| Dependencies | Does not appear in Spectrum Analyzer Mode | |
| Preset | VXT Models M9410A/11A | 0 dB |
| | All Others | 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB | |
| Max | VXT Models M9410A/11A | 50 dB |
| | All Others | 20 dB |

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1771. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

| | | |
|----------------|--|--------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code> | |
| Example | <code>:POW:RANG:MIX:OFFS -5 dB</code> | |
| Preset | 0 dB | |
| State Saved | Saved in instrument state | |
| Min | VXT Models M9410A/11A | -34 dB |
| | All Others | -35 dB |
| Max | 30 dB | |

3.5.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1788 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 1774 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "[Proper Preselector Operation](#)" on page 702.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe] :POWer [:RF] :PCENter</code> |
| Example | <code>:POW:PCEN</code> |
| Notes | The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command |
| Dependencies | Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Couplings | The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1774 |
| Status Bits/OPC dependencies | When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed |

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1773 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

|------------------------------|---|
| State Saved | The Preselector Adjust value set by " Presel Center " on page 1773, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle |
| Min/Max | -/+500 MHz |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command |
| Notes | The command has no effect, and the query always returns MWAVE |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code> |

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

| Selection | Example | Note |
|------------|---|---|
| Off | <code>:POW:GAIN OFF</code> | |
| Low Band | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code> | Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown |
| Full Range | <code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code> | Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear |

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code> |
| Example | <code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code> |
| Dependencies | Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled |
| Preset | LOW |
| State Saved | Saved in instrument state |
| Annotation | When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp) |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code> |
| Example | <code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code> |
| Preset | OFF |

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to ["Internal Preamp" on page 1775](#). LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with ["Internal Preamp" on page 1775](#), although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see ["More Information" on page 706](#)

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATE] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATE]?</code> |
| Example | <code>:POW:GAIN:LNA ON</code> |
| Dependencies | Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled |
| Preset | OFF |
| State Saved | Saved in State |

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

| Path | Example | Note |
|-----------------------|----------------------|--|
| Standard Path | :POW:MW:PATH STD | Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled |
| Low Noise Path Enable | :POW:MW:PATH LNP | See " Low Noise Path Enable " on page 711 |
| μW Preselector Bypass | :POW:MW:PATH MPB | See " μW Preselector Bypass " on page 713 |
| Full Bypass Enable | :POW:MW:PATH FULL | See " Full Bypass Enable " on page 714 |

| Remote Command | <code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code> | | | | | | | | | | | | | | |
|-----------------|--|------|-------|-------------|---|-------|---|------|--|----------|--|-----------------|------------|---|--|
| Example | <code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code> | | | | | | | | | | | | | | |
| Notes | <p>When "Presel Center" on page 1773 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p> | | | | | | | | | | | | | | |
| Dependencies | <p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</p> | | | | | | | | | | | | | | |

 If Full Bypass Enable is selected but the LNP switch is not thrown:
 μW Path: FByp,Off
 If Full Bypass Enable is selected and the LNP switch is thrown:
 μW Path: FByp,On

μW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **μW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

| Measurement | μW Path Control Auto behavior |
|------------------|---|
| Digital Demod | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Custom OFDM | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |

| Measurement | μ W Path Control Auto behavior |
|--------------------|------------------------------------|
| ACP | Always Presel Bypass |
| SEM | Always Presel Bypass |
| Spurious Emissions | Always Standard Path |

WLAN Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|--|
| Modulation Analysis | Always Presel Bypass |
| Spectral Flatness | Always Presel Bypass |
| Power vs Time | Always Presel Bypass |
| Monitor Spectrum | Always Presel Bypass |
| IQ Waveform | Always Presel Bypass |
| Channel Power | Always Presel Bypass |
| Occupied BW | Always Presel Bypass |
| CCDF | Always Presel Bypass |
| SEM | For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto μ W path is standard For other cases, auto μ W path is presel bypass if presel bypass is enabled, auto μ W path is standard if presel bypass is not enabled |
| Spurious Emissions | Always Standard Path |

5G NR Mode

| Measurement | μ W Path Control Auto behavior |
|---------------------|---|
| Modulation Analysis | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass |
| Monitor Spectrum | Always Standard Path |
| IQ Waveform | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass |
| Channel Power | Always Standard Path |
| Occupied BW | Always Standard Path |
| CCDF | Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass |
| ACP | Always Standard Path |
| SEM | Always Standard Path |
| Spurious | Always Standard Path |

3 WLAN Mode
3.5 Spurious Emissions Measurement

| Measurement | μ W Path Control Auto behavior |

| Couplings | See " μW Path Control Auto " on page 709 above |
| Preset | ON |
| Range | ON OFF |

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and **"Y Scale"** on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

| | |
|------------------------------|--|
| Example | Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code> |
| Notes | Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>) |
| Preset | ON |
| Backwards Compatibility SCPI | <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code> |

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

| Type | ID | |
|---|-----|---|
|  | 159 | Settings Alert - DETECTED;Presel/Meas BW conflict |

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1778.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1778 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command `[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ON | OFF | 1 | 0`

`[:SENSe] :POWer [:RF] :MW :PATH :AUTO :FULL ?`

Example `:POW :MW :PATH :AUTO :FULL ON`

`:POW :MW :PATH :AUTO :FULL ?`

Dependencies Only appears if Option FBP is installed, and in the following measurements

- 5GNRMode: Modulation Analysis and IQ Waveform
- WLAN Mode: IQ Waveform
- Channel Quality Mode: Group Delay and Noise Power Ratio

Preset **OFF**

State Saved Saved in instrument state

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two

traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code> |
| Example | <code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code> |
| Dependencies | Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements |
| Couplings | Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state |
| Preset | N9041B OFF N9042B+V3050A ON M9410A/11A ON |
| State Saved | Saved in instrument state |

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

3 WLAN Mode
 3.5 Spurious Emissions Measurement

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code> |
| Example | <code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1788 is OFF . The grayout message is “Unavailable unless SW Presel enabled” |
| Preset | N9041B ADVanced N9042B+V3050A NORMa1 |
| State Saved | Saved in instrument state |

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code> |
| Example | <code>:POW:SWPR:BW NARR</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept |

| | | |
|-------------|--|---------------|
| | method | |
| | Grayed-out when " Software Preselection " on page 1788 is OFF . The grayout message is "Unavailable unless SW Presel enabled" | |
| | For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled | |
| Preset | N9041B | NORMa1 |
| | N9042B+V3050A | NARRow |
| State Saved | Saved in instrument state | |

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code> |
| Example | Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code> |
| Dependencies | Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz |
| Preset | See " Prefilter Presets " on page 720 below |
| State Saved | Saved in instrument state |

Prefilter Presets

| Meas | Mode | Preset |
|------|-------|--------|
| SPEC | BASIC | OFF |

3 WLAN Mode
3.5 Spurious Emissions Measurement

| Meas | Mode | Preset |
|------|---|--------|
| WAV | BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA | OFF |
| MON | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA | OFF |
| RHO | WCDMA | OFF |
| CDP | WCDMA | OFF |
| PCON | WCDMA | OFF |
| EVMQ | WCDMA | OFF |
| CHP | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |
| OBW | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |
| ACP | WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |
| SEM | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |
| PST | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |
| PVT | WLAN, LTEAFDD, LTEATDD, 5GNR | OFF |
| EVM | WLAN, LTEAFDD, LTEATDD, 5GNR | OFF |
| FLAT | WLAN | OFF |
| EVMM | WLAN | OFF |
| CEVM | LTEAFDD, LTEATDD | OFF |
| PAVT | 5GNR, VMA | OFF |
| DDEM | VMA | OFF |
| OFDM | VMA | OFF |
| SAN | SA | ON |
| HARM | SA | ON |

3.5.4 BW

There is no **BW** functionality in this measurement.

3.5.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.5.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View, or Window.

Center Frequency On/Off

Turns the display of **Center Frequency** on the **Meas Bar** On or Off.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:SPURious:FREQuency:CENTer[:STATe] ON OFF 1 0</code> <code>:DISPlay:SPURious:FREQuency:CENTer[:STATe]?</code> |
| Example | <code>:DISP:SPUR:FREQ:CENT ON</code> <code>:DISP:SPUR:FREQ:CENT?</code> |
| Preset | <code>ON</code> |
| State Saved | Yes |

3.5.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code> |
| Example | <code>:DISP:GRAT OFF</code> |
| Notes | The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis |
| Preset | <code>ON</code> |
| State Saved | Saved in instrument state |
| Backwards Compatibility SCPI | <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the <code>WINDow</code> , <code>TRACe</code> and <code>GRID</code> parameters are ignored |

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the `Trace` section.

3 WLAN Mode

3.5 Spurious Emissions Measurement

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code> |
| Example | <code>:DISP:ANN:SCR OFF</code> |
| Dependencies | Grayed-out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code> |
| Example | <code>:DISP:ANN:TRAC OFF</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code> |
| Example | <code>:DISP:ACT OFF</code> |
| Dependencies | Grayed out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code> |
| Example | <code>:DISP:ANN:MBAR OFF</code> |
| Dependencies | Grayed out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

3 WLAN Mode
3.5 Spurious Emissions Measurement

| Name | Command |
|----------------------------|-------------------------------|
| Select User View | :DISPlay:VIEW:ADVanced:SElect |
| Rename User View | :DISPlay:VIEW:ADVanced:REName |
| Delete User View | :DISPlay:VIEW:ADVanced:DElete |
| Create User View | :DISPlay:VIEW:ADVanced:NAME |
| Select Screen | :INSTrument:SCReen:SElect |
| Delete Screen | :INSTrument:SCReen:DElete |
| Delete All But This Screen | :INSTrument:SCReen:DElete:ALL |
| Add Screen | :INSTrument:SCReen:CREate |
| Rename Screen | :INSTrument:SCReen:REName |
| Sequencer On/Off | :SYSTem:SEQuencer |

| | |
|-------------------------------|---|
| Remote Command | :DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle? |
| Example | :DISP:ENAB OFF |
| Couplings | :DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB |
| Preset | ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet |
| State Saved | Not saved in instrument state |
| Backwards Compatibility Notes | :SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers |

3.5.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

This measurement has two predefined views:

| # | Name | SCPI |
|---|-------------------------------|--------|
| 1 | "Graph + Metrics" on page 726 | RESult |
| 2 | "All Ranges" on page 726 | ALL |

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change, depending on which window is selected.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:SPURious:VIEW[:SElect] RESult ALL</code> <code>:DISPlay:SPURious:VIEW[:SElect]?</code> |
| Example | <code>:DISP:SPUR:VIEW RANG</code> <code>:DISP:SPUR:VIEW?</code> |
| Preset | <code>RESult</code> |
| State Saved | No |
| Range | Graph + Metrics All Ranges |

Graph + Metrics

Windows: ["Graph" on page 676](#), ["Table" on page 677](#)

Select Graph + Metrics to view measurement results.

- The upper window displays a trace of the range that contains the currently selected spur
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

| | |
|---------|----------------------------------|
| Example | <code>:DISP:SPUR:VIEW RES</code> |
|---------|----------------------------------|

All Ranges

Windows: ["Graph" on page 676](#),

Select All Ranges to view measurement results for all the ranges.

- The upper window displays a merged trace of all the ranges
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

| | |
|---------|----------------------------------|
| Example | <code>:DISP:SPUR:VIEW ALL</code> |
|---------|----------------------------------|

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code> |
|----------------|--|

| | |
|---------------------------------|---|
| Example | Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code> |
| Notes | <p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOom</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |
| Backwards Compatibility SCPI | <p>The legacy node</p> <pre>:DISP:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p> |

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

| | |
|----------------|---|
| Remote Command | <code>:DISP:VIEW:ADV:NAME <alphanumeric></code> |
| Example | <pre>:DISP:VIEW:ADV:NAME "Baseband"</pre> <p>Creates a new View named Baseband from the current View, and selects it as the current View</p> |

| | |
|-------|---|
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p> |
|-------|---|

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code> |
| Example | <code>:DISP:VIEW:ADV:REN “Baseband”</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> already exists” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p> |

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DELete</code> |
|----------------|--|

| | |
|---------|---|
| Example | <code>:DISP:VIEW:ADV:DEL</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p> |

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DELeTe:ALL</code> |
| Example | <code>:DISP:VIEW:ADV:DEL:ALL</code> |
| Notes | Disabled if there are no User Views |

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:CAT?</code> |
| Notes | <p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example:</p> <p><code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> |

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:USER:CAT?</code> |
| Notes | <p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1804), then query the list of available Views, the result is undefined</p> |

3.5.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some settings in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by ["Meas Preset" on page 785](#). For example, ["Center Frequency" on page 754](#) is the same for all measurements - it does not change as you change measurements.

3.5.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, display span is held constant (see ["Range Settings" on page 750](#)).

The **Center Frequency** setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center

3 WLAN Mode
 3.5 Spurious Emissions Measurement

frequency value. If this is the case, then a **Global** tab appears in the **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe]:FREQuency:CENTer <freq></code> <code>[:SENSe]:FREQuency:CENTer?</code> |
| Example | Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of "CF Step" on page 735: <code>:FREQ:CENT UP</code> Return the current value of Center Frequency : <code>:FREQ:CENT?</code> |
| Notes | This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF:CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code> - For External Mixer it is equivalent to <code>:FREQ:EMIX:CENT</code> Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated |
| Dependencies | Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes |
| Preset | Depends on instrument maximum frequency, Mode, measurement, and selected input See "Center Frequency Presets" on page 732, "RF Center Freq" on page 734, "Ext Mix Center Freq" on page 734, "I/Q Center Freq" on page 735 and "VXT Models with Radio Heads/CIU Frequency Range" on page 733 |
| State Saved | Saved in instrument state |
| Min/Max | Depends on instrument maximum frequency, Mode, measurement, and selected input See "Center Frequency Presets" on page 732, "RF Center Freq" on page 734, "I/Q Center Freq" on page 735 and "VXT Models with Radio Heads/CIU Frequency Range" on page 733 |
| Annotation | Center <value> appears in the lower left corner of the display |
| Status Bits/OPC dependencies | Non-overlapped |

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------------------|----------------------|-----------------------------|-----------------------------|
| 503 (all but CXA) | 1.805 GHz | 3.6 GHz | 3.7 GHz |
| 503 (CXA) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| 507 (all but CXA) | 3.505 GHz | 7.0 GHz | 7.1 GHz |
| 507 (CXA) | 3.755 GHz | 7.5 GHz | 7.58 GHz |
| 508 (all but MXE) | 1.805 GHz | 3.6 GHz | 8.5 GHz |
| 508 (MXE) | 4.205 GHz | 8.4 GHz | 8.5 GHz |
| 513 | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| 526 (except CXA and MXE) | 13.255 GHz | 26.5 GHz | 27.0 GHz* |
| 526 (CXA) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 526 (MXE) | 1.805 GHz | 3.6 GHz | 27.0 GHz |
| 532 | 16.005 GHz | 32.0 GHz | 32.5 GHz |
| 540 | 20.005 GHz | 40.0 GHz | 40.5 GHz |
| 543 | 21.505 GHz | 43.0 GHz | 43.0 GHz |
| 544 | 22.005 GHz | 44.0 GHz | 45.0 GHz |
| 550 | 25.005 GHz | 50.0 GHz | 52 GHz |
| F03 (CXA-m) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| F07 (CXA-m) | 3.755 GHz | 7.5 GHz | 7.575 GHz |
| F13 (CXA-m) | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| F26 (CXA-m) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 504 (M9421A, M8920A) | 2.145 GHz | 3.88GHz | 3.88 GHz |
| 506 (M9421A, M8920A) | 3.245 GHz | 6.08GHz | 6.08 GHz |
| F06 (M9410A/11A) | 1.0 GHz | 6.08 GHz | 6.08 GHz |
| F06 (M9415A) | 1 GHz | 1.08 GHz | 6.6 GHz |
| F08 (M9415A) | 1 GHz | 1.08 GHz | 8.6 GHz |
| F12 (M9415A) | 1 GHz | 1.08 GHz | 12.9 GHz |

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

3 WLAN Mode
3.5 Spurious Emissions Measurement

| Input | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|---------------------|----------------------|-----------------------------|-----------------------------|
| Input 1, all models | 25.005 GHz | 50.0 GHz | 52 GHz |
| Input 2, opt 585 | 42.505 GHz | 85.0 GHz | 86 GHz |
| Input 2, opt 590 | 45.005 GHz | 90.0 GHz | 92 GHz |
| Input 2, opt 5CX | 55.005 GHz | 110.0 GHz | 110 GHz |

Input 2, CXA and MXE

| Model | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|-------------|----------------------|-----------------------------|-----------------------------|
| CXA opt C75 | 0.7505 GHz | 1.5 GHz | 1.58 GHz |
| MXE | 505 MHz | 1 GHz | 1.000025 GHz |

Tracking Generator Frequency Limits (CXA only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 9 kHz | 3.0 GHz | 3.08 GHz |
| T06 | 9 kHz | 6.0 GHz | 6.05 GHz |

Tracking Generator Frequency Limits(CXA-m only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 2 MHz | 3.08 GHz | 3.08 GHz |
| T07 | 2 MHz | 7.575 GHz | 7.575 GHz |
| T13 | 2 MHz | 13.8 GHz | 13.8 GHz |
| T26 | 2 MHz | 26.55 GHz | 26.55 GHz |

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

| Products with Radio Heads/CIU | Preset | Start frequency | Stop frequency |
|-------------------------------|--------|-----------------|----------------|
| M9421A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU + RRH | 25 GHz | 24.25 GHz | 43.5 GHz |

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code> |
| Example | <code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Dependencies | If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the stop frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning |
| Preset | See " Center Frequency Presets " on page 732 above |
| State Saved | Saved in instrument state |
| Min | -79.999995 MHz |
| Max | See " Center Frequency Presets " on page 732 above. Basically, instrument maximum frequency –5 Hz If the knob or step keys are being used, also depends on span (see " Range Settings " on page 750) |

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code> |
| Example | <code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Couplings | When returning to External Mixing after having switched to one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the Center Frequency that you had. However, span (" Range " on page 749) is not an input-dependent parameter, so the instrument returns to the span from the previous input, limited as necessary by the current mixer setup |
| Preset | When Mode Preset is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max Freq of the highest |

harmonic range in the Harmonic Table. **Center Frequency** thus presets to the point arithmetically equidistant from these two frequencies

Note that, if the current measurement has a limited span/range available to it, and cannot achieve the span shown in the table (**Range** = Stop Freq – Start Freq), the instrument uses the maximum span the measurement allows, and still sets **Center Frequency** to the midpoint of the start and stop Freq values in the Harmonic Table

When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose start and stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after **Restore Input/Output Defaults**, if you go to External Mixing and do **Mode Preset** while in Spectrum Analyzer Mode, the resulting **Center Frequency** is 33.25 GHz

| | |
|-------------|---|
| State Saved | Yes |
| Min | The minimum frequency in the currently selected mixer band +5 Hz If the knob or step keys are being used, also depends on Range |
| Max | The maximum frequency in the currently selected mixer band –5 Hz If the knob or step keys are being used, also depends on Range |

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQuency :IQ :CENTer ?</code> |
| Example | <code>:FREQ :IQ :CENT 30 MHz</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Preset | 0 Hz |
| State Saved | Saved in instrument state |
| Min/Max | –/+40.049995 MHz |

CF Step

Changes the step size for "**Center Frequency**" on page 754. Once a step size has been selected and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

| | |
|------------------------------|---|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code> |
| Example | Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> |
| Notes | Preset and Max values depend on Hardware Options |
| Dependencies | Not available in MSR, LTE-A FDD/TDD and 5G NR Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up -arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning |
| Couplings | When auto-coupled, CF Step size is set to 10% of Range |
| Preset | Auto |
| State Saved | Saved in instrument state |
| Min/Max | -/+ (the maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF Step range of +/- 27 GHz. Note that this is the maximum frequency, given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band |
| Status Bits/OPC dependencies | non-overlapped |

Auto Function

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO ?</code> |
| Example | <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO ?</code> |
| Preset | ON |

3.5.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.5.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

On any menu tab that displays **Select Marker**, the first control is always **Marker Frequency | Time**.

| | |
|--------------|---|
| Notes | The selected marker is remembered even when not in the Marker menu and is used if a Search is done, or a Band Function is turned on, or for Signal Track, or Continuous Peak |
| Preset | Marker 1 |
| State Saved | The number of the selected marker is saved in instrument state |
| Annunciation | Appears in the marker results block label for Normal and Delta markers |

3.5.7.2 Settings

The controls on this tab include the **Marker** active function and a radio button selection for the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode is **OFF**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** (**POSition**) or **DELTA**.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X?</code> |
| Example | <code>:CALC:SPUR:MARK2:X 25 kHz</code> <code>:CALC:SPUR:MARK3:X?</code> |
| Notes | If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time |
| Preset | After a preset, all markers are turned OFF , so Marker X-Axis Value query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min/Max | -/+9.9E+37 |
| Annotation | Mkr # <X value> and <Marker value> upper right on graph |

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** – except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X:POSition <real></code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X:POSition?</code> |
| Example | <code>:CALC:SPUR:MARK10:X:POS 300</code> <code>:CALC:SPUR:MARK10:X:POS?</code> |
| Notes | The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is OFF , the response is Not A Number |
| Preset | After a preset, all markers are turned OFF , so Marker X-Axis Value query returns Not A Number (NAN) |
| State Saved | Saved in instrument state |
| Min/Max | -/+9.9E+37 |

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y Axis unit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:Y?</code> |
| Example | <code>:CALC:SPUR:MARK11:Y?</code> |
| Notes | Returns the marker Y-Axis result, if the control mode is Normal or Delta . If the marker is OFF , the response is Not A Number In the Complex Spectrum measurement, when the marker is on and Marker Trace is set to IQ, it returns I and Q values Case #1 - MarkerTrace SPEC, I or Q: returns a single double value <ul style="list-style-type: none"> - <code>>:CALC:SPEC:MARK1:Y?</code> - <code>-2.402406506109E+001</code> Case #2 - MarkerTrace IQ: returns a double array of two values, the first is I, and the second is Q <ul style="list-style-type: none"> - <code>>:CALC: SPEC:MARK1:Y?</code> - <code>-3.006944493834E-003,+9.9870666467354E-004</code> The IQ selection is for backward compatibility purposes. It is recommended that the users use the I and/or Q selection instead |
| Preset | Result dependent on Marker setup and signal source |

| | |
|------------------------------|---|
| State Saved | No |
| Backwards Compatibility SCPI | :CALCulate:SPURious:MARKer[1] 2 ... 12:FUNCTION:RESult? |

Marker Mode

Sets the marker control mode to **POSITION** (Normal), **DELta**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **POSITION** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

| | |
|----------------|---|
| Remote Command | :CALCulate:SPURious:MARKer[1] 2 ... 12:MODE POSITION DELTa OFF :CALCulate:SPURious:MARKer[1] 2 ... 12:MODE? |
| Example | :CALC:SPUR:MARK:MODE POS :CALC:SPUR:MARK:MODE? |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | POSITION DELta OFF |
| Annotation | Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph |

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it in **POSITION** mode and places it at the center of the screen.

| | |
|-------------|---|
| Example | :CALC:SPUR:MARK3:STAT 1 :CALC:SPUR:MARK3:STAT? |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | OFF ON |

| | |
|-----------------------|---|
| Backwards | :CALCulate:SPURious:MARKer[1] 2 ... 12:STATe OFF ON 0 1 |
| Compatibility SCPI | :CALCulate:SPURious:MARKer[1] 2 ... 12:STATe? |

Delta Marker (Reset Delta)

Pressing this control has exactly the same effect as selecting **Delta** in "**Marker Mode**" on page 739. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

| | |
|-------------------|---------------------------------|
| Remote Command | :CALCulate:SPURious:MARKer:AOff |
| Example | :CALC:SPUR:MARK:AOff |

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental x-axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

| | |
|-------------------|--|
| Remote Command | :CALCulate:SPURious:MARKer:COUple[:STATe] ON OFF 1 0 |
| Example | :CALC:SPUR:MARK:COUP ON :CALC:SPUR:MARK:COUP? |
| Preset | OFF Preset by Mode Preset and All Markers Off |
| State Saved | Saved in instrument state |

3.5.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on page 737 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum y-axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

| | |
|----------------|--|
| Remote Command | :CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum |
|----------------|--|

| | |
|---------|------------------------------------|
| Example | :CALC:SPUR:MARK2:MAX :SYST:ERR? |
|---------|------------------------------------|

can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search

| | |
|-------|--|
| Notes | Sending this command selects the subcoded marker |
|-------|--|

In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was **OFF**, then it is turned on as a **POSition** marker and a peak search is performed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum:NEXT</code> |
| Example | <code>:CALC:SPUR:MARK2:MAX:NEXT</code> |
| Notes | Sending this command selects the subopcoded marker |
| State Saved | Not part of saved state |

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker.

If the selected marker was **OFF**, then it is turned on as a **POSition** marker and a peak search is performed.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum:RIGHT</code> |
| Example | <code>:CALC:SPUR:MARK2:MAX:RIGH</code> |
| Notes | Sending this command selects the subopcoded marker |
| State Saved | Not part of saved state |

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker.

If the selected marker was **OFF**, then it is turned on as a **POSition** marker and a peak search is performed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum:LEFT</code> |
| Example | <code>:CALC:SPUR:MARK2:MAX:LEFT</code> |
| State Saved | Not part of saved state |

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is **OFF**, it is turned **ON** before the minimum search is performed.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:MINimum</code> |
| Example | <code>:CALC:SPUR:MARK:MIN</code> |
| Notes | Sending this command selects the subopcoded marker |
| State Saved | Not part of saved state |

Pk-Pk Search

Finds and displays the amplitude and frequency differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Fixed** or **Normal** if it is not already on. (These markers may be on two different traces.)

If the selected marker is **OFF**, a **Delta** type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

| | |
|----------------|---|
| Remote Command | :CALCulate:SPURious:MARKer[1] 2 ... 12:PTPeak |
| Example | :CALC:SPUR:MARK:PTP |
| Notes | Turns on the Marker D active function Sending this command selects the subopcoded marker |
| Dependencies | Pk-Pk Search is not available when Coupled Markers is ON |
| Couplings | The selected marker becomes a Delta marker if not already in Delta mode |
| State Saved | Not part of saved state |

Marker Delta

Pressing this control has the same effect as selecting **Delta** in "**Marker Mode**" on [page 739](#) on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search, and change the marker's control mode to **Delta**, without having to access two separate menus.

3.5.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "**Marker Frequency**" on [page 737](#) on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** control. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:REFerence <integer></code> |
| Example | <code>:CALC:SPUR:MARK3:REF 5</code> <code>:CALC:SPUR:MARK:REF?</code> |
| Notes | This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself, so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker) |
| Couplings | If the reference marker is off it is turned on in Normal mode at the delta marker location |
| Preset | The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off, All Markers Off , or Preset |
| State Saved | Saved in instrument state. Not affected by Markers Off , hence not affected by Preset or power cycle |
| Min | 1 |
| Max | 12 |
| Annunciation | Appears in the marker label of a Delta marker |

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **OFF**, it moves the marker from the trace

3 WLAN Mode
3.5 Spurious Emissions Measurement

it was on to the new trace. If the marker is **OFF**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:TRACe:ATTached TRACe1 TRACe2 TRACe3</code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:TRACe:ATTached?</code> |
| Example | <code>:CALC:SPUR:MARK2:TRAC:ATT TRAC2</code> <code>:CALC:SPUR:MARK2:TRAC:ATT?</code> |
| Notes | A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number |
| Couplings | The state of Marker Trace is not affected by " Auto Couple " on page 1833 Sending the remote command causes the addressed marker to become selected |
| Preset | <code>TRACe1</code> |
| State Saved | Saved in instrument state |
| Range | <code>TRACe1 TRACe2 TRACe3</code> |

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "**Marker Settings Diagram**" on page 740 under **Settings**.

3.5.8 Meas Setup

Contains functions for setting up the measurement parameters, and for setting up parameters global to all measurements in the Mode.

3.5.8.1 Settings

Contains frequently-used **Meas Setup** functions, to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SPURious:AVERage:COUNT <integer></code> <code>[:SENSe]:SPURious:AVERage:COUNT?</code> |
| Example | <code>:SPUR:AVER:COUN 2500</code> |

| | |
|-------------|-------------------------------|
| | <code>:SPUR:AVER:COUN?</code> |
| Preset | 10 |
| State Saved | Saved in instrument state |
| Min/Max | 1/10000 |

Averaging On/Off

Turns Averaging on or off.

NOTE

In this measurement, the **Average Type** is preset to the **Log-Pwr Avg (Video)** method. Other averaging methods are not available.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:SPURious:AVERage[:STATe]?</code> |
| Example | <code>:SPUR:AVER ON</code> <code>:SPUR:AVER?</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | ON OFF |

Average Mode

Lets you set the Averaging Mode. Options are:

- **EXponential**: The measurement averaging continues using the specified number of averages to compute each averaged value. The average will be displayed at the end of each sweep
- **REPeat**: The measurement resets the average counter each time the specified number of averages is reached

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious:AVERage:TCONtrol EXponential REPeat</code> <code>[:SENSe]:SPURious:AVERage:TCONtrol?</code> |
| Example | <code>:SPUR:AVER:TCON REP</code> <code>:SPUR:AVER:TCON?</code> |
| Preset | EXponential |
| State Saved | Saved in instrument state |
| Range | EXponential REPeat |

Average Type

Enables you to control the way averaging is done by choosing one of the following averaging scales: Log-Power (Video) or Power (RMS).

There are three different averaging processes in the measurement, and all of them are affected by this setting: Trace Averaging, the Average detector, and VBW filtering.

| Control Selection | SCPI | Type |
|-------------------|------|---|
| Log-Pwr (Video) | LOG | Simulates the traditional spectrum analyzer type of averaging by averaging the log of the power |
| Power (RMS) | RMS | True power averaging that is equivalent to taking the RMS value of the voltage. This is the most accurate type of averaging |

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SPURious:AVERage:TYPE LOG RMS</code> <code>[:SENSe]:SPURious:AVERage:TYPE?</code> |
| Example | <code>:SPUR:AVER:TYPE LOG</code> <code>:SPUR:AVER:TYPE?</code> |
| Couplings | Sending this command will affect the VBW Average Type |
| Preset | LOG |
| State Saved | Yes |
| Range | Log-Pwr (Video) Power (RMS) |

Meas Type

Selects either **EXAMine** or **FULL** measurement type. This parameter is coupled to "Average Mode" on page 746. Therefore, if the **EXAMine** measurement type is selected, the measurement sets the Average Mode to exponential. If the **FULL** measurement type is selected, the measurement sets the Average Mode to repeat. The behavior of each measurement type is described in the table below. When averaging is on, trace averaging is used as each active range is measured. Averaging is not used at any other time.

| Type | Single | | Continuous | |
|---------|--|---|---|---|
| | No Spurs Found | Spurs Found | No Spurs Found | Spurs Found |
| EXAMine | All active ranges are measured. On completion the measurement is set to the idle state and the 'No | All active ranges are measured, and the spurs found reported. On completion | All active ranges are measured. On completion the SA remains set to last range checked with an active | All active ranges are measured, and the spurs found |

| Type | Single | | Continuous | |
|------|--|--|--|---|
| | No Spurs Found | Spurs Found | No Spurs Found | Spurs Found |
| | Spurs' happening is displayed | the measurement is set to the idle state and the trace containing the worst spur restored. The spur control is enabled. A marker is also added which is set to the frequency of the worst spur | trace and the 'No Spurs' happening is displayed | reported. On completion the SA is set to the range containing the worst spur found and continually sweeps this range. Note that the trace is continually updated but the metrics results aren't updated until restart to keep the initial results as references. Use marker readouts to refer the latest results. The spur control is enabled. A marker is also added which is set to the frequency of the worst spur |
| FULL | All active ranges are measured. On completion measurement is set to idle state and the 'No Spurs' happening is displayed | All active ranges are measured, and spurs found reported. On completion the measurement is set to the idle state, displaying the trace of the last active range | Measurement continually cycles through all active ranges | All active ranges are measured, and spurs found reported. On each cycle of the active ranges the spurs found are reset. This ensures any remote queries retrieve the trace data that matches the currently |

3 WLAN Mode
3.5 Spurious Emissions Measurement

| | Type | Single | | Continuous | |
|----------------|--|----------------|-------------|----------------|-------------------|
| | | No Spurs Found | Spurs Found | No Spurs Found | Spurs Found |
| Remote Command | <code>[:SENSe]:SPURious:TYPE EXAMine FULL</code> <code>[:SENSe]:SPURious:TYPE?</code> | | | | displayed results |
| Example | <code>:SPUR:TYPE FULL</code> <code>:SPUR:TYPE?</code> | | | | |
| Preset | <code>EXAMine</code> | | | | |
| State Saved | Saved in instrument state | | | | |
| Range | <code>EXAMine FULL</code> | | | | |

Spur

Displays any spurs found. Only enabled when the measurement type is set to **EXAMine**, and turns on upon completion of a measurement. Once the **Spur** control has been enabled, you can view any spur. The measurement sets the instrument to the range in which the currently selected spur was found. The range settings only change if the spur selected is in a range that is different from the current range settings. A marker is used to identify the currently selected spur on the trace.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SPURious:SPUR <integer></code> <code>[:SENSe]:SPURious:SPUR?</code> |
| Example | <code>:SPUR:SPUR 55</code> <code>:SPUR:SPUR?</code> |
| Preset | 1 |
| State Saved | No |
| Min/Max | 1/200 |

Range

Selects the sweep range of the display trace. **Marker** operation, such as peak search is performed in the selected range.

For more details, see ["Range Settings" on page 750](#).

| | |
|-------------|------|
| Preset | 1 |
| State Saved | No |
| Min/Max | 1/20 |

Spur Report Mode

Selects the spurious report mode. Options are:

| | | |
|-----------------|----------------|--|
| Limit Line Test | LIMTest | Report only spurs above the limit line. Any spurs reported will cause the measurement to fail. See Abs Start Limit for more information |
| All Spurs | ALL | Report all spurs detected by Peak Threshold and Peak Excursion |
| Minimum Margin | MMARgin | Report only the spur with the minimum margin from the limit line. For the spur above the limit, its margin is defined as the negative margin. If there are more than one spurs above the limit, only one spur with the largest negative margin is reported |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :SPURious :REPT :MODE ALL LIMTest MMARgin</code> <code>[:SENSe] :SPURious :REPT :MODE ?</code> |
| Example | <code>:SPUR :REPT :MODE LIMT</code> <code>:SPUR :REPT :MODE ?</code> |
| Dependencies | MMARgin is available only when option N9060A-7FP is installed |
| Preset | ALL |
| State Saved | Saved in instrument state |
| Range | All Spurs Limit Test Minimum Margin |

Range Settings

This dialog enables you to set range parameters. As you change values, the instrument settings are updated with the new parameter values.

In SA Mode, and most other Modes, each **Range** is defined by its Start Freq and Stop Freq. The index tabs that appear on the left side of this dialog let you change different sets of **Range** parameters; the **Ranges** themselves (Start Freq and Stop Freq) are the same in each of these tabs. In some measurements, **Center Frequency** and **Span** are also shown, but these depend on the Start Freq and Stop Freq parameters for each **Range**.

In MSR Mode, each **Range** is defined by the parameters under the **Frequency** Index tab. The parameters for each **Range** are defined using the other index tabs, tied to the **Frequency** tab by the **Range** number, which appears in the leftmost column of each table.

Each **Range** has an **Enabled** checkbox, which lets you decide whether to use the **Range** or not. The checkbox state is the same for all tabs.

3 WLAN Mode
3.5 Spurious Emissions Measurement

| | |
|-------------|--|
| | 1.5 GHz LTE, LTEAFDD: 9 kHz, 150 kHz, 30 MHz, 1 GHz, 1.92GHz, 1.98 GHz, 2.18 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz WLAN: 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz MSR: 9 kHz, 150 kHz, 30 MHz, 1 GHz, 1.92GHz, 1.98 GHz, 2.18 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz |
| State Saved | Saved in instrument state |
| Min/Max | -80 MHz/Hardware Dependent: - Option 503: 3699999990 - Option 508: 8499999990 - Option 513: 13799999990 - Option 526: 26999999990 |

Stop Freq

Sets the stop frequency of the instrument. This parameter can send up to 20 values.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

| | |
|----------------|---|
| Remote Command | <code>[:SENSE]:SPURious[:RANGE][:LIST]:FREQUENCY:STOP <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGE][:LIST]:FREQUENCY:STOP?</code> |

| State Saved | Yes |
| Min/Max | -79999990/Hardware Dependent: - Option 503: 3.7 GHz - Option 508: 8.5 GHz - Option 513: 13.8 GHz - Option 526: 27.0 GHz |

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, display span is held constant (see "[Range Settings](#)" on [page 750](#)).

The **Center Frequency** setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, then a **Global** tab appears in the **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency:CENTer <freq></code> <code>[:SENSe] :FREQuency:CENTer?</code> |
| Example | Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of " CF Step " on page 735 : <code>:FREQ:CENT UP</code> |

3 WLAN Mode
3.5 Spurious Emissions Measurement

| | |
|------------------------------|--|
| | Return the current value of Center Frequency : :FREQ:CENT? |
| Notes | This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input <ul style="list-style-type: none"> - For RF input it is equivalent to :FREQ:RF:CENT - For I/Q input it is equivalent to :FREQ:IQ:CENT - For External Mixer it is equivalent to :FREQ:EMIX:CENT <p>Preset and Max values depend on Hardware Options</p> <p>If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated</p> |
| Dependencies | Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes |
| Preset | Depends on instrument maximum frequency, Mode, measurement, and selected input See "Center Frequency Presets" on page 755, "RF Center Freq" on page 757, "Ext Mix Center Freq" on page 758, "I/Q Center Freq" on page 759 and "VXT Models with Radio Heads/CIU Frequency Range" on page 757 |
| State Saved | Saved in instrument state |
| Min/Max | Depends on instrument maximum frequency, Mode, measurement, and selected input See "Center Frequency Presets" on page 755, "RF Center Freq" on page 757, "I/Q Center Freq" on page 759 and "VXT Models with Radio Heads/CIU Frequency Range" on page 757 |
| Annotation | Center <value> appears in the lower left corner of the display |
| Status Bits/OPC dependencies | Non-overlapped |

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------------------|----------------------|-----------------------------|-----------------------------|
| 503 (all but CXA) | 1.805 GHz | 3.6 GHz | 3.7 GHz |
| 503 (CXA) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| 507 (all but CXA) | 3.505 GHz | 7.0 GHz | 7.1 GHz |
| 507 (CXA) | 3.755 GHz | 7.5 GHz | 7.58 GHz |
| 508 (all but MXE) | 1.805 GHz | 3.6 GHz | 8.5 GHz |
| 508 (MXE) | 4.205 GHz | 8.4 GHz | 8.5 GHz |
| 513 | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| 526 (except CXA and MXE) | 13.255 GHz | 26.5 GHz | 27.0 GHz* |
| 526 (CXA) | 13.255 GHz | 26.5 GHz | 26.55 GHz |

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|----------------------|-----------------------------|------------------------------------|------------------------------------|
| 526 (MXE) | 1.805 GHz | 3.6 GHz | 27.0 GHz |
| 532 | 16.005 GHz | 32.0 GHz | 32.5 GHz |
| 540 | 20.005 GHz | 40.0 GHz | 40.5 GHz |
| 543 | 21.505 GHz | 43.0 GHz | 43.0 GHz |
| 544 | 22.005 GHz | 44.0 GHz | 45.0 GHz |
| 550 | 25.005 GHz | 50.0 GHz | 52 GHz |
| F03 (CXA-m) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| F07 (CXA-m) | 3.755 GHz | 7.5 GHz | 7.575 GHz |
| F13 (CXA-m) | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| F26 (CXA-m) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 504 (M9421A, M8920A) | 2.145 GHz | 3.88GHz | 3.88 GHz |
| 506 (M9421A, M8920A) | 3.245 GHz | 6.08GHz | 6.08 GHz |
| F06 (M9410A/11A) | 1.0 GHz | 6.08 GHz | 6.08 GHz |
| F06 (M9415A) | 1 GHz | 1.08 GHz | 6.6 GHz |
| F08 (M9415A) | 1 GHz | 1.08 GHz | 8.6 GHz |
| F12 (M9415A) | 1 GHz | 1.08 GHz | 12.9 GHz |

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

| Input | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|---------------------|-----------------------------|------------------------------------|------------------------------------|
| Input 1, all models | 25.005 GHz | 50.0 GHz | 52 GHz |
| Input 2, opt 585 | 42.505 GHz | 85.0 GHz | 86 GHz |
| Input 2, opt 590 | 45.005 GHz | 90.0 GHz | 92 GHz |
| Input 2, opt 5CX | 55.005 GHz | 110.0 GHz | 110 GHz |

Input 2, CXA and MXE

| Model | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------|-----------------------------|------------------------------------|------------------------------------|
| CXA opt C75 | 0.7505 GHz | 1.5 GHz | 1.58 GHz |
| MXE | 505 MHz | 1 GHz | 1.000025 GHz |

Tracking Generator Frequency Limits (CXA only)

3 WLAN Mode
3.5 Spurious Emissions Measurement

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 9 kHz | 3.0 GHz | 3.08 GHz |
| T06 | 9 kHz | 6.0 GHz | 6.05 GHz |

Tracking Generator Frequency Limits(CXA-m only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 2 MHz | 3.08 GHz | 3.08 GHz |
| T07 | 2 MHz | 7.575 GHz | 7.575 GHz |
| T13 | 2 MHz | 13.8 GHz | 13.8 GHz |
| T26 | 2 MHz | 26.55 GHz | 26.55 GHz |

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

| Products with Radio Heads/CIU | Preset | Start frequency | Stop frequency |
|-------------------------------|--------|-----------------|----------------|
| M9421A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU + RRH | 25 GHz | 24.25 GHz | 43.5 GHz |

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code> |
| Example | <code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Dependencies | If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the stop frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning |

| | |
|-------------|--|
| Preset | See "Center Frequency Presets" on page 755 above |
| State Saved | Saved in instrument state |
| Min | -79.999995 MHz |
| Max | See "Center Frequency Presets" on page 755 above. Basically, instrument maximum frequency -5 Hz If the knob or step keys are being used, also depends on span (see "Range Settings" on page 750) |

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code> |
| Example | <code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Couplings | When returning to External Mixing after having switched to one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the Center Frequency that you had. However, span ("Range" on page 749) is not an input-dependent parameter, so the instrument returns to the span from the previous input, limited as necessary by the current mixer setup |
| Preset | When Mode Preset is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited span/range available to it, and cannot achieve the span shown in the table (Range = Stop Freq - Start Freq), the instrument uses the maximum span the measurement allows, and still sets Center Frequency to the midpoint of the start and stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose start and stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after Restore Input/Output Defaults , if you go to External Mixing and do Mode Preset while in Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz |
| State Saved | Yes |
| Min | The minimum frequency in the currently selected mixer band +5 Hz If the knob or step keys are being used, also depends on Range |
| Max | The maximum frequency in the currently selected mixer band -5 Hz If the knob or step keys are being used, also depends on Range |

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:FREQuency:IQ:CENTer <freq></code> <code>[:SENSe]:FREQuency:IQ:CENTer?</code> |
| Example | <code>:FREQ:IQ:CENT 30 MHz</code> |
| Notes | This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode |
| Preset | 0 Hz |
| State Saved | Saved in instrument state |
| Min/Max | -/+40.049995 MHz |

Span

Sets the span of the instrument. This parameter can send up to 20 values. The location where the span occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:SPAN <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:SPAN?</code> |
| Example | <code>:SPUR:FREQ:SPAN 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz</code> <code>:SPUR:FREQ:SPAN?</code> |
| Preset | (Preset of Stop Freq) - (Preset of Start Freq) |
| State Saved | No |
| Min/Max | 0Hz/Instrument maximum frequency + 80MHz |

Res BW

Sets the resolution bandwidth of the instrument. This parameter can send up to 20 values.

3 WLAN Mode
3.5 Spurious Emissions Measurement

| | | |
|---------------------------------|--|---|
| | <code>[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth[:RESolution]:AUTO?</code> | |
| Example | <code>:SPUR:BWID:AUTO ON, ON, ON, OFF, OFF, OFF, OFF, OFF, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, ON, ON</code> <code>:SPUR:BWID:AUTO?</code> | |

| State Saved | Saved in instrument state | |
| Backwards Compatibility SCPI | <code>[:SENSe]:SPURious[:RANGe][:LIST]:BWIDth[:RESolution]:AUTO</code> | |

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer number. It shows a ratio between Integration BW and Resolution BW of the measurement result:

$$\text{Integ BW} = \text{Meas BW} * \text{Resolution BW}$$

Integration BW is desired resolution bandwidth and Resolution BW is actual bandwidth for sweep. Measurement sweeps with Resolution BW and **Meas BW** compensates sweep resolution bandwidth to Integration BW.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

| | | |
|----------------|--|--|
| Remote Command | <code>[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:IMULti <integer>, ...</code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:IMULti?</code> | |

| | |
|------------------------------|---|
| Preset | 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1 |
| State Saved | Yes |
| Max | 1000 |
| Min/Max | 1 |
| Backwards Compatibility SCPI | <code>[:SENSe] : SPURious [:RANGe] [:LIST] : BWIDth : IMULti</code> |

Video BW

Sets the **Video BW** mode of the instrument. This can be Auto, where the instrument determines the optimum setting, or Manual, where you determine the setting. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

| | |
|------------------------------|---|

Auto Function

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See "**Enabled**" on page 751

Frequency Type

Selects the frequency type as either **ABSolute** or **OFFSet**:

ABSolute The frequency range is determined by Abs Start Freq and Abs Stop Freq. Absolute and offset frequencies are not coupled

OFFSet The frequency range is determined based on Offset Start Freq and Offset Stop Freq. Abs Start Freq and Abs Stop Freq are coupled with the offset parameters and show the actual frequency ranges. The following coupling equations are used to calculate Abs Start Freq and Abs Stop Freq

When Offset Side is Negative:

$$[\text{Abs Start Freq}] = [\text{OB Start Freq}] - [\text{Offset Stop Freq}]$$

$$[\text{Abs Stop Freq}] = [\text{OB Start Freq}] - [\text{Offset Start Freq}]$$

When Offset Side is Positive:

$$[\text{Abs Start Freq}] = [\text{OB Stop Freq}] + [\text{Offset Start Freq}]$$

$$[\text{Abs Stop Freq}] = [\text{OB Stop Freq}] + [\text{Offset Stop Freq}]$$

When changing OB Start/Stop Freq, Abs Start/Stop Freq is changed and Offset Start/Stop Freq remains unchanged.

When changing Offset Start/Stop Freq, Abs Start/Stop Freq is changed and OB Start/Stop Freq remains unchanged.

| | |
|----------------|--|
| Remote Command | <pre>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:TYPE ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet</pre> |
| Example | <pre>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:TYPE? :SPUR:FREQ:TYPE OFFS, OFFS, ABS, ABS, ABS :SPUR:FREQ:TYPE?</pre> |
| Couplings | <p>Freq Type automatically changes to OFFSet when you change a value of Offset Start Freq, Offset Stop Freq or Offset Side, and automatically changes to ABSolute when you change a value of Abs Start Freq or Abs Stop Freq</p> |

| State Saved | Saved in instrument state |
| Range | <code>ABSolute OFFSet</code> |

Abs Start Freq

Sets the start frequency of the instrument. This parameter can send up to 20 values. The location where the start frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

This parameter is coupled with either Offset Start Freq or Offset Stop Freq. The coupling equations are shown in ["Enabled" on page 764](#).

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious[:RANGE][:LIST]:FREQUency:STARt <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGE][:LIST]:FREQUency:STARt?</code> |

Abs Stop Freq

Sets the stop frequency of the instrument. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with.

This parameter is coupled with either "Offset Start Freq" on page 766 or "Offset Stop Freq" on page 767. The coupling equations are shown in "Enabled" on page 764.

The location of where the stop frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STOP <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STOP?</code> |

Offset Start Freq

Sets the range frequency as offset from one of the operating band edges. This parameter can send up to 20 values. The location where the start frequency occurs in the list sent to the measurement corresponds to the range the value is associated with. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

This parameter is coupled with either "Abs Start Freq" on page 765 or "Abs Stop Freq" on page 765 using the coupling equations shown in "Enabled" on page 764.

3 WLAN Mode
3.5 Spurious Emissions Measurement

This value is clipped to keep Abs Start/Stop Freq within the available frequency range. This clipping applies even when OB Start Freq, OB Stop Freq or Offset Side is changed.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STARt <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STARt?</code> |
| Example | <code>:SPUR:OFFS:FREQ:STAR 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz</code> <code>:SPUR:OFFS:FREQ:STAR?</code> |
| Preset | 10 MHz, 20 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz |
| State Saved | Saved in instrument state |
| Min/Max | -80 MHz/SA Max Freq - 10Hz (Hardware Dependent) |

Offset Stop Freq

Sets the range frequency as offset from one of operating band edges. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with.

The location of where the stop frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

This parameter is coupled with either ["Abs Start Freq" on page 765](#) or ["Abs Stop Freq" on page 765](#) using the coupling equations shown in ["Enabled" on page 764](#).

This value is clipped to keep Abs Start/Stop Freq inside the available frequency range. This clipping applies even when OB Start Freq, OB Stop Freq or Offset Side is changed.

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See ["Enabled" on page 751](#).

Start Freq

Same as the Start Freq column under the **Bandwidth** tab. See ["Start Freq" on page 752](#). This column does not appear in MSR mode.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** tab. See ["Stop Freq" on page 753](#). This column does not appear in MSR mode.

Center Frequency

Same as the Center column under the **Bandwidth** index tab. See ["Center Frequency" on page 769](#).

Span

Same as the Span column under the **Bandwidth** tab. See ["Span" on page 759](#). This column does not appear in MSR mode.

Sweep Time

Sets the **Sweep Time** mode of the instrument. This can be **Auto**, where the instrument determines the optimum setting, or **Manual**, where you determine the setting.

Limits

Lets you set Start and Stop Limits and Threshold values for each Range.

Frequency Range

Same as **Frequency Range** under the **Bandwidth** tab. See "[Frequency Range](#)" on [page 774](#). This control does not appear in MSR mode.

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See "[Enabled](#)" on [page 751](#).

Start Freq

Same as the Start Freq column under the **Bandwidth** tab. See "[Start Freq](#)" on [page 752](#). This column does not appear in MSR.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** tab. See "[Stop Freq](#)" on [page 753](#). This column does not appear in MSR.

Center Frequency

Same as the Center column under the **Bandwidth** tab. See "[Center Frequency](#)" on [page 769](#). This column does not appear in MSR mode.

Span

Same as the Span column under the **Bandwidth** tab. See "[Span](#)" on page 759. This column does not appear in MSR mode.

Abs Start Limit

Determines the limit above which spurs will report a failing. If Abs Stop Limit Mode is set to **Auto**, this is coupled to **Abs Stop Limit** to make a flat limit line. If set to **Man**, Abs Start Limit and Abs Stop Limit can take different values to make a sloped limit line.

If the Limit Line Test parameter is off, then any spurs that are found to be above the current 'Peak Excursion' are added to the results table. From these spurs, the amplitude is checked using the abs limit start and abs limit stop parameters, then the limit is calculated. An 'F' is appended to the amplitude value of the spur if the measured amplitude is above the limit. If the Limit Line Test is on, only the spurs whose amplitudes exceed the limit are reported.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Abs Stop Limit

Determines the limit above which spurs will report a failing. If Abs Stop Limit Mode is set to **Auto**, this is coupled to **Abs Start Limit** to make a flat limit line. If set to **Man**, Abs Start Limit and Abs Stop Limit can take different values to make a sloped limit line.

Abs Stop Limit Mode, when set to Couple, couples Abs Start Limit and Abs Stop Limit to make a flat limit line. If set to Man, Abs Start and Abs Stop can take different values to make a sloped limit line.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query for this parameter always returns 20 values.

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure

accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 784 below.

| | |
|-------------------------------|--|
| Remote Command | :COUPle ALL |
| Example | :COUP ALL |
| Backwards Compatibility SCPI | :COUPLE ALL NONE |
| Backwards Compatibility Notes | :COUP :NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs |

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

3 WLAN Mode

3.5 Spurious Emissions Measurement

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

| | |
|----------------|----------------------------------|

3.5.8.2 Radio

Contains controls to select Radio Standard and settings.

Radio Std

In this menu, 7 groups of WLAN standards can be selected:

1. 802.11a/b/g/j/p includes 802.11a/g/j/p, 802.11b/g, 802.11g DSSS-OFDM, 802.11j/p 10M, 802.11p 5M
2. 802.11n includes 802.11n 20MHz and 802.11n 40MHz
3. 802.11ac includes 802.11ac 20MHz, 802.11ac 40MHz, 802.11ac 80MHz, 802.11ac 80+80MHz and 802.11ac 160MHz
4. 802.11ah includes 802.11ah1MHz, 802.11ah2MHz, 802.11ah4MHz, 802.11ah 8MHz, and 802.11ah16MHz
5. 802.11af includes 802.11af 6MHz, 802.11af 7MHz and 802.11af 8MHz
6. 802.11ax includes 802.11ax 20MHz, 802.11ax 40MHz, 802.11ax 80MHz, 802.11ax 80+80MHz and 802.11ax 160MHz
7. 802.11be includes 802.11be 20MHz, 802.11be 40MHz, 802.11be 80MHz, 802.11be 160MHz and 802.11be 320MHz

Below each standard, parameters related to demodulation can be set, such as Modulation Format, Guard Interval, and so on.

3.5.8.3 Advanced

Contains controls for setting advanced functions of the instrument.

This tab does not appear in VXT.

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer), support two states of NFE, Full and Adaptive. The **ON** state (in Modes that do not support Adaptive NFE) matches the **FULL** state (in Modes that *do* support Adaptive NFE).

In **ON** or **FULL** NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off

case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact in having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, therefore it does nothing when **External Mixing** is selected.

In Modes that support Adaptive NFE, the default state of NFE is **Adaptive**. In Modes that do not support Adaptive NFE, the default state of NFE is **OFF**. Prior to the introduction of Adaptive NFE (firmware version A. 18.00), the default state of NFE was **OFF** for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On/Off** to **Full/Adaptive/Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0]` is retained, default changed to On for modes which support Adaptive NFE

`[[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0]` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON` plus
`:CORRection:NOISe:FLOor:ADAPtive ON`

Remote Command `[[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0]`

`[[:SENSe]:CORRection:NOISe:FLOor?`

Example `:CORR:NOIS:FLO ON`

3 WLAN Mode

3.5 Spurious Emissions Measurement

| | |
|----------------|--|
| Dependencies | Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect) |
| Couplings | If NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed If NFE is enabled via SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue |
| Preset | Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive |
| State Saved | No |
| Remote Command | <code>[:SENSe]:CORRection:NOISe:FLOor:ADApTive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor:ADApTive?</code> |
| Example | First turn NFE on, this is Full mode <code>:CORR:NOIS:FLO ON</code> Then set it to Adaptive <code>:CORR:NOIS:FLO:ADAP ON</code> |
| Dependencies | Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command is accepted without error, but has no effect |
| Couplings | Sending <code>:CORR:NOIS:FLO ON</code> turns NFE Adaptive OFF for backwards compatibility, so to turn Adaptive on, you must issue the commands in the proper order, as shown in the example above |
| Preset | Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults |
| State Saved | No |

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving

just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and

when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you Cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

3.5.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 1850) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|------------------------------|--|
| Remote Command | <code>:INSTRument:COUPle:FREQuency:CENTer ALL NONE</code> <code>:INSTRument:COUPle:FREQuency:CENTer?</code> |
| Example | <code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code> |
| Preset | Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |
| Preset | OFF |
| Backwards Compatibility SCPI | <code>:GLOBal:FREQuency:CENTer[:STATE] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATE]?</code> |

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 1852 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

| | |
|----------------|--|
| Remote Command | <code>:INSTRument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPle:EMC:STANdard?</code> |
| Example | <code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code> |
| Dependencies | Only available if Option EMC is installed |
| Preset | Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes |
| Range | ALL NONE |

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

| | |
|---------------------------------|----------------------------|
| Remote Command | :INSTrument:COUPle:DEFault |
| Example | :INST:COUP:DEF |
| Backwards Compatibility SCPI | :GLOBal:DEFault |

3.5.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.5.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 794

| | |
|----------------|---|
| Remote Command | :INITiate:CONTinuous OFF ON 0 1 :INITiate:CONTinuous? |
| Example | Put instrument into Single measurement operation: :INIT:CONT 0 :INIT:CONT OFF Put instrument into Continuous measurement operation: :INIT:CONT 1 :INIT:CONT ON |
| Preset | ON |

Note that **:SYST:PRES** sets **:INIT:CONT** to **ON**, but ***RST** sets **:INIT:CONT** to **OFF**

| | |
|-------------------------------|---|
| State Saved | Saved in instrument state |
| Annunciation | <p>The Single/Continuous icon in the Meas Bar changes depending on the setting:</p> <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous |
| Backwards Compatibility Notes | <p>X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and INIT:CONT ON) switched to continuous measurement, but never restarted a measurement and never reset a sweep</p> <p>X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep</p> |

More Information

| | |
|-----------------|---|
| Continuous Mode | <p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p> |
| Single Mode | <p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p> |

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1853 for details of **:INIT:IMMediate**.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 796

| | |
|------------------------------|--|
| Remote Command | <code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code> |
| Example | <code>:INIT:IMM</code> <code>:INIT:REST</code> |
| Notes | <code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function |
| Couplings | Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement |
| Status Bits/OPC dependencies | This is an Overlapped command The <code>STATus:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUESTionable</code> register bit 9 (<code>INTEgrity</code> sum) is cleared The <code>SWEEPING</code> bit is set |

| | |
|-------------------------------|---|
| | The MEASURING bit is set |
| Backwards Compatibility Notes | For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well |

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** > 1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TC ON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

| Event | Trace Effect |
|---|--|
| Clear/Write pressed (even if already in Clear/Write) | Set to mintracevalue |
| Max Hold pressed (even if already in Max Hold) | Set to mintracevalue |
| Min Hold pressed (even if already in Min Hold) | Set to maxtracevalue |
| Trace Average pressed (even if already in Trace Average) | Trace data unaffected but start new sweep/avg/hold |
| Restart pressed | Trace data unaffected but start new sweep/avg/hold |
| Parameter requiring restart changed (e.g., RBW) | Trace data unaffected but start new sweep/avg/hold |

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

| | |
|----------------|---|
| Remote Command | <code>:INITiate:PAUSe</code> <code>:INITiate:RESume</code> |
| Example | <code>:INIT:PAUS</code> <code>:INIT:RES</code> |
| Dependencies | Not displayed in Modes that do not support pausing |
| Annotation | Only on control |

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

| | |
|------------------------------|--|
| Remote Command | <code>:ABORt</code> |
| Example | <code>:ABOR</code> |
| Notes | If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met |
| Dependencies | For continuous measurement, <code>:ABORt</code> is equivalent to the Restart key Not all measurements support this command |
| Status Bits/OPC dependencies | The <code>STATus:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUESTionable</code> register bit 9 (INTEGRity sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORt</code> , the Abort command will cause the <code>*OPC</code> query to return true |

3.5.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Type

Sets the **Sweep Type** of the spurious measurement to either **Auto** or **Swept**.

When in **Auto**, the selections of swept type of ranges are governed by the Best Speed Sweep Type Rule, and FFT analysis might be chosen for some ranges if it speeds up the measurement.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:SPURious[:RANGe]:ALL:SWEep:TYPE:AUTO OFF ON 0 1</code> <code>[:SENSe]:SPURious[:RANGe]:ALL:SWEep:TYPE:AUTO?</code> |
| Example | <code>:SPUR:ALL:SWE:TYPE:AUTO 1</code> <code>:SPUR:ALL:SWE:TYPE:AUTO?</code> |
| Dependencies | Available only when Option N9060A-7FP is installed |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | Auto Swept |
| Annotation | When in Auto , and the instrument is in FFT analysis, an indicator, “FFT” is displayed at the right bottom of range spectrum trace window |

Sweep Time Rules

Switches the instrument between **NORMa1** and **ACCuracy** sweep states.

Setting **Auto Sweep Time** to **Accy** (**ACCuracy**) results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the **Preset** state, instrument amplitude accuracy specifications do not apply.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:SPURious:SWEep:TIME:AUTO:RULEs NORMa1 ACCuracy</code> <code>[:SENSe]:SPURious:SWEep:TIME:AUTO:RULEs?</code> |
| Example | <code>:SPUR:SWE:TIME:AUTO:RUL ACC</code> |

| | |
|--------------|--|
| | <code>:SPUR:SWE:TIME:AUTO:RUL?</code> |
| Notes | This command is implemented as <code>[:SENSe]:SPURious [:RANGe] [:LIST]:SWEep:TIME:AUTO:RULEs</code> to avoid illegal SCPI node definition, so this command should be used as <code>[:SENSe]:SPURious:SWEep:TIME:AUTO:RULEs</code> |
| Dependencies | Does not appear in SA Mode in VXT |
| Preset | <code>NORMal</code> |
| State Saved | Saved in instrument state |
| Range | <code>NORMal ACCuracy</code> |

3.5.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The "Trace Control" on page 1728 tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points* - 1) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator

The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

The Invalid Data Indicator is also turned on:

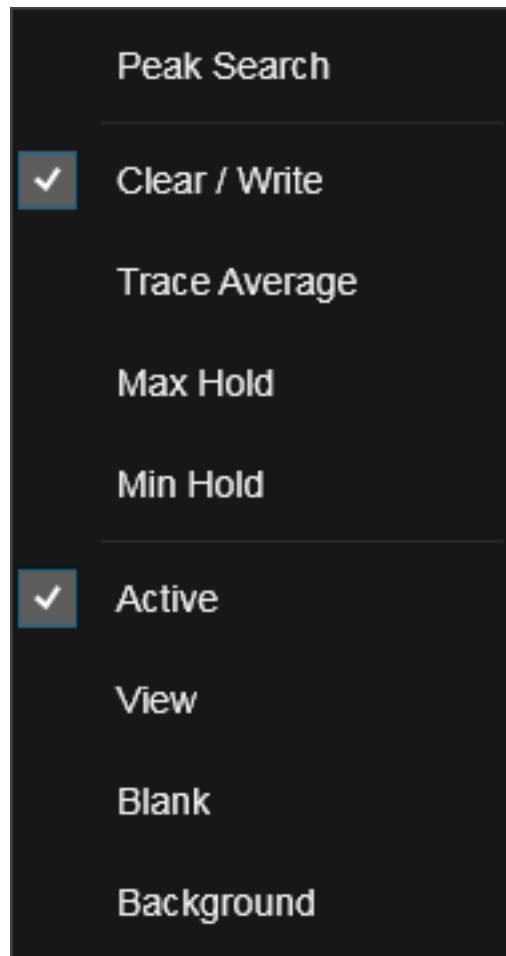

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE

The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.

Trace right-click menu

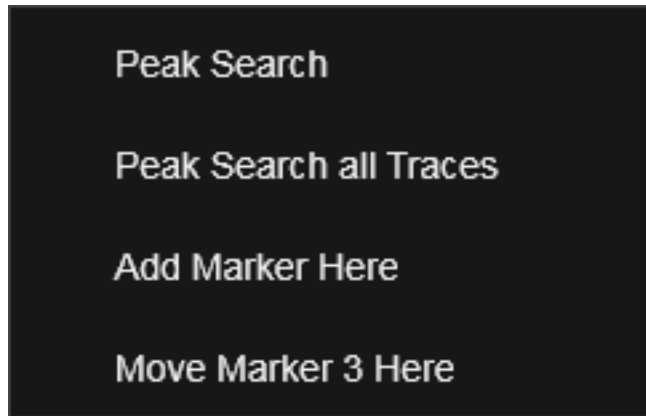

If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:

If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on [page 1728](#). **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on [page 1734](#) type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:

In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT's, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^), which moves across the bottom of the graticule showing the current trace point.

Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:

Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

| | |
|---|---------------|
| W | Clear/Write |
| A | Trace Average |
| M | Max Hold |
| m | Min Hold |

If the letter is white, it means the trace is being updated (**Update = ON**); if the letter is dimmed, it means the trace is not being updated (**Update = OFF**). A strikethrough indicates that the trace is blanked (**Display = OFF**). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

| | |
|---|---------------|
| N | Normal |
| A | Average |
| P | peak |
| p | negative peak |
| S | Sample |
| Q | Quasi Peak |
| E | EMI Average |
| R | RMS Average |
| f | math function |

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

3 WLAN Mode

3.5 Spurious Emissions Measurement

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is **ON**, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the **"Math Function"** on page 815.

The detector labels are:

| | |
|----------------|---|
| NORM | Normal |
| PEAK | Peak |
| SAMP | Sample |
| NPEAK | Negative Peak |
| RMS | Average detector with Power Average (RMS) |
| LG AVG | Average detector with Log-Pwr Average |
| VAVG | Average detector with Voltage Average |
| QPEAK | Quasi Peak |
| EMI AVG | EMI Average |
| RMS AVG | RMS Average |

The trace math labels are:

| | |
|-------------|------------------|
| PDIF | Power Difference |
| PSUM | Power Sum |
| LOFF | Log Offset |
| LDIF | Log Difference |

3.5.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

| | |
|--------------|---|
| Notes | The selected trace is remembered even when not in the Trace menu |
| Dependencies | For the Swept SA measurement: <ul style="list-style-type: none"> - In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View - When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled |
| Preset | Trace 1 |
| State Saved | Yes |

3.5.10.2 Trace Control

The controls on this tab allow you to set the "**Trace Type**" on page 1728 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "**View/Blank**" on page 1734 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

| Option | Parameter | SCPI Example | Details |
|---------------|-----------|------------------|--|
| Clear/Write | WRITe | :TRAC2:TYPE WRIT | See: " Clear/Write " on page 810 |
| Trace Average | AVERage | :TRAC2:TYPE AVER | See: " Trace Average " on page 810 |
| Maximum Hold | MAXHold | :TRAC3:TYPE MAXH | See: " Max Hold " on page 811 |
| Minimum Hold | MINHold | :TRAC5:TYPE MINH | See: " Min Hold " on page 811 |

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "[View/Blank](#)" on page 1734 state must be set to **Active** (**Update: ON, Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "[Trace Mode Backwards Compatibility Commands](#)" on page 808

| | |

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1734.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The **:TRACe:MODE** command is retained for backwards compatibility, and the **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay** commands introduced for ongoing use. The old Trace Modes are selected using **:TRAC:MODE**, whose parameters are mapped into calls to **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay**, and the old global Averaging command **[:SENSe]:AVERage[:STATe]** is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or **:INIT:IMM**, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

| | |
|-------------------------------|---|
| Preset | WRITE |
| State Saved | The trace mode is an alias only |
| Backwards Compatibility SCPI | :TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK :TRACe[1] 2 ... 6:MODE? |
| Backwards Compatibility Notes | <p>The legacy :TRACe:MODE command is retained for backwards compatibility. In conjunction with the legacy :AVERage command, it works as follows:</p> <ul style="list-style-type: none"> – :AVERage ON OFF sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the [:SENSe]:AVERage[:STATe] command description below – :TRACe:MODE WRITE sets :TRACe:TYPE WRITE (Clear/Write) unless average is true, in which case it sets it to :TRACe:TYPE AVERage. It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace – :TRACe:MODE MAXHold sets :TRACe:TYPE MAXHold (Max Hold). It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace |

3 WLAN Mode

3.5 Spurious Emissions Measurement

- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

| | |
|-------------------------------|--|
| Preset | <code>OFF</code> |
| State Saved | The state of Average is saved in Instrument State for ghosting purposes |
| Backwards Compatibility SCPI | <code>[:SENSe]:AVERAge[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERAge[:STATe]?</code> |
| Backwards Compatibility Notes | <p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERAge[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERAge[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p> |

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1728 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

| | |
|-------------------|--|
| Active | Update and Display both ON |
| View | Update OFF ; Display ON |
| Blank | Update OFF ; Display OFF |
| Background | Update ON , Display OFF |

Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

3 WLAN Mode
3.5 Spurious Emissions Measurement

See: ["More Information" on page 814](#)

| | |
|--------------|--|
| Notes | For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 813 and "Trace Display State On/Off" on page 813 below |
| Dependencies | When Signal ID is on, this key is grayed-out |
| Couplings | <p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending <code>[:SENS] :DET :TRAC</code>) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 815 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p> |

Trace Update State On/Off

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode): <code>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 ... 6:UPDate[:STATe]?</code></p> <p>For all other measurements: <code>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</code></p> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <p>Make trace 2 inactive (stop updating): <code>:TRAC2:UPD 0</code></p> |
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
| Preset | <p>For Swept SA Measurement (in SA Mode): <code>1 0 0 0 0 0</code> ON for Trace 1; OFF for 2–6</p> <p>For all other measurements: <code>1 0 0</code> ON for Trace 1; OFF for 2 & 3</p> |
| State Saved | Saved in instrument state |

Trace Display State On/Off

| | |
|----------------|--|
| Remote Command | <p>For Swept SA Measurement (in SA Mode): <code>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</code></p> <p>For all other measurements:</p> |
|----------------|--|

| | |
|-------------|--|
| | <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p> |
| Example | <p>Make trace 1 visible:</p> <pre>:TRAC2:DISP 1</pre> <p>Blank trace 3:</p> <pre>:TRAC3:DISP 3</pre> |
| Couplings | Whenever you set Update to ON for any trace, the Display is set to ON for that trace |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p> |
| State Saved | Saved in instrument state |

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.5.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 821 controls.

- See "How trace math is processed" on page 819

Remote Command For option details, see "Trace Math Options" on page 817

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate:MATH? <trace_num>
```

where <trace_num> is any one of:

```
TRACe1|...|TRACe6
```

For all other measurements:

```
:CALCulate:<meas>;MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

<meas> is the identifier for the current measurement, and

<trace_num> is any one of:

```
TRACe1|TRACe2|TRACe3
```

Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACe3,PDIF,TRACe1,TRACe2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACe3,PSUM,TRACe1,TRACe2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACe3,LOFF,TRACe1,TRACe2,-6.00,0
```

| | |
|--------------|---|
| | <p>Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB</p> <p><code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code></p> <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0</code></p> <p>Turns off trace math for trace 1</p> |
| Notes | <p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> -Set 2 defines the “function”: <code>PDIFference PSUM LOFFset LDIFference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p> |
| Dependencies | <p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p> |
| Couplings | When a math function is changed for a trace, that trace is set to Display = ON ; and Update = ON |
| Preset | <p>For Swept SA Measurement (in SA Mode):</p> <p><code>OFF,TRACE5,TRACE6,0,0 OFF,TRACE6,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0 </code> <code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE4,0,0 OFF,TRACE4,TRACE5,0,0</code></p> <p>For all other measurements:</p> <p><code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0</code></p> |
| State Saved | The trace math function for each trace is saved in instrument state |
| Annunciation | An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; |

| | |
|------------------------------|---|
| | and the function is annotated on the trace if Trace Annotation is on |
| Status Bits/OPC dependencies | *OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep |

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log_{10}(10^{(1/10)(\text{FirstTrace})} - 10^{(1/10)(\text{SecondTrace})})$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

| | |
|--------------|---|
| Example | <p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre> |
| Notes | See " Math Function " on page 815 for how to specify Operands 1 and 2 using :CALCulate:MATH |
| Dependencies | The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown |
| Preset | Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace |

| | |
|-------------|---|
| | 5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5 |
| State Saved | Operands 1 and 2 for each trace are stored in instrument state |

Offset

Used by the Log Offset math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code> |
| State Saved | The Log Offset value for each trace is saved in Instrument State |
| Min | -100 dB |
| Max | 100 dB |

Reference

Used by the Log Diff math function.

| | |
|-------------|---|
| Example | The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code> |
| State Saved | The Log Difference reference value for each trace is saved in instrument state |
| Min/Max | Same as reference level |

3.5.10.4 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **"To Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 823** when a **"Copy" on page 823** or **"Exchange" on page 824** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 823** and **"To Trace" on page 823** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`

For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`

where `<meas>` is the identifier for the current measurement

Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1,TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>,<dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`

For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 823 and "To Trace" on page 823 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

| | |
|----------------|--|
| Remote Command | For Swept SA Measurement (in SA Mode): :TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6 For all other measurements: :TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3 where <meas> is the identifier for the current measurement Note that the format of the :TRACe<n> parameter differs from that for the Swept SA Measurement |
| Example | Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: :TRAC:EXCH TRACE1,TRACE2 |
| Notes | The command is of the form: :TRACe:EXCHange <trace_1>,<trace_2> |
| Couplings | Both traces are put in View (Update=Off, Display=On) after the exchange |

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

| | |
|----------------|--|
| Remote Command | :TRACe[:<meas>]:PRESet:ALL |
| Example | :TRAC:PRE:ALL |
| Dependencies | When Signal ID is on, this key is grayed-out |

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads **mintracevalue** into all of the points for all traces, except traces in **Min Hold**, in which case it loads **maxtracevalue**, even if **Update = OFF**.

| | |
|----------------|--|
| Remote Command | :TRACe[:<meas>]:CLEar:ALL |
| Example | :TRAC:CLE:ALL |
| Dependencies | When Signal ID is on, this key is grayed-out |

3.5.10.5 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

| | |
|----------------|--|
| Remote Command | <pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre> |
| Example | <pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre> |
| Dependencies | In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled |
| Preset | TRACe1 |
| State Saved | No |
| Range | Trace 1 Trace 2 Trace 3 |

3.6 Modulation Analysis Measurement

This measurement provides modulation analysis capabilities for signals complying with 802.11a/b/j/p/g/n/ac/ah/af/ax/be standards. The definition and requirement for modulation analysis measurement in different standards refer to the following table:

| Standard | Date | Sections |
|-------------------------------|---------|--|
| IEEE Std 802.11a-1999(R2003) | 2003-06 | 17.3.9.4 |
| | | 17.3.9.5 |
| | | 17.3.9.6 |
| | | 17.3.9.7 |
| IEEE Std 802.11b-1999(R2003)) | 2003-06 | 18.4.7.4 |
| | | 18.4.7.5 |
| | | 18.4.7.7 |
| | | 18.4.7.8 |
| IEEE Std 802.11g-1999(R2003) | 2003-06 | ERP OFDM: refer to 11a sections |
| | | ERP DSSS/PBCC/CCK: refer to 11b sections |
| | | DSSS-OFDM: 19.7.2.7 |
| IEEE Std 802.11n™ | 2009-06 | 20.3.20.4 |
| | | 20.3.20.7 |
| IEEE P802.11ac™/D1.1 | | 22.3.19.6 |
| IEEE P802.11ah™/D0.2 | | 23.3.17.4 |
| IEEE Std 802.11af™-2013 | 2013 | 23.3.18.4 |
| IEEE Std 802.11ax D1.0 | 2016 | 28.3.18.4 |
| IEEE Std 802.11be D1.0 | 2021 | 36.3.18.4 |

This measurement does not provide the users with complete demod bits for PBCC.

The WLAN application automatically handles all 802.11b signal formats, including the short preamble and the PBCC formats (though it doesn't decode the bits of the PBCC formats). The WLAN automatically handles all 802.11g formats that are compatible with 802.11b, including the PBCC22 and PBCC33 modes (though it again doesn't decode the bits of these PBCC formats).

This measurement is dedicated for WLAN.

Modulation Analysis Measurement Commands

The following commands are used to retrieve the measurement results:

```
:CONFigure:EVM
:CONFigure:EVM:NDEFault
:INITiate:EVM
```

3 WLAN Mode
3.6 Modulation Analysis Measurement

`:FETCh:EVM[n]?`

`:READ:EVM[n]?`

`:MEASure:EVM[n]?`

Remote Command Results for Modulation Analysis Measurement

When Radio Std is 802.11ac/ax 80+80MHz, these measurement results are also for one channel. Using SCPI `:CALCulate:EVM:SEGM` to specify that these contents are the first segment results or the second segment results.

For Radio Std = 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be

| Index: n | Results Returned |
|----------------------|--|
| 0 | Returns unprocessed I/Q trace data of Capture Interval, as a series of trace point values. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values |
| 1 (or not specified) | <p>Returns the following 60 comma-separated scalar results</p> <p>Result 41 and 42 are -999, reserved for 802.11b/g (DSSS/CCK/PBCC);</p> <p>Result 44 and 45 are for 802.11a/g/j/p (OFDM), 802.11g(DSSS-OFDM), 802.11n, 802.11ac, 802.11ax, 802.11af and 802.11be;</p> <p>Result 44 and 45 are -999 for 802.11ah</p> <p>“Avg” means the average of the individual measurements when averaging is on</p> <p>“Max” means the maximum of the individual measurements when averaging is on</p> <p>The following are 60 scalar results:</p> <ol style="list-style-type: none"> 1. | 51. | Symbol Index for Peak Unused Tone Error Max (It will be -999.0 if radio std is NOT 11ax or 11be) |
| 52. | Ru Index for Peak Unused Tone Error Max (It will be -999.0 if radio std is NOT 11ax or 11be) |
| 53. | HE/EHT PPDU type (it is 0~6 and will always be -999 if radio std is NOT 11ax or 11be) |
| | For the 53rd result, HE/EHT PPDU type, the returned integer means: |
| 0 | HE_SU |
| 1 | HE_MU |
| 2 | HE_Extended Range SU |
| 3 | HE_TriggerBased |
| 4 | HE_SU_Sounding_NDP |
| 5 | HE_TriggerBased_NDP |
| 6 | EHT_MU |
| 7 | EHT_TriggerBased |
| 8 | EHT_Sounding_NDP |
| -999 | Unknown |
| 54. | Common Pilot Error Max (Degree) (If radio std is NOT 11ac, 11n, 11ah, 11ax or 11be, it will be -999.0. If radio std is 11n or 11ah, but the firmware version is prior to A.26.00 or the version of N9077EM0E-1FP is prior to 2020.0220, it returns -999.0) |
| 55. | Common Pilot Error Avg (Degree) (If radio std is NOT 11ac, 11n, 11ah, 11ax or 11be, it will be -999.0. If radio std is 11n or 11ah, but the firmware version is prior to A.26.00 or the version of N9077EM0E-1FP is prior to 2020.0220, it returns -999.0) |

| Index: n | Results Returned | | | | | | | | | | |
|----------|--|---|---------|---|---------|---|---------|---|---------|---|---------|
| 56. | Packet Extension Duration (us) (it will be -999.0 if radio std is NOT 11ax or 11be) | | | | | | | | | | |
| 57. | Guard Interval of Trigger-based PPDU Guard Interval (us) (it will be -999.0 if radio std is NOT 11ax or 11be) | | | | | | | | | | |
| 58. | HE-LTF/EHT-LTF type of Trigger-based PPDU if radio std is 11ax/11be; it will be -999.0 if radio std is NOT 11ax or 11be HE-LTF Type of Trigger-based PPDU, the returned integer means: <table border="0"> <tr> <td>0</td> <td>1 x LTF</td> </tr> <tr> <td>1</td> <td>2 x LTF</td> </tr> <tr> <td>2</td> <td>4 x LTF</td> </tr> </table> EHT-LTF Type of Trigger-based PPDU, the returned integer means: <table border="0"> <tr> <td>1</td> <td>2 x LTF</td> </tr> <tr> <td>2</td> <td>4 x LTF</td> </tr> </table> | 0 | 1 x LTF | 1 | 2 x LTF | 2 | 4 x LTF | 1 | 2 x LTF | 2 | 4 x LTF |
| 0 | 1 x LTF | | | | | | | | | | |
| 1 | 2 x LTF | | | | | | | | | | |
| 2 | 4 x LTF | | | | | | | | | | |
| 1 | 2 x LTF | | | | | | | | | | |
| 2 | 4 x LTF | | | | | | | | | | |
| 59. | The minimal Meas Interval for successful PSDU CRC decoding (if the Firmware Version is below A.22.00, it returns -999.0 which means Invalid) | | | | | | | | | | |
| 60. | PSDU CRC for 802.11a/11n/11ac/11af (if the Firmware Version is below A.22.00 or it is not 802.11a/11n/11ac/11af , 1 means Fail, 0 means Pass, -999 means Invalid) | | | | | | | | | | |
| 61. | Duty On Period (Unit is microseconds, it is the pulse width, if the Firmware Version is below A.30.00 or it is not found, it returns -999.0 which means Invalid.-999.0 means invalid) | | | | | | | | | | |
| 62. | Duty Off Period (Unit is microseconds, it is (pulse period – pulse width), if the Firmware Version is below A.30.00 or it is not found, it returns -999.0 which means Invalid.) | | | | | | | | | | |
| 63. | Duty Cycle (Unit is %, it is pulse width / pulse period, if the Firmware Version is below A.30.00 or (either Duty On or Off is not found), it returns -999.0 which means Invalid) | | | | | | | | | | |
| 64. | Average RMS ccEVM, if the Firmware Version is below A.33.00 or Cross-Correlated EVM is off, it returns -999.0 which means Invalid. Here “Average” means using data of each measurement in measurement loop to calculate RMS ccEVM. ccEVM is not accurate and can't reflect source EVM if data point is not sufficient, use more data points (average number * Data Points), then it can lead to a more stable and accurate ccEVM result. It will not only benefit for the cases that data point is obviously not sufficient (small BW, small MCS, small symbol length), for all cases, it will lead to a more accurate ccEVM result, the key point is to balance time and improvement | | | | | | | | | | |
| 65. | Valid data points that used to calculate ccEVM, if the Firmware Version is below A.33.00 or ccEVM is off, it returns -999.0 which means Invalid | | | | | | | | | | |
| 66. | Total data points that used to calculate ccEVM, if the Firmware Version is below A.33.00 or ccEVM is off, it returns -999.0 which means Invalid | | | | | | | | | | |
| 67. | Partial Burst Power Max (dBm), if the Firmware Version is below A.36 Minor or Radio Std is not 11n/ac/ax/be, returns -999.0, which means Invalid. Valid when Radio Std is 11agjp if Radio Std Detection is auto, but invalid if Radio Std Detection is Manual | | | | | | | | | | |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| Index: n | Results Returned |
|----------|---|
| 68. | Partial Burst Power Avg(dBm) if the Firmware Version is below A.36 Minor or Radio Std is not 11n/ac/ax/be, returns -999.0, which means Invalid. Valid when Radio Std is 11agjp if Radio Std Detection is auto, but invalid if Radio Std Detection is Manual |
| 2 | EVM vs. Symbol trace returns series of floating-point numbers (in percent) that represent each sample in the EVM vs. Symbol trace of Capture Interval. The first number is the symbol 0 decision point |
| 3 | EVM vs. Carrier trace returns series of floating-point numbers (in percent) that represent each sample in the EVM vs. Carrier trace of Capture Interval |
| 7 | Corrected measured trace returns series of floating-point numbers that alternately represent I and Q pairs of the corrected measured trace. The magnitude of each I and Q pair are normalized to 1.0, when the IQ Normalize is turned on. The first number is the in-phase (I) sample and the second is the quadrature-phase (Q) sample |
| 8 | Returns Demod Bits |
| 9 | Returns 4 comma-separated scalar values of the pass/fail (0.0 = passed, or 1.0 = failed) results determined by testing the following items 802.11 standard (OFDM) specifies that EVM or IQ offset Pass/Fail test should use average values <ol style="list-style-type: none"> 1. Test result of RMS EVM(Avg) 2. Test result of Frequency Error(Max) 3. Test result of symbol clock error(Max) 4. Test result of I/Q Origin Offset(Avg) |
| 10 | If radio stand is 11n, returns the decode bits of HT-SIG Signal If radio stand is 11ac, returns the decode bits of VHT-SIG-A and VHT_SIG_B Signal. The trace length depends on radio standards |

| Radio Standard | Trace Length |
|-----------------|--------------|
| 802.11ac 20M | 48 + 26 |
| 802.11ac 40M | 48 + 27 |
| 802.11ac 80M | 48 + 29 |
| 802.11ac 160M | 48 + 29 |
| 802.11ac 80+80M | 48 + 29 |

If radio standard is 11ah and PPDU format is greater than or equal to 2 MHz long format, return the decode bits of SIG-A and SIG-B signal. The trace length depends on radio standard and MU/SU

| SU/MU | Radio Standard | Trace Length |
|-------|----------------|--------------|
| SU | - | 48 |
| MU | 802.11ah 2M | 48 + 26 |
| MU | 802.11ah 4M | 48 + 27 |
| MU | 802.11ah 8M | 48 + 29 |
| MU | 802.11ah 16M | 48 + 29 |

| 32 | HE-SIG-B / EHT-SIG channel 1 contents |

NOTE

The results will not be available unless radio standard is 802.11ax/be

For 802.11ax

It will return HE-SIG-B contents for channel 1 which is defined by 11ax specification

The returned values are float, each float number represents one bit (i.e., 1.0 means bit 1 and 0.0 means bit 0)

The format of the returned values are:

| Radio Standard | Returned Values |
|----------------------------|--|
| 11ax 20 M or 11ax 40M | RU1-242(8 bits), CRC(4 bits), Tail(6 bits), HE-SIG-B user field (bits are variable depending on the number of users) |
| 11ax 80 M | RU1-242(8 bits), RU3-242(8 bits), Center 26-tone RU (1 bit), CRC(4 bits), Tail(6 bits), HE-SIG-B user field (bits are variable depending on the number of users) |
| 11ax 160 M or 11ax 80+80 M | RU1-242(8 bits), RU3-242(8 bits), RU5-242(8 bits), RU7-242(8 bits),Center 26-tone RU (1 bit), CRC(4 bits), Tail(6 bits), HE-SIG-B user field (bits are variable depending on the number of users) |

The definitions of RU1, RU3, RU5 and RU7 refer to 802.11ax specification HE-SIG-B part

For 802.11be

3 WLAN Mode
3.6 Modulation Analysis Measurement

Index: n Results Returned

It will return EHT-SIG contents for channel 1 which is defined by 11be specification
 The returned values are float, each float number represents one bit (i.e., 1.0 means bit 1 and 0.0 means bit 0)
 EHT-SIG contents contains common field and user specific field
 For non-OFDMA transmission, common field include U-SIG overflow bits and Number of non-OFDMA users
 For EHT Sounding NDP, common field include U-SIG overflow bits, CRC and Tail
 For OFDMA transmission, common field include U-SIG overflow bits, RU Allocation subfields, CRC and Tail
 The detailed return value for OFDMA transmission are:

| Radio Standard | Returned Values |
|-----------------|---|
| 11be 20 M / 40M | U-SIG overflow(17 bits), RU Allocation-1(9 bits), CRC(4 bits), Tail(6 bits), EHT-SIG user field (bits are variable depending on the number of users) |
| 11be 80M | U-SIG overflow(17 bits), RU Allocation-1(9 bits), RU Allocation-1(9 bits), CRC(4 bits), Tail(6 bits), EHT-SIG user field (bits are variable depending on the number of users) |
| 11be 160M | U-SIG overflow(17 bits), RU Allocation-1 (9 bits), RU Allocation-1 (9 bits), CRC(4 bits), Tail(6 bits), RU Allocation-2 (9 bits), RU Allocation-2 (9 bits), CRC(4 bits), Tail(6 bits), EHT-SIG user field (bits are variable depending on the number of users) |
| 11be 320M | U-SIG overflow(17 bits), RU Allocation-1 (9 bits), RU Allocation-1 (9 bits), CRC(4 bits), Tail(6 bits), RU Allocation-2 (9 bits), RU Allocation-2 (9 bits), RU Allocation-2 (9 bits), RU Allocation-2 (9 bits), RU Allocation-2 (9 bits), RU Allocation-2 (9 bits), CRC(4 bits), Tail(6 bits), EHT-SIG user field (bits are variable depending on the number of users) |

33 HE-SIG-B / EHT-SIG channel 2 contents

NOTE **The results will not be available unless radio standard is 802.11ax/be**

For 11ax
 It will return HE-SIG-B contents for channel 2 which is defined 11ax specification
 The returned values are float, each float number represents one bit (i.e., 1.0 means bit 1 and 0.0 means bit 0)
 The format of the returned values are:

| Radio Standard | Returned Values |
|----------------|--|
| 11ax 20 M | -999.0 |
| 11ax 40M | RU2-242(8 bits), CRC(4 bits), Tail(6 bits), HE-SIG-B user field (bits are variable depending on the number of users) |

| -999 | StdModeUnknown |

3. Standard Format

If radio standard is either of 11a/11n/11ac/11af/11ax/11be,

| Returned Value | Standard Format | Meaning |
|----------------|-----------------|--|
| 0 | Std80211a | A non-HT (Legacy) 20 MHz IEEE 802.11a signal was found |
| 1 | Std80211n20GF | An IEEE 802.11n HT-greenfield 20 MHz signal was found |
| 2 | Std80211n20MM | An IEEE 802.11n HT-mixed Mode 20 MHz signal was found |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| Index: n | Results Returned | | |
|----------|------------------|-----------------|--|
| | Returned Value | Standard Format | Meaning |
| 3 | | Std80211n40GF | An IEEE 802.11n HT-greenfield 40 MHz signal was found |
| 4 | | Std80211n40MM | An IEEE 802.11n HT-mixed Mode 40 MHz signal was found |
| 5 | | Std80211ac40DL | An IEEE 802.11 40 MHz non-HT Duplicate signal was found |
| 6 | | Std80211ac20 | An IEEE 802.11 ac 20 MHz VHT signal was found |
| 7 | | Std80211ac40 | An IEEE 802.11 ac 40 MHz VHT signal was found |
| 8 | | Std80211ac80 | An IEEE 802.11 ac 80 MHz VHT signal was found |
| 9 | | Std80211ac160 | An IEEE 802.11 ac 160 MHz VHT signal was found |
| 10 | | Std80211ac80DL | An IEEE 802.11 80 MHz non-HT Duplicate signal was found |
| 11 | | Std80211ac160DL | An IEEE 802.11 160 MHz non-HT Duplicate signal was found |
| 12 | | Std80211ax20 | An IEEE 802.11 ax 20 MHz VHT signal was found |
| 13 | | Std80211ax40 | An IEEE 802.11 ax 40 MHz VHT signal was found |
| 14 | | Std80211ax80 | An IEEE 802.11 ax 80 MHz VHT signal was found |
| 15 | | Std80211ax160 | An IEEE 802.11 ax 160 MHz VHT signal was found |
| 16 | | Std80211be20 | An IEEE 802.11 be 20 MHz EHT signal was found |
| 17 | | Std80211be40 | An IEEE 802.11 be 40 MHz EHT signal was found |
| 18 | | Std80211be80 | An IEEE 802.11 be 80 MHz EHT signal was found |
| 19 | | Std80211be160 | An IEEE 802.11 be 160 MHz EHT signal was found |
| 20 | | Std80211be320 | An IEEE 802.11 be 320 MHz EHT signal was found |
| 21 | | Std80211be320DL | An IEEE 802.11 320 MHz non-HT Duplicate signal was found |
| -999 | | Unknown | |

If radio standard is 11ah,

| Returned Value | Standard Format |
|----------------|-----------------|
| 0 | StdModeShort |
| 1 | StdModeShortDup |
| 2 | StdModeLong |
| 3 | StdModeLongDup |
| 4 | StdModeS1G1Mdup |
| 5 | StdModeUnknown |

4. StreamsOut: The number of streams

Index: n Results Returned

5. HTSigStatus

| Returned Value | HTSigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 0 | HdrStatNone | No Header expected |
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

6. LsigStatus

| Returned Value | LsigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 0 | HdrStatNone | No Header expected |
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

7. SigAStatus / U-SigStatus

If radio standard is either of 11n/11ac/11af/11ax, it's SigAStatus

If radio standard is 11be, it's U-SigStatus

| Returned Value | LsigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 0 | HdrStatNone | No Header expected |
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

If radio standard is 11ah, -999.0

8. SigBStatus / EHT-SigStatus

If radio standard is either of 11n/11ac/11af/11ax, it's SigBStatus

If radio standard is 11be, it's EHT-SigStatus

- 20*N+29. reserved(-999.0)
- 20*N+30. reserved(-999.0)

37

Decoded bits for each user. It's only available for 802.11n/ac/ax/af/be

Note that, if the Firmware Version is prior to A.23.00 or the version of N9077EM1x-1FP is prior to 2109.0228, it returns -999.0

The first value is the user number to indicate how many users the decoded bits are for

If the user number = N, then from 2nd to (N + 1)th values indicate the decoded bits number for each user

Then from (N+2)th to (2N + 1)th values indicate the PSDU CRC status for each user (1 means Fail, 0 means Pass, -999 means Invalid. Pass/Fail indicator is valid when Data Decode is ON)

From (2N+2)th to end values are some int16 integers which indicate the decoded bits. Each integer can be converted to 16 bits

For example, if there are 3 users, 1st user contains 100 bits, 2nd contains 300 bits and 3rd user contains 500 bits. Then if you query EVM37, you can get an array like,

| Returned Value | Notes |
|----------------|---|
| 3 | The decoded bits are used for 3 users |
| 100 | decoded bits 1~100 are for the 1 st user |
| 200 | decoded bits 101~300 are for the 2 nd user |
| 500 | decoded bits 301~800 are for the 3 rd use |
| 0 | PSDU CRC status is Pass for the 1 st user |
| 0 | PSDU CRC status is Pass for the 2 nd user |
| 0 | PSDU CRC status is Pass for the 3 rd user |
| 9216 | The number of integers (from 9216 to 7253) is 800/16 =50. There are 50 integer values |
| ... | As you convert the 50 decimal values to binary, you can get totally 800 bits, for example, 1 st integer 9216 = 0010 0100 0000 0000, there are 16 bits, from b0 to b15, then 2 nd integer can be converted to another 16 bits, from b16 to b31, etc. |
| 7253 | The 1 st 100 bits are for user1 and 2 nd 200 bits are for user 2 and 3rd 300 bits are for user 3 |

So, the returned values contain:

1. user number
2. bits number for 1st user
3. bits number for 2nd user

Pass/Fail indicator is valid when Data Decode is ON) From (3N + 2)th to (3N + M₁ + 1)th values indicate the decoded bits number of each subframe for the 1st user From (3N + M₁ + 2)th to (3N + M₁ + M₂ + 1)th values indicate the decoded bits number of each subframe for the 2nd user ... From (3N + M₁ + M₂ + ... M_{N-1} + 2)th to (3N + M₁ + M₂ + ... M_N + 1)th values indicate the decoded bits number of each subframe for the Nth user From (3N + M₁ + M₂ + ... M_N + 2)th to (3N + 2M₁ + M₂ + ... M_N + 1)th values indicate the CRC status of each subframe for the 1st user. (1 means Fail, 0 means Pass, -999 means Invalid. Pass/Fail indicator is valid when Data Decode is ON) From (3N + 2M₁ + M₂ + ... M_N + 2)th to (3N + 2M₁ + 2M₂ + ... M_N + 1)th values indicate the CRC status of</p> |

| Index: n | Results Returned |
|----------|------------------|
|----------|------------------|

each subframe for the 2nd user. (1 means Fail, 0 means Pass, -999 means Invalid. Pass/Fail indicator is valid when Data Decode is ON)

...

From $(3N + 2M_1 + 2M_2 + \dots + 2M_{N-1} + M_N + 2)$ th to $(3N + 2M_1 + 2M_2 + \dots + 2M_N + 1)$ th values indicate the CRC status of each subframe for the Nth user

From $(3N + 2M_1 + 2M_2 + \dots + 2M_N + 2)$ th to end values are some int16 integers which indicate the decoded bits. Each integer can be converted to 16 bits

For example, if there are 3 users, and 1st user contains 100 bits, 2nd contains 300 bits and 3rd user contains 400 bits. Each user has multi-subframes, 2 subframes for the 1st user, each contains 50 bits, 3 subframes for the 2nd user, each contains 100 bits, and 5 subframes for the 3rd user, each contains 80 bits

Then if you query EVM39, you can get an array like,

- 3
- 2
- 3
- 5

- 40 Power vs. Symbol trace returns series of floating-point numbers that represent each sample in the Power vs. Symbol trace of Capture Interval. The first number is the symbol 0 decision point
Not available if the Firmware Version is prior to A.26.00
If the Firmware Version is A.26.00 or later and N9077EM1x-1FP Option version is prior to 2020.0220, it returns -999.0
- 41 Returns I/Q trace data for Reference Symbols used in EVM calculation, as a series of trace point values. The I values are listed first in each pair, using the even-indexed values (starting at 0). The Q values are the odd-indexed values
- 42 ccEVM vs. Symbol trace returns series of floating-point numbers that represent each sample in the ccEVM vs. Symbol trace of Capture Interval. The first number is the symbol 0 decision point
Not available if the Firmware Version is prior to A.33.00, it returns -999.0
- 43 The results corresponding to Burst info window of Burst & Sig Info view.
The results will be available except 802.11bg, otherwise it will return one value -999.0.
The total number of results is $20 + \text{Number of Burst Info Type} * 5$.
The first 20 results are:

4. StreamsOut: The number of streams

5. HTSigStatus

| Returned Value | HTSigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 0 | HdrStatNone | No Header expected |
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

6. LsigStatus

| Returned Value | LsigStatus | Meaning |
|----------------|-------------|--------------------|
| 0 | HdrStatNone | No Header expected |

Index: n Results Returned

| Returned Value | LsigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

7. SigAStatus / U-SigStatus
If radio standard is either of 11n/11ac/11af/11ax, it's SigAStatus
If radio standard is 11be, it's U-SigStatus.

| Returned Value | LsigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 0 | HdrStatNone | No Header expected |
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

If radio standard is 11ah, -999.0

8. SigBStatus / EHT-SigStatus
If radio standard is either of 11n/11ac/11af/11ax, it's SigBStatus.
If radio standard is 11be, it's EHT-SigStatus.

| Returned Value | LsigStatus | Meaning |
|----------------|-----------------|------------------------------------|
| 0 | HdrStatNone | No Header expected |
| 1 | HdrStatUnk | Unknown status |
| 2 | HdrStatNotFound | Expected Header but didn't find it |
| 3 | HdrStatErrBits | Invalid bits found |
| 4 | HdrStatErrCRC | Checksum failed |
| 5 | HdrStatOK | |

If radio standard is 11ah, returns -999.0

9. HE TB NDP feedback status

NOTE

If the Firmware Version is prior to A.26.00, or the N9077EM1E-1FP Option version is prior to 2020.0220, it returns -999.

If radio standard is 11ax, and Standard Mode is StdModeHE_TRIG_BASED_NDP (HE PPDU format is HE_TriggerBased_NDP), it returns 0 or 1.

3 WLAN Mode

| 38. | Peak Burst Power Avg(dBm) |
| 39. | Peak-to-Avg Burst Power Ratio Max |
| 40. | Peak-to-Avg Burst Power Ratio Avg |
| 41. | Data Modulation Format ** |
| 42. | Data Bit Rate (Mbits/s) |
| 43. | Burst Number analyzed in the last acquisition |
| 44. | Wlan Octets |
| 45. | -999.0 (Reserved) |
| 46. | Time Offset (seconds) |
| 47. | Duty On Period (Unit is microseconds, it is the pulse width, if the Firmware Version is below A.30.00 or it is not found, it returns -999.0 which means Invalid.-999.0 means invalid) |
| 48. | Duty Off Period (Unit is microseconds, it is (pulse period – pulse width), if the Firmware Version is below A.30.00 or it is not found, it returns -999.0 which means Invalid.) |
| 49. | Duty Cycle (Unit is %, it is pulse width / pulse period, if the Firmware Version is below A.30.00 or (either Duty On or Off is not found), it returns -999.0 which means Invalid) |
| 4 | EVM trace returns series of floating-point numbers (in percent) that represent the EVM value for each chip in the measurement interval |
| 5 | Magnitude error trace returns series of floating-point numbers (in percent) that represent the magnitude error value for each chip in the measurement interval |
| 6 | Phase error trace returns series of floating-point numbers (in degrees) that represent the phase error value for each chip in the measurement interval |
| 7 | Corrected measured trace returns series of floating-point numbers that alternately represent I and Q pairs of the corrected measured trace. The magnitude of each I and Q pair are normalized to 1.0, when the IQ Normalize is turned on. The first number is the in-phase (I) sample of chip 0 decision point and the second is the quadrature-phase (Q) sample of chip 0 decision point |
| 8 | Returns Demod Bits |
| 9 | Returns 5 comma-separated scalar values of the pass/fail (0.0 = passed, or 1.0 = failed) results determined by testing the following items |
| | 802.11 standard (OFDA) specifies that EVM / IQ offset pass fail test should use average value. To keep consistent in one mode, also change 802.11b EVM vs. carrier suppression pass fail test to use average value |
| | 1. Test result of RMS EVM (Avg) |
| | 2. Test result of 1000 Chips EVM (Avg) |
| | 3. Test result of Frequency Error (Max) |
| | 4. Test result of RF Carrier Suppression (Min) |

| Index: n | Results Returned |
|----------|---|
| 5. | Test result of Chip clock error (Avg) |
| 10 | Return the demod bits of PLCP Preamble |
| 11 | Return the demod bits of PLCP Header |
| | * when the input is BBIQ, this number will be -999.0 |
| | ** this result will return integer numbers, 0 represents DSSS1, 1 represents DSSS2, 2 represents CCK5.5, 3 represents CCK11, 4 represents PBCC5.5, 5 represents PBCC11, 6 represents PBCC22, 7 represents PBCC33. |
| | *** Peak EVM Index, Peak Magnitude Error Index and Peak Phase Error Index are instant value. While Average Number great than 1, they keep the last measurement's results in the average cycle. |
| | Selects the Modulation Analysis measurement. |
| | 1. |
| | Noise-Corrected EVM result |

| Index: n | Results Returned |
|----------|---|
| 1 | 69. ncEVM Avg result If the Firmware Version is below A.37, or does not support Noise-Corrected EVM, returns -999.0, which means Invalid |

3.6.1 Views

The Modulation Analysis measurement has up to 132 views, depending on the selected Radio Standard.

You can select the desired measurement view from the selections listed in the table below. There are two available commands, allowing you to select the view using either a string ID or a numeric ID value.

`:DISP:EVM:VIEW[:SEL] <string ID>`

`:DISP:EVM:VIEW:NSEL <numeric ID>`

NOTE I/Q Error is only available when 802.11b/g (DSSS/CCK/PBCC) is selected

NOTE OFDM EVM is only available when 802.11a/g/j/p(OFDM), 801.11g (DSSS-OFDM), 802.11n, 802.11ac, 802.11ah, 802.11ax, 802.11be is selected.

NOTE Demod Bits is not available for 802.11be.

-
- NOTE** Burst & Signal Info is not available for 802.11b/g (DSSS/CCK/PBCC).
-
- NOTE** Preamble Freq Error is not available for 802.11b/g(DSSS/CCK/PBCC) and 802.11af.
-
- NOTE** IQ Impairments is not available for 802.11a/g/j/p(OFDM), 802.11b/g (DSSS/CCK/PBCC) and 802.11af.
-
- NOTE** User Information Summary is only available for 802.11ax/be.
-
- NOTE** Unused Tone Error is only available for 802.11ax/be.
-
- NOTE** Power vs. Symbol is only available for 802.11n/ac/ax/be.
-
- NOTE** ccEVM vs. Symbol is only available for 802.11n/ac/ax/be except 802.11ac/ax 80MHz + 80MHz
-

 3.6 Modulation Analysis Measurement

Some of these Views are multiple-window Views. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

This is a list of Views and their associated Windows.

| View | Displayed Window |

3.6.1.1 I/Q Measured Polar Graph

This view has the following windows:

- I/Q Measured Polar Graph
- Numeric Results

Example `:DISP:EVM:VIEW POLor`

3.6.1.2 I/Q Error

This view has the following windows:

- EVM Graph
- Mag Error Graph
- Phase Error Graph
- I/Q Error Numeric Results

Example `:DISP:EVM:VIEW IQERror`

3.6.1.3 OFDM EVM

This view has the following windows:

- EVM vs. Symbol Graph
- EVM vs. Carrier Graph
- IQ Measured Polar Graph
- OFDM EVM Numeric Results

Example `:DISP:EVM:VIEW OFDM`

3.6.1.4 Demod Bits

This view has the following window:

- Demod Bits

Example `:DISP:EVM:VIEW DBIT`

3.6.1.5 Numeric Results

This view has the following window:

- Numeric Results

Example `:DISP:EVM:VIEW NRES`

3.6.1.6 Burst & Signal Info

This view has the following windows:

- Burst Info
- Signal Info

Example `:DISP:EVM:VIEW BHTS`

3.6.1.7 Preamble Freq Error

This view has the following window:

- Preamble Freq Error vs. Time

Frequency error is the difference between the measured center frequency of the transmitted signal and the setting center frequency. This trace shows how the measured center frequency drifts during the preamble part of the burst. The units of this trace are in Hz. This includes the constant frequency error in addition to any time-varying frequency error.

Example `:DISP:EVM:VIEW PFERror`

3.6.1.8 I/Q Impairments

This view has the following windows:

- IQ Gain Imbalance vs. Carrier
- IQ Quadrature Skew vs. Carrier
- EVM vs. Carrier

Example `:DISP:EVM:VIEW IQIM`

3.6.1.9 User Information Summary (11ax)

This view has the following windows:

- User Information Summary
- HE-SIG-B User Field
- HE-SIG-B Common Field

Example `:DISP:EVM:VIEW USER`

3.6.1.10 Unused Tone Error

This view has the following windows:

- Unused Tone Error
- Unused Tone Error Metrics

Example `:DISP:EVM:VIEW UTER`

3.6.1.11 Power vs. Symbol View

This view has the following window:

- Power vs. Symbol

Example `:DISP:EVM:VIEW PSYMBOL`

3.6.1.12 User Information Summary (11be)

This view has the following windows:

- User Information Summary
- EHT-SIG User Field
- EHT-SIG Common Field

Example `:DISP:EVM:VIEW EHTU`

3.6.2 Windows

The following windows are available in the Modulation Analysis measurement.

You can select a different window display in the drop-down box by tapping the window name on the upper left corner of each window.

| Window | Number |
|---------------------------|--------|
| I/Q Polar Metrics | 1 |
| I/Q Measured Polar | 2 |
| Magnitude Error | 3 |
| Phase Error | 4 |
| EVM vs. Chips | 5 |
| IQ Error Metrics | 6 |
| EVM vs. Symbol | 7 |
| EVM vs. Carrier | 8 |
| OFDM EVM Metrics | 9 |
| Demod Bits | 10 |
| Numeric Results | 11 |
| Burst Info | 12 |
| Signal Info | 13 |
| Preamble Freq Error | 14 |
| I/Q Gain Imbalance | 15 |
| I/Q Quadrature Skew | 16 |
| User Info Summary | 17 |
| HE-SIG-B User Field | 18 |
| HE-SIG-B Common Field | 19 |
| Unused Tone Error | 20 |
| Unused Tone Error Metrics | 21 |
| Power vs. Symbol | 22 |
| EHT-SIG User Field | 23 |
| EHT-SIG Common Field | 24 |

3.6.2.1 I/Q Polar Metrics

The I/Q Polar Metrics window appears in the following View:

| View | Size | Position |
|--------------------------|------------------------|----------|
| I/Q Measured Polar Graph | Full, one-thirds width | Left |

| | |
|---------------------|---------------------------|
| Marker Operation | No |
| Corresponding Trace | n=1 IQ Polar Metric trace |

In Numeric Results,

- “Avg” means the average of the individual measurements when averaging is on.
- “Max” means the maximum of the individual measurements when averaging is on.
- “Min” means the minimum of the individual measurements when averaging is on.

3.6.2.2 I/Q Measured Polar

This Graph window appears in the following View:

| View | Size | Position |
|--------------------------|------------------------|------------|
| I/Q Measured Polar Graph | Full, two-thirds width | Right |
| OFDM EVM | Half, half width | Lower left |

| | |
|---------------------|--|
| Marker Operation | Yes [Symbol or Chip – (X,Y)] |
| Corresponding Trace | Corrected measured trace (n=7) This trace is affected by I/Q Meas Polar view setting parameters |

3.6.2.3 EVM vs. Chips

The EVM vs. Chips window appears in the following View:

| View | Size | Position |
|-----------|------------------|------------|
| I/Q Error | Half, half width | Lower left |

| | |
|---------------------|-------------------|
| Marker Operation | Yes (Chips - EVM) |
| Corresponding Trace | n=4 EVM trace |

3.6.2.4 Mag Error

The Mag Error Graph window appears in the following View:

| View | Size | Position |
|-----------|------------------|------------|
| I/Q Error | Half, half width | Upper left |

| | |
|---------------------|---------------------------|
| Marker Operation | Yes (Chips – Magnitude) |
| Corresponding Trace | n=5 Magnitude Error Trace |

3.6.2.5 Phase Error

The Phase Error window appears in the following View:

| View | Size | Position |
|---------------------|-----------------------|-------------|
| I/Q Error | Half, half width | Upper right |
| Marker Operation | Yes (Chips - Phase) | |
| Corresponding Trace | n=6 Phase Error Trace | |

3.6.2.6 I/Q Error Metrics

The I/Q Error Metrics window appears in the following View:

| View | Size | Position |
|---------------------|------------------|-------------|
| I/Q Error | Half, half width | Lower right |
| Marker Operation | No | |
| Corresponding Trace | None | |

3.6.2.7 EVM vs. Symbol

The EVM vs. Symbol window appears in the following View:

| View | Size | Position |
|---------------------|------------------------------|------------|
| OFDM EVM | Half, half width | Upper left |
| Marker Operation | Yes (Symbol – Magnitude EVM) | |
| Corresponding Trace | n=2 EVM vs. Symbol Trace | |

3.6.2.8 EVM vs. Carrier

The EVM vs. Carrier window appears in the following View:

| View | Size | Position |
|---------------------|----------------------------------|-------------|
| OFDM EVM | Half, half width | Upper right |
| IQ Impairments | One thirds, full width | Bottom |
| Marker Operation | Yes (Subcarrier – Magnitude EVM) | |
| Corresponding Trace | n=3 EVM vs. Carrier Trace | |

3.6.2.9 OFDM EVM Metrics

The Numeric Results window appears in the following View:

| View | Size | Position |
|---------------------|------------------|-------------|
| OFDM EVM | Half, half width | Lower right |
| Marker Operation | | No |
| Corresponding Trace | | None |

3.6.2.10 Demod Bits

The Demod Bits window appears in the following View:

| View | Size | Position |
|---------------------|------|----------------------|
| Demod Bits | Full | --- |
| Marker Operation | | No |
| Corresponding Trace | | n=8 Demod Bits trace |

3.6.2.11 Numeric Results

The Numeric Results window appears in the following View:

| View | Size | Position |
|---------------------|------|---------------------------|
| Numeric Results | Full | --- |
| Marker Operation | | No |
| Corresponding Trace | | n=1 Results Metrics trace |

3.6.2.12 Burst Info

The Burst Info Content window appears in the following View:

| View | Size | Position |
|---------------------|------------------|----------|
| Burst & Signal Info | Half, full width | Upper |
| Marker Operation | | No |
| Corresponding Trace | | None |

3.6.2.13 Signal Info

The Signal Info window appears in the following View:

| View | Size | Position |
|---------------------|------------------|----------|
| Burst & Signal Info | Half, full width | Bottom |
| Marker Operation | | No |
| Corresponding Trace | | None |

U-Sig No

The U-SIG content shall be identical in each non-punctured 20 MHz subchannels within each 80 MHz subblock, while it can be different in each 80 MHz subblocks when BW is greater than 80MHz.

You can choose 'U-SIG No' to see decoded information for each 80 MHz subblock.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:EVM:USIG[:NUMBER] <integer></code> <code>:DISPlay:EVM:USIG[:NUMBER]?</code> |
| Example | <code>:DISP:EVM:USIG 1</code> <code>:DISP:EVM:USIG?</code> |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 1 for 11be 20M/40M/80M 2 for 11be 160M 4 for 11be 320M |

3.6.2.14 Preamble Freq Error

Frequency error is the difference between the measured center frequency of the transmitted signal and the setting center frequency. This trace shows how the measured center frequency drifts during the preamble part of the burst. The units of this trace are in Hz. This includes the constant frequency error in addition to any time-varying frequency error.

Preamble Frequency Error is sampled at 64 times the subcarrier spacing for 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n (20 MHz), and 128 times the subcarrier spacing for 802.11n (40 MHz).

For 802.11a/g (OFDM) signal, the trace length is coupled with Sync Training Sequence. When Sync Training Sequence is set to Short, Preamble Frequency Error

covers both the short training sequence and the long training sequence(channel estimation sequence), the length will be 16us. When the Sync type parameter is set to Long (Channel Estimation Sequence), Preamble Frequency Error covers only the channel estimation sequence, the length will be 8us.

For 802.11g (DSSS-OFDM), it can only use Long Sync Training Sequence, since it does not contain the short training sequence

For 802.11n signal, the trace length is auto determined by signals.

For HT-mixed signals, the Preamble Frequency Error covers only the Legacy Short Training Field (L-STF) and Legacy Long Training Field (L-LTF) parts of the preamble. This is the initial 16 us of the burst.

For HT-greenfield signals, the Preamble Frequency Error covers only the Legacy Short Training Field (L-STF) and the First High Throughput Long Training Field (HT-LTF1) parts of the preamble. This is the initial 16 us of the burst.

The Preamble Freq Error vs. Time window appears in the following View:

| View | Size | Position |
|---------------------|---|----------|
| Preamble Freq Error | Full | --- |
| Marker Operation | Yes | |
| Corresponding Trace | n=12 Preamble Freq Error vs. Time trace | |

3.6.2.15 IQ Gain Imbalance

The IQ Gain Imbalance window appears in the following View:

| View | Size | Position |
|---------------------|--|----------|
| I/Q Impairments | One thirds, full width | Top |
| Marker Operation | Yes (Subcarrier – IQ Gain Imbalance) | |
| Corresponding Trace | n=19 IQ gain imbalance vs. Carrier trace | |

3.6.2.16 IQ Quadrature Skew

The IQ Quadrature Skew window appears in the following View:

| View | Size | Position |
|---------------------|--|----------|
| I/Q Impairments | One thirds, full width | Middle |
| Marker Operation | Yes (Subcarrier – IQ Quadrature Skew) | |
| Corresponding Trace | n=20 IQ quadrature error vs. Carrier trace | |

3.6.2.17 User Information Summary

The User Info Summary window appears in the following Views:

| View | Size | Position |
|---------------------------------|------------------------------|----------|
| User Information Summary (11ax) | One thirds, full width | Top |
| User Information Summary (11be) | One thirds, full width | Top |
| Marker Operation | No | |
| Corresponding Trace | n=29 User Info Summary trace | |

3.6.2.18 HE-SIG-B User Field

The HE-SIG-B User Field window appears in the following View:

| View | Size | Position |
|---------------------------------|------------------------------|----------|
| User Information Summary (11ax) | One thirds, full width | Middle |
| Marker Operation | No | |
| Corresponding Trace | n=29 User Info Summary trace | |

3.6.2.19 HE-SIG-B Common Field

The HE-SIG-B Common Field window appears in the following View:

| View | Size | Position |
|---------------------------------|------------------------------|----------|
| User Information Summary (11ax) | One thirds, full width | Bottom |
| Marker Operation | No | |
| Corresponding Trace | n=29 User Info Summary trace | |

3.6.2.20 Unused Tone Error

The Unused Tone Error window appears in the following View:

| View | Size | Position |
|---------------------|------------------------------|----------|
| Unused Tone Error | One half, full width | Upper |
| Marker Operation | Yes | |
| Corresponding Trace | n=31 Unused Tone Error trace | |

3.6.2.21 Unused Tone Error Metrics

The Unused Tone Error Metrics window appears in the following View:

| View | Size | Position |
|---------------------|------------------------------|----------|
| Unused Tone Error | One half, full width | Lower |
| Marker Operation | No | |
| Corresponding Trace | n=31 Unused Tone Error trace | |

3.6.2.22 Power vs. Symbol Window

The Power vs. Symbol window appears in the following View:

| View | Size | Position |
|---------------------|-----------------------------|----------|
| Power vs. Symbol | Full | --- |
| Marker Operation | Yes | |
| Corresponding Trace | n=40 Power vs. Symbol trace | |

3.6.2.23 EHT-SIG User Field

The EHT-SIG User Field window appears in the following View:

| View | Size | Position |
|---------------------------------|------------------------|----------|
| User Information Summary (11be) | One thirds, full width | Middle |
| Marker Operation | No | |
| Corresponding Trace | None | |

3.6.2.24 EHT-SIG Common Field

The EHT-SIG Common Field window appears in the following View:

| View | Size | Position |
|---------------------------------|------------------------|----------|
| User Information Summary (11be) | One thirds, full width | Bottom |
| Marker Operation | No | |
| Corresponding Trace | None | |

3.6.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.6.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference.

The reference value specifies the amplitude of a signal displayed on the reference graticule line. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

The Ref Value control applies only to the selected window. The functionality depends on the selected window.

If a Table type window is selected, the Ref Value control is unavailable.

Remote Command `:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:Y[:SCALe]:RLEVel <real>`
`:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:Y[:SCALe]:RLEVel?`

The applicable windows are numbered as follows:

| :Window | :Number |
|----------------------|---------|
| :Magnitude Error | :3 |
| :Phase Error | :4 |
| :EVM vs. Chips | :5 |
| :EVM vs. Symbol | :7 |
| :EVM vs. Carrier | :8 |
| :Preamble Freq Error | :14 |
| :I/Q Gain Imbalance | :15 |
| :I/Q Quadrature Skew | :16 |
| :Unused Tone Error | :20 |
| :Power vs. Symbol | :22 |

Example `:DISP:EVM:WIND3:TRAC:Y:RLEV 10 dBm`
`:DISP:EVM:WIND3:TRAC:Y:RLEV?`

Preset The preset values for different windows are defined as follows:

| Window | Number | Preset |
|---------------------|--------|-----------|
| Magnitude Error | 3 | 0.0% |
| Phase Error | 4 | 0.0°(deg) |
| EVM vs. Chips | 5 | 0.0% |
| EVM vs. Symbol | 7 | 0.0 dB |
| EVM vs. Carrier | 8 | 0.0 dB |
| Preamble Freq Error | 14 | 0.0 Hz |
| I/Q Gain Imbalance | 15 | 0.0 dB |
| I/Q Quadrature Skew | 16 | 0.0°(deg) |
| Unused Tone Error | 20 | 10.0 dB |
| Power vs. Symbol | 22 | 10.0 dB |

State Saved Saved in instrument state

Min The Min values for different windows are defined as follows:

| Window | Number | Min |
|---------------------|--------|----------------|
| Magnitude Error | 3 | -500.0% |
| Phase Error | 4 | -36000.0°(deg) |
| EVM vs. Chips | 5 | -500.0% |
| EVM vs. Symbol | 7 | -250.0 dB |
| EVM vs. Carrier | 8 | -250.0 dB |
| Preamble Freq Error | 14 | -5.0 kHz |
| I/Q Gain Imbalance | 15 | -250.0 dB |
| I/Q Quadrature Skew | 16 | -36000.0°(deg) |
| Unused Tone Error | 20 | -250.00 dBm |
| Power vs. Symbol | 22 | -250.0 dBm |

Max The Max values for different windows are defined as follows:

| Window | Number | Max |
|-----------------|--------|---------------|
| Magnitude Error | 3 | 500.0% |
| Phase Error | 4 | 36000.0°(deg) |
| EVM vs. Chips | 5 | 500.0% |
| EVM vs. Symbol | 7 | 250.0 dB |

| Window | Number | Max |
|---------------------|--------|---------------|
| EVM vs. Carrier | 8 | 250.0 dB |
| Preamble Freq Error | 14 | 5.0 kHz |
| I/Q Gain Imbalance | 15 | 250.0 dB |
| I/Q Quadrature Skew | 16 | 36000.0°(deg) |
| Unused Tone Error | 20 | 250.00 dBm |
| Power vs. Symbol | 22 | 250.0 dBm |

Scale/Div

For measurements that support a logarithmic Y-Axis, Scale/Div sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command
`:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:Y[:SCALe]:PDIVision <rel_ampl>`
`:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:Y[:SCALe]:PDIVision?`

The applicable windows are numbered as follows:

| :Window | :Number |
|----------------------|---------|
| :Magnitude Error | :3 |
| :Phase Error | :4 |
| :EVM vs. Chips | :5 |
| :EVM vs. Symbol | :7 |
| :EVM vs. Carrier | :8 |
| :Preamble Freq Error | :14 |
| :I/Q Gain Imbalance | :15 |
| :I/Q Quadrature Skew | :16 |
| :Unused Tone Error | :20 |
| :Power vs. Symbol | :22 |

Example
`:DISP:EVM:WIND3:TRAC:Y:PDIV 5`
`:DISP:EVM:WIND3:TRAC:Y:PDIV?`

Preset
The preset values for different windows are defined as follows:

| Window | Number | Preset |
|-----------------|--------|--------|
| Magnitude Error | 3 | 3.0% |

| Window | Number | Preset |
|---------------------|--------|-----------|
| Phase Error | 4 | 7.5°(deg) |
| EVM vs. Chips | 5 | 1.5% |
| EVM vs. Symbol | 7 | 10.0 dB |
| EVM vs. Carrier | 8 | 10.0 dB |
| Preamble Freq Error | 14 | 1.0 kHz |
| I/Q Gain Imbalance | 15 | 10.0 dB |
| I/Q Quadrature Skew | 16 | 7.5°(deg) |
| Unused Tone Error | 20 | 10.0 dBm |
| Power vs. Symbol | 22 | 10.0 dBm |

State Saved Saved in instrument state

Min/Max The Min/Max values for different windows are defined as follows:

| Window | Number | Min/Max |
|---------------------|--------|--------------------------|
| Magnitude Error | 3 | 0.1% / 50.0% |
| Phase Error | 4 | 0.01°(deg)/ 3600.0°(deg) |
| EVM vs. Chips | 5 | 0.1% / 50.0% |
| EVM vs. Symbol | 7 | 0.1 dB / 20.0 dB |
| EVM vs. Carrier | 8 | 0.1 dB / 20.0 dB |
| Preamble Freq Error | 14 | -5.0 kHz / 5.0 kHz |
| I/Q Gain Imbalance | 15 | 0.5 dB / 20.0 dB |
| I/Q Quadrature Skew | 16 | 0.01°(deg)/ 3600.0°(deg) |
| Unused Tone Error | 20 | 0.1 dB / 20.00 dB |
| Power vs. Symbol | 22 | 0.1 dB / 20.00 dB |

Annotation Upper left corner of trace grid, same grey as grid. (see Display under Mode Overview)

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display.

Changing the reference position does not change the reference level value.

Remote Command `:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:Y[:SCALE]:RPOsition TOP | CENTER | BOTTom`
`:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:Y[:SCALE]:RPOsition?`

The applicable windows are numbered as follows:

3 WLAN Mode
3.6 Modulation Analysis Measurement

| :Window | :Number |
|----------------------|---------|
| :Magnitude Error | :3 |
| :Phase Error | :4 |
| :EVM vs. Chips | :5 |
| :EVM vs. Symbol | :7 |
| :EVM vs. Carrier | :8 |
| :Preamble Freq Error | :14 |
| :I/Q Gain Imbalance | :15 |
| :I/Q Quadrature Skew | :16 |
| :Unused Tone Error | :20 |
| :Power vs. Symbol | :22 |

Example :DISP:EVM:WIND3:TRAC:Y:RPOS CENT
:DISP:EVM:WIND3:TRAC:Y:RPOS?

Preset The preset values for different windows are defined as follows:

| Window | Number | Preset |
|---------------------|--------|--------|
| Magnitude Error | 3 | CENT |
| Phase Error | 4 | CENT |
| EVM vs. Chips | 5 | BOTTOM |
| EVM vs. Symbol | 7 | TOP |
| EVM vs. Carrier | 8 | TOP |
| Preamble Freq Error | 14 | CENT |
| I/Q Gain Imbalance | 15 | CENT |
| I/Q Quadrature Skew | 16 | CENT |
| Unused Tone Error | 20 | TOP |
| Power vs. Symbol | 22 | TOP |

Range Top|Center|Bottom

Auto Scaling

Toggles **Auto Scaling** between On and Off.

When Auto Scaling is On, pressing the Restart front-panel key results in automatically determining scale per division and reference values based on the measurement results.

When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off.

| Remote Command | <pre>:DISPlay:EVM:WINDow3 4 5 7 8 14 15 16 20:TRACe:Y[:SCALe]:COUPlE 0 1 OFF ON</pre> <pre>:DISPlay:EVM:WINDow3 4 5 7 8 14 15 16 20:TRACe:Y[:SCALe]:COUPlE?</pre> <p>The applicable windows are numbered as follows:</p> <table border="1"> <thead> <tr> <th>:Window</th> <th>:Number</th> </tr> </thead> <tbody> <tr> <td>:Magnitude Error</td> <td>:3</td> </tr> <tr> <td>:Phase Error</td> <td>:4</td> </tr> <tr> <td>:EVM vs. Chips</td> <td>:5</td> </tr> <tr> <td>:EVM vs. Symbol</td> <td>:7</td> </tr> <tr> <td>:EVM vs. Carrier</td> <td>:8</td> </tr> <tr> <td>:Preamble Freq Error</td> <td>:14</td> </tr> <tr> <td>:I/Q Gain Imbalance</td> <td>:15</td> </tr> <tr> <td>:I/Q Quadrature Skew</td> <td>:16</td> </tr> <tr> <td>:Unused Tone Error</td> <td>:20</td> </tr> <tr> <td>:Power vs. Symbol</td> <td>:22</td> </tr> </tbody> </table> | :Window | :Number | :Magnitude Error | :3 | :Phase Error | :4 | :EVM vs. Chips | :5 | :EVM vs. Symbol | :7 | :EVM vs. Carrier | :8 | :Preamble Freq Error | :14 | :I/Q Gain Imbalance | :15 | :I/Q Quadrature Skew | :16 | :Unused Tone Error | :20 | :Power vs. Symbol | :22 | | | | | | | | | | | |

3.6.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 893
- See ["Single-Attenuator Configuration"](#) on page 894

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code> |
| Example | <code>:POW:FRAT 14</code> <code>:POW:FRAT?</code> |
| Notes | When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value |
| Dependencies | Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists |
| Couplings | This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1753 command descriptions |
| Preset | 20 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Only valid values are 0, 6, 14, 20 dB |
| Annotation | <p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1745 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB |

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1775 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 898

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code> |
| Example | <code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual |
| Dependencies | Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1756 See " Attenuator Configurations and Auto/Man " on page 898 for more information on the Auto/Man functionality |
| Couplings | If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1752 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below</p> |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | | |
|-------------|--|-------------------------|
| | 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB | |
| Preset | Auto | The Auto value is 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased | |
| Max | CXA Option 503 or 507 | 50 dB |
| | EXA | 60 dB |
| | All other models | 70 dB |
| | Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB | |
| Annotation | <p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p> | |

Auto Function

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code> |
| Example | Turn Auto Mech AttenON : <code>:POW:ATT:AUTO ON</code> |
| Dependencies | <code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA |
| Preset | ON |

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 1750, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 896 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 1756 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

3 WLAN Mode
 3.6 Modulation Analysis Measurement

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 900](#)

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code> |
| Example | <code>:POW:EATT 10</code> <code>:POW:EATT?</code> |
| Notes | Electronic Attenuation's specification is defined only when Mech Atten is 6 dB |
| Dependencies | <p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1775 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1777 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p> |
| Couplings | Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator |

| | |
|----------------|---|
| | Transition Rules" on page 901 |
| Preset | 0 dB |
| State Saved | Saved in instrument state |
| Min | 0 dB |
| Max | Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB |
| Annotation | See Annotation under the Mech Atten control description |
| Auto Function | |
| Remote Command | <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code> |
| Example | <code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code> |
| Preset | OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator |

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 902](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1755](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1760.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Example | <code>:POW:RANG:OPT IMM</code> |
| Notes | Executing Adjust Atten for Min Clipping initiates the measurement |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code> |
| Example | <code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code> |
| Dependencies | Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes |
| Preset | <code>COMBined</code> |
| State Saved | Saved in instrument state |

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1759 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 904

| Selection | SCPI | Note |
|-----------------|-------------------------|--|
| Off | <code>OFF</code> | This is the default setting |
| On | <code>ON</code> | Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to <code>COMBined</code> |
| Elec Atten Only | <code>ELECTrical</code> | Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster |
| Elec+Mech Atten | <code>COMBined</code> | In Dual-Attenuator models, this selects both attenuators to participate in the autoranging |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Example | <code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code> |

| | | | | | |
|---------------------------|--|-------------------------|---|---------------------------|----------|
| Notes | <p>The parameter option ELECTRICAL sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBINED is mapped to ELECTRICAL in Single-Attenuator models. If you send COMBINED, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBINED</p> | | | | |
| Dependencies | <p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 1756 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 903 is grayed-out</p> <p>Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>Appears in the Waveform measurement in BASIC and 5G NR Modes</p> | | | | |
| Preset | OFF when Elec Atten is Disabled at preset, otherwise ELEC | | | | |
| State Saved | Saved in instrument state | | | | |
| Range | <table border="1"> <tr> <td>Dual-Attenuator models:</td> <td>Off Elec Atten Only Mech + Elec Atten</td> </tr> <tr> <td>Single-Attenuator models:</td> <td>Off On</td> </tr> </table> | Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten | Single-Attenuator models: | Off On |
| Dual-Attenuator models: | Off Elec Atten Only Mech + Elec Atten | | | | |
| Single-Attenuator models: | Off On | | | | |

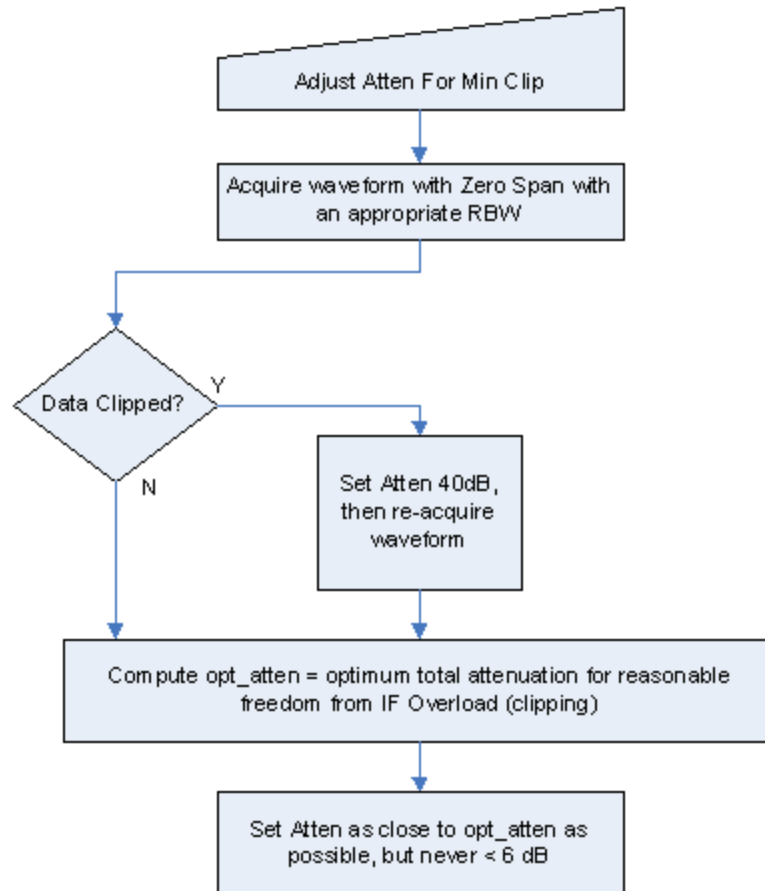

Backwards Compatibility Command

| | |
|------------------------------|--|
| Notes | <p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p> |
| Backwards Compatibility SCPI | <pre>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?</pre> |

Adjustment Algorithm

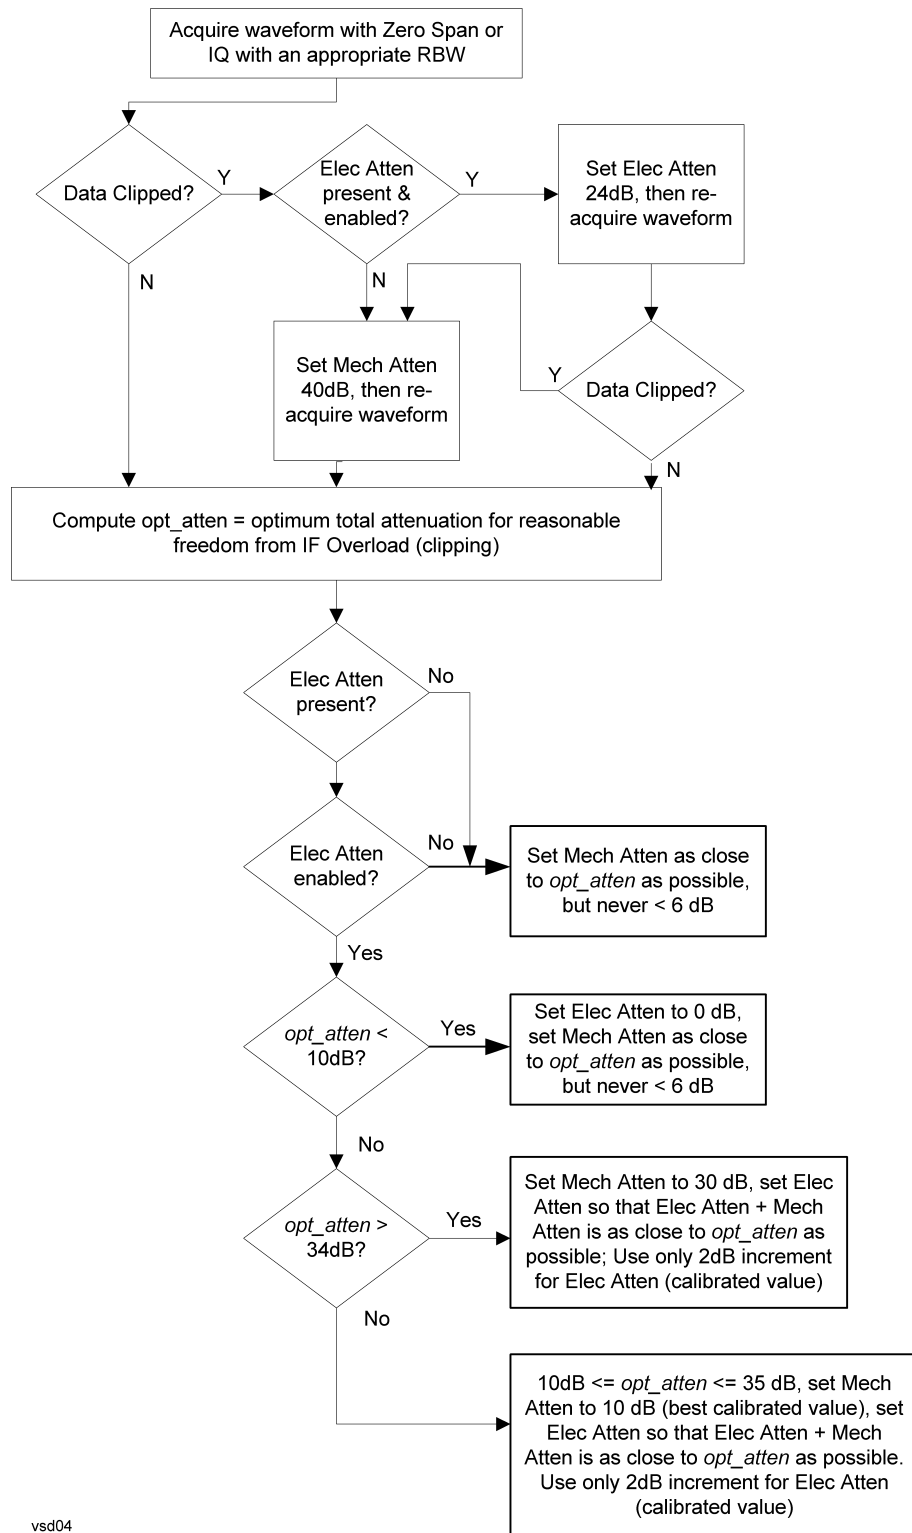

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1759 or "Pre-Adjust for Min Clipping" on page 903 selection is Mech + Elec Atten:

"Pre-Adjust for Min Clipping" on page 903 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

| | |
|--------------|---|
| | <code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code> |
| Example | <code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code> |
| Notes | Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10 |
| Dependencies | Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error |
| Couplings | When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB |
| Preset | EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB |
| State Saved | Saved in instrument state |

3.6.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

| Gain Setting | Volts RMS | Volts Peak | Volts Peak - Peak | dBm (50Ω) | Break Point |
|--------------|-----------|------------|-------------------|-----------|--------------|
| 0 dB | 0.7071 | 1.0 | 2.0 | 10 | n/a |
| 6 dB | 0.3536 | 0.5 | 1.0 | 4 | 0.502 V Peak |
| 12 dB | 0.1768 | 0.25 | 0.5 | -2 | 0.252 V Peak |
| 18 dB | 0.0884 | 0.125 | 0.25 | -8 | 0.127 V Peak |

| | |
|--------------|---|
| Dependencies | Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs" |
| State Saved | No |

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :VOLTage :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :VOLTage :IQ :RANGe :AUTO?</code> |
| Example | Put the I Range and Q Range in manual <code>:VOLT :IQ :RANG :AUTO OFF</code> <code>:VOLT :IQ :RANG :AUTO?</code> |
| Dependencies | If Auto is not supported, sending the SCPI command generates an error |
| Couplings | When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to YMax |
| Preset | ON |
| State Saved | Saved in instrument state |
| Annotation | When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI. |
| Remote Command | <code>[:SENSe] :POWer :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :POWer :IQ :RANGe :AUTO?</code> |
| Example | Put the I Range and Q Range in manual <code>:POW :IQ :RANG :AUTO OFF</code> <code>:POW :IQ :RANG :AUTO?</code> |
| Notes | <code>:POW :IQ :RANG :AUTO</code> is an alternate form of <code>:VOLT :IQ :RANG :AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command |
| Preset | ON |
| Range | Auto Man |

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :VOLTage :IQ [:I] :RANGe [:UPPer] <voltage></code> <code>[:SENSe] :VOLTage :IQ [:I] :RANGe [:UPPer]?</code> |
| Example | Set the I Range to 0.5 V Peak <code>:VOLT :IQ :RANG 0.5 V</code> |

| | |
|----------------|---|
| | <code>:VOLT:IQ:RANG?</code> |
| Notes | The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V |
| Couplings | When " Q Same as I " on page 1769 is On, the I Range value will be copied to " Q Range " on page 1768 Changing the value also sets Range = Man |
| Preset | Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak |
| State Saved | Saved in instrument state |
| Range | 1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω) |
| Min | 0.125 V |
| Max | 1 V |
| Annotation | The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power. |
| Remote Command | <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <ampl></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code> |
| Example | Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code> |
| Notes | The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9 |
| Preset | 10.0 dBm |
| Range | -20 dBm to 10 dBm |
| Min | -20 dBm |
| Max | 10 dBm |

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "**I Range**" on page 1766 determines both I and Q channel range settings.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code> |
| Example | Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code> |
| Notes | The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1766 determines both I and Q channel range settings |
| Couplings | When " Q Same as I " on page 1769 is On, the " I Range " on page 1766 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man |
| Preset | 1 V Peak |
| State Saved | Saved in instrument state |
| Range | 1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω) |
| Min | 0.125 V |
| Max | 1 V |
| Annotation | The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V" the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power. |
| Remote Command | <code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;1></code> <code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</code> |
| Example | Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code> |
| Notes | The POWer form of the command is provided for convenience. It maps to the same underlying gain |

range parameter as the **VOLTage** form of the command

The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the **VOLTage** form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:

50 Ω: 10, 4, -2, -8

75 Ω: 8.2, 2.2, -3.8, -9.8

600 Ω: -0.8, -6.8, -12.8, -18.9

| | |
|--------|-------------------|
| Preset | 10.0 dBm |
| Range | -20 dBm to 10 dBm |
| Min | -20 dBm |
| Max | 10 dBm |

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :VOLTage POWer : IQ : MIRRored OFF ON 0 1</code> <code>[:SENSe] :VOLTage POWer : IQ : MIRRored?</code> |
| Example | Turn off the mirroring of I Range to Q Range <code>:VOLT : IQ : MIRR OFF</code> <code>:POW : IQ : MIRR OFF</code> |
| Couplings | When ON , the " I Range " on page 1766 value is mirrored (copied) to the " Q Range " on page 1768 |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | OFF ON |

3.6.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

| | |
|-------------|----|
| State Saved | No |
|-------------|----|

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code> |
| Example | <code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code> |
| Notes | The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting. |
| Preset | 0 dBm |
| State Saved | Yes |
| Min/Max | -/+100 |
| Annotation | Meas Bar |

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code> |
| Notes | Executing Adjust Range for Min Clipping initiates the measurement. |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements. |

Pre-Adjust for Min Clipping

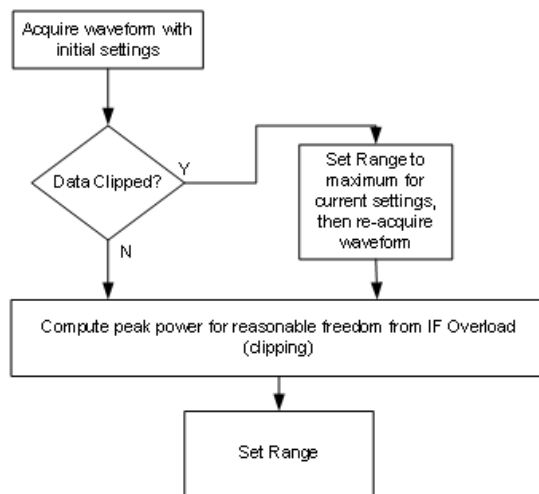

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBined</code> |
|----------------|---|

| | |
|--------------|--|
| | <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code> |
| Notes | Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC |
| Dependencies | Does not appear in the Swept SA and Monitor Spectrum measurements |
| Preset | OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping |
| State Saved | Saved in instrument state |

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1769 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code> |
| Example | <code>:POW:RANG:PAR 12 dB</code> |
| Notes | In some Modes, this parameter is read-only; meaning the value will appear on the control and query |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | | |
|--------------|---|-------|
| | via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated | |
| Dependencies | Does not appear in Spectrum Analyzer Mode | |
| Preset | VXT Models M9410A/11A | 0 dB |
| | All Others | 10 dB |
| State Saved | Saved in instrument state | |
| Min | 0 dB | |
| Max | VXT Models M9410A/11A | 50 dB |
| | All Others | 20 dB |

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1771. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

| | | |
|----------------|--|--------|
| Remote Command | <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code> | |
| Example | <code>:POW:RANG:MIX:OFFS -5 dB</code> | |
| Preset | 0 dB | |
| State Saved | Saved in instrument state | |
| Min | VXT Models M9410A/11A | -34 dB |
| | All Others | -35 dB |
| Max | 30 dB | |

3.6.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1788](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1774](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 917](#).

| | |
|-----------------|---|
| Remote Command | <code>[:SENSe] :POWer [:RF] :PCENter</code> |
| Example | <code>:POW:PCEN</code> |
| Notes | The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command |
| Dependencies | Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View |
| Couplings | The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1774 |
| Status Bits/OPC | When centering the preselector, *OPC does not return true until the process is complete and a |

dependencies subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries
 The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1773 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

3 WLAN Mode
3.6 Modulation Analysis Measurement

| Selection | Example | Note |
|------------|--|---|
| Off | :POW:GAIN OFF | |
| Low Band | :POW:GAIN ON :POW:GAIN:BAND LOW | Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown |
| Full Range | :POW:GAIN ON :POW:GAIN:BAND FULL | Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear |

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code> |
| Example | <code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code> |
| Dependencies | Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled |
| Preset | <code>LOW</code> |
| State Saved | Saved in instrument state |
| Annotation | When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" |

When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1 [:SENSe]:POWer[:RF]:GAIN[:STATe]?</code> |
| Example | <code>:POW:GAIN OFF :POW:GAIN?</code> |
| Preset | <code>OFF</code> |

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1775. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "[Internal Preamp](#)" on page 1775, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 921

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1 [:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code> |
| Example | <code>:POW:GAIN:LNA ON</code> |
| Dependencies | Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled |
| Preset | <code>OFF</code> |
| State Saved | Saved in State |

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB  
Pre: Int on, LNA on  
μW Path: LNP, On  
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB  
Pre: Int off, LNA on  
μW Path: LNP, On  
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the **μW Preselector** is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the **μW Preselector's** bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

| Path | Example | Note |
|-----------------------|----------------------|--|
| Standard Path | :POW:MW:PATH STD | Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled |
| Low Noise Path Enable | :POW:MW:PATH LNP | See " Low Noise Path Enable " on page 926 |
| μW Preselector Bypass | :POW:MW:PATH MPB | See " μW Preselector Bypass " on page 928 |
| Full Bypass Enable | :POW:MW:PATH FULL | See " Full Bypass Enable " on page 928 |

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :POWer [:RF] :MW :PATH STD LNPath MPBypass FULL</code> <code>[:SENSe] :POWer [:RF] :MW :PATH ?</code> |
| Example | <code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH ?</code> |
| Notes | When " Presel Center " on page 1773 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished |
| Dependencies | Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP |

3 WLAN Mode
3.6 Modulation Analysis Measurement

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

3 WLAN Mode
3.6 Modulation Analysis Measurement

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

| | |
|------------------------------|--|
| Example | Bypass the microwave preselector: :POW:MW:PRES OFF |
| Notes | Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB) |
| Preset | ON |
| Backwards Compatibility SCPI | [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]? |

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

| Type | ID | |
|------|-----|---|
| | 159 | Settings Alert - DETECTED;Presel/Meas BW conflict |

Allow Full Bypass in Auto

Enable or disable Full Bypass in μ W Path Auto rule. See " [\$\mu\$ W Path Control](#)" on page 1778.

When this function is **ON**, and " [\$\mu\$ W Path Control](#)" on page 1778 is in **AUTO**, it is possible for the auto rules to select the **FULL** Bypass state, which bypasses both the Preamp and the Microwave Preselector. Otherwise, the auto rules never select the **FULL** Bypass state. This is convenient when making wideband measurements, but it also adds some risk of damage to the first converter.

CAUTION

When **Full Bypass Enable** is selected, and "[Y Scale](#)" on page 1745 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq > 3.6 GHz and the Preamp is either not licensed, set to **Low Band** or **Off**). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Remote Command `[:SENSe] :POWer [:RF] :MW:PATH:AUTO:FULL ON | OFF | 1 | 0`
`[:SENSe] :POWer [:RF] :MW:PATH:AUTO:FULL?`

| | |
|--------------|---|
| Example | <code>:POW:MW:PATH:AUTO:FULL ON</code> <code>:POW:MW:PATH:AUTO:FULL?</code> |
| Dependencies | Only appears if Option FBP is installed, and in the following measurements <ul style="list-style-type: none"> - 5GNRMode: Modulation Analysis and IQ Waveform - WLAN Mode: IQ Waveform - Channel Quality Mode: Group Delay and Noise Power Ratio |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be

used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code> |
| Example | <code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code> |
| Dependencies | Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements |
| Couplings | Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state |
| Preset | N9041B OFF N9042B+V3050A ON M9410A/11A ON |
| State Saved | Saved in instrument state |

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code> |
| Example | <code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1788 is OFF. The grayout message is “Unavailable unless SW Presel enabled” |
| Preset | N9041B ADVanced N9042B+V3050A NORMa1 |
| State Saved | Saved in instrument state |

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)

- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code> |
| Example | <code>:POW:SWPR:BW NARR</code> |
| Dependencies | Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1788 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled |
| Preset | N9041B NORMa1 N9042B+V3050A NARRow |
| State Saved | Saved in instrument state |

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code> |
| Example | Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|--------------|--|
| | Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: :SAN:PFIL ON |
| Dependencies | Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz |
| Preset | See " Prefilter Presets " on page 935 below |
| State Saved | Saved in instrument state |

Prefilter Presets

| Meas | Mode | Preset |
|------|---|--------|
| SPEC | BASIC | OFF |
| WAV | BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA | OFF |
| MON | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA | OFF |
| RHO | WCDMA | OFF |
| CDP | WCDMA | OFF |
| PCON | WCDMA | OFF |
| EVMQ | WCDMA | OFF |
| CHP | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |
| OBW | WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA | OFF |

| DDEM | VMA | OFF |
| OFDM | VMA | OFF |
| SAN | SA | ON |
| HARM | SA | ON |

3.6.4 BW

Opens the **BW** (Bandwidth) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.6.4.1 Settings

Contains the basic Bandwidth functions. In most measurements it is the only tab under **BW**.

Info BW

Enables you to specify the information bandwidth for the analyzer. This is used to set the hardware filter of the ADC.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:EVM:BANDwidth[:RESolution] <freq></code> <code>[:SENSe]:EVM:BANDwidth[:RESolution]?</code> |
| Example | <code>:EVM:BAND 1 kHz</code> <code>:EVM:BAND?</code> |
| Dependencies | Grayed out if Radio Std Detection is auto with disabled message: Info BW is fixed when Radio Std Detection is auto |
| Preset | 25 MHz Info BW is limited by hardware capability and coupled by Radio Standard: if Radio Std is 802.11a/b/g = 25MHz if Radio Std is 802.11n-20M = 25MHz if Radio Std is 802.11n-40M = 40MHz if Radio Std is 802.11ac-20M = 25MHz if Radio Std is 802.11ac-40M = 40MHz if Radio Std is 802.11ac-80M or 80M+ 80M = 80MHz if Radio Std is 802.11ac-160M = 160MHz if Radio Std is 802.11ah-1MHz : 3MHz if Radio Std is 802.11ah-2M = 3MHz if Radio Std is 802.11ah-4M = 4MHz if Radio Std is 802.11ah-8M = 8MHz if Radio Std is 802.11ah-16M = 16MHz (25MHz if only B25 option installed) if Radio Std is 802.11j/p-10M = 10MHz if Radio Std is 802.11p-5M = 5MHz if Radio Std is 802.11af-6M: 5.3333 MHz if Radio Std is 802.11af-7M: 5.3333 MHz if Radio Std is 802.11af-8M: 7.1111 MHz if Radio Std is 802.11ax-20M = 25MHz if Radio Std is 802.11ax-40M = 40MHz if Radio Std is 802.11ax-80M or 80M+ 80M = 80MHz if Radio Std is 802.11ax-160M = 160MHz |

3 WLAN Mode

M941xE-B4X = 400.0 MHz
M941xE-B8X = 800.0 MHz
M941xE-B12 = 1.2 GHz
M941xAU-B6X = Upgrade from 400.0 MHz to 800.0 MHz
M941xAU-B12 = Upgrade from 400.0 MHz to 1.2 GHz
M941xAU-BU2 = Upgrade from 800.0 MHz to 1.2 GHz
All other models:
B1Y=160 MHz, B1X=140 MHz, B1A=125 MHz, B85= 85 MHz, B40=40 MHz, B25=25 MHz, else 10 MHz
When Info BW auto coupled by Radio Std exceeds max BW of hardware, there will be an error message: "Invalid result; Wider BW required"
If BW is less than Radio Std default value, there will be a conditional warning message: "Setting Alert; BW is less than xxx"

Backwards Compatibility SCPI `[:SENSe] : <meas> : BWIDth [:RESolution]`

3.6.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.6.5.1 Meas Display

Contains controls for setting the display for the current window.

I/Q Polar Vec/Constln

Specifies the format of the Polar Vector graph display. You can select one of the following formats:

- Vec Constln (Vector and Constellation)
- Vector (Vector only)
- Constellation (Constellation only)

This function is available for I/Q Measured Polar window when Radio Standard is 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), or 802.11n/ac/ah/ax/be.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:POLar VC VECTOR CONSTln</code> |
| Example | <code>:DISP:EVM:VIEW:WIND:TRAC:POL CONS</code> |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-------------|--|
| | <code>:DISP:EVM:VIEW:WIND:TRAC:POL?</code> |
| Couplings | Default Value is coupled with Radio Std |
| Preset | If Radio Std is 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n, 802.11ac/ax/be, 802.11ah, or 802.11af: CONS If Radio Std is 802.11b/g (DSSS/CCK/PBCC): VC |
| State Saved | Saved in instrument state |

I/Q Points

Specifies the number of I/Q Points displayed for the I/Q measured polar graph.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:IQPoints <integer></code> <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:IQPoints?</code> |
| Example | <code>:DISP:EVM:VIEW:WIND:TRAC:IQP 10</code> <code>:DISP:EVM:VIEW:WIND:TRAC:IQP?</code> |
| Notes | Default, Max values are coupled with Radio Std and Meas Interval |
| Couplings | Change the Meas Interval will set the I/Q Points as the same number as Meas Interval when Meas Interval is no bigger than 24564, otherwise, it will be clipped to 24564 |
| Preset | If Radio Std is 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n, 802.11ac/ax/be, 802.11ah, or 802.11af: 60 symbols If Radio Std is 802.11b/g (DSSS/CCK/PBCC): 2794 chips |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | Meas Interval, when Meas Interval <= 24564 24564, when Meas Interval > 24564 |

I/Q Points Offset

Specifies the number of points offset from the first one in the Meas Interval.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:IQOffset <integer></code> <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:IQOffset?</code> |
| Example | <code>:DISP:EVM:VIEW:WIND:TRAC:IQOF 10</code> <code>:DISP:EVM:VIEW:WIND:TRAC:IQOF?</code> |
| Notes | Max Value is coupled with Meas Interval and I/Q Points |
| Couplings | Change of Meas Interval will set the I/Q Points Offset to be 0 |
| Preset | 0 |
| State Saved | Saved in instrument state |

| | |
|-----|----------------------------|
| Min | 0 |
| Max | Meas Interval – I/Q Points |

I/Q Rotation

Toggles the display rotation function between On and Off. If set to On, the I/Q polar vector or I/Q polar constellation graph is rotated from 0 to 359.5 degrees.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:ROTation <real></code> <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:ROTation?</code> <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:ROTation:STATe 0 1 OFF ON</code> <code>:DISPlay:EVM:VIEW[1]:WINDow1:TRACe:ROTation:STATe?</code> |
| Example | <code>:DISP:EVM:VIEW:WIND:TRAC:ROT 45</code> <code>:DISP:EVM:VIEW:WIND:TRAC:ROT?</code> |
| Preset | 45.0 OFF |
| State Saved | Saved in instrument state |
| Range | On Off |
| Min | 0 |
| Max | 359.5 |

Full Vector

Toggles the full vector display function between On and Off. If set to On, the full vector traces, that are shown in gray, are displayed in the background of the polar vector solid traces, which are shown in yellow. Both traces can be interpolated by using the Interpolation key.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:FVECTor[:STATe] 0 1 OFF ON</code> <code>:DISPlay:EVM:VIEW[1]:WINDow[1]:TRACe:FVECTor[:STATe]?</code> |
| Example | <code>:DISP:EVM:VIEW:WIND:TRAC:FVEC ON</code> <code>:DISP:EVM:VIEW:WIND:TRAC:FVEC?</code> |
| Dependencies | Grayed out if the selected view is I/Q Measured Polar Graph and the selected I/Q Polar Vec/Constln is Constellation. Forceful message”-221 Setting conflict; Full vector is not available for Constellation only” |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

U-Sig No

The U-SIG content shall be identical in each non-punctured 20 MHz subchannels within each 80 MHz subblock, while it can be different in each 80 MHz subblocks when BW is greater than 80MHz.

You can choose 'U-SIG No' to see decoded information for each 80 MHz subblock.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:EVM:USIG[:NUMBer] <integer></code> <code>:DISPlay:EVM:USIG[:NUMBer]?</code> |
| Example | <code>:DISP:EVM:USIG 1</code> <code>:DISP:EVM:USIG?</code> |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 1 for 11be 20M/40M/80M 2 for 11be 160M 4 for 11be 320M |

EHT SIG No

For OFDMA transmission or non-OFDMA transmission to multiple users, EHT-SIG field when BW is greater than 80 MHz contains two EHT-SIG content channels per 80 MHz and the EHT-SIG content channels per 80 MHz are allowed to carry different information.

You can choose EHT-SIG No to see EHT-SIG filed decoded information for each 80 MHz subblock.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:EVM:EHTSig[:NUMBer] <integer></code> <code>:DISPlay:EVM:EHTSig[:NUMBer]?</code> |
| Example | <code>:DISP:EVM:EHTS 1</code> <code>:DISP:EVM:EHTS?</code> |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 1 for 11be 20M/40M/80M 2 for 11be 160M 4 for 11be 320M |

3.6.5.2 View

See Section "Views" on page 872 "Views" on page 872.

View

Contains controls for selecting the current **View**, and for editing User Views.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code> |
| Example | Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code> |
| Notes | <p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |
| Backwards Compatibility SCPI | <p>The legacy node</p> <pre>:DISPlay:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p> |

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code> |
| Example | <code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View |
| Notes | <code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated |

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code> |
|----------------|---|

| | |
|---------|---|
| Example | <code>:DISP:VIEW:ADV:REN "Baseband"</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DELeTe</code> |
| Example | <code>:DISP:VIEW:ADV:DEL</code> |
| Notes | <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p> |

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:DELeTe:ALL</code> |
| Example | <code>:DISP:VIEW:ADV:DEL:ALL</code> |
| Notes | Disabled if there are no User Views |

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy

nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

| | |
|----------------|---|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:CAT?</code> |
| Notes | Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code> No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined |

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code> |
| Example | <code>:DISP:VIEW:ADV:USER:CAT?</code> |
| Notes | Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1804), then query the list of available Views, the result is undefined |

3.6.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

| | |
|------------------------------|--|
| Remote Command | <code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code> |
| Example | <code>:DISP:GRAT OFF</code> |
| Notes | The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis |
| Preset | ON |
| State Saved | Saved in instrument state |
| Backwards Compatibility SCPI | <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored |

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code> |
| Example | <code>:DISP:ANN:SCR OFF</code> |
| Dependencies | Grayed-out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code> |
| Example | <code>:DISP:ANN:TRAC OFF</code> |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code> |
| Example | <code>:DISP:ACT OFF</code> |
| Dependencies | Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code> |
| Preset | <code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code> |
| State Saved | Saved in instrument state |

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

| | |
|----------------|--|
| Remote Command | <code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code> |
|----------------|--|

| | |
|--------------|--|
| Example | <code>:DISP:ANN:MBAR OFF</code> |
| Dependencies | Grayed out and forced to OFF when System Display Settings, Annotation is OFF |
| Preset | ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF |
| State Saved | Saved in instrument state |

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

| Name | Command |
|------------------|--|
| Select User View | <code>:DISPLAY:VIEW:ADVANCED:SELECT</code> |
| Rename User View | <code>:DISPLAY:VIEW:ADVANCED:RENAME</code> |
| Delete User View | <code>:DISPLAY:VIEW:ADVANCED:DELETE</code> |
| Create User View | <code>:DISPLAY:VIEW:ADVANCED:NAME</code> |
| Select Screen | <code>:INSTRUMENT:SCREEN:SELECT</code> |
| Delete Screen | <code>:INSTRUMENT:SCREEN:DELETE</code> |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| Name | Command |
|----------------------------|-------------------------------|
| Delete All But This Screen | :INSTRUMENT:SCREEN:DELETE:ALL |
| Add Screen | :INSTRUMENT:SCREEN:CREATE |
| Rename Screen | :INSTRUMENT:SCREEN:RENAME |
| Sequencer On/Off | :SYSTEM:SEQUENCER |

| | |
|-------------------------------|---|
| Remote Command | :DISPLAY:ENABLE OFF ON 0 1 |
| Example | :DISP:ENAB OFF |
| Couplings | :DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB |
| Preset | ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTEM:PRESet |
| State Saved | Not saved in instrument state |
| Backwards Compatibility Notes | :SYST:PRES no longer turns on :DISPLAY:ENABLE as it did in legacy analyzers |

3.6.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

Meas Global settings can be identified by the “Meas Global” in the Scope row in the SCPI tables.

3.6.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule (when frequency Scale Type is set to linear). While adjusting the Center Frequency the Span is held constant, this means that both Start Frequency and Stop Frequency will change.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer ?</code> |
| Example | <code>:FREQ:CENT 50 MHz</code> <code>:FREQ:CENT UP</code> changes the center frequency to 150 MHz if you use <code>FREQ:CENT:STEP 100 MHz</code> to set the center frequency step size to 100 MHz <code>:FREQ:CENT?</code> |
| Notes | This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to <code>FREQ:RF:CENT</code> For I/Q input it is equivalent to <code>FREQ:IQ:CENT</code> For External Mixer it is equivalent to <code>FREQ:EMIX:CENT</code> Preset and Max values are dependent on Hardware Options If no terminator (e.g., MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated. Forceful -131 |
| Dependencies | Start, Stop, Center and Span have interdependencies. These must be strictly enforced when any of these four values is modified. The Center Frequency can be limited by Start or Stop Freq limits, if the Span is so large that Start or Stop reaches their limit. |
| Couplings | When operating in “swept span”, any value of the Center Frequency or Span that is within the frequency range of the analyzer is allowed when the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the analyzer’s frequency range Coupling between center frequency and span: numeric (keypad) entries are treated differently than changing the value using the step keys (up/down arrows) or the knob. Similarly, for remote operation sending a numeric frequency value is treated differently than the UP DOWN keywords Numeric entries (keypad or remote) - any value of center frequency or span (within the frequency range of the analyzer) is allowed. The other parameter is forced, as necessary, to keep the Start Freq and Stop Freq within the analyzer frequency range Knob or Step keys (up/down arrows) or UP DOWN keywords - the value of the parameter being changed (center frequency or span) is limited so the other parameter is not forced to a new value. Thus, if only the step keys and knob are used, you can get back to the initial Center Freq and Span by changing only the current parameter NOTE: since out-of-range Start Freq and Stop Freq are never allowed, markers and trace math work nicely without requiring anything special for out-of-range conditions |
| Preset | Depends on instrument maximum frequency, mode, measurement, and selected input |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-------------|--|
| | See "RF Center Freq " on page 953 and "Ext Mix Center Freq " on page 954 and "I/Q Center Freq " on page 955 |
| State Saved | Saved in instrument state |
| Min | Depends on instrument maximum frequency, mode, measurement, and selected input.. See "RF Center Freq " on page 953 and "I/Q Center Freq " on page 955 |
| Max | Depends on instrument maximum frequency, mode, measurement, and selected input.. See "RF Center Freq " on page 953 and "I/Q Center Freq " on page 955 |

More Information

In measurements that also have Start Freq and Stop Freq controls, pressing Center Freq sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the Frequency menu is **Center Freq**. In the Start/Stop annotation mode, Start Freq and Stop Freq are displayed below the graticule instead of Center Freq and Span.

Pressing Center Freq also sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the Frequency menu is **Center Freq**.

When frequency Scale Type is set to log, pressing Center Freq sets the frequency that corresponds to the arithmetic mean of the start frequency and stop frequency, which is not at the horizontal center of the graticule.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your analyzer has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

| Freq Option | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|--------------------------|-----------------------------|------------------------------------|------------------------------------|
| 503 (all but CXA) | 1.805 GHz | 3.6 GHz | 3.7 GHz |
| 503 (CXA) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| 507 (all but CXA) | 3.505 GHz | 7.0 GHz | 7.1 GHz |
| 507 (CXA) | 3.755 GHz | 7.5 GHz | 7.58 GHz |
| 508 (all but MXE) | 1.805 GHz | 3.6 GHz | 8.5 GHz |
| 508 (MXE) | 4.205 GHz | 8.4 GHz | 8.5 GHz |
| 513 | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| 526 (except CXA and MXE) | 13.255 GHz | 26.5 GHz | 27.0 GHz* |
| 526 (CXA) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 526 (MXE) | 1.805 GHz | 3.6 GHz | 27.0 GHz |
| 532 | 16.005 GHz | 32.0 GHz | 32.5 GHz |
| 540 | 20.005 GHz | 40.0 GHz | 40.5 GHz |
| 543 | 21.505 GHz | 43.0 GHz | 43.0 GHz |
| 544 | 22.005 GHz | 44.0 GHz | 45.0 GHz |
| 550 | 25.005 GHz | 50.0 GHz | 52 GHz |
| F03 (CXA-m) | 1.505 GHz | 3.0 GHz | 3.08 GHz |
| F07 (CXA-m) | 3.755 GHz | 7.5 GHz | 7.575 GHz |
| F13 (CXA-m) | 6.805 GHz | 13.6 GHz | 13.8 GHz |
| F26 (CXA-m) | 13.255 GHz | 26.5 GHz | 26.55 GHz |
| 504 (M9421A, M8920A) | 2.145 GHz | 3.88GHz | 3.88 GHz |
| 506 (M9421A, M8920A) | 3.245 GHz | 6.08GHz | 6.08 GHz |
| F06 (M9410A/11A) | 1.0 GHz | 6.08 GHz | 6.08 GHz |
| F06 (M9415A) | 1 GHz | 1.08 GHz | 6.6 GHz |
| F08 (M9415A) | 1 GHz | 1.08 GHz | 8.6 GHz |
| F12 (M9415A) | 1 GHz | 1.08 GHz | 12.9 GHz |

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

| Input | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|---------------------|-----------------------------|------------------------------------|------------------------------------|
| Input 1, all models | 25.005 GHz | 50.0 GHz | 52 GHz |
| Input 2, opt 585 | 42.505 GHz | 85.0 GHz | 86 GHz |
| Input 2, opt 590 | 45.005 GHz | 90.0 GHz | 92 GHz |
| Input 2, opt 5CX | 55.005 GHz | 110.0 GHz | 110 GHz |

3 WLAN Mode
3.6 Modulation Analysis Measurement

Input 2, CXA and MXE

| Model | CF after Mode Preset | Stop Freq after Mode Preset | Max Freq (can't tune above) |
|-------------|----------------------|-----------------------------|-----------------------------|
| CXA opt C75 | 0.7505 GHz | 1.5 GHz | 1.58 GHz |
| MXE | 505 MHz | 1 GHz | 1.000025 GHz |

Tracking Generator Frequency Limits (CXA only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 9 kHz | 3.0 GHz | 3.08 GHz |
| T06 | 9 kHz | 6.0 GHz | 6.05 GHz |

Tracking Generator Frequency Limits(CXA-m only)

| Tracking Generator Option | Min Freq (clips to this freq when turn TG on and can't tune below while TG on) | If above this Freq, Stop Freq clipped to this Freq when TG turned on | Max Freq (can't tune above) while TG on |
|---------------------------|--|--|---|
| T03 | 2 MHz | 3.08 GHz | 3.08 GHz |
| T07 | 2 MHz | 7.575 GHz | 7.575 GHz |
| T13 | 2 MHz | 13.8 GHz | 13.8 GHz |
| T26 | 2 MHz | 26.55 GHz | 26.55 GHz |

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

| Products with Radio Heads/CIU | Preset | Start frequency | Stop frequency |
|-------------------------------|--------|-----------------|----------------|
| M9421A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU | 6 GHz | 5.9 GHz | 12 GHz |
| M9410A + CIU + RRH | 25 GHz | 24.25 GHz | 43.5 GHz |

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command `[:SENSe] :FREQuency:RF:CENTer <freq>`
 `[:SENSe] :FREQuency:RF:CENTer?`

Example `:FREQ:RF:CENT 30 MHz`

| :FREQ:RF:CEN? | |
|--|---|
| Notes | This command is the same in all modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode |
| Dependencies | <p>If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. Forceful -221.1100 If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning</p> <p>If Source Mode is set to Tracking, and the Max or Min Center Freq is therefore limited by the limits of the source, a warning message is generated -222.2001, “Data out of range; clipped to source max/min” if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep</p> |
| Preset | See table above |
| State Saved | Saved in instrument state |
| Min | -79.999995 MHz, unless Source Mode is set to Tracking, in which case it is limited by the minimum frequency of the Source |
| Max | <p>See table above. Basically, instrument maximum frequency - 5 Hz. Note that, if the Source Mode is set to Tracking, the effective instrument maximum frequency may be limited by the source maximum frequency</p> <p>If the knob or step keys are being used, also depends on the value of the other three interdependent parameters Span, Start Frequency and Stop Frequency</p> |
| <p>Ext Mix Center Freq</p> <p>SCPI command for specifying the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the Center Freq function in the Frequency menu on the front panel always applies to the currently selected input.</p> | |
| Remote Command | <p>[:SENSe] :FREQuency:EMIXer:CENTer <freq></p> <p>[:SENSe] :FREQuency:EMIXer:CENTer?</p> |
| Example | <p>:FREQ:EMIX:CEN 60 GHz</p> <p>:FREQ:EMIX:CEN?</p> |
| Notes | This command is the same in all modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode |
| Couplings | When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So, you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the analyzer comes back with the span from the previous input, limited as necessary by the current mixer setup |
| Preset | When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest |

3 WLAN Mode
3.6 Modulation Analysis Measurement

harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies

Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the analyzer uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table

When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz

Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz

| | |
|----------------|--|
| State Saved | Saved in instrument state |
| Min | The minimum frequency in the currently selected mixer band + 5 Hz |
| Max | The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on the value of the other three interdependent parameters Span, Start Frequency and Stop Frequency |
| | I/Q Center Freq SCPI command for specifying the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the Center Freq function in the Frequency menu on the front panel always applies to the currently selected input. |
| Remote Command | <code>[:SENSe] :FREQuency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQuency :IQ :CENTer?</code> |
| Example | <code>:FREQ:IQ:CENT 30 MHz</code> |
| Notes | This command is the same in all modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode |
| Preset | 0 Hz |
| State Saved | Saved in instrument state |
| Min | -40.049995 MHz |
| Max | 40.049995 MHz |

Center Frequency Segment1

NOTE

This key is only available when radio standard is 802.11ac/ax 80+80MHz and when the active measurement is SEM, CHP or Modulation Analysis.

This parameter sets the center frequency of Segment 1.

Note that the SCPI command will set this center frequency even if radio standard is NOT 802.11ac/ax 80+80MHz.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer :SEGMENT1 <freq></code> <code>[:SENSe] :FREQuency :CENTer :SEGMENT1?</code> |
| Example | <code>:FREQ:CENTer:SEGM1 5.53 GHz</code> <code>:FREQ:CENTer:SEGM1?</code> |
| Notes | For an 80+80 MHz channel, the Segment 1 will be the lower or upper segment. The center frequency of this Segment1 is independent from the center frequency of Segment2 SEM measurement will rearrange the Segment 1 and Segment 2 based on their center frequency, and will generate a “setting conflict” error message if the spacing between the two segments is less than 80 MHz |
| Preset | 5.21 GHz |
| State Saved | Saved in instrument state |
| Min | Depends on instrument minimum center frequency Same as Center Frequency |
| Max | Depends on instrument maximum center frequency Same as Center Frequency |

Center Frequency Segment2

This key is only available when radio standard is 802.11ac/ax 80+80MHz and when the active measurement is SEM, CHP or Modulation Analysis.

This parameter sets the center frequency of Segment 2.

Note that the SCPI command will set this center frequency even if radio standard is NOT 802.11ac/ax 80+80MHz.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :FREQuency :CENTer :SEGMENT2 <freq></code> <code>[:SENSe] :FREQuency :CENTer :SEGMENT2?</code> |
| Example | <code>:FREQ:CENTer:SEGM2 5.53 GHz</code> <code>:FREQ:CENTer:SEGM2?</code> |
| Notes | For an 80+80 MHz channel, the Segment 2 will be the lower or upper segment. The center frequency of this Segment2 is independent from the center frequency of Segment1 SEM measurement will rearrange the Segment 1 and Segment 2 based on their center frequency, and will generate a “setting conflict” error message if the spacing between the two segments is less than 80 MHz |
| Preset | 5.45 GHz |
| State Saved | Saved in instrument state |
| Min | Depends on instrument minimum center frequency Same as Center Frequency |

3 WLAN Mode
3.6 Modulation Analysis Measurement

Max Depends on instrument maximum center frequency
Same as Center Frequency

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the analyzer.

Note that the start and stop frequencies also step by the CF Step value.

It could be called Freq Step, but since Start and Stop are rarely stepped, the legacy name “CF Step” best describes the control’s main use.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq></code> <code>[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?</code> |
| Example | <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> increases the current center frequency value by 500 MHz <code>:FREQ:CENT:STEP?</code> |
| Notes | Preset and Max values are depending on Hardware Options (503, 507, 508, 513, 526) Preset and Max values are dependent on Hardware Options (5xx) |
| Dependencies | Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning |
| Couplings | When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value |
| Preset | Auto |
| State Saved | Saved in instrument state |
| Min | – (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band |
| Max | The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band |
| Remote Command | <code>[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe]:FREQuency:CENTer:STEP:AUTO?</code> |

| | |
|---------|--|
| Example | :FREQ:CENT:STEP:AUTO ON :FREQ:CENT:STEP:AUTO? |
| Preset | ON |

3.6.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement.

If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display.

If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace which is determined by the Marker Trace on the Properties tab.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.6.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, and so on.

You can change the trace where a Marker is placed on by changing Marker Trace on the Properties tab.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

On any menu tab for which Select Marker displays, the first control is always Marker X.

| | |
|-------------|---|
| Notes | The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak |
| Preset | Marker 1 |
| State Saved | The number of the selected marker is saved in instrument state |

3.6.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker X

Set the X Axis value of the selected marker in the current X Axis Scale unit. If the marker mode is off, the SCPI command has no affect other than to cause the marker to become selected.

NOTE

The X label and value can change if the marker is moved to a trace with a different domain.

If the marker mode is Normal, the Marker X position is absolute.

If the mode is Delta, then the X position is relative to the reference marker.

The valid X positions are the actual data points in the trace; the marker cannot be located between points. If a SCPI command attempts to place the marker between two points, the X value snaps to the closest point.

Note that for Vector or Constellation format, the X axis is perpendicular to the screen (because the screen axes are used to show the real and imaginary parts of the Y value), so adjusting the X value in this case only causes the marker to move horizontally if the real Y value changes.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:MARKer[1] 2 ... 12:X <real></code> <code>:CALCulate:EVM:MARKer[1] 2 ... 12:X?</code> |
| Example | <code>:CALC:EVM:MARK:X 0.325</code> <code>:CALC:EVM:MARK:X?</code> |
| Notes | Marker X does not go outside the bounds of the data. If you attempt to set it to a value outside the bounds, it is clipped at the closest limit and error -222 Data Out of Range is generated If suffix is sent, it must match the X units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated If you try to read or set the position of a Delta marker, remember that the position is in relative units |
| Couplings | See "Coupling of Delta and Reference markers " on page 960 |
| Preset | None until marker is turned on |
| State Saved | Saved in instrument state |
| Min | Depends on trace data |
| Max | Depends on trace data |

Marker X Position (Remote Command Only)

Via SCPI, the marker position can also be set or queried in trace points. In this case, the position setting or reading is absolute regardless of control mode.

NOTE

The entered value in Trace Points is immediately translated into the current domain units for setting the value of the marker. The marker's value in domain units, NOT trace points, is preserved if a change is made to the X Axis scale settings. Thus, if you use this command to place a marker on point 500, which happens at that time to correspond to 13 GHz, and then you change the Start Frequency so that point 500 is no longer 13 GHz, the marker stays at 13 GHz, NOT at point 500.

If the trace marker is on a 2-dimensional domain, the points are numbered in the following way:

Starting at the minimum X and Z position, this point is numbered 0. Each time you increment the point number, increment the X value to the next available value. When X reaches the maximum X position, then reset X to the minimum and increment the Z value. Then continue incrementing the X position in the same manner as before.

Note that for symbol tables, which have no axes, incrementing the X position in points moves the marker consecutively through all table entries.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:MARKer[1] 2 ... 12:X:POsition <real></code> <code>:CALCulate:EVM:MARKer[1] 2 ... 12:X:POsition?</code> |
| Example | <code>:CALC:EVM:MARK:X:POS 25</code> <code>:CALC:EVM:MARK:X:POS?</code> |
| Notes | When a marker mode is changed from off to any other mode, the X position is set to mid-screen |
| Preset | None until marker is turned on |
| State Saved | Saved in instrument state |
| Min | Depends on trace data |
| Max | Depends on trace data |

Coupling of Delta and Reference markers

These coupling rules are for these reasons:

We want to make it convenient to turn on a delta marker measurement with a fixed reference, and turn the fixed reference off when we're done.

Deltas have no good definition when the reference and the delta marker have different dimensions.

We do not yet support cross-trace deltas even when domains have the same dimensions.

We want to honor what the user has requested as reasonably as possible.

The following coupling rules apply from the front panel and also if the equivalent SCPI commands are sent.

Pressing the Delta key causes the selected marker to become a delta marker if it is not already. Also, the selected marker's reference is affected as follows:

If the reference marker was off, it is turned on as a normal marker.

The reference marker is moved to the trace of the selected marker and set to the same position as the selected marker.

If the delta marker has a marker function turned on, the reference marker takes on the same function (with the same band limits).

Exception: Pressing Delta when the selected marker's mode is not yet Delta does not move or change a reference marker that is already turned on (Normal, or Delta) and on the same trace as the selected marker. It merely changes the selected marker's mode to Delta and shows the current offset between it and the reference. If you press Delta again (when the selected marker is already in Delta mode) then the reference is moved and modified as described above.

When a delta marker is changed to any other control mode, the reference marker is turned off.

If you move a delta marker to a different trace, it is forced to Normal mode and the reference is turned off.

A delta marker is forced to Normal mode if you turn its reference off or if you move its reference to another trace. (In the latter case the reference is not turned off.)

If you change the selected marker's reference (using the Marker, Properties, Relative To), the selected marker is forced to Delta mode. This change of the selected marker to Delta mode causes its new reference's control mode and position to change as described above.

Marker Mode

Sets the marker control mode to **Normal**, **Delta**, or **Off**.

All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the **Marker Trace** rules.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function, and the active function is turned off.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:MARKer[1] 2 ... 12:MODE POSition DELTa OFF</code> <code>:CALCulate:EVM:MARKer[1] 2 ... 12:MODE?</code> |
| Example | <code>:CALC:EVM:MARK3:MODE POS</code> <code>:CALC:EVM:MARK3:MODE?</code> |

| | |
|------------------------------|--|
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | Normal DELTa (D) Off |
| | Backwards Compatibility SCPI Commands |
| | Sets or queries the state of a marker. Setting a marker that is OFF to state ON or 1 puts it in Normal mode and places it at the center of the screen. |
| Example | :CALC:EVM:MARK3:STAT ON :CALC:EVM:MARK3:STAT? |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |
| Backwards Compatibility SCPI | :CALCulate:EVM:MARKer[1] 2 ... 12:STATe OFF ON 0 1 :CALCulate:EVM:MARKer[1] 2 ... 12:STATe? |

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

| | |
|----------------|----------------------------|
| Remote Command | :CALCulate:EVM:MARKer:AOff |
| Example | :CALC:EVM:MARK:AOff |

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker which is not Off. “equal X Axis movement” means to preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of

3 WLAN Mode
3.6 Modulation Analysis Measurement

the trace that marker is on), and the X Axis value of the marker being moved (in the same fundamental x-axis units).

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:MARKer:COUPle[:STATe] ON OFF 1 0</code> <code>:CALCulate:EVM:MARKer:COUPle[:STATe]?</code> |
| Example | <code>:CALC:EVM:MARK:COUP ON</code> <code>:CALC:EVM:MARK:COUP?</code> |
| Notes | In general, when coupling is turned on then all Normal or Delta markers with the same (or equivalent) domain as the selected marker move in the same manner as the selected marker. See " More Information " on page 963 |
| Preset | OFF (presets on Mode Preset and All Markers Off) |
| State Saved | Saved in instrument state |

More Information

Coupling is relative between markers on the same trace (so that their relative positions in the domain are maintained). Coupling can be absolute between markers on different traces that have equivalent domains. That is, they have the same position in the domain, if possible. (As an example of equivalent domains, demodulated symbol positions can be derived from time by using the current symbol rate). When you move the selected marker, then others on related traces track it. This enables you to correlate different measurement results. For example, you can place a marker at a particular symbol time on an error vector magnitude display, have tracking markers on the symbol table and pre-demod time trace showing you the symbol value, and the actual time-varying signal value at the same point in time.

Absolute coupling is performed only for the lowest numbered Normal or Delta marker on each trace. All other markers on a trace couple relatively. When you turn on marker coupling, the subset of markers that have the same domain as the selected marker track it and all other markers remain at their current location. The absolutely coupled markers within this subset is moved at this time to match the domain setting of the selected marker, with the relatively coupled markers following accordingly to maintain offsets within their respective traces. Those markers with different domains remain at their current location. When you select a marker with a different domain than the previously selected marker, the subset of markers with that domain go through the same procedure.

Any marker that coupling would move outside its range of X values, remains at the closest limiting value. If the coupled markers are on data that do not have the same domain resolution, then they are positioned as close to each other as possible.

If markers change mode or trace, or trace data is changed below them, the coupling rules are immediately applied to the new set.

3.6.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the Peak Search hardkey automatically moves you to the Peak Search page of the Marker menu AND performs a Peak Search.

Pressing the Peak Search tab once you are already IN the Marker menu does NOT perform a Peak Search.

Marker X

See "[Marker X](#)" on page 959, on the Settings tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

Pressing the Peak Search hardkey automatically moves you to the Peak Search page of the Marker menu *and* performs a Peak Search.

| | |
|----------------|---|
| Remote Command | :CALCulate:EVM:MARKer[1] 2 ... 12:MAXimum |
| Example | :CALC:EVM:MARK2:MAX |
| | The command SYST:ERR? can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search |

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value. If there is no valid peak lower than the current marker position, a "No peak found" message is generated, and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

| | |
|----------------|--|
| Remote Command | :CALCulate:EVM:MARKer[1] 2 ... 12:MAXimum:NEXT |
| Example | :CALC:EVM:MARK2:MAX:NEXT |
| State Saved | Not saved in instrument state |

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria. If there is no valid peak to the right of the current marker position, a “No peak found” message is generated, and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

| | |
|----------------|---|
| Remote Command | :CALCulate:EVM:MARKer[1] 2 ... 12:MAXimum:RIGHT |
| Example | :CALC:EVM:MARK2:MAX:RIGH |
| Notes | Sending this command selects the subopcoded marker |
| State Saved | Not saved in instrument state |

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria (see Peak Search Config, Section 4.4). If there is no valid peak to the left of the current marker position, a “No peak found” message is generated, and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

| | |
|----------------|--|
| Remote Command | :CALCulate:EVM:MARKer[1] 2 ... 12:MAXimum:LEFT |
| Example | :CALC:EVM:MARK2:MAX:LEFT |
| State Saved | Not saved in instrument state |

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value. If the selected marker is Off, it is turned on before the minimum search is performed.

| | |
|----------------|--|
| Remote Command | :CALCulate:EVM:MARKer[1] 2 ... 12:MINimum |
| Example | :CALC:EVM:MARK2:MIN |
| Notes | Sending this command selects the subopcoded marker |
| State Saved | Not saved in instrument state |

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace. And it places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Normal** if it is not already on.

The rules for finding the maximum peak are exactly the same as for **Peak Search**, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is off, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta which turns on the reference marker if needed, and then it performs the peak-to-peak function.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:MARKer[1] 2 ... 12:PTPeak</code> |
| Example | <code>:CALC:EVM:MARK:PTP</code> |
| Notes | Turns on the Marker D active function Sending this command selects the subopcoded marker |
| Dependencies | Pk-Pk Search is not available when Coupled Markers is on |
| Couplings | The selected marker becomes a delta marker if not already in delta mode |
| State Saved | Not saved in instrument state |

Marker Delta

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.6.7.4 Properties

The controls in this tab are used to set certain properties of the selected marker.

Marker X

See "[Marker X](#)" on page 959, on the Settings tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:MARKer[1] 2 ... 12:REference <integer></code> <code>:CALCulate:EVM:MARKer[1] 2 ... 12:REference?</code> |
| Example | <code>:CALC:EVM:MARK:REF 5</code> <code>:CALC:EVM:MARK:REF?</code> |
| Notes | This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker) |
| Couplings | If the reference marker is off it is turned on in Normal mode at the delta marker location. |
| Preset | The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off , All Markers Off , or Preset |
| State Saved | Saved in instrument state Not affected by Marker Off and hence not affected by Preset or power cycle |
| Min | 1 |
| Max | 12 |

Marker Trace

Assigns the specified marker to the designated trace.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:MARKer[1] 2 ... 12:TRACe POLar EVM MERRor PERRor EVMS EVMC PFERRor IQGain IQQuad UTError</code> |

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as "[Marker Settings Diagram](#)" on page 962 on the Settings tab.

3.6.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.6.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Avg|Burst Number

Used to specify the number of data acquisitions that are averaged. After the specified number of average counts, the averaging mode (termination control) setting determines the averaging action.

Avg number is the number of bursts, is *not* the number of data acquisition. If search length is large enough to include all the bursts, acquisition will only execute once (single mode). If the bursts number include in one capture is smaller than average number, multi capture and measurement is necessary.

- On – Sets measurement averaging on
- Off – Sets measurement averaging off

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:EVM:AVERage:COUNT <integer></code> <code>[:SENSe]:EVM:AVERage:COUNT?</code> |
|----------------|---|

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-------------|---|
| Example | <code>:EVM:AVER:COUN 1</code> <code>:EVM:AVER:COUN?</code> |
| Preset | 10 |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 10000 |

Averaging On/Off

Turns averaging on or off.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:EVM:AVERage[:STATe]?</code> |
| Example | <code>:EVM:AVER OFF</code> <code>:EVM:AVER?</code> |
| Couplings | As Radio Std Detection is set to Auto, Average State is coupled to OFF |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | On Off |

Avg Mode

Selects the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached.

- Exponential: After the average count is reached, each successive data acquisition is exponentially weighted and combined with the existing average
- Repeat: After reaching the average count, the averaging is reset, and a new average is started

The default value is Exp.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:AVERage:TCONtrol EXPonential REPeat</code> <code>[:SENSe]:EVM:AVERage:TCONtrol?</code> |
| Example | <code>:EVM:AVER:TCON REP</code> <code>:EVM:AVER:TCON?</code> |
| Preset | EXPonential |
| State Saved | Saved in instrument state |
| Range | Exponential Repeat |

Segment Number

Selects the segment to be analyzed.

| | |
|-------------|---|
| Couplings | Available when Radio Std is set to 802.11ac/ax 80+80MHz |
| State Saved | Saved in instrument state |

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Common

You can set up the following parameters on the same page.

- Avg|Burst Number
- Average Mode
- Phase Noise Optimization
- LO Dither
- IF Gain
- Search Length
- Meas Interval
- Meas Offset
- Result Length
- Max Result Length

Demod

You can set up the following parameters on the same page.

- Modulation Format
- Chip Rate
- Descramble
- Equalizer

3 WLAN Mode
3.6 Modulation Analysis Measurement

- IQ Normalize
- Multi-Carrier Filter
- Spectrum

Else

You can set up the following parameters on the same page.

- Clock Adjust
- Track Phase
- Reference Filter
- Reference Filter Alpha/BT
- Measurement Filter
- IQ Compensation
- IQ Gain Imbalance
- Quadrature Error
- Timing Skew

Optimize EVM

This is an "immediate action" function. It is used to set the combination of preamp, mechanical and electronic attenuation and IF gain value based on measured signal peak level. Its purpose is to get better EVM results by improving SNR and avoid ADC overload at the same time.

This key is not visible for B25 IF bandwidth option. This key will be gray out if radio standard is 802.11ac/ax 80+80MHz. and it will not be visible if radio standard is 11b/g.

After this key pressed, Pre adjust for min clip will be changed to off, IF gain auto will be changed to Manu.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :EVM:OPTimize</code> |
| Example | <code>:EVM:OPT</code> |
| Dependencies | Does not appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E |

EVM Optimization Method

NOTE

“Optimize EVM” is an immediate action, before the action, the EVM Optimization Method should be selected.

There are 2 methods for EVM Optimization

- Normal method is to adjust hardware settings to minimize EVM by some algorithm which is dependent on the measured peak power of input signal
- Iterative method is to adjust hardware settings to minimize EVM by some algorithm which is to iterate measured EVM of input signal

Generally, Iterative method is slower than Normal method, but it can always get better EVM.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:OPTMethod NORMal ITERative</code> <code>[:SENSe]:EVM:OPTMethod?</code> |
| Example | <code>:EVM:OPTM NORM</code> <code>:EVM:OPTM?</code> |
| Preset | <code>Normal</code> |
| State Saved | Saved in instrument state |
| Range | <code>NORMal ITERative</code> |

Average Number for Iterative EVM Optimization (Remote Command Only)

In iterative EVM Optimization, the algorithm stability is very dependent on the variation of measured EVM.

Averaging EVM is used in the algorithm to reduce the variation of EVM reading.

More averaging will get more stable EVM reading but longer measurement time. This SCPI only parameter can adjust averaging number to balance the stability and measurement time.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:EVM:OPTMethod:AVERage:COUNT <integer></code> <code>[:SENSe]:EVM:OPTMethod:AVERage:COUNT?</code> |
| Example | <code>:EVM:OPTM:AVER:COUN 1</code> <code>:EVM:OPTM:AVER:COUN?</code> |
| Preset | 4 |
| State Saved | No |
| Min | 1 |
| Max | 10 |

Spur Avoidance

Because the VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The Spur Avoidance function is provided to eliminate this spur, at the expense of some measurement speed.

When Spur Avoidance is enabled (the default), the analyzer uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the $BW \leq \text{maxBW}/2.5$.

You can disable this function in order to speed up your measurement. When Spur Avoidance is turned Off, a warning message will appear in the status bar as “Settings Alert; Spur Avoidance Off”. This is to alert you that measurement accuracy might be impacted because you have defeated the spur avoidance algorithm.

The spur avoidance function is not available for:

- M9410A/11A with EP6 option at frequency above 6 GHz
- M9415A/16A at frequency below 380 MHz and above 12.3 GHz
- M9410E/11E/15E/16E at frequency below 380 MHz and above 25.9 GHz

More Information

Maximum digital IF BW is limited by both Option and Center frequency.

For VXT models M9410A/11A:

Bandwidth Option limitation:

| Option | Max Digital IF BW |
|--------|-------------------|
| B40 | 40 MHz |
| B3X | 300 MHz |

| Option | Max Digital IF BW |
|--------|-------------------|
| B6X | 600 MHz |
| B12 | 1200 MHz |

Center frequency limitation:

| Center Frequency | Max Digital IF BW |
|--|---------------------|
| 330 MHz ~ 380 MHz | (CF - 330 MHz) * 2 |
| 380 MHz ~ 550 MHz | 100 MHz |
| 550 MHz ~ 1310 MHz | 200 MHz |
| 1310 MHz ~ 2000 MHz (without Option EP6) | 600 MHz |
| 2000 MHz ~ 5480 MHz (without Option EP6) | 1200 MHz |
| 5480 MHz ~ 6080 MHz (without Option EP6) | (6080 MHz - CF) * 2 |
| 1310 MHz ~ 1900 MHz (Option EP6) | 600 MHz |
| 1900 MHz ~ 6000 MHz (Option EP6) | 1200 MHz |
| 6000 MHz ~ 6600 MHz (Option EP6) | (6600 MHz - CF) * 2 |

For VXT models M9415A/16A:

Bandwidth Option limitation:

| Option | Max Digital IF BW |
|--------|-------------------|
| B4X | 400 MHz |
| B8X | 800 MHz |
| B12 | 1200 MHz |

Center frequency limitation:

| Center Frequency | Max Digital IF BW |
|-----------------------|----------------------|
| 330 MHz ~ 380 MHz | (CF - 330 MHz) * 2 |
| 380 MHz ~ 550 MHz | 100 MHz |
| 550 MHz ~ 1310 MHz | 200 MHz |
| 1310 MHz ~ 2000 MHz | 600 MHz |
| 2000 MHz ~ 12300 MHz | 1200 MHz |
| 12300 MHz ~ 12900 MHz | (12900 MHz - CF) * 2 |

M9410E/11E

Option Limitation:

| Option | Maximum IF BW |
|--------|---------------|
| B40 | 40 MHz |
| B3X | 300 MHz |

3 WLAN Mode
 3.6 Modulation Analysis Measurement

| Option | Maximum IF BW |
|--------|---------------|
| B6X | 600 MHz |
| B12 | 1200 MHz |

Center Frequency Limitation:

| Center Frequency | Maximum IF BW |
|--|---|
| 1 MHz ~ 10 MHz (Option LFE) | 500 kHz |
| 10 MHz ~ 20 MHz (Option LFE) | 5 MHz |
| 20 MHz ~ 60 MHz (Option LFE) | 10 MHz |
| 60 MHz ~ 80 MHz (Option LFE) | 20 MHz |
| 80 MHz ~ 380 MHz (Option LFE) | 40 MHz |
| 330 MHz ~ 380 MHz (without Option LFE) | (CF - 330 MHz) * 2 |
| 380 MHz ~ 550 MHz | 100 MHz |
| 550 MHz ~ 1310 MHz | 200 MHz |
| 1310 MHz ~ 2000 MHz (without Option EP6) | 600 MHz |
| 2000 MHz ~ 25.9 GHz (without Option EP6) | 1200 MHz |
| 1310 MHz ~ 1900 MHz (Option EP6) | 600 MHz |
| 1900 MHz ~ 25.9 GHz (Option EP6) | 1200 MHz |
| 25.9 GHz ~ 26.5 GHz | Min(Max BW by option, 2*(26.5 GHz-Center Freq)) |

M9415E/16E

Option Limitation:

| Option | Maximum IF BW |
|--------|---------------|
| B4X | 400 MHz |
| B8X | 800 MHz |
| B12 | 1200 MHz |

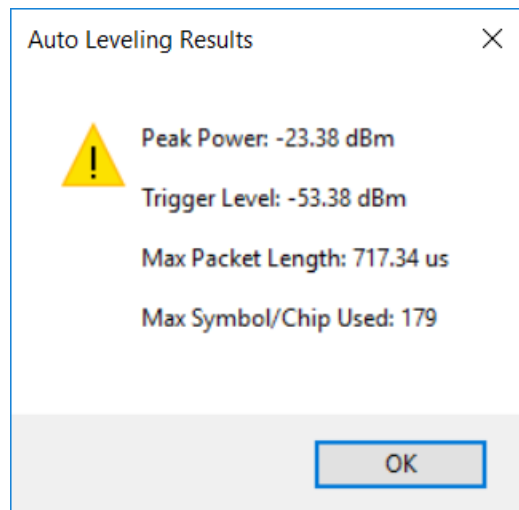

Center Frequency Limitation:

| Center Frequency | Maximum IF BW |
|--|--------------------|
| 1 MHz ~ 10 MHz (Option LFE) | 500 kHz |
| 10 MHz ~ 20 MHz (Option LFE) | 5 MHz |
| 20 MHz ~ 60 MHz (Option LFE) | 10 MHz |
| 60 MHz ~ 80 MHz (Option LFE) | 20 MHz |
| 80 MHz ~ 380 MHz (Option LFE) | 40 MHz |
| 330 MHz ~ 380 MHz (without Option LFE) | (CF - 330 MHz) * 2 |
| 380 MHz ~ 550 MHz | 100 MHz |
| 550 MHz ~ 1310 MHz | 200 MHz |

| Center Frequency | Maximum IF BW |
|---------------------|---|
| 1310 MHz ~ 2000 MHz | 600 MHz |
| 2000 MHz ~ 25.9 GHz | 1200 MHz |
| 25.9 GHz ~ 26.5 GHz | Min(Max BW by option, 2*(26.5 GHz-Center Freq)) |

Auto Leveling

Performs auto-leveling for EVM measurements. A dialog box containing the results of auto-leveling will show up after the process is done. When processing auto-leveling by SCPI, the dialog box will not show up. You can query the result by SCPI though, see [More Information](#).

| | |
|----------------|--|
| Remote Command | :CALCulate:EVM:LEVel:AUTO |
| Example | :CALC:EVM:LEV:AUTO |
| Dependencies | Only appears in modular products, such as VXT model M9410A or E6630A This control is enabled when radio device is not 802.11ac 80+80MHz and is grayed-out otherwise |

More Information

Here is the detail for parameters in the dialog box.

| Value | SCPI | Unit of returned | Notes |
|---------------|--|------------------|---|
| Peak Power | :CALCulate:EVM:LEVel:PEAK? :CALC:EVM:LEV:PEAK? | dBm | Queries the peak power of the burst |
| Trigger Level | :CALCulate:EVM:LEVel:TRIGger? :CALC:EVM:LEV:TRIG? | dBm | Queries the recommended video trigger level |

| Value | SCPI | Unit of returned | Notes |
|----------------------|--|------------------|---|
| Max Packet Length | :CALCulate:EVM:LEVel:TIME? :CALC:EVM:LEV:TIME? | second | Queries the max packet length |
| Max Symbol/Chip Used | :CALCulate:EVM:LEVel:POINt? :CALC:EVM:LEV:POIN? | None | Queries the number of the max symbol/chip used in the burst. For 11b/g, this value is the total number of chips. For OFDM format, this value is the total number of symbols |

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 978 below.

| | |
|-------------------------------|---|
| Remote Command | :COUPle ALL |
| Example | :COUP ALL |
| Backwards Compatibility SCPI | :COUPLE ALL NONE |
| Backwards Compatibility Notes | :COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs |

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it

would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command `:CONFigure:EVM`

Example `:CONF:EVM`

3.6.8.2 Radio

Contains controls to select Radio Standard and settings.

Radio Std Detection

Enables automatic detection of the radio standard of a WLAN signal from DUT. The auto detection can detect all WLAN family, *except* 802.11ah.

This function is available for Modulation Analysis and Spectral Flatness measurements. In other measurements, when **Auto** is selected, error message “-221 Setting conflict, Auto detection is not available for current measurement” appears.

When **Radio Std Detection** is **Auto**, **Radio Std** is grayed-out.

When set to **Man**, the radio standard is determined by "[Radio Std](#)" on page 1835.

The default settings is **Manual**.

Remote Command `[:SENSe]:RADio:STANdard[:WLAN]:DETECT:AUTO OFF | ON | 0 | 1`

Remote Command `[:SENSe]:RADio:STANdard[:WLAN]:DETECT:AUTO?`

Example `:RAD:STAN:DET:AUTO ON`

Example `:RAD:STAN:DET:AUTO?`

Notes Auto detection can detect all WLAN family, *except* 802.11ah

The auto detection function is available for Modulation Analysis and Spectral Flatness measurements. In other measurements, if **Auto** is selected, error message “-221 Setting conflict, Auto detection is not available for current measurement” appears

| | |
|-------------|--|
| | Auto Detection is <i>not</i> recommended for Multi-Carrier signals |
| Preset | OFF |
| State Saved | Saved in instrument state |

Radio Std

In this menu, 7 groups of WLAN standards can be selected:

1. 802.11a/b/g/j/p includes 802.11a/g/j/p, 802.11b/g, 802.11g DSSS-OFDM, 802.11j/p 10M, 802.11p 5M
2. 802.11n includes 802.11n 20MHz and 802.11n 40MHz
3. 802.11ac includes 802.11ac 20MHz, 802.11ac 40MHz, 802.11ac 80MHz, 802.11ac 80+80MHz and 802.11ac 160MHz
4. 802.11ah includes 802.11ah1MHz, 802.11ah2MHz, 802.11ah4MHz, 802.11ah 8MHz, and 802.11ah16MHz
5. 802.11af includes 802.11af 6MHz, 802.11af 7MHz and 802.11af 8MHz
6. 802.11ax includes 802.11ax 20MHz, 802.11ax 40MHz, 802.11ax 80MHz, 802.11ax 80+80MHz and 802.11ax 160MHz
7. 802.11be includes 802.11be 20MHz, 802.11be 40MHz, 802.11be 80MHz, 802.11be 160MHz and 802.11be 320MHz

Below each standard, parameters related to demodulation can be set, such as Modulation Format, Guard Interval, and so on.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :RADio :STANdard [:WLAN] AG BG GDO N20 N40 AC20 AC40 AC80 ACT80 AC160 AH1 AH2 AH4 AH8 AH16 JP10 P5 AF6 AF7 AF8 AX20 AX40 AX80 AXT80 AX160 BE20 BE40 BE80 BE160 BE320</code> <code>[:SENSe] :RADio :STANdard [:WLAN] ?</code> |
| Example | <code>:RAD:STAN AG</code> <code>:RAD:STAN?</code> |
| Notes | If the command is sent with unsupported parameters, an error is generated “Settings conflict; option not installed” For IQ measurements (CCDF, Power vs Time, Spectral Flatness, IQ Waveform or Modulation Accuracy), they are also limited by BW Option installed. when any radio standard is selected in an IQ measurement which maximum BW could not meet this radio standard request, the “Invalid result; Wider BW required” message will be displayed, and the measurement should return invalid data: Enum value ACT80 means “AC Two 80MHz” (802.11ac 80+80 MHz) Enum value AXT80 means “AX Two 80MHz” (802.11ax 80+80 MHz) |
| Preset | AG |

Subcarrier Spacing (Radio Std NOT 802.11b/g(DSSS/CCK/PBCC) or 802.11ax, 802.11be)

Specifies the subcarrier frequency spacing of the input signal. This parameter must match the actual subcarrier frequency spacing of the input signal, otherwise demodulation will fail. The default 312.5 kHz matches the 802.11a/g/n/ac standards.

Remote Command
 Radio Std = 802.11a/g/j/p(OFDM 20 MHz)
 [:SENSe]:DEMod[:WLAN]:AG:SUBCarrier:SPACing <freq>
 [:SENSe]:DEMod[:WLAN]:AG:SUBCarrier:SPACing?

Guard Interval Selection (Radio Std NOT 802.11b/g(DSSS/CCK/PBCC) or 802.11ax/be)

Specifies the guard interval (also called cyclic extension) length for each symbol time, as a fraction of the FFT length. The value must match the guard interval length actually used in the input signal in order for demodulation to work properly. The value should be between zero and one, and values outside that range are clipped to be within the range. The value is rounded to the nearest 1/128th.

Other Guard Interval (Radio Std NOT 802.11b/g(DSSS/CCK/PBCC) or 802.11ax, 802.11be)

Specifies the guard interval (also called cyclic extension) length for each symbol time.

When "Guard Interval Selection (Radio Std NOT 802.11b/g(DSSS/CCK/PBCC) or 802.11ax/be)" on page 1504 is set to **Other**, this value is available and used as Guard Interval.

HE Guard Interval Selection (Radio Std 802.11ax)

Specifies the guard interval (also called cyclic extension) length for each symbol time, as a fraction of the FFT length. The value must match the guard interval length actually used in the input signal in order for demodulation to work properly. The value should be between zero and one, and values outside that range are clipped to be within the range. The value is rounded to the nearest 1/128th. The 802.11ax HE Guard Interval is for HE part of signal, the Guard Interval of Non-HE part is fixed to 1/4. The Auto selection allows to detect 11ax HE Guard Interval automatically.

HE-LTF Size (Radio Std 802.11ax)

To indicate HE-LTF(the HE Long Training field) size, a HE PPDU supports 3 HE-LTF Sizes, which are 1x HE-LTF, 2x HE-LTF, and 4x HE-LTF. Duration of each 1x HE-LTF OFDM/2x HE-LTF OFDM/4x HE-LTF OFDM symbol without GI is 3.2us/6.4us/12.8us separately. In 11ax specification, HE-LTF size is always bundled with CP length, for example, 1x HE-LTF + 0.8 μ s, 2x HE-LTF + 0.8 μ s, 2x HE-LTF + 1.6 μ s and 4x HE-LTF + 3.2 μ s, then 1x/2x/4x HE-LTF is HE-LTF Size which should be set here and 0.8us/1.6us/3.2us are HE Guard Interval should be set by HE Guard Interval under mode setup/802.11ax, the HE Guard Interval should be 1/16, 1/8, 1/4, separately. The Auto Detect selection allows to detect 11ax HE-LTF Size automatically.

3.6.8.3 Time

Accesses the meas time menu for the current measurement.

Search Length

Sets the length of time to acquire the input signal. This defines the length of time that the burst search is performed.

The analyzer searches within the specified search length, find all burst positions within this search length, and demodulates burst one by one if average state is on and average number is still not reached. If one acquisition does not include total required bursts, multi capture is needed. So, if you want to get results for continues bursts, make sure search length is large enough to include all the bursts. Otherwise multi acquisitions will be performed.

Meas Interval

For standard 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be.

This parameter specifies the measurement interval (length), in symbol times, of the portion of the OFDM burst that will be analyzed. This analyzed portion of the OFDM burst starts at a measurement offset specified by Meas Offset.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:TIME:INTerval <integer></code> <code>[:SENSe]:EVM:TIME:INTerval?</code> |
| Example | <code>:EVM:TIME:INT 15</code> <code>:EVM:TIME:INT?</code> |
| Preset | For 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be: 16 symbols For 802.11b/g (DSSS/CCK/PBCC): 2794 chips |
| State Saved | Saved in instrument state |
| Min | For 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be: 1 symbols For 802.11b/g (DSSS/CCK/PBCC): 1 chips |

|-----|--|

Meas Offset

For 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be:

This parameter specifies the measurement offset, in symbol times, of the portion of the OFDM burst that will be analyzed. The length of this analyzed portion of the OFDM burst is specified by Meas Interval.

For 802.11b/g (DSSS/CCK/PBCC):

Used to set the measurement offset, in chips, of the portion of the WLAN burst that will be analyzed. The length of this analyzed portion of the WLAN burst is specified by Meas Interval. If the specified measurement offset is less than zero, a value of zero is used instead.

The measurement interval and offset are relative to the ideal starting point of the PLCP preamble portion of the burst. For a signal that uses the long PLCP format, the ideal starting point of the PLCP preamble is exactly 128 symbol times (128*11 chip times) before the start of the SFD sync pattern. For a signal that uses the short PLCP format, the ideal starting point of the PLCP preamble is exactly 56 symbol times (56*11 chip times) before the start of the SFD sync pattern.

| Max | If Result Length is Auto, then the specified measurement offset will be clipped to be less than or equal to the value of Max Result Length – Meas Interval If Result Length is Man, then the specified measurement offset will be clipped to be less than or equal to the value of Result Length – Meas Interval |

Result Length

For 802.11a/g/j/p (OFDM) and 801.11g (DSSS-OFDM):

3 WLAN Mode
3.6 Modulation Analysis Measurement

when Result Length is Auto, the length of the burst is auto-detected. The result length is determined from the decoded SIGNAL symbol. The value of Max Result Length specifies the maximum result length for the burst; any burst longer than that will be treated as though that were the length of the burst.

When Result Length is Man, you can specify the result length of the burst regardless of the actual length of the burst.

For 802.11n/ac/ah/af/ax/be, if From HT-Sig is On:

The result length is detected from the Signal Field. It compares the decode length information to the Max Result Length parameter and uses the smaller value as the measurement result length.

For 802.11n/ac/ah/af/ax/be, if From HT-Sig is Off:

When Result Length is Auto, the analyzer automatically determines the measurement result length by burst search. It compares the detected result length to the Max Result Length parameter and uses the smaller value as the measurement result length.

When Result Length is Man, it compares the input result length to the Result Length parameter and uses the smaller value as the measurement.

| | |
|------------------------------|---|
| Remote Command | <pre>[:SENSe]:EVM:TIME:RESult:LENGth <integer> [:SENSe]:EVM:TIME:RESult:LENGth? [:SENSe]:EVM:TIME:RESult:LENGth:AUTO OFF ON 0 1 [:SENSe]:EVM:TIME:RESult:LENGth:AUTO?</pre> |
| Example | <pre>:EVM:TIME:RES:LENG 10 :EVM:TIME:RES:LENG? :EVM:TIME:RES:LENG:AUTO ON :EVM:TIME:RES:LENG:AUTO?</pre> |
| Preset | <p>802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be: 16 symbols 802.11b/g (DSSS/CCK/PBCC): 2816 chips ON</p> |
| State Saved | <p>Saved in instrument state Saved in instrument state</p> |

| Min | <p>802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be: 2 symbols 802.11b/g (DSSS/CCK/PBCC) 150 chips</p> |
| Max | <p>802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n/ac/ah/af/ax/be: 21848 symbols 802.11b/g (DSSS/CCK/PBCC): 96360 chips</p> |
| Backwards Compatibility SCPI | <pre>[:SENSe]:EVM:TIME:RESult[:STATE]:AUTO OFF ON 0 1 [:SENSe]:EVM:TIME:RESult[:STATE]:AUTO?</pre> |

Max Result Length

Specifies a maximum result length.

If the auto-detected length is greater than the specified maximum result length, the maximum result length is used instead.

The actual results returned will be for a subset of this maximum, as specified by the Meas Interval and Meas Offset, and will be further limited to the auto-detected result length if that is shorter than the maximum result length.

| | |
|------------------------------|--|
| Remote Command | <code>[:SENSe]:EVM:TIME:RESult:LENGth:MAX <integer></code> <code>[:SENSe]:EVM:TIME:RESult:LENGth:MAX?</code> |
| Example | <code>:EVM:TIME:RES:LENG:MAX 45</code> <code>:EVM:TIME:RES:LENG:MAX?</code> |
| Preset | 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM) 802.11n/ac/ah/af/ax/be: 16 symbols 802.11b/g (DSSS/CCK/PBCC): 2816 chips |
| State Saved | Saved in instrument state |
| Min | 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM) 802.11n/ac/ah/af/ax/be: 2 symbols 802.11b/g (DSSS/CCK/PBCC): 150 chips |
| Max | 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM) 802.11n/ac/ah/af/ax/be: 21848 symbols 802.11b/g (DSSS/CCK/PBCC): 96360 chips |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:TIME:RESMax <integer></code> <code>[:SENSe]:EVM:TIME:RESMax?</code> <code>[:SENSe]:EVM:TIME:RESult:MAX <integer></code> <code>[:SENSe]:EVM:TIME:RESult:MAX?</code> |

From SIG Symbols

For 802.11n/ac/ah/af/ax/be, if From SIG Syms is On:

The Result Length is detected from Signal Field. It compares the decoded length information to the Max Result Length parameter and uses the smaller value as the measurement result length.

For 802.11n/ac/ah/af/ax/be, if From SIG Syms Off:

When Result Length is Auto, the analyzer automatically determines the measurement result length by burst search. It compares the detected result length to Max Result Length parameter and uses the smaller value as the measurement result length.

When Result Length is Man, it compares the input result length to the Result Length parameter and uses the smaller value as the measurement.

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:TIME:RESult:SIG OFF ON 0 1</code> <code>[:SENSe]:EVM:TIME:RESult:SIG?</code> |
| Example | <code>:EVM:TIME:RES:SIG ON</code> <code>:EVM:TIME:RES:SIG?</code> |
| Notes | Available when Radio Std is 802.11n/ac/ah/af/ax/be The result length is determined by decoding the HT-SIG symbols and using the HT Length field. The value of Max Result Length specifies a maximum result length for the pulse; any pulse longer than that will be treated as though that were the length of the pulse |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

Burst Power Meas Offset

To measure power of a specified period, this parameter specifies the measuring start time of a burst.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:TIME:BPOwer:OFFSet <time></code> <code>[:SENSe]:EVM:TIME:BPOwer:OFFSet?</code> |
| Example | <code>:EVM:TIME:BPOW:OFFS 1us</code> <code>:EVM:TIME:BPOW:OFFS?</code> |
| Dependencies | Only available for 11n/ac/ax/be and 11agjp when radio std detection is auto |
| Preset | 1us |
| State Saved | Saved in instrument state |
| Min/Max | -/+3 ms |

Burst Power Meas Length

To measure power of a specified period, this parameter specifies the measurement length.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:TIME:BPOwer:LENGth <time></code> <code>[:SENSe]:EVM:TIME:BPOwer:LENGth?</code> |
| Example | <code>:EVM:TIME:BPOW:LENG 10us</code> <code>:EVM:TIME:BPOW:LENG?</code> |
| Dependencies | Only available for 11n/ac/ax/be and 11agjp when Radio Std detection is auto |
| Preset | 20us |
| State Saved | Saved in instrument state |
| Min/Max | 1us/6 ms |

Meas Time Diagram

- Result Length
- Max Result Length
- Acquisition Point

3.6.8.4 Sync

Accesses synchronization parameter settings. These features are recommended for use only by advanced users.

Symbol Timing Adjust

This parameter is available when Radio Std is NOT 802.11b/g(DSSS/CCK/PBCC).

| | |
|----------------|---|
| Remote Command | <pre>:CALCulate:EVM:SYMBOL:ADJUST <percent> :CALCulate:EVM:SYMBOL:ADJUST? :CALCulate:EVM:SYMBOL:ADJUST:AUTO ON OFF 1 0 :CALCulate:EVM:SYMBOL:ADJUST:AUTO?</pre> |
| Example | <pre>:CALC:EVM:SYMB:ADJ -3.125 :CALC:EVM:SYMB:ADJ? :CALC:EVM:SYMB:ADJ:AUTO ON :CALC:EVM:SYMB:ADJ:AUTO?</pre> |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-------------|---|
| Notes | When Symbol Timing Adjust is Auto checked, the demodulation algorithm chooses the symbol timing adjust value automatically; When Symbol Timing Adjust is Auto unchecked, the manually set Symbol Timing Adjust value is used in demodulation The Min Value of Symbol Timing Adjust is $-100.0 * \text{Guard Interval}$ The value of Symbol Timing Adjust clipped to times of 1/128. (For 11n, Bebob 's support can be clipped to 1/256, to keep simple, we use 1/128 also) |
| Preset | -3.125% OFF |
| State Saved | Saved in instrument state Saved in instrument state |
| Range | Auto Man |
| Min | $-100.0 * \text{Guard Interval}$ |
| Max | 0.0 |

Track Amplitude

This parameter is available when Radio Std is NOT 802.11b/g(DSSS/CCK/PBCC).

Track Amplitude specifies whether the analyzer tracks amplitude changes in the pilot subcarriers. When Track Amplitude is selected, the analyzer applies pilot subcarrier amplitude error correction to the pilot and data subcarriers. This is in addition to Track Phase and Track Timing error correction, if selected.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:PIlot:TRACk:AMPLitude OFF ON 0 1</code> <code>:CALCulate:EVM:PIlot:TRACk:AMPLitude?</code> |
| Example | <code>:CALC:EVM:PIL:TRAC:AMPL 1</code> <code>:CALC:EVM:PIL:TRAC:AMPL?</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

Track Phase

Radio Std is NOT 802.11b/g (DSSS/CCK/PBCC)

Specifies whether the analyzer tracks phase changes and which data part will be used to calculate the phase error correction. When Track Phase is ON, the analyzer applies tracked phase error correction to the pilot and data subcarriers. If Track Phase from pilot, only pilot will be used to calculate phase error correction; if Track Phase from pilot & data, both pilot and data carriers will be used to calculate phase

error correction. This is in addition to Track Amplitude and Track Timing error correction if selected.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:PILot:TRACk:PHASe:SOURce PILOT PDATa</code> <code>:CALCulate:EVM:PILot:TRACk:PHASe:SOURce?</code> <code>:CALCulate:EVM:PILot:TRACk:PHASe OFF ON 0 1</code> <code>:CALCulate:EVM:PILot:TRACk:PHASe?</code> |
| Example | <code>:CALC:EVM:PIL:TRAC:PHAS:SOUR PIL</code> <code>:CALC:EVM:PIL:TRAC:PHAS:SOUR?</code> <code>:CALC:EVM:PIL:TRAC:PHAS 0</code> <code>:CALC:EVM:PIL:TRAC:PHAS?</code> |
| Notes | PDATa is only available for 802.11n/ac/ax/be |
| Preset | PILOT ON |
| State Saved | Saved in instrument state |

Radio Std IS 802.11b/g (DSSS/CCK/PBCC)

Specifies whether to perform phase tracking, to track carrier frequency changes during the course of the WLAN burst. The default is OFF, because the 802.11b/g standards do not appear to call for phase tracking. If this parameter is ON, phase tracking is performed after all frequency/phase/timing synchronization, and before any equalization or computation of EVM.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:TRACk:PHASe OFF ON 0 1</code> <code>:CALCulate:EVM:TRACk:PHASe?</code> |
| Example | <code>:CALC:EVM:TRAC:PHAS ON</code> <code>:CALC:EVM:TRAC:PHAS?</code> |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

Track Timing

This parameter is available when Radio Std is *not* 802.11b/g(DSSS/CCK/PBCC).

The Track Timing parameter specifies whether the analyzer tracks timing changes in the pilot subcarriers. When Track Timing is selected the analyzer applies pilot subcarrier timing error correction (frequency offset correction) to the pilot and data subcarriers. This is in addition to Track Amplitude and Track Phase error correction if selected.

| | |
|--------|---|
| Remote | <code>:CALCulate:EVM:PILot:TRACk:TIMing OFF ON 0 1</code> |
|--------|---|

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|---------------------------------|---|
| Command | <code>:CALCulate:EVM:PILot:TRACk:TIMing?</code> |
| Example | <code>:CALC:EVM:PIL:TRAC:TIM 1</code> <code>:CALC:EVM:PIL:TRAC:TIM?</code> |
| Couplings | Coupled to ON when Symbol Clock Error Compensation switches to ON |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:TRACk:TIMing</code> |

Track Mode

This parameter is available when Radio Std is *not* 802.11b/g(DSSS/CCK/PBCC).

The Tracking Mode parameter specifies where the Pilot Tracking occurs. Traditional single channel modulation always has the phase tracked after the equalizer. With multiple data streams, that may not be the best place to do it. If the phase noise is being generated by the receiver, the signal after the equalizer has a mixture of phase noise from the two oscillators. Because of this mixing, it is difficult to track the phase noise after applying the equalizer. The Pre EQ tracking algorithm tracks and remove the phase noise before the equalizer. The Post EQ tracks and removes the phase noise after the equalizer and is the default Tracking Mode.

Typically, if the phase noise is primarily caused by the receiver rather than the transmitter, it's beneficial to select Pre EQ and do pilot tracking before the equalizer. If the phase noise primarily comes from the transmitter and the phase noise from the receiver is minimal, select Post EQ. Try both, look at the EVM and use the one that gives the best result.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:PILot:TRACk:MODE POSTeq PREeq</code> <code>:CALCulate:EVM:PILot:TRACk:MODE?</code> |
| Example | <code>:CALC:EVM:PILot:TRACk:MODE POST</code> <code>:CALC:EVM:PILot:TRACk:MODE?</code> |
| Preset | POSTeq |
| State Saved | Saved in instrument state |
| Range | Post EQ Pre EQ |

Sync Training Sequence

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM.

This parameter specifies synchronization method to use when synchronizing to the start of the OFDM burst.

A value of Short means to search for and synchronize to an 802.11a/g/j/p (OFDM) preamble short symbol sequence.

Short value should not be used for 802.11g DSSS-OFDM, because the DSSS-OFDM preamble does not contain the short symbol sequence.

A value of Long means to search for and synchronize to an 802.11a/g (OFDM) preamble long symbol sequence (also called the channel estimation sequence).

| | |
|---------------------------------|--|
| Remote Command | <code>[:SENSe]:EVM:STSequence LONG SHORt</code> <code>[:SENSe]:EVM:STSequence?</code> |
| Example | <code>:EVM:STS LONG</code> <code>:EVM:STS?</code> |
| Preset | <code>SHORt</code> |
| State Saved | Saved in instrument state |
| Range | Long Short |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:SYNCseq LONG SHORt</code> <code>[:SENSe]:EVM:SYNCseq?</code> |

Frequency Sync (Radio Std 802.11n/ac/ax/be)

This parameter is available when Radio Std is 802.11n/ac/ax/be.

Frequency Sync determines which portion of data is used for carrier frequency offset estimation in modulation analysis.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:FREQuency:SYNC PPILot PPData PREamble</code> <code>[:SENSe]:EVM:FREQuency:SYNC?</code> |
| Example | <code>:EVM:FREQ:SYNC PPIL</code> <code>:EVM:FREQ:SYNC?</code> |
| Notes | Available when Radio Std is 802.11n/ac/ax/be Preamble & Pilot is the default value to keep the backward compatibility Preamble, Pilot & Data, and Preamble only are new options for customer to choose |
| Preset | <code>PPILot</code> |
| State Saved | Saved in instrument state |
| Range | Preamble & Pilot Preamble,Pilot & Data Preamble Only |

Clock Adjust

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

3 WLAN Mode
3.6 Modulation Analysis Measurement

In a normal measurement, the signal is synchronized to the chip timing. In unusual cases, it is possible for the synchronization to be off slightly. This parameter allows the user to specify a timing offset which is added to the chip timing detected. This parameter should only be used when trying to debug unusual signals.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:CADJust <real></code> <code>[:SENSe]:EVM:CADJust?</code> |
| Example | <code>:EVM:CADJ -0.1</code> <code>:EVM:CADJ?</code> |
| Preset | 0 chip |
| State Saved | Saved in instrument state |
| Min | -0.5 chip |
| Max | 0.5 chip |

3.6.8.5 Demod

Accesses parameter settings for signal demodulation.

Subcarrier Selection

This parameter is available when Radio Std is NOT 802.11b/g(DSSS/CCK/PBCC).

This parameter specifies whether the demodulation results are for all subcarriers in the signal, or for a single subcarrier, or for just the pilot subcarriers.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:SUBCarrier ALL PILOt SINGLE</code> <code>:CALCulate:EVM:SUBCarrier?</code> |
| Example | <code>:CALC:EVM:SUBC ALL</code> <code>:CALC:EVM:SUBC?</code> |
| Preset | ALL |
| State Saved | Saved in instrument state |
| Range | All Pilot Single |

Single Subcarrier

Specifies the demodulation results are for which subcarrier. When Subcarrier Selection selects Single, this number will indicate which subcarrier is used to do demodulation.

This is *not* available when Radio Std is 802.11b/g (DSSS/CCK/PBCC). It is available when Subcarriers Selection is selected as Single.

| | |
|----------------|--|
| Remote Command | :CALCulate:EVM:SUBCarrier:COUNT <integer> :CALCulate:EVM:SUBCarrier:COUNT |
| Example | :CALC:EVM:SUBC:COUN 2 :CALC:EVM:SUBC:COUN? |
| Preset | Radio Std = 802.11ac 160 MHz 802.11ah 16 MHz, 6 Otherwise, 2 |
| State Saved | Saved in instrument state |
| Min/Max | See the table below: |

Equalizer Training

This parameter is available when Radio Std is *not* 802.11b/g(DSSS/CCK/PBCC).

This specifies how the equalizer is initialized, or “trained”. The valid values are Channel Estimation Seq Only and Channel Estimation Seq & Data. The value Channel Estimation Seq Only, which is the default, specifies that the equalizer is trained using only the channel estimation sequence (also called the “long sync”) portion of the burst preamble. The 802.11a/g/n standards imply that the equalizer

3 WLAN Mode
3.6 Modulation Analysis Measurement

should be implemented this way when measuring EVM, and this matches how a real receiver would probably implement an equalizer.

The value and Channel Estimation Seq & Data specifies that the equalizer should be trained using both the channel estimation sequence and the entire data portion of the burst. This usually gives a more accurate estimate of the equalizer response. It also typically lowers the EVM by between one and three dB.

| | |
|------------------------------|--|
| Remote Command | <code>:CALCulate:EVM:EQUalizer:TMODe SEQuence SDATa</code> <code>:CALCulate:EVM:EQUalizer:TMODe?</code> |
| Example | <code>:CALC:EVM:EQU:TMOD SDAT</code> <code>:CALC:EVM:EQU:TMOD?</code> |
| Preset | <code>SEQ</code> |
| State Saved | Saved in instrument state |
| Range | Channel Estimation Sequence Only Channel Estimation Sequence&Data |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:EQUalizer:TRAIning SEQuence SDATa</code> <code>[:SENSe]:EVM:EQUalizer:TRAIning?</code> |

I/Q Normalize

Specifies whether the I/Q signals will be normalized.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:IQNorm OFF ON 0 1</code> <code>:CALCulate:EVM:IQNorm?</code> |
| Example | <code>:CALC:EVM:IQN ON</code> <code>:CALC:EVM:IQN?</code> |
| Preset | <code>ON</code> |
| State Saved | Saved in instrument state |
| Range | On Off |

Multi-Carrier Filter

Specifies whether or not to apply a filter to filter out adjacent carriers.

When there are adjacent carriers to the BW of interest, this multi-carrier filter can be used to filter out the unwanted carriers and minimize leakage into the BW of interest.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:MCFilter[:STATe] ON OFF 1 0</code> <code>:CALCulate:EVM:MCFilter[:STATe]?</code> |
| Example | <code>:CALC:EVM:MCF 1</code> |

| | |
|-------------|--|
| | <code>:CALC:EVM:MCF?</code> |
| Notes | Not available in 802.11b/g(DSSS/CCK/PBCC), 802.11g(DSSS-OFDM), 802.11ac/ax 80MHz+80MHz or 802.11af |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | ON OFF |

Spectrum

Sets a spectrum to either normal or to inverted for demodulation related measurements. If set to INVert, the upper and lower spectrums are swapped.

The invert function conjugates the spectrum, which is equivalent to taking the negative of the quadrature component in demodulation. The correct setting (Normal or Invert) depends on whether the signal at the input of the instrument has a high or a low side mix.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:SPECTrum INVert NORMal</code> <code>:CALCualte:EVM:SPECTrum?</code> |
| Example | <code>:CALC:EVM:SPEC INV</code> <code>:CALC:EVM:SPEC?</code> |
| Preset | NORMal |
| State Saved | Saved in instrument state |
| Range | Normal Invert |

Channel Estimation Filter

This parameter is available when Radio Std is 802.11n/ac/ax/be.

Specify the filter type used to interpolate or smooth the channel response sequence.

- None/Linear: No interpolation filter is applied.
- Triangular: A simple triangular-weighted moving average, with special handling at the ends of the channel response to avoid biasing the end points, is applied to the channel response estimate before equalization.

The triangular weights applied to the subcarrier and adjacent subcarriers are as follows: 1 2 ... (N-1)/2 ... 2 1

- Wiener (default): a Wiener filter is applied to the channel response estimate before equalization.

3 WLAN Mode
3.6 Modulation Analysis Measurement

Channel Estimation Filter will be coupled to 'None/Linear' when Equalizer Training switches to "Ch Est Seq & Data". Since "Wiener filter" and "Triangle filter" will degrade the "Least squared" estimated channel using both the channel estimation sequence and the entire data portion of the burst and then degrades the EVM performance.

| | |
|--------------------|--|
| Remote Command | <code>:CALCulate:EVM:CEFilter:TYPE WIENer TRIangle NONE</code> <code>:CALCulate:EVM:CEFilter:TYPE?</code> |
| Example | <code>:CALC:EVM:CEF:TYPE NONE</code> <code>:CALC:EVM:CEF:TYPE?</code> |
| Notes | Only used in 802.11n/ac/ax/be |
| Dependencies | Only visible for 802.11n/ac/ax/be |
| Couplings | Coupled to None/Linear when Equalizer Training switches to Ch Est Seq & Data. Coupled to Wiener when Equalizer Training switches to Ch Est Seq Only |
| Preset | WIEN |
| State Saved | Saved in instrument state |
| Range | Wiener Triangle None/Linear |
| Backwards | <code>:CALCulate:EVM:SMEQualizer[:STATE] OFF ON 0 1</code> |
| Compatibility SCPI | <code>:CALCulate:EVM:SMEQualizer[:STATE]?</code> |

Wiener Normalized Delay Spread

This parameter is available when Radio Std is 802.11n/ac/ax/be and channel estimation filter is Wiener.

Specify the estimated channel delay spread value for the system, which normalized by OFDM symbol interval.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:CEFilter:WNDSpread <real></code> <code>:CALCulate:EVM:CEFilter:WNDSpread?</code> |
| Example | <code>:CALC:EVM:CEF:WNDS 0.25</code> <code>:CALC:EVM:CEF:WNDS?</code> |
| Notes | Only used in 802.11n/ac/ax/be It is visible when Channel Estimation Filter Selection is Wiener |
| Preset | 0.125 |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 0.25 |

Triangle Filter Length

This parameter is available when Radio Std is 802.11n/ac/ax/be and channel estimation filter is Triangle.

Specifies the total length of the triangle filter's impulse response.

| Remote Command | <code>:CALCulate:EVM:CEFilter:TFLength <integer></code> <code>:CALCulate:EVM:CEFilter:TFLength?</code> | | | | | | | | | | | | | | | | | | | | |
|---------------------------------------|--|----------------|-----------|------------------|----------------|----------------|-----------------|------------------------|-----------------|----------------|-----------------|-------------------|-----------------|-------------------|-----------------|---------------------------------------|-----------------|--------------------|------------------|-----------------|------------------|
| Example | <code>:CALC:EVM:CEF:TFL 21</code> <code>:CALC:EVM:CEF:TFL?</code> | | | | | | | | | | | | | | | | | | | | |
| Notes | Only used in 802.11n/ac/ax/be Visible when Channel Estimation Filter Selection is Triangle The value must be an odd number | | | | | | | | | | | | | | | | | | | | |
| Preset | 5 subcarriers | | | | | | | | | | | | | | | | | | | | |
| State Saved | Saved in instrument state | | | | | | | | | | | | | | | | | | | | |
| Min | 1 | | | | | | | | | | | | | | | | | | | | |
| Max | Depend on the Radio Standard as follows | | | | | | | | | | | | | | | | | | | | |
| | <table border="1"> <thead> <tr> <th>Radio Standard</th> <th>Max Value</th> </tr> </thead> <tbody> <tr> <td>802.11n/ac 20MHz</td> <td>57 subcarriers</td> </tr> <tr> <td>802.11n/ac 40M</td> <td>117 subcarriers</td> </tr> <tr> <td>802.11ac80MHz/80+80MHz</td> <td>245 subcarriers</td> </tr> <tr> <td>802.11ac160MHz</td> <td>501 subcarriers</td> </tr> <tr> <td>802.11ax/be 20MHz</td> <td>245 subcarriers</td> </tr> <tr> <td>802.11ax/be 40MHz</td> <td>489 subcarriers</td> </tr> <tr> <td>802.11ax/be 80MHz or 802.11ax80+80MHz</td> <td>1001subcarriers</td> </tr> <tr> <td>802.11ax/be 160MHz</td> <td>2025 subcarriers</td> </tr> <tr> <td>802.11be 320MHz</td> <td>4073 subcarriers</td> </tr> </tbody> </table> | Radio Standard | Max Value | 802.11n/ac 20MHz | 57 subcarriers | 802.11n/ac 40M | 117 subcarriers | 802.11ac80MHz/80+80MHz | 245 subcarriers | 802.11ac160MHz | 501 subcarriers | 802.11ax/be 20MHz | 245 subcarriers | 802.11ax/be 40MHz | 489 subcarriers | 802.11ax/be 80MHz or 802.11ax80+80MHz | 1001subcarriers | 802.11ax/be 160MHz | 2025 subcarriers | 802.11be 320MHz | 4073 subcarriers |

Eq Training Using L-LTF

This parameter is available when Radio Std is 802.11n/ac/ax/be.

As this parameter is set to On, the channel estimation used by Equalizer is not only from HE-LTF part, but also from L-LTF part. If HE-LTF data ensures the same channel as L-LTF data, the algorithm is equivalent to extend the training sequence length to improve the estimation accuracy to improve EVM performance.

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:EQUalizer:LLTF[:STATe] OFF ON 0 1</code> <code>:CALCulate:EVM:EQUalizer:LLTF[:STATe]?</code> |
| Example | <code>:CALC:EVM:EQU:LLTF 1</code> <code>:CALC:EVM:EQU:LLTF?</code> |
| Notes | Only used in 802.11n/ac/ax/be |
| Preset | OFF |
| State Saved | Yes |
| Range | ON OFF |

Chip Rate

NOTE

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

This specifies the fundamental chip rate of the signal to be analyzed. The value should be positive, and default is 11 MHz, which matches the chip rate of 802.11b/g.

The only special case is the optional 802.11g 33Mbit PBCC mode. In this mode, the chip rate of the transmitted signal starts at 11 MHz, but changes to 16.5 MHz in the middle of the burst. For signals of this type, the CHIP_RATE should still be specified as 11 MHz, and the measurement will automatically switch to 16.5 MHz at the appropriate place in the burst.

| | |
|---------------------------------|---|
| Remote Command | <code>[:SENSe]:EVM:CRATe <frequency></code> <code>[:SENSe]:EVM:CRATe?</code> |
| Example | <code>:EVM:CRAT 11MHz</code> <code>:EVM:CRAT?</code> |
| Preset | 11.0 MHz |
| State Saved | Saved in instrument state |
| Min | 1.0 MHz |
| Max | 25.0 MHz |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:CHPRate <frequency></code> <code>[:SENSe]:EVM:CHPRate?</code> |

Descramble

NOTE

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

This parameter specifies what type of descrambling to do when producing bit vector results. The valid values are: All, None, Preamble Only, Preamble & Header Only. None means no descrambling is done at all. Preamble Only means only the PLCP preamble is descrambled. Preamble & Header Only means that the PLCP preamble and PLCP header are descrambled. All means that all parts of the burst are descrambled.

Normally, an 802.11b/g signal has all bits scrambled before transmission, so normally you would want to descramble all of the bitvector results. However, when debugging an 802.11b/g transmitter, it is sometimes helpful to disable scrambling in the transmitter, in which case you would disable descrambling.

| | |
|---------------------------------|---|
| Remote Command | <code>[:SENSe]:EVM:DESCramble ALL NONE PONLy PHONLy</code> <code>[:SENSe]:EVM:DESCramble?</code> |
| Example | <code>:EVM:DESC NONE</code> <code>:EVM:DESC?</code> |
| Preset | <code>ALL</code> |
| State Saved | Saved in instrument state |
| Range | All None Preamble Only Preamble & Header Only |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:PREamble ALL NONE PONLy PHONLy</code> <code>[:SENSe]:EVM:PREamble?</code> |

Equalizer

NOTE

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

Specifies the total length of the equalizer filter's impulse response, in chips.

The minimum valid value for Equalizer Len is 3. The maximum valid value is 99, and also must be less than either Max Result Length or Result Length. The value must be an odd number. The impulse response is centered, so that it extends $(EQ_FILT_LEN-1)/2$ chips on either side of $t=0$.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:EVM:EQualizer:LENGth <integer></code> <code>[:SENSe]:EVM:EQualizer:LENGth?</code> <code>[:SENSe]:EVM:EQualizer[:STATe] OFF ON 0 1</code> <code>[:SENSe]:EVM:EQualizer[:STATe]?</code> |
| Example | <code>:EVM:EQU:LENG 23</code> <code>:EVM:EQU:LENG?</code> <code>:EVM:EQU ON</code> <code>:EVM:EQU?</code> |
| Preset | 21 chips |

| | |
|-------------|---|
| | OFF |
| State Saved | Saved in instrument state Saved in instrument state |
| Range | Auto Man |
| Min | 3 |
| Max | Result Length Selection is set to Auto Min (99, Max Result Length) Result Length Selection is NOT Auto Min (99, Result Length) |

Reference Filter

NOTE

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

Controls the reference filter type used when computing the reference data for computing EVM.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:FILTer:REFerence:TYPE GAUSSian RECT RC</code> <code>[:SENSe]:EVM:FILTer:REFerence:TYPE?</code> |
| Example | <code>:EVM:FILT:REF:TYPE GAUS</code> <code>:EVM:FILT:REF:TYPE?</code> |
| Preset | RECT |
| State Saved | Saved in instrument state |
| Range | Gaussian Rect Raised Cosine |

Reference Filter Alpha/BT

NOTE

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

Used only when the Reference Filter is set to “GAUSSIAN” or “Raised Cosine”, or the Measurement filter is set to “RRC”. In these cases, this parameter controls the bT value for the Gaussian filter and alpha values for Raised Cosine and RRC filters.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:FILTer:ALPHa <real></code> <code>[:SENSe]:EVM:FILTer:ALPHa?</code> |
| Example | <code>:EVM:FILT:ALPH 0.5</code> <code>:EVM:FILT:ALPH?</code> |
| Preset | 0.50 |

| | |
|-------------|--|
| State Saved | Saved in instrument state |
| Min | 0.50 |
| Max | 100.0 when Reference Filter is set to Gaussian or, 1.0 when Reference Filter is set to Raised Cosine |

Measurement Filter

NOTE

This parameter is available when Radio Std is 802.11b/g(DSSS/CCK/PBCC).

Controls the measurement filter type used for computing EVM.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:FILTer:MEASurement:TYPE NONE RRC</code> <code>[:SENSe]:EVM:FILTer:MEASurement:TYPE?</code> |
| Example | <code>:EVM:FILT:MEAS:TYPE RRC</code> <code>:EVM:FILT:MEAS:TYPE?</code> |
| State Saved | Saved in instrument state |
| Range | None RRC |

EVM Method

NOTE

This setting is used only for 802.11b/g (DSSS/CCK/PBCC) standard.

For 802.11b, the standard 1999/2007/2016 defined different EVM calculation equations. This parameter is used to select the specific EVM calculation corresponding to the specific standard.

3 WLAN Mode

3.6 Modulation Analysis Measurement

Range Standard 1999 | Standard 2007 | Standard 2016

Data Decode

Specifies whether to do data decode. When Data Decode is ON, the result PSDU CRC will show in Burst Info view for 11a/11n/11ac/11af and 11ax/11be Non-HT signal, will show in 'User Information Summary' for 11ax and 11be.

Remote Command :CALCulate:EVM:DECode:ENABle OFF | ON | 0 | 1

:CALCulate:EVM:DECode:ENABle?

Example :CALC:EVM:DEC:ENAB ON

:CALC:EVM:DEC:ENAB?

Dependencies Not visible for 11b/g and 11ah
Grayed-out for 11a when Radio Std Detection is Manual

Couplings Coupled to ON when Radio Std Detection switches to Auto

Preset OFF

| | |
|-------------|---------------------------|
| State Saved | Saved in instrument state |
| Range | On Off |

Detect Non-HT PPDU

Used to control whether to detect non-HT PPDU when Radio Std is 11ax/11be.

When Detect Non-HT is Off, analyzer will not detect non-HT PPDU, just demode signal as HE or EHT PPDU. When Detect Non-HT is On, analyzer will detect non-HT PPDU first, if it's non-HT PPDU, demode signal as non-HT PPDU, otherwise just demode signal as HE or EHT PPDU.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:DETECT:NHT OFF ON 0 1</code> <code>:CALCulate:EVM:DETECT:NHT?</code> |
| Example | <code>:CALC:EVM:DET:NHT ON</code> <code>:CALC:EVM:DET:NHT?</code> |
| Dependencies | Only visible for 11ax/11be when Radio Std Detection is Manual |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

Demod Using Reference Symbol

The reference symbols (constellation points) used in making an EVM measurement are usually recovered from the received signal. However, if the signal quality is not sufficient for the reference symbols to be recovered from it, you can specify the reference symbols to be used instead. This feature allows you to choose one or the other of these options.

If ON is selected, you will need to set (or load from a file) the necessary reference symbols, and the measurement will use those values to calculate EVM. Total Reference Symbols (displayed under the menu key for this feature) shows the number of reference symbols currently set. To set the reference symbols directly, see [Set Reference Symbols \(SCPI only\)](#). To load the symbols from a file, see [Recall Reference Symbols@1600057](#).

If OFF is selected, the reference symbols will be recovered automatically from the received signal.

Total Reference Symbols (displayed under the menu key for this feature) shows the number of reference symbols. If there are none.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:DEMod:RSYMBOLS ON OFF 1 0</code> <code>[:SENSe]:EVM:DEMod:RSYMBOLS?</code> |
|----------------|--|

3.6 Modulation Analysis Measurement

| | |
|------------------------------|---|
| Example | <code>:EVM:DEM:RSYM 1</code> <code>:EVM:DEM:RSYM?</code> |
| Notes | If this is set to On, but no Reference Symbols have been specified or loaded, the warning message "Please load Reference Symbols" will be displayed |
| Dependencies | The key is blank when the following conditions are met at the same time: Radio std Detection = Manual Radio = 802.11a/b/g/j/p |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:DEMod:REFSymbols ON OFF 1 0</code> <code>[:SENSe]:EVM:DEMod:REFSymbols?</code> |

Set Reference Symbols (Remote Command only)

Directly specifies I/Q data for Reference Symbols used in EVM measurement. (An alternative method is to load the data from a file; see Recall Reference Symbols@1600057.)

| | |
|------------------------------|--|
| Remote Command | <code>[:SENSe]:EVM:DEMod:LIST:RSYMBOLs I,Q,I,Q...</code> <code>[:SENSe]:EVM:DEMod:LIST:RSYMBOLs?</code> |
| Example | <code>:EVM:DEM:LIST:RSYM 1.0,2.0,3.0,4.0</code> <code>:EVM:DEM:LIST:RSYM?</code> |
| Backwards Compatibility SCPI | <code>[:SENSe]:EVM:DEMod:LIST:REFSymbols I,Q,I,Q...</code> <code>[:SENSe]:EVM:DEMod:LIST:REFSymbols?</code> |

3.6.8.6 IQ Comp

Provides the capability to control separate compensation function explicitly.

Subcarrier I/Q Estimation

This parameter is available when Radio Std is 802.11n/ah/ac/ax/be.

Allows you to turn On or Off the estimation for IQ Gain Imbalance vs. subcarrier, IQ Quadrature Error vs. subcarrier in the input signal.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:IQEstimation OFF ON 0 1</code> <code>:CALCulate:EVM:IQEstimation?</code> |
| Example | <code>:CALC:EVM: IQES ON</code> <code>:CALC:EVM: IQES?</code> |

| | |
|-------------|--|
| Notes | The accuracy of the IQ gain imbalance and quadrature error estimation is affected by the receiver's ability to determine the correct ideal reference constellation points for each symbol in the modulated signal. Large IQ impairments may result in incorrect determination of reference points, which will lead to incorrect estimates for the IQ errors. Generally, the receiver can provide correct IQ estimation with greater levels of IQ impairment for lower-order modulation such as QPSK than for higher-order modulation such as 64QAM |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

I/Q Compensation

This parameter is available when Radio Std is NOT 802.11a/b/g/j/p.

Allows you to turn On or Off the compensation for IQ Gain Imbalance, IQ Quadrature Error, and IQ Timing Skew found in the input signal.

If it is On, what the exact compensation functions are executed depends on the state of Explicit IQ Compensation: IQ Gain Imbalance, IQ Quadrature Error, IQ Timing Skew.

If it is Off, the compensation function will be bypassed.

This control is available for all 802.11 radio standards except 802.11a/b/g/j/p.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:COMPensate OFF ON 0 1</code> <code>[:SENSe]:EVM:COMPensate?</code> |
| Example | <code>:EVM:COMP ON</code> <code>:EVM:COMP?</code> |
| Notes | If I/Q Compensation is On, what the exact compensation functions are executed depends on the state of Explicit IQ Compensation: IQ Gain Imbalance, IQ Quadrature Error, IQ Timing Skew If I/Q Compensation is Off, the compensation function will be bypassed although IQ Compensation: IQ Gain Imbalance, IQ Quadrature Error, IQ Timing Skew are all On |
| Dependencies | If the Radio Std is 802.11a/b/g/j/p, it will be grayed out and message "-221 Setting conflict, IQ Compensation is not available for current Radio Setting" appears |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

I/Q Gain Imbalance

NOTE

This parameter is available when Radio Std is NOT 802.11a/b/g/j/p.

3 WLAN Mode
3.6 Modulation Analysis Measurement

Allows you to turn On or Off the compensation for IQ Gain Imbalance found in the input signal.

If On, the IQ Gain imbalance in the signal will be compensated.

If Off, the IQ Gain Imbalance compensation will be bypassed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:COMPensate:GAIN[:STATe] OFF ON 0 1</code> <code>:CALCulate:EVM:COMPensate:GAIN[:STATe]?</code> |
| Example | <code>:CALC:EVM:COMP:GAIN 1</code> <code>:CALC:EVM:COMP:GAIN?</code> |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | On Off |

Quadrature Error

NOTE This parameter is available when Radio Std is NOT 802.11a/b/g/j/p.

Allows you to turn On or Off the compensation for Quadrature Error found in the input signal.

If On, the Quadrature Error in the signal will be compensated.

If Off, the Quadrature Error compensation will be bypassed.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:COMPensate:QUADrature[:STATe] OFF ON 0 1</code> <code>:CALCulate:EVM:COMPensate:QUADrature[:STATe]?</code> |
| Example | <code>:CALC:EVM:COMP:QUAD 0</code> <code>:CALC:EVM:COMP:QUAD?</code> |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | On Off |

Timing Skew

NOTE This parameter is available when Radio Std is NOT 802.11a/b/g/j/p.

Allows you to turn On or Off the compensation for Timing Skew found in the input signal.

- If On, the Timing Skew in the signal will be compensated.
- If Off, the Timing Skew compensation will be bypassed.

| | |
|----------------|--|
| Remote Command | :CALCulate:EVM:COMPensate:TSKew[:STATe] OFF ON 0 1 :CALCulate:EVM:COMPensate:TSKew[:STATe]? |
| Example | :CALC:EVM:COMP:TSK 1 :CALC:EVM:COMP:TSK? |
| Preset | ON |
| State Saved | Saved in instrument state |
| Range | On Off |

Symbol Clock Error Compensation

NOTE

This parameter is available when Radio Std is 802.11n/ac/ax/be.

Compensates symbol clock error on a complete burst.

When measuring a long signal with a lot of symbols, the sample clock error may accumulate to a degree on which the EVM of some symbols on the rear position may deteriorate rapidly. It is recommended to turn this setting **ON** in order to continuously compensate sample clock error at the cost of increased measurement time.

When measuring a short signal with a few symbols, it's recommended to turn this setting **OFF**.

| | |
|------------------------------|--|
| Remote Command | :CALCulate:EVM:SCERror:COMPensation[:STATe] OFF ON 0 1 :CALCulate:EVM:SCERror:COMPensation[:STATe]? |
| Example | :CALC:EVM:SCER:COMP 1 :CALC:EVM:SCER:COMP? |
| Couplings | Coupled to OFF when switched to 11n/ac, coupled to ON when switched to 11ax/be |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |
| Backwards Compatibility SCPI | :CALCulate:EVM:SYMBOL:CLOCK:COMPensate[:STATe] OFF ON 0 1 :CALCulate:EVM:SYMBOL:CLOCK:COMPensate[:STATe]? |

3.6.8.7 RU Allocation

NOTE This function is available when Radio Std is 802.11ax/be.

Provides the capability to control RU allocation settings.

RU Allocation Detection

RU allocation can be detected from SIG-B information automatically, but sometimes, customers want to test some signal which is not consistent with SIG-B or SIG-B is broken, then RU allocation should be manually filled in from UI or file loading.

When set to manual, use RU allocation defined in “Edit RU Allocation” to analysis signals, otherwise auto-detect RU allocation.

RU Allocation Auto Detection can successfully decode the TB signal with one and only one active RU. The rest inactive RUs will be decoded as multiple 26-tone RUs (RU26).

For the TB signal with more than one active RUs, RU Allocation Detection should be set to manual. Otherwise, the measurement results might not be accurate.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:RUAllocation:DETECT:AUTO ON OFF 1 0</code> <code>:CALCulate:EVM:RUAllocation:DETECT:AUTO?</code> |
| Example | <code>:CALC:EVM:RUAL:DET:AUTO ON</code> <code>:CALC:EVM:RUAL:DET:AUTO?</code> |
| Notes | Only available when Radio Std is 802.11ax/11be |
| Preset | ON |
| State Saved | Yes |
| Range | Auto Man |

Edit RU Allocation

This function is available for 802.11ax.

RU allocation can be auto-detected for most cases. For a Trigger-Based signal with multi active RU, auto detection may not work; so it is necessary to manually configure RU allocation in the Edit RU Allocation dialog.

Edit RU allocation is a dialog which is designed to set RU allocation parameters, like RU arrangement, RU settings, and user settings.

"RU Allocation Index" on page 1037: You can set the RU allocation index for the each 20MHz sub band; this will determine the RU allocation, including RU Size and User Number, of each RU.

"RU Size" on page 1034: Apart from RU Allocation Index, you can also set RU size directly.

"RU State" on page 1036: You can set the state of each RU to On or Off.

"Tx Chain Number of Each RU" on page 1040: You can set the TX chain number of each RU.

"User Number of Each RU" on page 1041: Apart from the RU Allocation Index, you can also set the user number of each RU directly.

"User MCS" on page 1041: Modulation and Coding Schemas range from 0 to 13. Modulation Format can be determined by MCS.

"Spatial Stream Number of Each User" on page 1041: Spatial Stream Number of each user.

"Channel Coding Mode of Each User" on page 1042: Channel coding mode of each user.

"DCM of Each User " on page 1042: DCM state of each user.

More Information

802.11ax/be utilizes RU (Resource Unit) allocation to implement OFDMA.

AP (Access Point) will send RU allocation signaling (8 bits for each 20 MHz band) to indicate RU allocation pattern (including RU size and RU position). In order to demodulate OFDMA signal, it's required to set Modulation Format (BPSK/QPSK/16QAM/64QAM/256QAM/1024QAM/4096QAM) and MCS (Modulation and Coding Schemas, range from 0 to 11).

RU Size

This parameter determines the size of each RU.

This is a list of parameters, and the length of the list is the number of RUs.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:SIZE <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:SIZE?</code> |
| Example | <code>:DEM:RU:LIST:SIZE 26,26,26,26,26,26,26,26,26</code> <code>:DEM:RU:LIST:SIZE?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | 242 |
| State Saved | Saved in instrument state |
| Range | For 11ax |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| RU | RU Size |
|-----------|----------------|
| 26 | 26 |
| 52 | 52 |
| 106 | 106 |
| 242 | 242 |
| 484 | 484 |
| 996 | 996 |
| 1992 | 1992 |

For 11be

| RU/MRU | RU Size |
|-----------------------|----------------|
| 26 | 26 |
| 52 | 52 |
| 26+52 | 78 |
| 52+26 | 79 |
| 52+26(Center26) | 80 |
| 106 | 106 |
| 26+106 | 132 |
| 106+26 | 133 |
| 242 | 242 |

| 484+[gap-242]+242+996 | 1724 |
| 484+242+[gap-242]+996 | 1725 |

| RU/MRU | RU Size |
|---------------------------|---------|
| 996+[gap-242]+242+484 | 1726 |
| 996+242+[gap-242]+484 | 1727 |
| 996+484+[gap-242]+242 | 1728 |
| 996+484+242+[gap-242] | 1729 |
| 2x996 | 1992 |
| [gap-484]+484+996+996 | 2476 |
| 484+[gap-484]+996+996 | 2477 |
| 996+[gap-484]+484+996 | 2478 |
| 996+484+[gap-484]+996 | 2479 |
| 996+996+[gap-484]+484 | 2480 |
| 996+996+484+[gap-484] | 2481 |
| [gap-996]+996+996+996 | 2988 |
| 996+[gap-996]+996+996 | 2989 |
| 996+996+[gap-996]+996 | 2990 |
| 996+996+996+[gap-996] | 2991 |
| [gap-484]+484+996+996+996 | 3472 |
| 484+[gap-484]+996+996+996 | 3473 |
| 996+[gap-484]+484+996+996 | 3474 |
| 996+484+[gap-484]+996+996 | 3475 |
| 996+996+[gap-484]+484+996 | 3476 |
| 996+996+484+[gap-484]+996 | 3477 |
| 996+996+996+[gap-484]+484 | 3478 |
| 996+996+996+484+[gap-484] | 3479 |
| 4x996 | 3984 |

'+' indicate this is an MRU. An MRU consists of selected combinations of multiple RUs of 26-tone RU, 52-tone RU, 106-tone RU, 242-tone RU, 484-tone RU, 996-tone RU, and 2.996-tone RU. [gap-xxx] represents a null allocation with size xxx.

RU State

Determines the state of each RU.

| | |
|----------------|--|
| Remote Command | <code>[:SENSE]:DEMod[:WLAN]:RU:LIST:STATe OFF ON 0 1,...</code> <code>[:SENSE]:DEMod[:WLAN]:RU:LIST:STATe?</code> |
| Example | <code>:DEM:RU:LIST:STAT 1,1,0,0,0,0,0,0,0</code> <code>:DEM:RU:LIST:STAT?</code> |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|----------------|---|
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | ON |
| State Saved | Saved in instrument state |
| | RU MCS |
| | Determines MCS (modulation and coding schema) of each RU. |
| | This is a list parameter, and the length of the list is the number of RUs. |
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:MCS <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:MCS?</code> |
| Example | <code>:DEM:RU:LIST:MCS 0,11,0,11,0,11,0,11,0</code> <code>:DEM:RU:LIST:MCS?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | 0 |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 11 |

RU Allocation Index

This parameter determines the RU allocation index for each 20MHz sub band. It may contain multiple small-size RUs/MRUs or a large-size RU/MRU that may span multiple 20MHz sub bands including the current sub band.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:ALLocation[01] 2 ... 16 <string></code> <code>[:SENSe]:DEMod[:WLAN]:RU:ALLocation[01] 2 ... 16?</code> |
| Example | <code>:DEM:RU:ALL '00000000'</code> <code>:DEM:RU:ALL?</code> |
| Notes | String length is 8 for 11ax and 9 for 11be. Valid character is only 0 and 1. |
| Dependencies | Only available for 11ax/be. |
| Preset | 11ax 11000000 11be 001000000 |
| State Saved | Saved in instrument state |

RU Size

This parameter determines the size of each RU.

This is a list of parameters, and the length of the list is the number of RUs.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:SIZE <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:SIZE?</code> |
| Example | <code>:DEM:RU:LIST:SIZE 26,26,26,26,26,26,26,26,26</code> <code>:DEM:RU:LIST:SIZE?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | 242 |
| State Saved | Saved in instrument state |

Range For 11ax

| RU | RU Size |
|------|---------|
| 26 | 26 |
| 52 | 52 |
| 106 | 106 |
| 242 | 242 |
| 484 | 484 |
| 996 | 996 |
| 1992 | 1992 |

For 11be

| RU/MRU | RU Size |
|-----------------|---------|
| 26 | 26 |
| 52 | 52 |
| 26+52 | 78 |
| 52+26 | 79 |
| 52+26(Center26) | 80 |
| 106 | 106 |
| 26+106 | 132 |
| 106+26 | 133 |
| 242 | 242 |
| 484 | 484 |

3 WLAN Mode
 3.6 Modulation Analysis Measurement

| RU/MRU | RU Size |

| 996+484+[gap-484]+996+996 | 3475 |
| 996+996+[gap-484]+484+996 | 3476 |

| RU/MRU | RU Size |
|---------------------------|---------|
| 996+996+484+[gap-484]+996 | 3477 |
| 996+996+996+[gap-484]+484 | 3478 |
| 996+996+996+484+[gap-484] | 3479 |
| 4x996 | 3984 |

'+' indicate this is an MRU. An MRU consists of selected combinations of multiple RUs of 26-tone RU, 52-tone RU, 106-tone RU, 242-tone RU, 484-tone RU, 996-tone RU, and 2.996-tone RU. [gap-xxx] represents a null allocation with size xxx.

RU State

Determines the state of each RU.

This is a list of parameters, and the length of the list is the number of RUs.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:STATe OFF ON 0 1,...</code> <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:STATe?</code> |
| Example | <code>:DEM:RU:LIST:STAT 1,1,0,0,0,0,0,0,0</code> <code>:DEM:RU:LIST:STAT?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | ON |
| State Saved | Saved in instrument state |

Tx Chain Number of Each RU

This parameter determines TX chain number of each RU.

This is a list of parameters, and the length of the list is the number of RUs.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:TXCHain <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:TXCHain?</code> |
| Example | <code>:DEM:RU:LIST:TXCH 1,1</code> <code>:DEM:RU:LIST:TXCH?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | 1 |
| State Saved | Saved in instrument state |

User Number of Each RU

This parameter determines user number of each RU.

This is a list of parameters, and the length of the list is the number of RUs.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:USER <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:RU:LIST:USER?</code> |
| Example | <code>:DEM:RU:LIST:USER 1,1</code> <code>:DEM:RU:LIST:USER?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | 1 |
| State Saved | Saved in instrument state |

User MCS

Determines MCS (modulation and coding schema) of each RU.

This is a list parameter, and the length of the list is the number of users.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:MCS <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:MCS?</code> |
| Example | <code>:DEM:USER:LIST:MCS 0,11,0,11,0,11,0,11,0</code> <code>:DEM:USER:LIST:MCS?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | 08 |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 13 |

Spatial Stream Number of Each User

This parameter determines MCS (modulation and coding schema) of each RU.

This is a list parameter, and the length of the list is the number of users.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:STReam <integer>,<integer>,<integer>,...</code> <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:STReam?</code> |
|----------------|---|

| | |
|--------------|---|
| Example | <code>:DEM:USER:LIST:STR 1,1</code> <code>:DEM:USER:LIST:STR?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | <code>1</code> |
| State Saved | Saved in instrument state |

Channel Coding Mode of Each User

This parameter determines channel coding mode of each RU.

This is a list parameter, and the length of the list is the number of users.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:CCMode BCC LDPC, BCC LDPC, BCC LDPC,...</code> <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:CCMode?</code> |
| Example | <code>:DEM:USER:LIST:CCM LDPC,LDPC</code> <code>:DEM:USER:LIST:CCM?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | LDPC |
| State Saved | Saved in instrument state |
| Range | BCC LDPC |

DCM of Each User

This parameter determines DCM (Dual Carrier Modulation) of each RU.

This is a list parameter, and the length of the list is the number of users.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:DCM OFF ON 0 1,...</code> <code>[:SENSe]:DEMod[:WLAN]:USER:LIST:DCM?</code> |
| Example | <code>:DEM:USER:LIST:DCM 0,0</code> <code>:DEM:USER:LIST:DCM?</code> |
| Notes | The length of the list is variable and determined by the number of RUs |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Preset | <code>ON</code> |
| State Saved | Saved in instrument state |

Edit Trigger-Based PPDU

Only available for 802.11ax/be.

For a Trigger-Based signal, to decode it correctly, it is necessary to manually configure decode parameters in the “Edit Trigger-Based PPDU” dialog. If ‘Data Decode’ is disabled, there is no need to specify these parameters.

Pre-FEC Padding Factor

Specifies the Pre-FEC Padding Factor.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:TB:PPFactor <integer></code> <code>[:SENSe]:DEMod[:WLAN]:TB:PPFactor?</code> |
| Example | <code>:DEM:TB:PPF 2</code> <code>:DEM:TB:PPF</code> |
| Dependencies | Available for 802.11ax/ 802.11be only |
| Preset | <code>1</code> |
| State Saved | Saved in instrument state |
| Min | 1 |
| Max | 4 |

PE Disambiguity

Specifies PE Disambiguity.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:TB:PED OFF ON 0 1</code> <code>[:SENSe]:DEMod[:WLAN]:TB:PED?</code> |
| Example | <code>:DEM:TB:PED 1</code> <code>:DEM:TB:PED?</code> |
| Dependencies | Available for 802.11ax/ 802.11be only |
| Preset | <code>OFF</code> |
| State Saved | Saved in instrument state |

LDPC Extra Symbol Segment

Specifies the presence of the extra OFDM symbol for LDPC.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:TB:LESS OFF ON 0 1</code> <code>[:SENSe]:DEMod[:WLAN]:TB:LESS?</code> |
|----------------|--|

| | |
|--------------|---|
| Example | <code>:DEM:TB:LESS 1</code> <code>:DEM:TB:LESS?</code> |
| Dependencies | Available for 802.11ax/ 802.11be only |
| Preset | OFF |
| State Saved | Saved in instrument state |

STBC

Enables/disables space time block coding. STBC encoder spreads constellation points from NSS spatial stream into NSTS space-time streams using a space-time block code. STBC is allowed only with single spatial stream and two space-time streams. STBC is not applied with 4x HE-LTF and 0.8 us GI.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:DEMod[:WLAN]:TB:STBC OFF ON 0 1</code> <code>[:SENSe]:DEMod[:WLAN]:TB:STBC?</code> |
| Example | <code>:DEM:TB:STBC 1</code> <code>:DEM:TB:STBC?</code> |
| Dependencies | Available for 802.11ax only |
| Preset | OFF |
| State Saved | Saved in instrument state |

3.6.8.8 Limits

Accesses the Limits menu that allows you to set up the test limit for channel power or power spectral density.

Edit Limit

Allows you to set the measurement test limit.

Edit Common Limit

Defines the limit for all standards.

6 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

3 WLAN Mode
3.6 Modulation Analysis Measurement

Sets 6 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M6 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M6?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M6 -20</code> <code>:CALC:EVM:LIM:RMS:M6?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -5.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

9 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 9 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M9 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M9?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M9 -20</code> <code>:CALC:EVM:LIM:RMS:M9?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -8.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

12 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 12 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M12 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M12?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M12 -20</code> |

| | |
|-------------|---|
| | <code>:CALC:EVM:LIM:RMS:M12?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -10.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

18 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 18 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M18 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M18?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M18 -20</code> <code>:CALC:EVM:LIM:RMS:M18?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -13.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

24 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 24 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M24 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M24?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M24 -20</code> <code>:CALC:EVM:LIM:RMS:M2?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -16.00 dB |
| State Saved | Saved in instrument state |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-----|----------|
| Min | -1000.00 |
| Max | 0.00 |

36 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 36 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M36 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M36?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M36 -20</code> <code>:CALC:EVM:LIM:RMS:M36?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -19.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

48 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 48 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M48 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M48?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M48 -20</code> <code>:CALC:EVM:LIM:RMS:M48?</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -22.00 Db |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

54 Mbits/s RMS EVM

This parameter is available when Radio Std is 802.11a/b/g/j/p OFDM 20 MHz or 802.11g DSSS-OFDM.

Sets 54 Mbits/s RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:M54 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:M54?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:M54 -25</code> <code>:CALC:EVM:LIM:RMS:M954</code> |
| Notes | This limit value is used in 802.11a/g/j/p (OFDM 20M), 801.11g (DSSS-OFDM) |
| Preset | -25.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000.00 |
| Max | 0.00 |

Freq Error

Sets a frequency error limit to warn you if the measured maximum frequency error value exceeds the limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:FERRor <real></code> <code>:CALCulate:EVM:LIMit:FERRor ?</code> |
| Example | <code>:CALC:EVM:LIM:FERR 15</code> <code>:CALC:EVM:LIM:FERR?</code> |
| Couplings | If Radio Std is 802.11n 802.11ax or 802.11be and Center Frequency for 5GHz band, freq error limit will be coupled to 20.0ppm |
| Preset | If Radio Std is 802.11a/g/j/p (OFDM), 802.11ac, or 802.11ah: 20.00 ppm If Radio Std is 802.11b/g (DSSS/CCK/PBCC), 801.11g (DSSS-OFDM): 25.00 ppm If Radio Std is 802.11n, 802.11af, 802.11ax, 802.11be for 2.4G Band: 25.0ppm |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 500 ppm |

Clock Error

Sets a clock error limit to warn you if the measured maximum clock error value exceeds the limit.

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|------------------------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:CERRor <real></code> <code>:CALCulate:EVM:LIMit:CERRor ?</code> |
| Example | <code>:CALC:EVM:LIM:CERR 15</code> <code>:CALC:EVM:LIM:CERR?</code> |
| Couplings | If Radio Std is 802.11n 802.11ax or 802.11be and Center Frequency for 5 GHz band, Clock Error limit will be coupled to 20.0ppm |
| Preset | If Radio Std is 802.11a/g/j/p (OFDM), 802.11ac or 802.11ah: 20.00 ppm If Radio Std is 802.11b/g (DSSS/CCK/PBCC), 801.11g (DSSS-OFDM): 25.00 ppm If Radio Std is 802.11n, 802.11af, 802.11ax, 802.11be for 2.4 GHz Band: 25.0ppm |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 100 ppm |
| Backwards Compatibility SCPI | <code>:CALCulate:EVM:LIMit:CLKerror <real></code> <code>:CALCulate:EVM:LIMit:CLKerror ?</code> |

I/Q Offset (Center Freq Leakage, CFL)

Sets Center Freq Leakage limit to warn you if the measured average Center Freq Leakage exceeds the limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:CFLeakage <rel_ampl></code> <code>:CALCulate:EVM:LIMit:CFLeakage?</code> |
| Example | <code>:CALC:EVM:LIM:CFL -15</code> <code>:CALC:EVM:LIM:CFL?</code> |
| Preset | If Radio Std is 802.11a/g/j/p (OFDM), 801.11g (DSSS-OFDM), 802.11n (20 MHz): -15dB If Radio Std is 802.11n (40 MHz): -20 dB If Radio Std is 802.11ac: $-10\log_{10}(N)$ (N is fft length) 11ac 20M: -18dB 11ac 40M: -21dB 11ac 80M: -24dB 11ac 160M: -27dB If Radio Std is 802.11ah: $-10\log_{10}(N)$ (N is fft length) 11ah 1M: -15dB |

| | |
|--|--|
| | 11ah 2M: -18dB |
| | 11ah 4M: -21dB |
| | 11ah 8M: -24dB |
| | 11ah 16M: -27dB |
| | If Radio Std is 802.11af: $-10\log_{10}(N)$ (N is total number of subcarriers:114): -21 dB |
| | If Radio Std is 802.11ax or 11be: -32dB |

| | |
|-------------|---------------------------|
| State Saved | Saved in instrument state |
| Min | -100 |
| Max | 0 |

RMS EVM

This parameter is available when Radio Std is 802.11b/g.

Sets an RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS <percent></code> <code>:CALCulate:EVM:LIMit:RMS?</code> |
| Example | <code>:CALC:EVM:LIM:RMS 20</code> <code>:CALC:EVM:LIM:RMS?</code> |
| Notes | This limit value is used in 802.11b/g (DSSS/CCK/PBCC) |
| Preset | 16.0% |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 100.0% |

1000 Chips EVM

This parameter is available when Radio Std is 802.11b/g.

Sets 1000 Chips EVM limit to warn you if the measured average 1000 Chips value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:CHIP <percent></code> <code>:CALCulate:EVM:LIMit:CHIP?</code> |
| Example | <code>:CALC:EVM:LIM:CHIP 20</code> <code>:CALC:EVM:LIM:CHIP?</code> |
| Notes | This limit value is used in 802.11b/g (DSSS/CCK/PBCC) |
| Preset | 35.0% |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-------------|---------------------------|
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 100.0% |

RF Carrier Suppression

This parameter is available when Radio Std is 802.11b/g.

Sets an RF Carrier Suppression limit to warn you if the measured average RF Carrier Suppression value is less than a limit.

| | |
|---------------------------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:CSUPpression <rel_ampl></code> <code>:CALCulate:EVM:LIMit:CSUPpression?</code> |
| Example | <code>:CALC:EVM:LIM:CSUP 20</code> <code>:CALC:EVM:LIM:CSUP?</code> |
| Notes | This limit value is used in 802.11b/g (DSSS/CCK/PBCC) |
| Preset | 15.00 |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 100.00 |
| Backwards Compatibility SCPI | <code>:CALCulate:EVM:LIMit:CARRier <rel_ampl></code> <code>:CALCulate:EVM:LIMit:CARRier?</code> |

BPSK-1/2 repetition RMS EVM

Sets BPSK coding rate 1/2 repetition RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:BPSK:R1B2:REP2 <rel_ampl></code> <code>:CALCulate:EVM:LIMit:RMS:BPSK:R1B2:REP2</code> |
| Example | <code>:CALC:EVM:LIM:RMS:BPSK:R1B2:REP2 -20</code> <code>:CALC:EVM:LIM:RMS:BPSK:R1B2:REP2?</code> |
| Notes | This limit value is used in 802.11ah |
| Preset | -5.00 dB |
| State Saved | Yes |
| Min | -1000 |
| Max | 0 |

BPSK-1/2 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets BPSK coding rate 1/2 RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:BPSK:R1B2 <rel_amp1></code> |
| Command | <code>:CALCulate:EVM:LIMit:RMS:BPSK:R1B2</code> |
| Example | <code>:CALC:EVM:LIM:RMS:BPSK:R1B2 -20</code> <code>:CALC:EVM:LIM:RMS:BPSK:R1B2?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -5.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

BPSK-3/4 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, or 802.11p 5M.

Sets BPSK coding rate 3/4 RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:BPSK:R3B4 <rel_amp1></code> |
| Command | <code>:CALCulate:EVM:LIMit:RMS:BPSK:R3B4</code> |
| Example | <code>:CALC:EVM:LIM:RMS:BPSK:R3B4 -20</code> <code>:CALC:EVM:LIM:RMS:BPSK:R3B4?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M |
| Preset | -8.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

QPSK-1/2 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

3 WLAN Mode
3.6 Modulation Analysis Measurement

Sets QPSK coding rate $\frac{1}{2}$ RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QPSK:R1B2 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:QPSK:R1B2</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QPSK:R1B2 -20</code> <code>:CALC:EVM:LIM:RMS:QPSK:R1B2?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -10.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

QPSK-3/4 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets QPSK coding rate $\frac{3}{4}$ RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QPSK:R3B4 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:QPSK:R3B4</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QPSK:R3B4 -20</code> <code>:CALC:EVM:LIM:RMS:QPSK:R3B4?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -13.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

16QAM-1/2 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets 16QAM coding rate $\frac{1}{2}$ RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA16:R1B2 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:QA16:R1B2</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA16:R1B2 -20</code> |

| | |
|-------------|--|
| | <code>:CALC:EVM:LIM:RMS:QA16:R1B2?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -16.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

16QAM-3/4 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets 16QAM coding rate $\frac{3}{4}$ RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA16:R3B4 <rel_amp1></code> |
| | <code>:CALCulate:EVM:LIMit:RMS:QA16:R3B4</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA16:R3B4 -20</code> <code>:CALC:EVM:LIM:RMS:QA16:R3B4?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -19.00 dB |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

64QAM-2/3 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets 64QAM coding rate $\frac{2}{3}$ RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA64:R2B3 <rel_amp1></code> |
| | <code>:CALCulate:EVM:LIMit:RMS:QA64:R2B3</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA64:R2B3 -20</code> <code>:CALC:EVM:LIM:RMS:QA64:R2B3?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -22.00 dB |
| State Saved | Saved in instrument state |

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|-----|-------|
| Min | -1000 |
| Max | 0 |

64QAM-3/4 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets 64QAM coding rate 3/4 RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA64:R3B4 <rel_amp1></code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA64:R3B4 -20</code> <code>:CALC:EVM:LIM:RMS:QA64:R3B4?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -25.00 Db |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

64QAM-5/6 RMS EVM

This parameter is available when Radio Std is 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, or 802.11af.

Sets 64QAM coding rate 5/6 RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA64:R5B6 <rel_amp1></code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA64:R5B6 -20</code> <code>:CALC:EVM:LIM:RMS:QA64:R5B6?</code> |
| Notes | This limit value is used in 802.11j/p 10M, 802.11p 5M, 802.11n, 802.11ac, 802.11ah, 802.11af |
| Preset | -27.00 Db |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

256QAM-3/4 RMS EVM

This parameter is available when Radio Std is 802.11ac, or 802.11ah.

Sets 256QAM coding rate 3/4 RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA256:R3B4 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:QA256:R3B4</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA256:R3B4 -20</code> <code>:CALC:EVM:LIM:RMS:QA256:R3B4?</code> |
| Notes | This limit value is used in 802.11ac or 802.11ah |
| Preset | -30.00 Db |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

256QAM-5/6 RMS EVM

This parameter is available when Radio Std is 802.11ac or 802.11ah.

Sets 256QAM coding rate 5/6 RMS EVM limit to warn you if the measured average RMS EVM value exceeds a limit.

| | |
|----------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:QA256:R5B6 <rel_amp1></code> <code>:CALCulate:EVM:LIMit:RMS:QA256:R5B6</code> |
| Example | <code>:CALC:EVM:LIM:RMS:QA256:R5B6 -20</code> <code>:CALC:EVM:LIM:RMS:QA256:R5B6?</code> |
| Notes | This limit value is used in 802.11ac or 802.11ah |
| Preset | -32.00 Db |
| State Saved | Saved in instrument state |
| Min | -1000 |
| Max | 0 |

Edit 11ax/11be Limit

This page defines the EVM limit for 11ax/11be:

- "Relative Constellation Error in common" on page 1057
- "Relative Constellation Error in trigger-based PPDU > max power of MCS7" on page 1059
- "Relative Constellation Error in trigger-based PPDU power <= max power of MCS7" on page 1061

Relative Constellation Error in common

This parameter is available when Radio Std is 802.11ax or 802.11be.

Specifies RMS EVM limits in a list of 18/16 elements for HE SU PPDU, HE extended rate SU PPDU, HE MU PPDU. EHT MU PPDU. Each element is an RMS EVM limit of a specific MCS and DCM state.

| | |
|------------------------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:RCERror[:LIST]:COMMon <rel_ampl>,...</code> <code>:CALCulate:EVM:LIMit:RMS:RCERror[:LIST]:COMMon?</code> |
| Example | <code>:CALC:EVM:LIM:RMS:RCER:COMM -5, -10, -13, -16, -19, -22, -25, -27, -30, -32, -32, -32, -38, -38, -5, -5, -10, -13</code> <code>:CALC:EVM:LIM:RMS:RCER:COMM?</code> |
| Notes | This limit value is only available in 802.11ax/802.11be It is a list of 18 elements for 802.11ax Comma separated list of values MCS=0 without DCM, MCS=1 without DCM, MCS=2 without DCM, MCS=3 without DCM, MCS=4 without DCM, MCS=5 without DCM, MCS=6 without DCM, MCS=7 without DCM, MCS=8 without DCM, MCS=9 without DCM, MCS=10 without DCM, MCS=11 without DCM, MCS=12 without DCM, MCS=13 without DCM, MCS=0 with DCM, MCS=1 with DCM, MCS=3 with DCM, MCS=4 with DCM It is a list of 16 elements for 802.11be MCS=0, MCS=1, MCS=2, MCS=3, MCS=4, MCS=5, MCS=6, MCS=7, MCS=8, MCS=9, MCS=10, MCS=11, MCS=12, MCS=13, MCS=14, MCS = 15 |
| Dependencies | Only available for 802.11ax/ 802.11be |
| Couplings | If Modulation is 1024-QAM, limit value should be -35 dB when Track Amplitude under Sync is On and -32 dB when Track Amplitude under Sync is Off |
| Preset | 11ax: -5, -10, -13, -16, -19, -22, -25, -27, -30, -32, -32, -32, -38, -38, -5, -5, -10, -13 11be: -5, -10, -13, -16, -19, -22, -25, -27, -30, -32, -32, -32, -38, -38, -5, -5 |
| State Saved | Yes |
| Min | -1000.00 |
| Max | 0 |
| Backwards Compatibility SCPI | <code>:CALCulate:EVM:LIMit:RMS:AX[:LIST]:COMMon <rel_ampl>,...</code> <code>:CALCulate:EVM:LIMit:RMS:AX[:LIST]:COMMon?</code> |

More Information

11ax 18 elements are comma separated and defined as the following list, corresponding to a specific MCS index and DCM state.

| <rel_ampl>, ... | MCS Index | DCM State | RMS EVM Limit Preset value (dB) |
|------------------------------|------------------|------------------|--|
| #1 | 0 | OFF | -5 |
| #2 | 1 | OFF | -10 |
| #3 | 2 | OFF | -13 |
| #4 | 3 | OFF | -16 |
| #5 | 4 | OFF | -19 |
| #6 | 5 | OFF | -22 |
| #7 | 6 | OFF | -25 |
| #8 | 7 | OFF | -27 |
| #9 | 8 | OFF | -30 |
| #10 | 9 | OFF | -32 |
| #11 | 10 | OFF | -35/-32 |
| #12 | 11 | OFF | -35/-32 |
| #13 | 12 | OFF | -38 |
| #14 | 13 | OFF | -38 |
| #15 | 0 | ON | -5 |
| #16 | 1 | ON | -5 |
| #17 | 3 | ON | -10 |
| #18 | 4 | ON | -13 |

11be 16 elements are comma separated and defined as the following list, corresponding to a specific MCS index and DCM state.

| <rel_ampl>, ... | MCS Index | RMS EVM Limit Preset value (dB) |
|------------------------------|------------------|--|
| #1 | 0 | -5 |
| #2 | 1 | -10 |
| #3 | 2 | -13 |
| #4 | 3 | -16 |
| #5 | 4 | -19 |
| #6 | 5 | -22 |
| #7 | 6 | -25 |
| #8 | 7 | -27 |
| #9 | 8 | -30 |
| #10 | 9 | -32 |
| #11 | 10 | -35/-32 |
| #12 | 11 | -35/-32 |
| #13 | 12 | -38 |

| <rel_ampl>, ... | MCS Index | RMS EVM Limit Preset value (dB) |
|------------------------------|------------------|--|
| #14 | 13 | -38 |
| #15 | 14 | -5 |
| #16 | 15 | -5 |

Relative Constellation Error in trigger-based PPDU > max power of MCS7

This parameter is available when Radio Std is 802.11ax or 802.11be.

Specifies RMS EVM limits in a list of 18/15 elements for a HE/EHT trigger-based PPDU (dB) when its transmit power is greater than the maximum power of MCS7 (dB).

| | |
|--------------------|---|
| Remote Command | <code>:CALCulate:EVM:LIMit:RMS:RCERror[:LIST]:TBASed <rel_ampl>,...</code> <code>:CALCulate:EVM:LIMit:RMS:RCERror[:LIST]:TBASed?</code> |

MCS of Trigger-based PPDU

This parameter is available only when Radio Std is 802.11ax/11be.

MCS (Modulation Coding Scheme) information is defined in Trigger Frame, with a range from 0~15. Trigger-based PPDU format is used for a PPDU that is a response of a Trigger frame, which does not include MCS information. You need to manually set the MCS information to select EVM limit for your test.

See "[More Information about HE PPDU](#)" on page 1063.

| | |
|---------------------------------|---|
| Remote Command | :CALCulate:EVM:TBASed:MCS <integer> :CALCulate:EVM:TBASed:MCS? |
| Example | :CALC:EVM:TBAS:MCS 8 :CALC:EVM:TBAS:MCS? |
| Dependencies | Only available for 11ax/be |
| Preset | 1 |
| State Saved | Saved in instrument state |
| Min | 0 |
| Max | 15 |
| Backwards Compatibility SCPI | :CALCulate:EVM:AX:TBASed:MCS <integer> :CALCulate:EVM:AX:TBASed:MCS? |

More Information about HE PPDU

HE PPDU has four formats. The FORMAT parameter determines the overall structure of the PPDU:

- **HE SU PPDU format** is used for single-user PPDU, if FORMAT=HE_SU. In HE SU PPDU format, the HE-SIG-A field is not repeated. Support for the HE SU PPDU format is mandatory
- **HE MU PPDU format** is used for a multi-user PPDU that is not a response of a Trigger frame, if FORMAT=HE_MU. It is similar to SU format, except that an HE-SIG-B field is present. Support for the HE MU PPDU format is mandatory
- **HE extended range SU PPDU** format is used for single-user PPDU, if FORMAT=HE_EXT_SU. It is similar to SU format, except that the HE-SIG-A field is repeated. Support for the HE extended range SU PPDU format is TBD (mandatory or optional)

- **HE trigger-based PPDU** format is used for a PPDU that is a response of a Trigger frame, if FORMAT=HE_TRIG. The preamble format is identical to the HE SU PPDU format until the HE-STF field

More Information about EHT PPDU

EHT PPDU has two formats.

- EHT MU PPDU format is used for transmission to one or more users if the PPDU is not a response to a triggering frame. In the EHT MU PPDU, the EHT-SIG field is present. It's used for non-OFDMA or OFDMA single or multiuser transmission
- EHT TB PPDU format is used for a transmission that is a response to a triggering frame from an AP. In the EHT TB PPDU, the EHT-SIG field is not present and the duration of the EHT-STF field is twice the duration of the EHT-STF field in the EHT MU PPDU

DCM of Trigger-based PPDU

This is available only when Radio Std is 802.11ax/11be.

DCM (Dual sub-Carrier Modulation) information is defined in Trigger Frame, applicable only to MCS 0,1,3,4.

Trigger-based PPDU format is used for a PPDU that is a response of a Trigger frame, which does not include DCM information. You need to manually set the DCM information to select EVM limit for your test.

See More Information about HE PPDU.

PhNoise Opt

Allows you to select the LO (local oscillator) phase noise behavior for various operating conditions

| | |
|----------------|--|
| Remote Command | <code>[:SENSe] :EVM:FREQuency:SYNThesis[:STATe] 1 ... 5</code> For the meaning of each numeric option value, see "Parameter Options & Installed Options" on page 1065 below <code>[:SENSe] :EVM:FREQuency:SYNThesis[:STATe] ?</code> |
| Example | <code>:EVM:FREQ:SYNT 1</code> <code>:EVM:FREQ:SYNT?</code> |
| Dependencies | This control does not appear in UXM E7515A, Modular PXI Signal Analyzer M9393A or M9391A |
| Preset | 3 |
| State Saved | Saved in instrument state |
| Range | See "Ranges" on page 1070 |

Parameter Options & Installed Options

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster

without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

| Option | # | Description |
|---------------------------------|---------|--|
| "Balanced" on page 1067 | 1 | <ul style="list-style-type: none"> - In instruments with EPO, balances close-in phase noise with spur avoidance - In instruments without EPO optimizes phase noise for small frequency offsets from the carrier |
| "Best Wide-offset" on page 1067 | 2 | Optimizes phase noise for wide frequency offsets from the carrier |
| "Fast Tuning" on page 1068 | 3 | Optimizes LO for tuning speed |
| "Best Close-in" on page 1066 | 4 or 1* | <ul style="list-style-type: none"> - In instruments with EPO, emphasizes close-in phase noise performance without regard to spur avoidance - In instruments without EPO, this setting is accepted but no action is taken |
| "Best Spurs" on page 1067 | 5 | <ul style="list-style-type: none"> - In instruments with EPO, emphasizes spur avoidance over close-in phase noise performance - In instruments without EPO, this setting is accepted but no action taken |
| Auto | - | Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions |

*Dependent on Option EPO installation. See "Best Close-in" on page 1066 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 1068 is identical in effect to "Best Close-in" on page 1066.

Best Close-in

Without option EPO

:FREQ:SYNT 1

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EPO

:FREQ:SYNT 4

In instruments with Option EPO, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 1067 setting, parameter 1 selects "Balanced" on page 1067 in EPO instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 1066, which is usually not as good a choice as "Balanced" on page 1067.

Balanced

:FREQ:SYNT 1

In instruments with EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Best Spurs

:FREQ:SYNT 5

In instruments with EPO, the LO is configured for better phase noise than the "Best Wide-offset" on page 1067 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 1066 case mostly within ± 1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 1067 case at better than -90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

:FREQ:SYNT 2

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EPO, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB

mostly within ± 1 octave around 400 kHz offset. The spurs will always be below -70 dBc.

Fast Tuning

:FREQ:SYNT 3

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "**Fast Tuning**" on page 1068 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EPO, this is the same configuration as "**Best Spurs**" on page 1067. It is available with the "**Fast Tuning**" on page 1068 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "**Fast Tuning**" on page 1068 option, the settings for "**Best Close-in**" on page 1066 are used if "**Fast Tuning**" on page 1068 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

:FREQ:SYNT:AUTO ON

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

| Models with Option | Conditions | Selection |
|--|-----------------------------------|----------------------------|
| EPO | Center frequency is < 699.9 kHz | "Balanced" on page 1067 |
| Models with option EPO have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA) | Span > 114.1 MHz, <i>or</i> | "Fast Tuning" on page 1068 |
| | RBW > 800 kHz | |
| | RBW > 290 kHz, <i>or</i> | "Best Wide-offset" on page |
| | Span > 4.2 MHz | |

3 WLAN Mode
 3.6 Modulation Analysis Measurement

| Models with Option | Conditions | Selection |
|--|--|--|
| | | 1067 |
| | Other conditions | "Balanced" on page 1067 |
| EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA) | Span > 44.44 MHz, <i>or</i> RBW > 1.9 MHz, <i>or</i> Source Mode is set to "Tracking" Center frequency is < 195 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 1.3 MHz <i>and</i> RBW <= 75 kHz | "Fast Tuning" on page 1068 "Best Close-in" on page 1066 |
| | All other conditions | "Best Wide-offset" on page 1067 |
| EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 1066; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise) | CF < 130 kHz, <i>or</i> CF > 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 40 kHz | "Best Close-in" on page 1066 |
| | Span > 22 MHz, <i>or</i> RBW > 400 kHz, <i>or</i> CF ≤ 12 MHz <i>and</i> Span < 495 kHz <i>and</i> RBW < 23 kHz | "Fast Tuning" on page 1068 |
| | All other conditions | "Best Wide-offset" on page 1067 |
| EP4 (available in CXA for improved phase noise) | Span > 101 MHz <i>or</i> RBW > 1.15 MHz <i>or</i> Source Mode is set to "Tracking" | "Fast Tuning" on page 1068 |
| | CF is < 109 kHz <i>or</i> CF >= 4.95 MHz <i>and</i> Span <= 666 kHz <i>and</i> RBW < 28 kHz | "Best Close-in" on page 1066 |
| | All other conditions | "Best Wide-offset" on page 1067 |
| All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 1068 are actually the same as "Best Close-in" on page 1066, but the rules are implemented this way so that the | Span > 12.34 MHz, <i>or</i> RBW > 250 kHz, <i>or</i> Source Mode is set to "Tracking" | "Fast Tuning" on page 1068 |

| Models with Option | Conditions | Selection |
|---|--|---------------------------------|
| user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning | Center frequency is < 25 kHz, <i>or</i> CF >= 1 MHz <i>and</i> Span <= 141.4 kHz <i>and</i> RBW <= 5 kHz | "Best Close-in" on page 1066 |
| | All other conditions | "Best Wide-offset" on page 1067 |

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

| Option | Option # | Phase Noise Option | Range |
|---------------|----------|--------------------|-------------------------|
| No EPx Option | 1 | Best Close-in | [offset < 20 kHz] |
| | 2 | Best Wide-offset | [offset > 30 kHz] |
| | 3 | Fast Tuning | [same as Best Close-In] |
| EP0 | 4 | Best Close-in | [offset < 600 kHz] |
| | 1 | Balanced | [offset < 600 kHz] |
| | 5 | Best Spurs | [offset < 600 kHz] |
| | 2 | Best Wide-offset | [offset > 800 kHz] |
| EP1 | 3 | Fast Tuning | [same as Best Close-In] |
| | 1 | Best Close-in | [offset < 140 kHz] |
| | 2 | Best Wide-offset | [offset > 160 kHz] |
| EP2, EP3, EP5 | 3 | Fast Tuning | [single loop] |
| | 1 | Best Close-in | [offset < 70 kHz] |
| | 2 | Best Wide-offset | [offset > 100 kHz] |
| EP4 | 3 | Fast Tuning | [medium loop bw] |
| | 1 | Best Close-in | [offset < 90 kHz] |
| | 2 | Best Wide-offset | [offset > 130 kHz] |
| | 3 | Fast Tuning | [same as Best Close-In] |

LO Dither

Remote Command `[:SENSe]:EVM:LO:DITHer[:STATe] ON | OFF | 1 | 0`
`[:SENSe]:EVM:LO:DITHer[:STATe]?`

3 WLAN Mode
3.6 Modulation Analysis Measurement

| | |
|--------------|---|
| Example | <code>:EVM:LO:DITH 1</code> <code>:EVM:LO:DITH?</code> |
| Dependencies | This feature is only available when the instrument has the option H1G installed The LO Dither key is turned Off and grayed out when IFBW <= 255M. If the user pressed the grayed-out key, then a warning message "Feature only available with the H1G path" is shown If the user tries to set LO Dither to ON via SCPI, a message -221, "Settings conflict; Feature only available with the H1G path" is returned |
| Preset | 0 |
| State Saved | Yes |
| Range | On Off |

IF Gain

In order to take full advantage of the RF dynamic range of the analyzer, we offer a switched IF amplifier with approximately 10 dB of gain. When it can be turned on without an overload, the dynamic range is always better with it on than off. The control "IF Gain" can be used to set the IF Gain function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

Enables you to control an internally switched IF amplifier with approximately 10 dB of gain. This amplifier takes full advantage of the RF dynamic range of the analyzer. When it can be turned on without an overload, the dynamic range is always better when the amplifier is set to On, than when it is set to Off. The control "IF Gain" can be used to set the IF Gain function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

IF Gain Auto

Activates the auto rules for IF Gain.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:IF:GAIN:AUTO[:STATe] OFF ON 0 1</code> <code>[:SENSe]:EVM:IF:GAIN:AUTO[:STATe]?</code> |
| Example | <code>:EVM:IF:GAIN:AUTO OFF</code> <code>:EVM:IF:GAIN:AUTO?</code> |
| Notes | This only applies to the RF input. It does not apply to baseband I/Q input |
| Dependencies | This control does not appear in UXM E7515A, Modular PXI Signal Analyzer M9393A or M9391A |
| Couplings | When either the auto attenuation is active (for example, with an electrical attenuator), or the optimize mechanical attenuator range is requested, the IF Gain setting is changed using the following rule The Auto selection sets IF Gain to 'High Gain' under any of the following conditions: <ul style="list-style-type: none"> - the input attenuator is set to 0 dB - the preamp is turned on |

| | |
|----------------|---|
| | <ul style="list-style-type: none"> – the Max Mixer Level is –20 dBm or lower <p>For other settings, Auto sets IF Gain to 'Low Gain'</p> |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | Auto Man |
| | <p>IF Gain Select</p> <p>Selects the range of IF gain.</p> <ul style="list-style-type: none"> – High gain: set 10dB IF gain for better noise level measurements – Low gain: set 0dB IF gain for large signals – Other: allow to set arbitrary IF gain value within -12dB to 12dB. This selection is not available for B25 If bandwidth option <p>When this parameter is changed, IF Gain Auto will become Man.</p> |
| Remote Command | <pre>[:SENSe]:EVM:IF:GAIN:SElect LOW HIGH OTHER [:SENSe]:EVM:IF:GAIN:SElect?</pre> |
| Example | <pre>:EVM:IF:GAIN:LEV LOW :EVM:IF:GAIN:LEV?</pre> |
| Dependencies | This control does not appear in UXM E7515A, Modular PXI Signal Analyzer M9393A or M9391A |
| Preset | LOW |
| State Saved | Saved in instrument state |
| Range | Low High Other |

Other IF Gain

This specifies the IF gain value. When IF gain is set to Other, this value will be used.

| | |
|----------------|---|
| Remote Command | <pre>[:SENSe]:EVM:IF:GAIN:LEVel <rel_amp1> [:SENSe]:EVM:IF:GAIN:LEVel?</pre> |
| Example | <pre>:EVM:IF:GINT:VAL -10 :EVM:IF:GINT:VAL?</pre> |
| Notes | <p>It is not available for B25 IF bandwidth option</p> <p>It would be changed after pressing optimize EVM</p> |
| Preset | 0 |
| State Saved | Saved in instrument state |
| Min | -12 |
| Max | 12 |

Spur Avoidance

NOTE

This control is available when the analyzer has installed Bandwidth Option H1G.

Allows you to eliminate the spur that occurs at -50MHz offset of Center Frequency on UXA H1G platform. This is an interleaving spur caused by the ADC.

- Auto: move the spur completely out of analysis bandwidth, the tradeoff is that the available analysis bandwidth will be reduced to 400MHz. And EVM could be worse as the edge of passband is used for analysis
- Manual: move the spur by specified value or turn off this feature by setting the value to 0

| | |
|----------------|--|
| Remote Command | <pre>[:SENSe]:EVM:SAVoid:FREQuency <freq> [:SENSe]:EVM:SAVoid:FREQuency? [:SENSe]:EVM:SAVoid:AUTO ON OFF 1 0 [:SENSe]:EVM:SAVoid:AUTO?</pre> |
|----------------|--|

| | |
|---------|---|
| Example | <pre>:EVM:SAV:FREQ 50MHz :EVM:SAV:FREQ? :EVM:SAV:AUTO ON :EVM:SAV:AUTO?</pre> |
|---------|---|

| | |
|-----------|---|
| Couplings | The control is only available for EVM measurement, it will not appear in other measurements |

| | |
|-------------|----------------------------------|
| State Saved | Saved in instrument state Yes |
|-------------|----------------------------------|

| | |
|-------|-------------|
| Range | Auto Manual |
|-------|-------------|

| | |
|-----|--------------------------------|
| Min | $-(1\text{GHz} - \text{BW})/2$ |
|-----|--------------------------------|

| | |
|-----|-------------------------------|
| Max | $(1\text{GHz} - \text{BW})/2$ |
|-----|-------------------------------|

Cross-Correlated EVM (Remote Command Only)

Cross-Correlated EVM (ccEVM) is a technique applied for RMS EVM to suppress analyzer noise resulting in lower EVM floor. A 2-channel analyzer, or two analyzers, demodulate the same signal independently, and perform cross-correlation on the error vectors to cancel out uncorrelated noise added by the analyzer.

Differences in impedance mismatch and amplitude/phase unflatness between channels are examples of uncorrelated noise between analyzers.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:CCEVM[:ENABle] OFF ON 0 1</code> <code>[:SENSe]:EVM:CCEVM[:ENABle]?</code> |
| Example | <code>:EVM:CCEV 1</code> <code>:EVM:CCEV?</code> |
| Notes | Before ccEVM, Remote Analyzer should be configured in Meas Setup\Global\Remote Analyzer Config. See " Remote Analyzer Config " on page 1077. |
| Dependencies | Grayed out for 802.11ajgp/11b/11ah/11af, 802.11ac/ax 80 MHz + 80 MHz and Radio Std Detection is On |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

Power Reference Plane

Allows you to increase the power by 3 dB for Baseband I+jQ measurements. Options are:

| Menu | SCPI |
|----------|----------|
| Baseband | BASEband |
| RF | RF |

| | |
|----------------|--|
| Remote Command | For valid <code><meas></code> values, see " Valid Measurement Keywords " on page 1074 <code>[:SENSe]:<meas>:POWer:IQ:REFerence:PLANe RF BASEband</code> <code>[:SENSe]:<meas>:POWer:IQ:REFerence:PLANe?</code> |
| Example | (Complex Spectrum measurement) <code>SPEC:POW:IQ:REF:PLAN BAS</code> <code>SPEC:POW:IQ:REF:PLAN?</code> |
| Dependencies | Only available if the I/Q input exists Enabled only when the input is I/Q and I/Q Path is I+jQ Disabled for all other conditions |
| Preset | RF |
| State Saved | Saved in instrument state |

Valid Measurement Keywords

This function is available *only* in certain Modes and measurements. Only the following listed values of `<meas>` are valid.

Min Idle Time

Min Idle Time is the minimum idle time of 2 burst.

Burst start/stop detection window length = Min Idle Time * Sample Rate, if it's less than 28, then use 28 instead to avoid false detection.

| | |
|----------------|--|
| Remote Command | <code>[[:SENSE]:EVM:BURSt:SEARch:ITIMe:MINimum <time></code> <code>[[:SENSE]:EVM:BURSt:SEARch:ITIMe:MINimum?</code> |
| Example | <code>:EVM:BURS:SEAR:ITIM:MIN 1us</code> <code>:EVM:BURS:SEAR:ITIM:MIN?</code> |
| Preset | 1us |
| State Saved | Saved in instrument state |
| Min | 0.1us |
| Max | 20us |

Noise-Corrected EVM (Remote Command Only)

Noise-Corrected EVM (ncEVM) is a technique to improve EVM by compensating analyzer's noise in EVM domain.

| | |
|----------------|--|
| Remote Command | <code>[[:SENSE]:EVM:NCEVm[:ENABle] OFF ON 0 1</code> |
|----------------|--|

| | |
|--------------|--|
| | <code>[:SENSe] :EVM:NCEVm [:ENABle] ?</code> |
| Example | <code>:EVM:NCEV 1</code> <code>:EVM:NCEV?</code> |
| Notes | Before ccEVM, Remote Analyzer should be configured in Meas Setup\Global\Remote Analyzer Config. See " Remote Analyzer Config " on page 1077 |
| Dependencies | Available on VXT3 platform only, and supports only the following radio standards: <ul style="list-style-type: none"> - 802.11be 320 MHz with 320M bandwidth - 802.11be 160 MHz with 480M bandwidth |
| Preset | OFF |
| State Saved | Saved in instrument state |
| Range | On Off |

EVM Noise Floor Extension

Specifies the technique used to improve the EVM floor.

| Option | SCPI | Details |
|--------|-------|--|
| Off | OFF | Off |
| CC-EVM | CCEVm | Cross-Correlated EVM A technique applied for RMS EVM to suppress analyzer noise resulting in lower EVM floor. A 2-channel analyzer, or two analyzers, demodulate the same signal independently, and perform cross-correlation on the error vectors to cancel out uncorrelated noise added by the analyzer |
| NC-EVM | NCEVm | Noise-Corrected EVM A technique to improve EVM by compensating analyzer's noise in EVM domain. The contribution of analyzer's noise to total EVM is estimated and removed |

| | |
|----------------|---|
| Remote Command | <code>[:SENSe] :EVM:EFE OFF CCEVm NCEVm</code> <code>[:SENSe] :EVM:EFE?</code> |
| Example | <code>:EVM:EFE CCEV</code> <code>:EVM:EFE?</code> |
| Notes | Before ccEVM, Remote Analyzer should be configured in Meas Setup\Global\Remote Analyzer Config. See " Remote Analyzer Config " on page 1077 |
| Dependencies | CC-EVM is not available for 802.11ajgp/11b/11ah/11af, 802.11ac/ax 80 MHz + 80 MHz and Radio Std Detection is On NC-EVM is available on M9415 and E6680 platforms only, and supports only the following radio standards: <ul style="list-style-type: none"> - 802.11be 320 MHz with 320M bandwidth |

| | |

| Range | Off Cross-Correlated EVM Noise-Corrected EVM |

3.6.8.10 Global

Remote Analyzer Config

The X-Series Signal Analyzers have a single RF channel. For the multi-channel measurement scenarios, such as MIMO, multiple X-Series Signal Analyzers can be configured to create a multi-analyzer system. The following setup establishes the LAN communication for the multi-analyzer system.

IP Address

Lets you enter a new IP address of the remote analyzer. After you enter the address you should press “Add” to add the analyzer at that address to the Available Analyzer List.

| | |
|-------------|---------|
| Preset | 0.0.0.0 |
| State Saved | No |

SCPI Socket Port

Let you enter a new SCPI socket port number of the remote analyzer. After you enter the number you should press “Add” to add the analyzer at that address to the Available Analyzer List.

| | |
|-------------|------|
| Preset | 5025 |
| State Saved | No |

Add Analyzer

Adds the new analyzer to the remote analyzer list. When pressing this softkey, the following items will be checked:

1. Whether it is a new one to the remote analyzer list.
2. Whether the IP address is valid.

3. Whether the SCPI socket port number is valid.
4. Whether the IP address is the local IP address or not.
5. Whether the IP address has been added or not.
6. Whether the IP address can be visited by TCP/IP.

If the items are OK, the new remote analyzer will be inserted at the end of the remote analyzer list.

The “Add” softkey will not work if the count of the list of the remote analyzers has reached 10.

| | |
|----------------|---|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:ADD[:IPAddress] <address string></code> |
| Example | <code>:SYST:COMM:ANAL:ADD "146.208.172.102:5025"</code> |
| Notes | <p>If no supported analyzer is found at the specified address, an error message will be generated, for example, “Invalid IP address and SCPI socket port 0.0.0.0:0000”</p> <p>The maximum number of analyzers is 10. If the user tries to add a new analyzer after the maximum number is reached, an error message will be generated, for example, “Maximum number of analyzer is reached.”</p> |

Verify Highlighted Analyzer

This key verifies the LAN interface connection to the Current Analyzer (It does NOT verify any signal connections.)

Each time after a new remote analyzer is inserted into the remote analyzer list, its state is “Unverified”.

When you press this key, the connection to the current analyzer will be verified. If the analyzer can be verified successfully, its “Verified” state will become “Yes”, otherwise its state will be “No”.

Verification includes the following items for all platforms:

1. Whether the remote analyzer with the IP address can be visited by TCP/IP.
2. Whether XA is started in the remote analyzer.
3. Whether the firmware of the remote analyzer is A.13.00 or a newer one.
4. Whether the remote Application in the remote analyzer is available.

And for modular platforms also includes:

5. Whether the remote analyzer has B40 option or not.
6. Whether the HW of the remote analyzer can support MIMO or not.

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:VERify <address string></code> |
| Example | <code>:SYST:COMM:ANAL:VER "146.208.172.102:5025"</code> |
| Notes | <p>The parameter of the SCPI command is the IP address and SCPI socket port number of the analyzer in the remote analyzer list</p> <p>If the parameter in an invalid IP address and SCPI socket port, for example an IP address with a wrong format or not in the list of the remote analyzers, an error message will be generated, for example, "Invalid IP address and SCPI socket port 0.0.0.0:0000"</p> <p>Use the command "SYSTem:COMMunicate:ANALyzer:INFormation?" to obtain the result of the verification</p> |

Select Highlighted Analyzer

You can navigate up and down in the list with the up and down arrow keys and can select any entry by pressing the "Select Highlighted Analyzer" key.

Each time when pressing this key, the local analyzer will take the following actions:

1. Sets the current analyzer to the highlighted analyzer.
2. Checks the prerequisites of the highlighted analyzer (firmware version, options, etc.)
3. Switch the current Application in the selected remote analyzer to be the remote Application.
4. Lock the front panel of the selected remote analyzer.

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:SElect[:IPAddress] <address string></code> <code>:SYSTem:COMMunicate:ANALyzer:SElect[:IPAddress]?</code> |
| Example | <code>:SYST:COMM:ANAL:SEL "146.208.172.102:5025"</code> <code>:SYST:COMM:ANAL:SEL?</code> returns all the selected analyzer |
| Notes | <p>The parameter of the SCPI command is the IP address and SCPI socket port number of the analyzer in the remote analyzer list. If command drops SCPI socket number, then default SCPI port number is taken</p> <p>In the "Analyzer Config" view, if an analyzer is selected successfully, then related "Selected" state will be "On", or otherwise its state is "Off". System will automatically choose one available channel number for new selected remote analyzer, which is displayed in "Ch" grid view</p> <p>If the parameter in an invalid IP address, for example an IP address with a wrong format or not in the remote analyzer list, an error message will be generated, for example, "0.0.0.0 is not a valid IP address."</p> |

If the local analyzer fails to select the highlighted analyzer, an error message, which is “0.0.0.0 cannot be selected.”, will be shown in the message area

If the highlighted analyzer is already selected, an error message will be generated, for example, “0.0.0.0 is already selected”

If an analyzer is selected successfully, “:SYSTem:COMMunicate:ANALyzer:IPADdress?” will return the IP address of the analyzers in the remote analyzer list. Otherwise, it will return an empty string

Multiple remote analyzer selection is allowed, thus, to support high order MIMO test. If there is already one selected analyzer, When a new remote one is selected, system will automatically assign next available channel number to it

E6640A:

There are constraints on remote analyzer connection configuration in E6640A. For MIMO 2x2, valid remote analyzer connection is TRX1 (Primary) + TRX2 (Secondary module) or TRX3 (Primary) + TRX4 (Secondary module) 2-channel configuration. For MIMO 3x3, valid remote analyzer connection is TRX1 (Primary) + TRX2 (Secondary module) + TRX3 (Secondary module) 3-Channel configuration. To violate these rules will get error “System Error; Invalid Primary TRX module configuration” or “System Error; Invalid Secondary TRX module configuration”

Preset The current analyzer selection is unaffected by a Mode Preset

Release Highlighted Analyzer

Releases the highlighted remote analyzer.

When the user presses this softkey, the front panel of the highlighted analyzer will be unlocked.

Remote Command :SYSTem:COMMunicate:ANALyzer:RELease:IPADdress <address string>

Example :SYST:COMM:ANAL:REL:IPAD “146.208.172.102:5125”
release the specified remote analyzer

Notes

In the “Analyzer Config” view, if the highlighted analyzer is released successfully, its “Channel Index” will be set to be -1

If the local analyzer fails to release the highlighted analyzer, a warning message, which is “0.0.0.0:0000 cannot be released.”, will be shown in the message area. However, its “Channel Index” will also be set to be -1

If there is no highlighted analyzer, no action will be taken and an error message will be generated, for example, “There is no selected analyzer.”

Backwards Compatibility SCPI :SYSTem:COMMunicate:ANALyzer:RELease
release the highlighted analyzer

Release All (Remote Command Only)

Release all the selected remote analyzer. The front panel of all the listed remoted analyzer will be unlocked.

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:RELease:ALL</code> |
| Example | <code>:SYST:COMM:ANAL:REL:ALL</code> |
| Notes | <p>In the “Analyzer Config” view, if the analyzer is released successfully, its “Channel Index” will be set to be -1</p> <p>If the local analyzer fails to release a remote analyzer, a warning message, which is “0.0.0.0:0000 cannot be released.”, will be shown in the message area. However, its “Channel Index” will also be set to be -1</p> <p>If there is no selected analyzer, no action will be taken and an error message will be generated, for example, “There is no selected analyzer.”</p> |

Delete Highlighted Analyzer

Deletes the highlighted analyzer from the remote analyzer list. You will be prompted with a dialog box to make sure you REALLY want to do this. The prompt says “The highlighted analyzer will be permanently deleted from the list. Are you sure you want to do this? Press Enter to proceed or Cancel (ESC) to cancel.”

| | |
|----------------|---|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:DELeTe[:IPADdress] <address string></code> |
| Example | <code>:SYST:COMM:ANAL:DEL “146.208.172.102:5025”</code> |
| Notes | <p>The parameter of this SCPI command is the IP address and SCPI socket port number of the analyzer in the remote analyzer list which the user wants to delete</p> <p>If the parameter is not a valid IP address and SCPI socket port number, for example, the IP address with a wrong format or not in the list of the remote analyzers, only the valid IP address will be accepted and an error message will be generated, for example, “Invalid IP address and SCPI socket port: 0.0.0.0:0000.”</p> <p>If the user tries to delete a selected analyzer, the local analyzer will first try to release the selected analyzer and then remove it from the list of the remote analyzers. If there is some errors during releasing the selected analyzer, an error message will be generated, for example, “Cannot release 0.0.0.0:0000.”. However, this analyzer will still be removed from the remote analyzer list</p> |

Delete All

Deletes all analyzers in the remote analyzer list. You will be prompted with a dialog box to make sure you REALLY want to do this. The prompt says “All analyzers will be permanently deleted. Are you sure you want to do this? Press Enter to proceed or Cancel (ESC) to cancel.”

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:DELeTe:ALL</code> |
| Example | <code>:SYST:COMM:ANAL:DEL:ALL</code> |
| Notes | If there is a selected analyzer, the local analyzer will first try to release the selected analyzer and then remove it from the list of the remote analyzers. If there is some errors during releasing the selected analyzer, an error message will be generated, for example, "Cannot release 0.0.0.0.0000". However, this analyzer will still be removed from the remote analyzer list |

Query Analyzer Information (Remote Command Only)

Gets the information of the remote analyzer.

The query result will be returned in a string in the following format:

Channel Index, Selection State, Verification State, IP Address, *IDN?

For example, "2, Selected, Verified, 146.208.172.102:5025, Keysight Technologies, N9020A, MY46471851, A.12.00_P0012"

| | |
|----------------|---|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:INFormation? <address string></code> |
| Example | <code>:SYST:COMM:ANAL:INF? "146.208.172.102:5025"</code> |
| Notes | The parameter of the SCPI command is the IP address and SCPI socket port number of the analyzer of the remote analyzer list If the parameter is an invalid IP address, for example an IP address with a wrong format or not in the list of the remote analyzers, an error message will be generated, for example, "Invalid IP address and SCPI socket port 0.0.0.0:0000." If the current analyzer is not selected, the Channel Index will be "-1" |

Query All Analyzer IP Addresses (Remote Query Only)

Gets the IP addresses of all analyzers in the list of the remote analyzers.

The query result will be returned in a string containing all IP addresses and SCPI socket port number of the analyzer in the remote analyzer list which is separated by comma:

146.208.172.102:5125,146.208.172.102:5225,146.208.172.102:5325

| | |
|----------------|--|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer[:IPADdress]?</code> |
| Example | <code>:SYST:COMM:ANAL?</code> |

Query remote analyzer MIMO capability (Remote Query Only)

Query the MIMO capability of the remote analyzers.

| | |
|----------------|---|
| Remote Command | <code>:SYSTem:COMMunicate:ANALyzer:MIMO:CAPability?</code> |
| Example | <code>:SYST:COMM:ANAL:MIMO:CAP?</code> |
| Notes | <p>This command is intended for VXT but be compatible to EXM</p> <p>The query result will be returned in a string containing maxInputChan, maxOutputChan and Multi-box synchronization capability separated by comma of the remote analyzer</p> <p>If –MMO installed and –MTS installed, then return 8,8,1</p> <p>If –MMO installed and –MTS not installed, then return 4,4,0</p> <p>If –MMO not installed and –MTS installed, then return 1,1,1</p> <p>If –MMO not installed and –MTS not installed, then return 1,1,0</p> |

3.6.8.11 Tx Beam Forming Type (Remote Command Only)

When license V9077B-KFP/KTP is installed, this parameter specifies the EVM demod algorithm for EVM results or Tx Beam Forming results.

| | |
|----------------|--|
| Remote Command | <code>[:SENSe]:EVM:BFORming:MTYPE EVM TXBFcal</code> <code>[:SENSe]:EVM:BFORming:MTYPE?</code> |
| Notes | <p>This command is only available when license V9077B-KFP/KTP is installed; otherwise, “-113, Undefined Header” error will be reported</p> <p>This parameter takes effect when the Radio Std is 802.11n(20MHz), 802.11n (40MHz), 802.11ac (20MHz), 802.11ac (40MHz), 802.11ac (80MHz) and 802.11ac (160MHz)</p> <p>When EVM is selected, the result index 1~20 are calculated with meaningful values for EVM measurement, and result 21, 22 and 23 results are -999.0;</p> <p>When TXBFcal is selected, the result index 1~20 values will not be calculated; Instead, result 21, 22 and 23 are calculated and returned</p> |
| Preset | EVM |
| Range | EVM TXBFcal |

3.6.8.12 MIMO Tx Channel (Remote Command Only)

Specifies the Tx channel count of the measured MIMO signal. This setting specifies Tx Beam Forming channel count, and **Fast Power Calibration** channel count.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:EVM:ACCHannel <integer></code> <code>[:SENSe]:EVM:ACCHannel?</code> |
| Notes | <p>For Radio Std 802.11n (20MHz) and 802.11n (40MHz), we only support Tx Beam Forming with channel count <=4;</p> <p>For Radio Std 802.11ac (20MHz), 802.11ac (40MHz), 802.11ac (80MHz), and 802.11ac (160MHz), we support Tx Beam Forming with channel count <=8</p> |

| | |
|--------|---|
| Preset | 1 |
| Min | 1 |

3.6.8.13 Enable MAC Header Decoding (Remote Command Only)

Specifies whether the MAC header should be decoded or not.

| | |
|----------------|--|
| Remote Command | <code>:CALCulate:EVM:DECode:MACHeader 1 0 ON OFF</code> <code>:CALCulate:EVM:DECode:MACHeader?</code> |
| Example | <code>:CALC:EVM:DEC:MACH 1</code> <code>:CALC:EVM:DEC:MACH?</code> |
| Notes | This command is available only when the N9077A-AFP license is installed If “Enable MAC Header Decoding” is ON, it will have a significant impact on the demod speed. Unless it is necessary, it should be set to be OFF |
| Preset | OFF |
| Range | On Off |

3.6.8.14 Fast Power Calibration State (Remote Command Only)

To accelerate the calibration speed of MIMO OFDM signals, a new algorithm is developed to estimate the power of each channel by measuring the combined power of these channels. This parameter turns on the Fast Power Calibration calculation.

| | |
|----------------|---|
| Remote Command | <code>[:SENSe]:EVM:PCALibrate 0 1 OFF ON</code> <code>[:SENSe]:EVM:PCALibrate?</code> |
| Notes | This parameter takes effect when the Radio Std is 802.11ac/802.11ax (20/40/80/160MHz) and “WLAN Preamble Puncturing Mode” license is present When it is On, result index 38 returns the channel power values. The channel number is decided by MIMO Tx Channel. All the other EVM results are meaningless; When it is Off, Result index 38 returns -999.0. All the other EVM results are meaningful |
| Preset | OFF |
| Range | On Off |

3.6.9 Sweep

Contains controls which allow you to control the sweep and measurement functions of the analyzer, such as the sweep or measurement time and whether in Single sweep/measure or Continuous sweep/measure mode.

3.6.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1085

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code> |
| Example | Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code> |
| Preset | ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF |
| State Saved | Saved in instrument state |
| Annunciation | The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous |
| Backwards Compatibility Notes | X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep |

More Information

| | |
|-----------------|--|
| Continuous Mode | The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping |
|-----------------|--|

| | |
|-------------|---|
| | <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p> |
| Single Mode | <p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p> |

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 1853 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/hold sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 1087

| | |
|-------------------------------|---|
| Remote Command | <code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code> |
| Example | <code>:INIT:IMM</code> <code>:INIT:REST</code> |
| Notes | <code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function |
| Couplings | Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement |
| Status Bits/OPC dependencies | This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (<code>INTEgrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set |
| Backwards Compatibility Notes | For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well |

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

| Event | Trace Effect |
|---|----------------------|
| Clear/Write pressed (even if already in Clear/Write) | Set to mintracevalue |
| Max Hold pressed (even if already in Max Hold) | Set to mintracevalue |

| Event | Trace Effect |
|---|--|
| Min Hold pressed (even if already in Min Hold) | Set to maxtracevalue |
| Trace Average pressed (even if already in Trace Average) | Trace data unaffected but start new sweep/avg/hold |
| Restart pressed | Trace data unaffected but start new sweep/avg/hold |
| Parameter requiring restart changed (e.g., RBW) | Trace data unaffected but start new sweep/avg/hold |

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

| | |
|----------------|---|
| Remote Command | <code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code> |
| Example | <code>:INIT:PAUS</code> <code>:INIT:RES</code> |
| Dependencies | Not displayed in Modes that do not support pausing |
| Annotation | Only on control |

3.6.9.2 X Scale

Accesses controls that enable you to configure the Sweep and Control functions of the analyzer, such as Sweep Rules.

Ref Value

Controls the X value of the selected trace at the chosen X Reference Position.

`:DISPlay:EVM:VIEW10:WINDow1:TRACe:X[:SCALe]:RPOSition?`

Auto Scaling

Toggles the scale coupling function between On and Off.

Remote Command `:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:X[:SCALe]:COUPLe 0 | 1 | OFF`
`| ON`

`:DISPlay:EVM:WINDow3|4|5|7|8|14|15|16|20:TRACe:X[:SCALe]:COUPLe?`

The applicable windows are numbered as follows:

| :Window | :Number |
|----------------------|---------|
| :Magnitude Error | :3 |
| :Phase Error | :4 |
| :EVM vs. Chips | :5 |
| :EVM vs. Symbol | :7 |
| :EVM vs. Carrier | :8 |
| :Preamble Freq Error | :14 |
| :I/Q Gain Imbalance | :15 |
| :I/Q Quadrature Skew | :16 |
| :Unused Tone Error | :20 |
| :Power vs. Symbol | :22 |

Example `:DISP:EVM:WIND7:TRAC:X:COUP ON`
`:DISP:EVM:WIND7:TRAC:X:COUP?`

Couplings When this parameter is set to On, pressing the front-panel Restart key activates the scale coupling function, that automatically determines scale per division and reference values based on the measurement results. When you set a value to either Scale/Div or Ref Value manually, Auto Scaling is automatically set to Off

Preset `ON`

State Saved Saved in instrument state

Range `On|Off`

Backwards `:DISPlay:EVM:VIEW10:WINDow1:TRACe:X[:SCALe]:COUPLe 0 | 1 | OFF | ON`

Compatibility `:DISPlay:EVM:VIEW10:WINDow1:TRACe:X[:SCALe]:COUPLe?`
 SCPI

3.6.9.3 Recording

Displays the Sample Rate, Sample Points and Sample Time of the saved IQ data file.

Recording and playback of signal data files is a multi-step process that involves controls in several menus:
