Executes a Trace Copy based on the **"From Trace" on page 1752** and **"To Trace" on page 1752** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode): <code>:TRACe:COPIY TRACE1 ... TRACE6, TRACE1 ... TRACE6</code> For all other measurements: <code>:TRACe:<meas>:COPIY TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code> where <meas> is the identifier for the current measurement Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement
Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On <code>:TRAC:COPIY TRACE1,TRACE3</code>
Notes	The command is of the form: <code>:TRACe:COPIY <source_trace>,<dest_trace></code>
Dependencies	When Signal ID is on, this key is grayed-out

Couplings	The destination trace is put in View (Update = Off, Display = On) after the copy
Preset	For Swept SA Measurement (in SA Mode): <code>TRACE1, TRACE2</code> For all other measurements: <code>TRACe1, TRACe2</code>

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1752 and "To Trace" on page 1752 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code> For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code> where <code><meas></code> is the identifier for the current measurement Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement
Example	Exchange Trace 1 and Trace 2 and put both traces in Update= OFF , Display= ON : <code>:TRAC:EXCH TRACE1,TRACE2</code>
Notes	The command is of the form: <code>:TRACe:EXCHange <trace_1>,<trace_2></code>
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	<code>:TRACe[:<meas>]:PRESet:ALL</code>
Example	<code>:TRAC:PREs:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces

in **Min Hold**, in which case it loads **maxtracevalue**, even if **Update = OFF**.

Remote Command	:TRACe[<meas>]:CLEAr:ALL
Example	:TRAC:CLE:ALL
Dependencies	When Signal ID is on, this key is grayed-out

3.5.15.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime
Example	Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?
Dependencies	In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled
Preset	TRACe1
State Saved	No
Range	Trace 1 Trace 2 Trace 3

3.6 Power Stat CCDF Measurement

Many modern digitally-modulated signals look noise-like in the time and frequency domain, requiring statistical measurement of these signals for meaningful characterization and differentiation. The **Power Statistics Complementary Cumulative Distribution Function (CCDF)** measurement displays curves to characterize the higher-level power statistics of digitally modulated signals. The curves can be useful in determining design parameters for digital communications systems.

The Power Statistics CCDF measurement displays probability on the Y-Axis and amplitude on the X-axis, for a display of the statistical amplitude distribution of a signal. This distribution can be affected by many factors. For example, modulation filtering, modulation format, combining the multiple signals at different frequencies, number of active codes, and correlation between symbols on different codes with spread spectrum systems will all affect measurement results. These factors are all related to modulation and signal parameters. External factors such as signal compression and expansion by nonlinear components, group delay distortion from filtering, and power control within the observation interval also affect the measurement.

The power measured in power statistics CCDF curves is actually instantaneous envelope power defined by the equation:

$$P = (I^2 + Q^2) / Z_0$$

where I & Q are the quadrature voltage components of the waveform, and Z_0 is the characteristic impedance.

A CCDF curve is defined by how much time the waveform spends at or above a given power level. The percent of time the signal spends at or above the level defines the probability for that particular power level. For capturing a lower probability down to 0.0001%, this measurement is made in the single mode by pressing Single. To make the power statistics CCDF measurement, the instrument uses digital signal processing (DSP) to sample the input signal in the channel bandwidth. The Gaussian distribution line as the band-limited Gaussian noise CCDF reference line, the user-definable reference trace, and the currently measured trace can be displayed on a semi-log graph. If the currently measured trace is above the user reference trace, it means that the higher peak power levels against the average power are included in the input signal.

Power Stat CCDF Measurement Commands

The general functionality of ["CONFigure" on page 2753](#), ["INITiate" on page 2754](#), ["FETCh" on page 2754](#), ["MEASure" on page 2756](#), and ["READ" on page 2755](#) are described in the section **SCPI Operation and Results Query** in the topic

Programming the Instrument.

The following measurement commands and queries are used to configure the measurement:

<code>:INITiate:PSTatistic</code>	Initiates a trigger cycle for the PST measurement, but does not return any data. You must then use <code>:FETC:PST[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings Returns the long form name of current measurement, in this case, PSTatistic
<code>:CONFigure:PSTatistic</code>	Selects PST measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1209
<code>:CONFigure:PSTatistic:NDEFault</code>	Selects PST measurement <i>without</i> affecting settings

The following queries are used to retrieve the results:

<code>:FETCh:PSTatistic?</code>	Retrieves the data specified by n
<code>:MEASure:PSTatistic[n]?</code>	Switches to PST measurement, restores default values, starts the measurement, then retrieves the data specified by n
<code>:READ:PSTatistic[n]?</code>	Starts the measurement, then retrieves the data specified by n

Measurement Results for Power Stat CCDF

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value **n**.

n	Results Returned																								
0	Returns unprocessed I/Q trace data, as a series of trace point values, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values																								
1, or not specified	Returns 11 scalar results: <table border="1" data-bbox="357 1396 1404 1755"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit, if any</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Average input power</td> <td>dBm</td> </tr> <tr> <td>2</td> <td>Probability at the average input power level</td> <td>%</td> </tr> <tr> <td>3</td> <td>Power level that has 10 % of the power</td> <td></td> </tr> <tr> <td>4</td> <td>Power level that has 1 % of the power</td> <td></td> </tr> <tr> <td>5</td> <td>Power level that has 0.1 % of the power</td> <td></td> </tr> <tr> <td>6</td> <td>Power level that has 0.01 % of the power</td> <td></td> </tr> <tr> <td>7</td> <td>Power level that has 0.001 % of the power</td> <td></td> </tr> </tbody> </table>	#	Item	Unit, if any	1	Average input power	dBm	2	Probability at the average input power level	%	3	Power level that has 10 % of the power		4	Power level that has 1 % of the power		5	Power level that has 0.1 % of the power		6	Power level that has 0.01 % of the power		7	Power level that has 0.001 % of the power	
#	Item	Unit, if any																							
1	Average input power	dBm																							
2	Probability at the average input power level	%																							
3	Power level that has 10 % of the power																								
4	Power level that has 1 % of the power																								
5	Power level that has 0.1 % of the power																								
6	Power level that has 0.01 % of the power																								
7	Power level that has 0.001 % of the power																								

Results Returned			
#	Item	Unit, if any	
8	Power level that has 0.0001 % of the power		
9	Peak power	dB	
10	Count		
11	Power level that has 0.00001% of the power if "Minimum Probability" on page 1138 is PP7 (0.00001 %) This value is returned only when PP7 is selected		
2	<p>Returns a series of 5001 floating point numbers (in percent) that represent the current measured power stat trace. This is the probability at particular power levels (average power), in the following order:</p> <ol style="list-style-type: none"> 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power <p>...</p> <ol style="list-style-type: none"> 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power 		
3	<p>Returns a series of 5001 floating point numbers (in percent) that represent the Gaussian trace. This is the probability at particular power levels (average power), in the following order:</p> <ol style="list-style-type: none"> 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power <p>...</p> <ol style="list-style-type: none"> 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power 		
4	<p>Returns a series of 5001 floating point numbers (in percent) that represent the user-definable reference trace. This is the probability at particular power levels (average power), in the following order:</p> <ol style="list-style-type: none"> 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power <p>...</p> <ol style="list-style-type: none"> 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power 		

3.6.1 Views

In the **LTEATDD** and **5GNR** Modes, this measurement has two views: "**Normal**" on page 1134 and **Slot**. In all other Modes, there is only a single view (**Normal**).

3 Spectrum Analyzer Mode
3.6 Power Stat CCDF Measurement

These are multiple-window Views. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

3.6.1.1 Normal

Windows: ["Metrics" on page 1135](#), ["Graph" on page 1134](#)

The Power Stat CCDF measurement provides CCDF curves and power statistics metrics. This is common for both Uplink (MS) and Downlink (BTS).

Example `:PST:SLTV OFF`

3.6.2 Windows

Three window types are defined:

1. ["Graph" on page 1134](#)
2. Slot
3. ["Metrics" on page 1135](#)

Slot only appears in LTEATDD and 5GNR Modes.

3.6.2.1 Graph

Displays Amplitude versus probability

3.6.2.2 Metrics

Displays the textual results of the Power Stat CCDF measurement.

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

For the list of $n = 1$ measurement results, see "[Measurement Results for Power Stat CCDF](#)" on page 1132 above.

Name	Unit	Corresponding Results	Results Item for $n = 1$	Explanation
Average Power	dBm	Average input power	1	99.99 dBm
Average Power	%	Probability at the average input power level	2	99.99 %
10.0%	dB	Power level that has 10 % of the power	3	99.99 dB
1.0%	dB	Power level that has 1 % of the power	4	99.99 dB
0.1%	dB	Power level that has 0.1 % of the power	5	99.99 dB
0.01%	dB	Power level that has 0.01 % of the power	6	99.99 dB
0.001%	dB	Power level that has 0.001 % of the power	7	99.99 dB

Name	Unit	Corresponding Results	Results Item for n = 1	Explanation
0.0001%	dB	Power level that has 0.0001 % of the power	8	99.99 dB
0.00001%	dB	Power level that has 0.00001% of the power if " Minimum Probability " on page 1138 is PP7 (0.00001 %)	11	99.99 dB
Peak	dB	Peak power	9	99.99 dB
Peak	dBm	Not available via remote commands	n/a	99.99 dBm

3.6.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.6.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns **Ref Level Offset** on or off. Setting a specific value turns **Ref Level Offset** ON.

For more on using offsets, see the Ref Level Offset control description for the Swept SA measurement.

Remote Command `:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet <rel_amp1>`
 `:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet?`

Example `:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7`
 `:DISP:WIND:TRAC:Y:RLEV:OFFS?`

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

	Sets the Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB will be assumed
Dependencies	Appears only in Spectrum Analyzer Mode
Preset	0 dBm
State Saved	Saved in instrument state
Min	The range for Ref Lvl Offset is variable. It is limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as "Ref Offset <value>" to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Auto Function

Remote Command	<code>:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet:STATe OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet:STATe?</code>
Example	Turn Ref Level Offset ON: <code>:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON</code>
Preset	OFF

Minimum Probability

Sets the minimum probability range.

Remote Command	<code>:CALCulate:PStatistic:RANGe[:PROBability]:MINimum PP2 ... PP7</code> For parameter values, see "Parameter Options" on page 1138 below <code>:CALCulate:PStatistic:RANGe[:PROBability]:MINimum?</code>
Example	<code>:CALC:PST:RANG:MIN PP6</code> <code>:CALC:PST:RANG:MIN?</code>
Preset	PP6
State Saved	Yes
Range	1 % 0.1 % 0.01 % 0.001 % 0.0001 % 0.00001 %

Parameter Options

Option	Value
PP2	1.0e-2 (1 %)
PP3	1.0e-3 (0.1 %)
PP4	1.0e-4 (0.01 %)
PP5	1.0e-5 (0.001 %)

Option	Value
PP6	1.0e-6 (0.0001 %)
PP7	1.0e-7 (0.00001 %)

3.6.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 1139
- See ["Single-Attenuator Configuration"](#) on page 1140

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_ampl></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1951 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:</p> <p>"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten</p> <p>For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 1144

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1960 See " Attenuator Configurations and Auto/Man " on page 1144 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1956 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below</p>

	7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB	
Preset	Auto	The Auto value is 10 dB
State Saved	Saved in instrument state	
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased	
Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
	Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB	
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p>	
	Auto Function	
Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO?</pre>	
Example	Turn Auto Mech Atten ON: <pre>:POW:ATT:AUTO ON</pre>	
Dependencies	:POW:ATT:AUTO is only available in measurements that support Auto , such as Swept SA	
Preset	ON	

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 1954, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 1142 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 1960 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 1146](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1981 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1982 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5G NR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p>
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator"

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

[Transition Rules" on page 1147](#)

Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1148](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1959](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set `Elec+Mech Atten`, in which case both attenuators participate in the autoranging, or `Elec Atten Only`, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 1150

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the <code>ON</code> parameter is supported and mapped to <code>COMBined</code>
Elec Atten Only	<code>ELECTrical</code>	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	<code>COMBined</code>	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code>

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

:POW:RANG:OPT:ATT?					
Notes	<p>The parameter option ELECTrical sets this function to ON in Single-Attenuator models</p> <p>The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query</p> <p>For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined</p>				
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed</p> <p>In instruments with Dual-Attenuator model, when "Elec Atten" on page 1960 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 1149 is grayed-out</p> <p>Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements</p> <p>Appears in the Waveform measurement in BASIC and 5G NR Modes</p>				
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC				
State Saved	Saved in instrument state				
Range	<table border="1"> <tr> <td>Dual-Attenuator models:</td> <td>Off Elec Atten Only Mech + Elec Atten</td> </tr> <tr> <td>Single-Attenuator models:</td> <td>Off On</td> </tr> </table>	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten	Single-Attenuator models:	Off On
Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten				
Single-Attenuator models:	Off On				

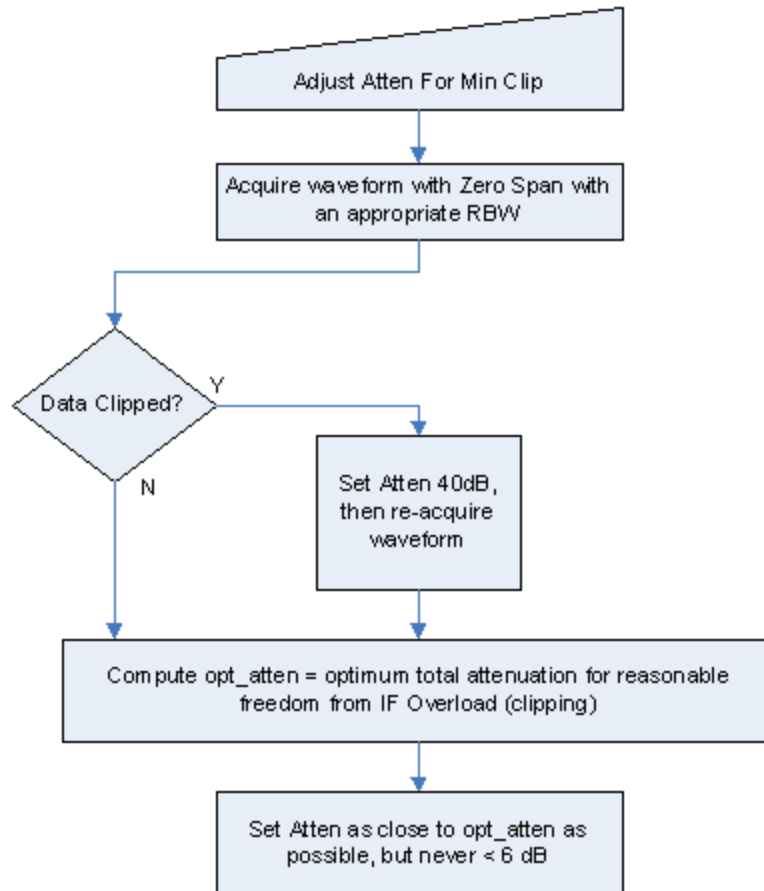

Backwards Compatibility Command

Notes	<p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p>
Backwards Compatibility SCPI	<p>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</p> <p>[:SENSe]:POWer[:RF]:RANGe:AUTO?</p>

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1149 selection is Mech + Elec Atten:

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 1149 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

	<code>[:SENSe] :POWer [:RF] :ATTenuation :STEP [:INCRement] ?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "[Max Mixer Lvl Rules](#)" on page 1969.

Remote Command	<code>[:SENSe] :POWer [:RF] :MIXer :RANGe [:UPPer] <real></code> <code>[:SENSe] :POWer [:RF] :MIXer :RANGe [:UPPer] ?</code>
Example	<code>:POW:MIX:RANG -15 dBm</code> <code>:POW:MIX:RANG?</code>
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Lets you optimize the Max Mixer Level setting for certain kinds of measurements.

NORMal	The historical, and thus backwards compatible, setting range (-50 to 0 dBm) and default setting (-10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression will be negligible
TOI	Allows a range of settings of the "Max Mixer Level" on page 1969, -50 to -10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, -25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
COMPression	Allows a range of settings of the Max Mixer Level, -10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, -3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	-10	-50	0
TOI	TOI-limited dynamic range	-25	-50	-10
COMPression	Compression-limited dynamic range	-3	-10	+30

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal TOI COMPression</code> <code>[:SENSe]:POWer[:RF]:MIXer:RULEs?</code>
Example	<code>:POW:MIX:RULE:COMP</code>
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	NORM

3.6.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases,

replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe] :VOLTage:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe] :VOLTage:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT:IQ:RANG:AUTO OFF</code> <code>:VOLT:IQ:RANG:AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to Y_{Max}
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#"

This is an alternate form of the command to match the **POWer** form of the I Range and Q Range SCPI.

Remote Command	<code>[:SENSe]:POWer:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code> <code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When "Q Same as I" on page 1974 is On, the I Range value will be copied to "Q Range" on page 1973 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

3 Spectrum Analyzer Mode
3.6 Power Stat CCDF Measurement

This is an alternate form of the command to allow entry as a power.

Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <amp;l></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω , and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω : 10, 4, -2, -8 75 Ω : 8.2, 2.2, -3.8, -9.8 600 Ω : -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "**I Range**" on page 1972 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1972 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1974 is On, the " I Range " on page 1972 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state

Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	<p>The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#"</p> <p>The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples:</p> <p>"Rng: 1 V Peak" the Q Range is 1 V Peak</p> <p>"Rng: 1 V, 0.5 V" the I Range is 1 V Peak and the Q Range is 0.5 V Peak</p> <p>This is an alternate form of the command to allow entry as a power.</p>
Remote Command	<pre>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;1> [:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</pre>
Example	<p>Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω:</p> <pre>:POW:IQ:Q:RANG 4 dBm :POW:IQ:Q:RANG?</pre>
Notes	<p>The POWER form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command</p> <p>The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:</p> <p>50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9</p>
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Remote Command	<code>[:SENSe]:VOLTage POWer:IQ:MIRROred OFF ON 0 1</code> <code>[:SENSe]:VOLTage POWer:IQ:MIRROred?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the "I Range" on page 1972 value is mirrored (copied) to the "Q Range" on page 1973
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.6.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:PARatio <real> [:SENSe]:POWer[:RF]:RANGe:PARatio?	
Example	:POW:RANG:PAR 12 dB	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.6.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1992 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "**Preselector Adjust**" on page 1979 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "**Proper Preselector Operation**" on page 1164.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1979
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "**Presel Center**" on page 1978 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz

State Saved	The Preselector Adjust value set by " Presel Center " on page 1978, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns <code>MWAVE</code>
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTernal</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1981. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "Internal Preamp" on page 1981, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 1168

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and Internal Preamp. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1173
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1175
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1176

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>														
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>														
Notes	<p>When "Presel Center" on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>

Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

3 Spectrum Analyzer Mode

3.6 Power Stat CCDF Measurement

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μ W Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

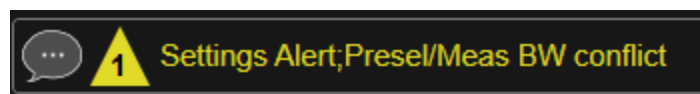

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code>	
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>	
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is “Unavailable unless SW Presel enabled”	
Preset	N9041B	ADVanced
	N9042B+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMal NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMal N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1182 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF

3.6.4 BW

Opens the Bandwidth (**BW**) menu, which contains the Info BW control.

3.6.4.1 Settings

Contains basic bandwidth functions. It is the only tab under **BW**.

Info BW

Allows you to enter a frequency value to set the channel bandwidth that will be used for data acquisition. When in **Auto**, it is set to the value that covers carriers set by carrier configuration.

Remote `[:SENSe]:PStatistic:BAWdth <freq>`

Command	<code>[:SENSe]:PStatistic:BAWdwidth?</code>
Example	<code>:PST:BAWd 8 MHz</code> <code>:PST:BAWd?</code>
Notes	Auto/Man is available only for 5G NR, LTE, LTE-TDD, LTE-AFDD, LTE-A TDD
Preset	Depends on Mode and installed Options. See "Preset Values" on page 1183 below
State Saved	Saved in instrument state
Min	10 kHz
Max	Hardware-dependent: RF Input - No Option = 10 MHz - WB (25 MHz or wider) = Hardware Option Limit I/Q Input (for I+jQ) - No Option = 20 MHz - Option B25 = 50 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:BWIDth</code>

Auto Function

Remote Command	<code>[:SENSe]:PStatistic:BAWdwidth:AUTO ON OFF 1 0</code> <code>[:SENSe]:PStatistic:BAWdwidth:AUTO</code>

3.6.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.6.5.1 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See ["Views" on page 1133](#).

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command `:DISPlay:VIEW:ADVanced:SElect <alphanumeric>`

	<code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <p><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></p> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with <code>:DISP:VIEW:ADV:SEL</code></p> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <p><code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code></p> <p><code>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</code></p> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node <code>:DISPlay:VIEW[:SElect]</code> is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code>

	Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> already exists” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example:</p> <p><code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p>

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2004), then query the list of available Views, the result is undefined

3.6.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	<code>ON</code>
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the <code>WINDow</code> , <code>TRACe</code> and <code>GRID</code> parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	ON

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPlay:VIEW:ADVanced:SElect</code>
Rename User View	<code>:DISPlay:VIEW:ADVanced:REName</code>
Delete User View	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Create User View	<code>:DISPlay:VIEW:ADVanced:NAME</code>

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Name	Command
Select Screen	:INSTRUMENT:SCREEN:SElect
Delete Screen	:INSTRUMENT:SCREEN:DElete
Delete All But This Screen	:INSTRUMENT:SCREEN:DElete:ALL
Add Screen	:INSTRUMENT:SCREEN:CREate
Rename Screen	:INSTRUMENT:SCREEN:REName
Sequencer On/Off	:SYSTEM:SEQuencer

Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTEM:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.6.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, **Center Frequency** is the same for all measurements – it does not change as you change measurements.

3.6.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set the center frequency for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input, **Center Frequency** will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

- ["Center Frequency Presets" on page 1194](#)
- ["VXT Models with Radio Heads/CIU Frequency Range" on page 1196](#)
- ["RF Center Freq" on page 1196](#)
- ["Ext Mix Center Freq" on page 1197](#)
- ["I/Q Center Freq" on page 1198](#)

Remote Command	<code>[:SENSe]:FREQuency:CENTer <freq></code> <code>[:SENSe]:FREQuency:CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of CF Step : <code>:FREQ:CENT UP</code> Return the current value of Center Frequency: <code>:FREQ:CENT?</code>
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF:CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code>

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

– For External Mixer it is equivalent to **:FREQ:EMIX:CENT**

Preset and Max values are dependent on Hardware Options
 If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated

Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1194, "RF Center Freq" on page 1196, "Ext Mix Center Freq" on page 1197, "I/Q Center Freq" on page 1198, and "VXT Models with Radio Heads/CIU Frequency Range" on page 1196
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1194, "RF Center Freq" on page 1196, "I/Q Center Freq" on page 1198, and "VXT Models with Radio Heads/CIU Frequency Range" on page 1196
Status Bits/OPC dependencies	Non-overlapped

The following command and parameters apply only to MSR, LTE-Advanced FDD/TDD and 5G NR Modes.

Remote Command	[:SENSe] :FREQuency :CENTer :AUTO ON OFF 1 0 [:SENSe] :FREQuency :CENTer :AUTO?
Example	:FREQ:CENT:AUTO OFF :FREQ:CENT:AUTO?
Dependencies	Only available for the Monitor Spectrum, Power Stat CCDF and IQ waveform measurements in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Couplings	When Center Frequency changes, state automatically changes to Manual (OFF) Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled. When Carrier Reference Frequency changes:

Center Frequency	Relationship
Auto	Center Frequency = Carrier Reference Frequency + Center Frequency Offset (fixed)
Man	Center Frequency (fixed) = Carrier Reference Frequency + Center Frequency Offset

Preset	ON
State Saved	Saved in instrument state
Range	Auto Man

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Lets you specify the RF Center Frequency. Sets the Center Frequency to use when the RF input is selected, even if the RF input is not selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command `[:SENSe]:FREQuency:RF:CENTer <freq>`

	<code>[:SENSe] :FREQuency :RF :CENTer ?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be > 3.6 GHz fails and results in an advisory message If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See "Center Frequency Presets" on page 1194
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See "Center Frequency Presets" on page 1194 . Basically, instrument maximum frequency - 5 Hz

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the Center Frequency to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :EMIXer :CENTer <freq></code> <code>[:SENSe] :FREQuency :EMIXer :CENTer ?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having switched to one of the other inputs (for example, RF), you will come back into the settings that you had when you left External Mixing. So, you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after **Restore Input/Output Defaults**, if you go to External Mixing and do a **Mode Preset** while in Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz

State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQuency :IQ :CENTer ?</code>
Example	<code>:FREQ :IQ :CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	-/+40.049995 MHz

CF Step

Changes the step size for the "**Center Frequency**" on page 1193 and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code>
Example	Increase the current center frequency value by 500 MHz: <code>:FREQ :CENT :STEP 500 MHz</code> <code>:FREQ :CENT UP</code> <code>:FREQ :CENT :STEP ?</code>

Notes	Preset and Max values are depending on Hardware Options
Dependencies	<i>Not</i> available in the MSR, LTEAFDD, LTEATDD, 5GNR, and Channel Quality Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-Arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min/Max	-/+ (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped
Auto Function	
Remote Command	<code>[:SENSe] :FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO?</code>
Example	<code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Preset	ON

Freq Offset

Enables you to set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a Mode Preset or set the frequency offset to 0 Hz.

See "[More Information](#)" on page 1200.

Remote Command	<code>[:SENSe] :FREQuency:OFFSet <freq></code> <code>[:SENSe] :FREQuency:OFFSet?</code>
Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values are dependent on Hardware Options
Dependencies	Appears only in Spectrum Analyzer Mode Not available in External Mixing. In this case the Freq Offset control is grayed-out and displays a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input

3 Spectrum Analyzer Mode
3.6 Power Stat CCDF Measurement

Preset	See "Center Frequency Presets" on page 1194
State Saved	Saved in instrument state
Min/Max	-/+500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:X[:SCALe]:OFFSet</code> For compatibility across platforms only. Not recommended for new development

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE

If a trace is exported with a nonzero **Freq Offset**, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want **Freq Offset** to be 0, or the offset would be applied again to data which is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.

3.6.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed at the center of the screen on the trace determined by the Marker Trace rules.

3.6.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the Marker menu, and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.6.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Position/Normal**, **Delta** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker X-Axis Value

Sets the marker X-Axis value in the current marker X-Axis Scale unit. This function has no effect if the control mode is **Off**, but is the remote command equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:X <rel_amp1></code> <code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:PST:MARK3:X 0</code> <code>:CALC:PST:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X-Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time . If the marker is Off the response is Not A Number
Preset	After a preset, all Markers are turned OFF , so Marker X-Axis Value query returns Not a Number (NAN)
State Saved	No
Min/Max	-/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker Y Axis Value (Remote Command Only)

Queries the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	:CALCulate:PStatistic:MARKer[1] 2 ... 12:Y?
Example	:CALC:PST:MARK11:Y?
Notes	Returns the marker Y-Axis result, if the control mode is Normal , or Delta . If the marker is Off , the response is <i>Not a Number</i>
Preset	0
State Saved	No
Backwards Compatibility SCPI	:CALCulate:PStatistic:MARKer[1] 2 ... 12:FUNCTION:RESult?

Marker Mode

Sets the marker control mode to **Normal (POSITION)**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **Off**, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

Remote Command	:CALCulate:PStatistic:MARKer[1] 2 ... 12:MODE POSition DELTa OFF :CALCulate:PStatistic:MARKer[1] 2 ... 12:MODE?
Example	:CALC:PST:MARK:MODE POS :CALC:PST:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELTa OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it into **Normal** mode and places it at the center of the screen.

Example	:CALC:PST:MARK3:STAT 1 :CALC:PST:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	:CALCulate:PStatistic:MARKer[1] 2 ... 12:STATe OFF ON 0 1 :CALCulate:PStatistic:MARKer[1] 2 ... 12:STATe?

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing **Delta** in "**Marker Mode**" on page 1202. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:PStatistic:MARKer:AOff
Example	:CALC:PST:MARK:AOff

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **Off**. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental x-axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off screen.

Remote Command	:CALCulate:PStatistic:MARKer:COUple[:STATe] ON OFF 1 0 :CALCulate:PStatistic:MARKer:COUple[:STATe]?
Example	:CALC:PST:MARK:COUP ON

	<code>:CALC:PST:MARK:COUP?</code>
Preset	OFF Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.6.7.3 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker X-Axis Value

This is the fundamental control that you use to move a marker around on the trace. This is the same as "[Marker X-Axis Value](#)" on page 1201 in **Settings**.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:REference <integer></code> <code>:CALCulate:PStatistic:MARKer[1] 2 ... 12:REference?</code>
Example	<code>:CALC:PST:MARK:REF 3</code> <code>:CALC:PST:MARK:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried, a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Fixed or Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off, All Markers Off, or Preset

State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Assigns the specified marker to the designated trace. The trace choices are:

- MEASured
- GAUSSian
- REFerence

Remote Command	:CALCulate:PStatistic:MARKer[1] 2 ... 12:TRACe MEASured GAUSSian REFerence
Example	:CALC:PST:MARK3:TRAC MEAS :CALC:PST:MARK:TRACE?
Preset	MEASured
State Saved	Yes
Range	MEASured GAUSSian REFerence

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as "[Marker Settings Diagram](#)" on page 1203 in **Settings**.

3.6.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.6.8.1 Settings

Contains frequently used functions to which you will want the fastest access.

Counts

Sets the accumulated number of sampling points for data acquisition. The range is 1.000 kpt (k point) to 2.00000 Gpt (G point) with 1 kpt resolution.

Remote Command	<code>[:SENSe]:PStatistic:COUNTs <integer></code> <code>[:SENSe]:PStatistic:COUNTs?</code>
Example	<code>:PST:COUN 5001</code> <code>:PST:COUN?</code>
Couplings	Coupled to " Meas Cycles " on page 1206, by: Counts = Meas Cycles * SamplingFrequency * "Meas Interval" on page 1206
Preset	10000000
State Saved	Saved in instrument state
Min/Max	1000/2000000000

Meas Cycles

Set the number of measurement cycles to calculate power statistic data. This number is coupled to "[Counts](#)" on page 1206, by:

$$\text{Meas Cycles} = \text{Counts} / (\text{Sampling Frequency} * \text{Meas Interval})$$

When the **Counts** value cannot be divided by (**Sampling Frequency** * "[Meas Interval](#)" on page 1206), this value is displayed as a decimal fraction.

Remote Command	<code>[:SENSe]:PStatistic:SWEp:CYCLes <real></code> <code>[:SENSe]:PStatistic:SWEp:CYCLes?</code>
Example	<code>:PST:SWE:CYCL 1001</code> <code>:PST:SWE:CYCL?</code>
Preset	Depends on the sampling frequency
Min	0.001
Max	Depends on the sampling frequency

Meas Interval

Sets the number of data points to be used as the measurement interval. This value couples to "[Counts](#)" on page 1206, as:

$$\text{Meas Interval} = \text{Counts} / (\text{"[Meas Cycles](#)" on page 1206} * \text{Sampling Frequency})$$

Remote Command	<code>[:SENSe]:PStatistic:SWEp:TIME <time></code>
----------------	--

Command	<code>[:SENSe]:PStatistic:SWEep:TIME?</code>
Example	<code>:PST:SWE:TIME 2 ms</code> <code>:PST:SWE:TIME?</code>
Preset	1.0 ms !unless noted below LTEATDD, 5G NR: 500 us
Min/Max	50.0 us/10.0 ms !unless noted below LTEATDD, 5G NR: 1 us/10.0 ms

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1208 below.

Remote Command	<code>:COUPle ALL</code>
Example	<code>:COUP ALL</code>
Backwards Compatibility SCPI	<code>:COUPLE ALL NONE</code>
Backwards Compatibility Notes	<code>:COUP:NONE</code> puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

3 Spectrum Analyzer Mode

3.6 Power Stat CCDF Measurement

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency

- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	<code>:CONFigure:PStatistic</code>
Example	<code>:CONF:PST</code>
Couplings	Selecting Meas Preset restores all measurement parameters to their default values

3.6.8.2 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	<code>[:SENSe]:RADio:STANdard[:SElect] NONE JSTD IS95a IS97D IS98D GSM W3GPP C2000MC1 C20001X NADC PDC BLUEtooth TETRa WL802DOT11A WL802DOT11B WL802DOT11G HIPERLAN2 DVBTLSN DVBTGPN DVBTIPN FCC15 SDMBSE UWBINDOOR LTEB1M4 LTEB3M LTEB5M LTEB10M LTEB15M LTEB20M WL11N20M WL11N40M WL11AC20M WL11AC40M WL11AC80M WL11AC160M WL11AX20M WL11AX40M WL11AX80M WL11AX160M WL11BE20M WL11BE40M WL11BE80M WL11BE160M WL11BE320M WL11AD2G WL11AY2G16 WL11AY4G32 WL11AY6G48 WL11AY8G64 NR5GFR1B100M</code> <code>[:SENSe]:RADio:STANdard[:SElect]?</code>
Example	<code>:RAD:STAN NONE</code> <code>:RAD:STAN?</code>
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

3 Spectrum Analyzer Mode
3.6 Power Stat CCDF Measurement

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	<code>[:SENSe]:RADio:STANdard:DEVIce BTS MS</code> <code>[:SENSe]:RADio:STANdard:DEVIce?</code>
Example	<code>:RAD:STAN:DEV MS</code> <code>:RAD:STAN:DEV?</code>
Preset	<code>BTS</code>
State Saved	Saved in instrument state
Range	<code>BTS MS</code>

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

	Swept SA	CHP	OBW	ACP	CCDF	Burst Power	Spurious Emission	SEM	List Sweep

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP W-CDMA	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 1.4 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
	RBW	Auto rules
3GPP LTE 5 MHz	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
	Span	7.5 MHz
	RBW	Auto rules
3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.6 Power Stat CCDF Measurement

3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules

PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN? Query always returns IS97D
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	<code>[:SENSe]:RADio:STANdard:BAND:CLASs BC0 BC1</code> <code>[:SENSe]:RADio:STANdard:BAND:CLASs?</code>
Example	<code>:RAD:STAN:BAND:CLAS BC0</code> <code>:RAD:STAN:BAND:CLAS?</code>
Preset	<code>BC0</code>
State Saved	Saved in instrument state
Range	0 (800 MHz Band) 1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.6 Power Stat CCDF Measurement

WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11b	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 40 MHz	Command Example	:RAD:STAN WL11N40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 20 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 80 MHz	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.6 Power Stat CCDF Measurement

WLAN 802.11be 80 MHz	Command Example	:RAD:STAN WL11BE80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 160 MHz	Command Example	:RAD:STAN WL11BE160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 320 MHz	Command Example	:RAD:STAN WL11BE320M
	IBW	320 MHz
	Span	480 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ad 2 GHz	Command Example	:RAD:STAN WL11AD2G
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 2.16 GHz	Command Example	:RAD:STAN WL11AY2G16
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 4.32 GHz	Command Example	:RAD:STAN WL11AY4G32
	IBW	4.32 GHz
	Span	6.48 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 6.48 GHz	Command Example	:RAD:STAN WL11AY6G48
	IBW	6.48 GHz
	Span	9.72 GHz
	RBW	1 MHz
	VBW	Auto rules

WLAN 802.11ay 8.64 GHz	Command Example	:RAD:STAN WL11AY8G64
	IBW	8.64 GHz
	Span	12.96 GHz
	RBW	1 MHz
	VBW	Auto rules
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
5G NR FR1 100MHz	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is **NONE**, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as **:CONF** allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to **NONE**.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to **NO**, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to **YES**, all measurements and standard selections are enabled, so you can select any combination.

NOTE

If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	[:SENSe]:RADio:STANdard:EAMeas YES NO [:SENSe]:RADio:STANdard:EAMeas?
Example	:RAD:STAN:EAM YES :RAD:STAN:EAM?
Preset	NO
State Saved	Saved in instrument state
Range	YES NO

3.6.8.3 Advanced

Contains controls for setting advanced functions of the instrument.

IF Gain

Used to set the IF Gain function to: Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Only applies to the RF input. Does not apply to baseband I/Q input.

Remote Command	<code>[:SENSe]:PStatistic:IF:GAIN[:STATe] ON OFF 1 0</code> <code>[:SENSe]:PStatistic:IF:GAIN[:STATe]?</code>
Example	<code>:PST:IF:GAIN ON</code> <code>:PST:IF:GAIN?</code>
Notes	ON = high gain OFF = low gain
Dependencies	Not available when IQ Input is selected Has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control Not available in VXT, EXM, or UXM
Couplings	Sending this command forces IF Gain Auto to OFF (Man)
Preset	OFF
State Saved	Saved in instrument state
Range	Low Gain High Gain
Auto Function	
Remote Command	<code>[:SENSe]:PStatistic:IF:GAIN:AUTO[:STATe] ON OFF 1 0</code> <code>[:SENSe]:PStatistic:IF:GAIN:AUTO[:STATe]?</code>
Example	<code>:PST:IF:GAIN:AUTO ON</code> <code>:PST:IF:GAIN:AUTO?</code>
Couplings	Auto sets IF Gain to High Gain if the input attenuator is set to 0 dB, or the preamp is turned on, or the Max Mixer Level is -20 dBm or lower For other conditions, Auto sets IF Gain to Low Gain
Preset	OFF

IF Upsampling Ratio

Allows you to select the upsampling ratio after data is captured for a measurement. Using this method, mitigation of peak detection error can be expected when upsampling ratio is set to > x1.

Remote Command	<code>[:SENSe]:PStatistic:URATio X1 X2 X4 X8 X16 X32</code>
----------------	--

	<code>[:SENSe]:PStatistic:URATio?</code>
Example	<code>:PST:URAT X8</code> <code>:PST:URAT?</code>
Notes	X1 is for backwards compatibility
Preset	<code>X1</code>
State Saved	Yes, Saved in instrument state
Range	<code>X1 X2 X4 X8 X16 X32</code>

3.6.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "[Restore Defaults](#)" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote	<code>:INSTrument:COUPlE:FREQuency:CENTer ALL NONE</code>
Command	<code>:INSTrument:COUPlE:FREQuency:CENTer?</code>

Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATe]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTrument:COUPle:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Global Limit Lines (Freq and Amptd)

When this control is set to **ALL**, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global Settings**, while **Global Limit Lines** is **ALL**, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to **NONE**, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is **ALL**, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to **NONE** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:LLINe ALL NONE :INSTrument:COUPle:LLINe?
Example	:INST:COUP:LLIN ALL NONE :INST:COUP:LLIN?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:FREQuency:BAND:EXTend 0 1 ON OFF :INSTrument:COUPle:FREQuency:BAND:EXTend?
Example	:INST:COUP:FREQ:BAND:EXT 1 :INST:COUP:FREQ:BAND:EXT?
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global settings** menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTrument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.6.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.6.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1229

Remote Command	:INITiate:CONTinuous OFF ON 0 1 :INITiate:CONTinuous?
Example	Put instrument into Single measurement operation: :INIT:CONT 0 :INIT:CONT OFF Put instrument into Continuous measurement operation: :INIT:CONT 1 :INIT:CONT ON
Preset	ON Note that :SYST:PRES sets :INIT:CONT to ON, but *RST sets :INIT:CONT to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: - A line with an arrow is Single

-
- A loop with an arrow is **Continuous**

Backwards
Compatibility
Notes

X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and **INIT:CONT ON**) switched to continuous measurement, but never restarted a measurement and never reset a sweep

X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 2039 for details of **:INIT:IMMediate**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a

trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending **:INIT:IMM**
- Sending **:INIT:REST**

See "[More Information](#)" on page 1231

Remote Command	:INITiate[:IMMEDIATE] :INITiate:REStart
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATus:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATus:QUESTionable register bit 9 (INTEgrity sum) is cleared The SWEEPING bit is set The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in

application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command **:INITiate:PAUSE**
 :INITiate:RESume

Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORT</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (INTEGRITY sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORT</code> , the Abort command will cause the <code>*OPC</code> query to return true

3.6.9.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Scale/Div

Enables you to enter a time value to change the horizontal scale.

3 Spectrum Analyzer Mode
 3.6 Power Stat CCDF Measurement

Remote Command	<code>:DISPlay:PStatistic:VIEW[1]:WINDow2:TRACe:X[:SCALE]:PDIVision <rel_ampl></code> <code>:DISPlay:PStatistic:VIEW[1]:WINDow2:TRACe:X[:SCALE]:PDIVision?</code>
Example	<code>:DISP:PST:VIEW:WIND2:TRAC:X:PDIV 10</code> <code>:DISP:PST:VIEW:WIND2:TRAC:X:PDIV?</code>
Notes	The CCDF measurement has the trace display only in Window 2, because values other than "2" are <i>not</i> available as the sub-op code
Preset	2.00
State Saved	Saved in instrument state
Min	0.1
Max	20
Backwards Compatibility SCPI	<code>:DISPlay:PStatistic:XSCale</code>

3.6.10 Trace

Lets you control the display and storage of trace data for the available traces.

3.6.10.1 Trace Control

The controls on this tab allow you to select display of the Reference Trace and the Gaussian Line, and store the Reference Trace.

Store Ref Trace

Copies the currently measured curve as the user-definable reference trace. The captured data remains until the other mode is chosen. Pressing this key also refreshes the reference trace.

No query is available.

Remote Command	<code>:CALCulate:PStatistic:STORe:REFerence</code>
Example	<code>:CALC:PST:STOR:REF</code>
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:SRTRace</code>

Ref Trace

Toggles the reference trace display On or Off.

Remote Command	<code>:DISPlay:PStatistic:RTRace[:STATe] OFF ON 0 1</code> <code>:DISPlay:PStatistic:RTRace[:STATe]?</code>
Example	<code>:DISP:PST:RTR OFF</code> <code>:DISP:PST:RTR?</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:RTRace[:STATe]</code>

Gaussian Line

Toggles the Gaussian trace display On or Off.

Remote Command	<code>:DISPlay:PStatistic:GAUSSian[:STATe] OFF ON 0 1</code> <code>:DISPlay:PStatistic:GAUSSian[:STATe]?</code>
Example	<code>:DISP:PST:GAUS OFF</code> <code>:DISP:PST:GAUS?</code>
Preset	<code>ON</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>
Backwards Compatibility SCPI	<code>[:SENSe]:PStatistic:GAUSSian[:STATe]</code>

3.7 Burst Power Measurement

The Burst Power (Transmit Power) measurement (at the base transceiver station) is used to determine the power delivered to the antenna system on the radio-frequency channel under test. The Burst Power measurement verifies the accuracy of the mean transmitted RF carrier power. This can be done across the frequency range and at each power step.

Mobile stations and base transceiver stations must transmit enough power, with sufficient modulation accuracy, to maintain a call of acceptable quality without leaking power into frequency channels or timeslots allocated for others. The Burst Power measurement determines the average power for an RF signal burst at or above a specified threshold value or during the detected burst width. The threshold value may be absolute, or relative to the peak value of the signal. Burst width can be set automatically or manually.

Measurement Commands for Burst Power (Transmit Power)

NOTE

The **BPOWer** form of the commands is included for backwards compatibility only, and are not recommended for use in new designs. Use the **TXPower** keyword.

The following commands and queries are used to retrieve the measurement results:

```
:CONFigure:TXPower|BPOWer  
:CONFigure:TXPower|BPOWer:NDEFault  
:INITiate:TXPower|BPOWer  
:FETCh:TXPower|BPOWer[n]?  
:READ:TXPower|BPOWer[n]?  
:MEASure:TXPower|BPOWer[n]?
```

Remote Command Results for Burst Power (Transmit Power)

For the queries listed above, the results returned depend on the value of n, as follows.

n	Results Returned
0	Returns unprocessed I/Q trace data, as a series of comma-separated trace points, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values
not specified or 1	Returns the following comma-separated scalar results: <ol style="list-style-type: none">Sample time: A floating point number representing the time between samples when using the trace queries (n=0, 2, etc.)

n	Results Returned
2.	Power: The mean power (in dBm) of the power value that calculated by specified method: above the threshold or measured burst width. If averaging is on, the power is for the latest acquisition
3.	Power averaged: the power (in dBm) for N averages, if averaging is on. An average consists of N acquisitions of data which represents the current trace. If averaging is off, the value of Power averaged is the same as the Power value
4.	Number of samples: The number of data points in the captured signal. This number is useful when performing a query on the signal (i.e. when n=0, 2, etc.)
5.	Threshold value: The absolute threshold level (in dBm) above which the power is calculated when Meas Method is set to Above Threshold
6.	Threshold points: The number of points that were above the threshold and were used to calculate Mean Transmit Power when " Meas Method " on page 1323 is set to Above Threshold. If it is set to Measured Burst Width, Measured Pts is returned
7.	Maximum value: The maximum peak level of the most recently acquired trace data (in dBm)
8.	Minimum value: The minimum peak level of the most recently acquired trace data (in dBm)
9.	Full Burst width: The burst width of this signal regardless of the parameter value set for the current Measured width. The Burst width is determined by the Threshold Lvl when Meas Method is set to Measured Burst Width. If Meas Method is set to Above Threshold Lvl, this value is zero
10.	Measured width: The time length that is used to calculate Mean Transmit Power when " Meas Method " on page 1323 is set to Measured Burst Width. If it is set to Above Threshold, this value is zero
11.	Measured points: The number of points used to calculate Mean Transmit Power when Meas Method is set to Measured Burst Width. If Meas Method is set to Above Threshold, this value is 0
2	Returns comma-separated trace points of the Measure Trace data These data points are floating point numbers representing the power of the signal (in dBm). There are N data points, where N is the number of samples. The period between the samples is defined by the sample time
3	Returns comma-separated trace points of the Max Hold Trace data These data points are floating point numbers representing the power of the signal (in dBm). There are N data points, where N is the number of samples. The period between the samples is defined by the sample time
4	Returns comma-separated trace points of the Min Hold Trace data These data points are floating point numbers representing the power of the signal (in dBm). There are N data points, where N is the number of samples. The period between the samples is defined by the sample time

3.7.1 Views

The Burst Power measurement has one view, the ["Normal" on page 1294](#) View.

3.7.1.1 Normal

Windows: ["Graph" on page 1238](#), ["Metrics" on page 1240](#)

Dual window view of the graph and the metrics.

The **Normal** View is a multiple-window View. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

3.7.2 Windows

The Burst Power measurement has two windows: ["Graph" on page 1238](#) and ["Metrics" on page 1240](#).

3.7.2.1 Graph

This window appears in the ["Normal" on page 1294](#) view, as follows:

View	Size	Position
Normal	Two thirds, full width	Top

RF Envelope view

RF Envelope view with Bar Graph

The bar graph represents the measured portion of the trace. It is the blue bar in the second figure. Its state (On/Off) is controlled by ["Bar Graph On/Off" on page 1293](#) under **Display**.

RF Envelope window

Marker Operation	Yes
Corresponding Trace	Corrected measured trace (n=2,3,4)

3.7.2.2 Metrics

Displays the textual results.

Metrics window appears in the "Normal" on page 1294 view, as follows:

View	Size	Position
Normal	One Third, full width	Bottom

Name	Corresponding Results	Display Format
Output Power	n = 1 3 rd	99.99 dBm
Above Threshold or Measured Burst Width	Power Value above the threshold or measured burst width for N averages, if averaging is on. An average consists of N acquisitions of data which represents the current trace. If averaging is off, the value of power averaged is the same as the Mean Transmit Power of Current Data	
Full Burst Width	n = 1 9 th Burst width that is determined by the "Threshold Level" on page 1319	999.9 us
Measured Width	n = 1 10 th Time length that is used to calculate Mean Transmit Power when "Meas Method" on page 1323 is Measured Burst Width. If "Meas Method" on page 1323 is set to Above Threshold, disappear from the window	999.9 us
Above Threshold Pts	n = 1 6 th Number of points that were above the threshold level and were used for the power calculation when "Meas Method" on page 1323 is Above Threshold Level	9999
Measured Points	n = 1 6 th Number of points that were used for the power calculation when "Meas Method" on page 1323 is Measured Burst Width	9999
Abs Amplitude Threshold	n = 1 5 th Threshold value is the threshold (in dBm) above which the power is calculated	99.99 dBm
Rel Amplitude Threshold	Threshold (in dB) relative to the peak carrier level above which the power is calculated	99.99 dB
Output power (Current data)	n = 1 2 nd Power value above the threshold or measured burst width. If averaging is on, the power is for the latest acquisition	99.99 dBm

Name	Corresponding Results	Display Format
Max Point Power	n = 1 7 th Maximum peak level of the most recently acquired trace data	99.99 dBm
Min Point Power	n = 1 8 th Minimum peak level of the most recently acquired trace data	99.99 dBm

Metrics window when Meas Method is Above Threshold

Metrics		Abs Amplitude Threshold	-104.6 dBm
Output Power (Above Threshold Level)	-82.240 dBm	Rel Amplitude Threshold	-30.00 dB
Above Threshold Pts	3176	Current Data	
		Output Power	-82.355 dBm
		Max Point Power	-74.650 dBm
		Min Point Power	-116.97 dBm

Metrics window when Meas Method is Burst Width

Metrics		Abs Amplitude Threshold	-104.6 dBm
Output Power (Measured Burst Width)	-84.236 dBm	Rel Amplitude Threshold	-30.00 dB
Full Burst Width	107.8 us	Current Data	
Measured Width	107.8 us	Output Power	-82.160 dBm
Measured Points	539	Max Point Power	-74.650 dBm
		Min Point Power	-116.97 dBm

3.7.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.7.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 1249.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:TXP:WIND:TRAC:Y:RLEV 5dBm</code> <code>:DISP:TXP:WIND:TRAC:Y:RLEV?</code>
Couplings	When "Auto Scaling" on page 1249 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to Ref Value
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code>

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_amp1></code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:TXP:WIND:TRAC:Y:PDIV 10dB</code> <code>:DISP:TXP:WIND:TRAC:Y:PDIV?</code>
Couplings	When "Auto Scaling" on page 1249 is ON , this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to OFF
Preset	10.00 dB / Div
State Saved	Saved in instrument state

Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:PDIVision</code>

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace <code><meas></code> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALE]:RANGe <rel_amp></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALE]:RANGe?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in ["Amplitude Data Query and Y Axis Unit" on page 1246](#) below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see ["Transducer Unit" on page 1247](#) below.

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

Remote Command	<code>:UNIT:POWer DBM DBMV DBMA V W A DBUV DBUA DBPW DBUVM DBUAM DBPT DBG</code> <code>:UNIT:POWer?</code>
Example	<code>:UNIT:POW dBmV</code> <code>:UNIT:POW?</code> See also " Remote Interface Examples " on page 1245 below
Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and dBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: <ul style="list-style-type: none"> - The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out - If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the Trace, Normalize menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	<code>:UNIT:POW DBM</code>	Y Axis Unit is set to dBm
dBmV	<code>:UNIT:POW DBMV</code>	Y Axis Unit is set to dBmV
dBmA	<code>:UNIT:POW DBMA</code>	Y Axis Unit is set to dBmA
W	<code>:UNIT:POW W</code>	Y Axis Unit is set to W
V	<code>:UNIT:POW V</code>	Y Axis Unit is set to V
A	<code>:UNIT:POW A</code>	Y Axis Unit is set to A
dBmV	<code>:UNIT:POW DBUV</code>	Y Axis Unit is set to dBmV
dBmA	<code>:UNIT:POW DBUA</code>	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	<code>:UNIT:POW DBPW</code>	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 1247 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If <code>:CORR:CSET:ANT?</code> returns NO C (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA , you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1247
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1247
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1247
DBG (Transducer Unit)	:UNIT:POW DBG	Sets the amplitude unit for the selected amplitude scale (log/lin) to DBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1247
dBmA	:UNIT:POW	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

Unit	Example	Notes
(Transducer Unit)	DBUA	<p>selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None</p> <p>See "Transducer Unit" on page 1247</p> <p>The unit dBuA can also appear as a normal Y Axis Unit (see above)</p> <p>dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit</p> <p>When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If <code>:CORR:CSET:ANT?</code> returns <code>NOC</code> (for No Conversion), you are using a normal Y-Axis dBuA. If it returns <code>UA</code>, you are using a Transducer Unit dBuA</p>

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE

The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.

Transducer Unit

Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though **DBUV** had been sent as the terminator.

When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:

And on the control it looks like this:

NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
DBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns **Ref Level Offset** on or off. Setting a value for **Ref Level Offset** turns it **ON**.

Remote Command `:DISP:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_amp1>`
`:DISP:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?`
`:DISP:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF | ON | 0 | 1`
`:DISP:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?`

Example `:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7`
`:DISP:WIND:TRAC:Y:RLEV:OFFS?`

Sets **Ref Level Offset** to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB will be assumed
`:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON`

	Turns Ref Level Offset On
Dependencies	Only in Spectrum Analyzer Mode
Preset	0 dBm OFF
State Saved	Saved in instrument state
Min	The range for Ref Lvl Offset is variable. It is limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTom</code> <code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?</code>
Example	<code>:DISP:TXP:WIND:TRAC:Y:RPOS CENT</code> <code>:DISP:TXP:WIND:TRAC:Y:RPOS?</code>
Preset	TOP
State Saved	Saved in instrument state
Range	TOP CENTer BOTTom
Annotation	Greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition</code>

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:Y[:SCALe]:COUPlE 0 1 OFF ON</code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:Y[:SCALe]:COUPlE?</code>
Example	<code>:DISP:TXP:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:TXP:WIND:TRAC:Y:COUP?</code>
Couplings	When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results

	When you change a value of "Scale/Div" on page 1242 , or "Ref Value" on page 1242 , Auto Scaling automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle

3.7.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 1250](#)
- See ["Single-Attenuator Configuration" on page 1251](#)

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten

In the **Amplitude**, "**Y Scale**" on page 1951 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten

"Total Atten above 50 GHz" followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "**Internal Preamp**" on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "**Attenuator Configurations and Auto/Man**" on page 1255

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1960 See " Attenuator Configurations and Auto/Man " on page 1255 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp,

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

External Gain, Ref Level Offset, Max Mixer Level, μ W Path Control and **IF Gain** settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto)

- In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "**Full Range Atten**" on page 1956 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto)

In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input

For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB

Preset	Auto The Auto value is 10 dB						
State Saved	Saved in instrument state						
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						

Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration: <i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration: <i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the "soft" attenuation is at 14 dB (see below for definition of "soft" attenuation)</p>
------------	--

When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	<code>ON</code>

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1954, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 1253 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1960 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 1258](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1981 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the</p>

	frequency range lockout takes precedence
	If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable
	If "LNA" on page 1982 is ON , the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:
	<ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5GNR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode
	The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 1258
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATE OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATE?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This

frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1259](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1959](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See ["Adjustment Algorithm" on page 1262](#)

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECtrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECtrical COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?	
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?	
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined	
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1960 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 1260 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)
-------	---

OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)

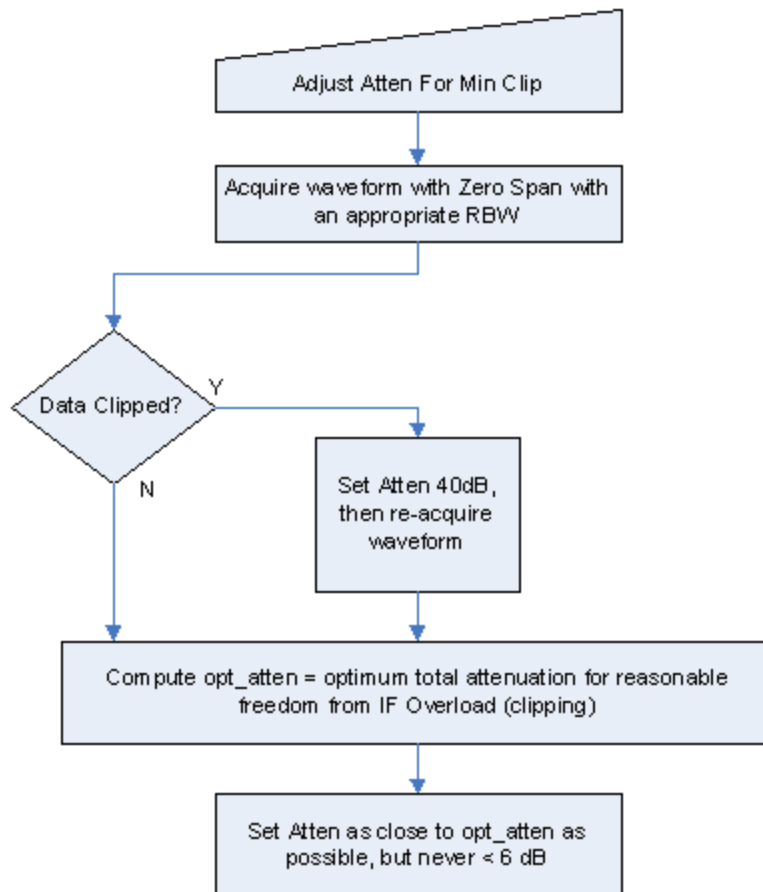

:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF

Backwards [:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0
Compatibility [:SENSe]:POWer[:RF]:RANGe:AUTO?
SCPI

Adjustment Algorithm

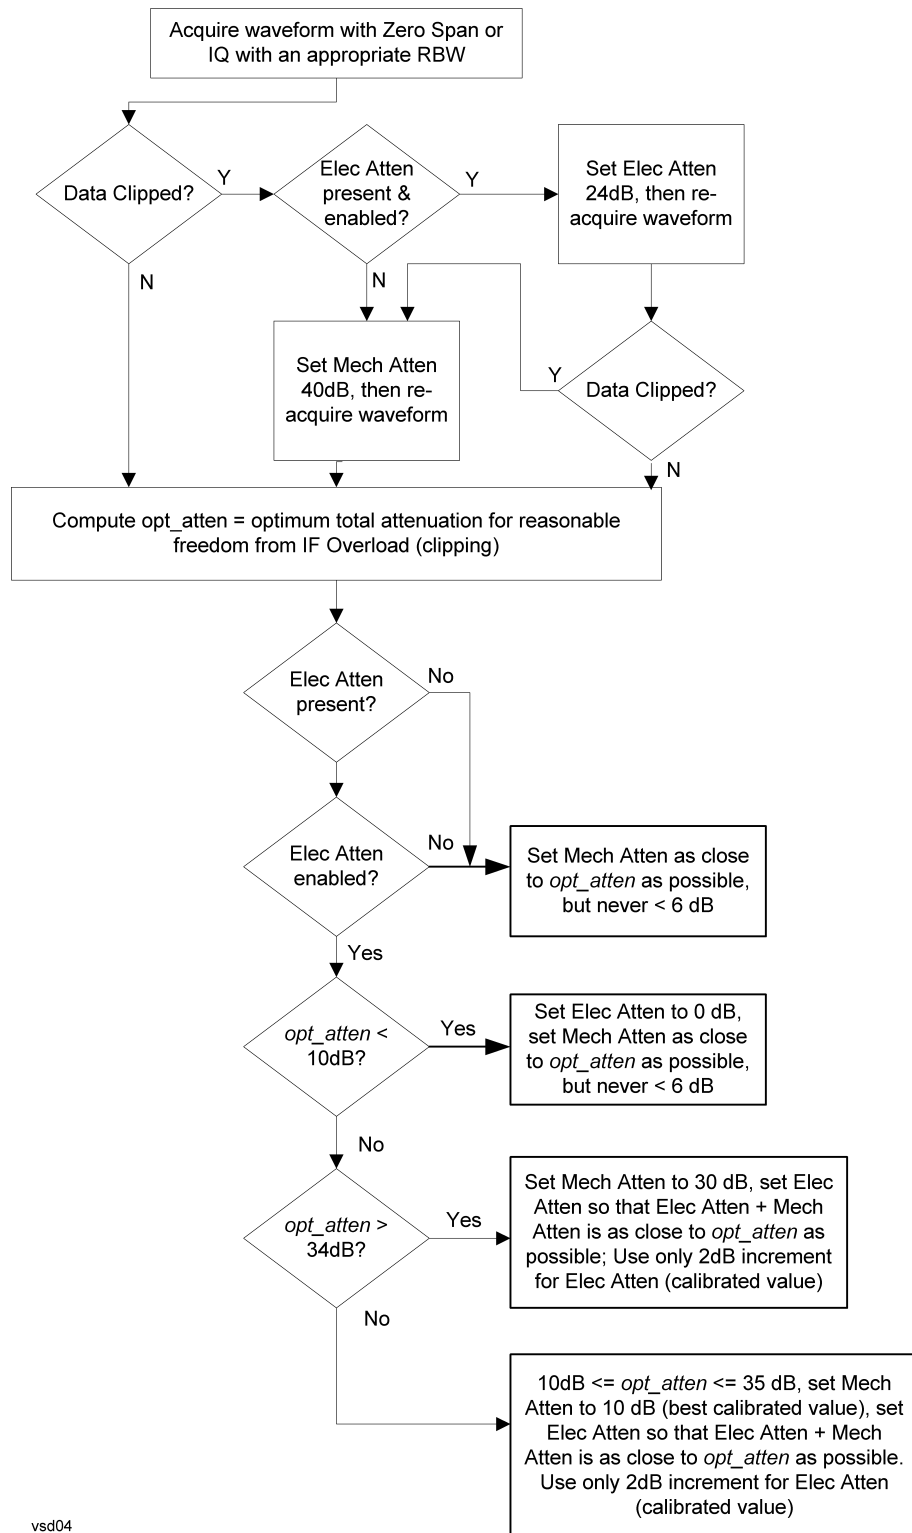

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

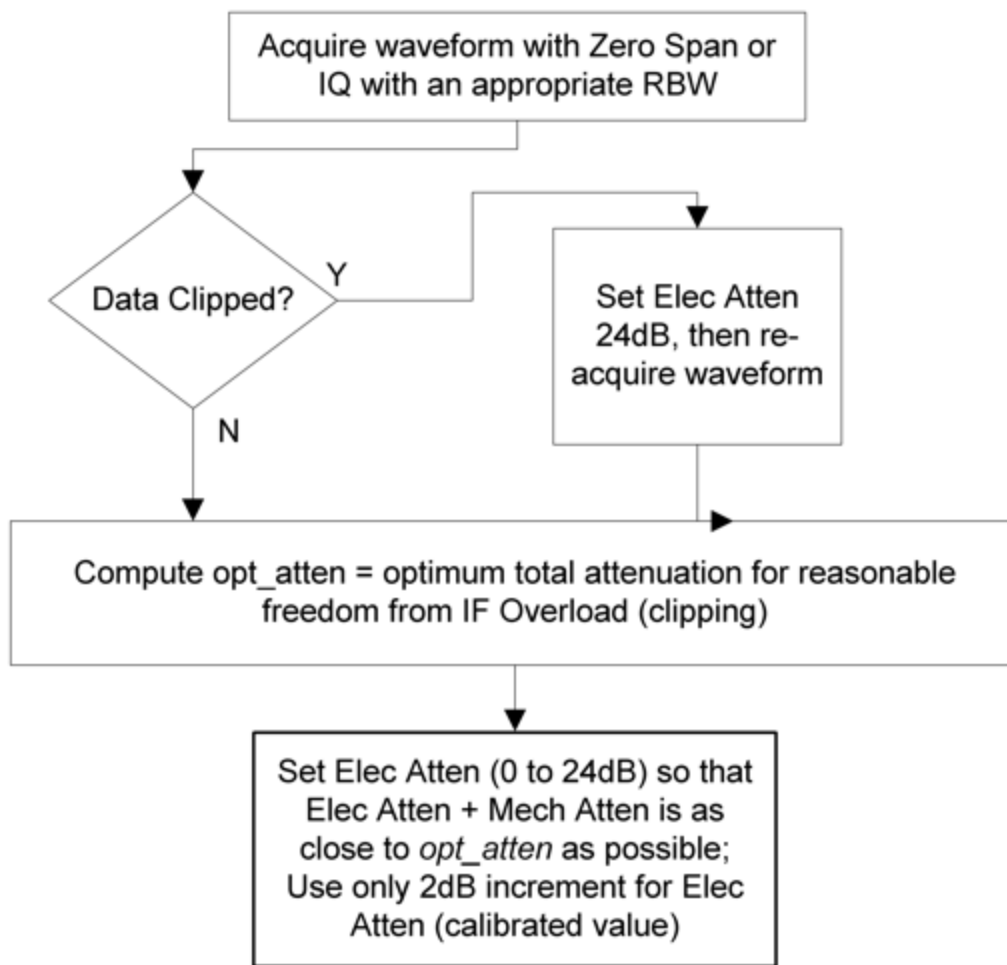

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1260 selection is Mech + Elec Atten:

vsd04

"Pre-Adjust for Min Clipping" on page 1260 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.7.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe] :VOLTage :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :VOLTage :IQ :RANGe :AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT :IQ :RANG :AUTO OFF</code> <code>:VOLT :IQ :RANG :AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to YMax
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#" This is an alternate form of the command to match the POWer form of the I Range and Q Range SCPI.
Remote Command	<code>[:SENSe] :POWer :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :POWer :IQ :RANGe :AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW :IQ :RANG :AUTO OFF</code> <code>:POW :IQ :RANG :AUTO?</code>
Notes	<code>:POW :IQ :RANG :AUTO</code> is an alternate form of <code>:VOLT :IQ :RANG :AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe] :VOLTage :IQ [:I] :RANGe [:UPPer] <voltage></code> <code>[:SENSe] :VOLTage :IQ [:I] :RANGe [:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT :IQ :RANG 0.5 V</code>

	<code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When " Q Same as I " on page 1974 is On, the I Range value will be copied to " Q Range " on page 1973 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <ampl></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "[I Range](#)" on page 1972 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTagE:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTagE:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1972 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1974 is On, the " I Range " on page 1972 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.
Remote Command	<code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;1></code> <code>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</code>
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: <code>:POW:IQ:Q:RANG 4 dBm</code> <code>:POW:IQ:Q:RANG?</code>
Notes	The POWER form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTagE form of the command

The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the **VOLTage** form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:

50 Ω: 10, 4, -2, -8
75 Ω: 8.2, 2.2, -3.8, -9.8
600 Ω: -0.8, -6.8, -12.8, -18.9

Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	<code>[:SENSe]:VOLTage POWer:IQ:MIRRed OFF ON 0 1</code> <code>[:SENSe]:VOLTage POWer:IQ:MIRRed?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the " I Range " on page 1972 value is mirrored (copied) to the " Q Range " on page 1973
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.7.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting.
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements.

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELEctrical COMBined</code>
----------------	---

	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

	via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.7.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1992](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1979](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 1274](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1979
Status Bits/OPC	When centering the preselector, *OPC does not return true until the process is complete and a

dependencies subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries
 The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1978 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	- Does not appear in CXA-m

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	LOW
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"

When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1981. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "[Internal Preamp](#)" on page 1981, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 1278

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	<code>OFF</code>
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB  
Pre: Int on, LNA on  
μW Path: LNP, On  
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB  
Pre: Int off, LNA on  
μW Path: LNP, On  
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the **μW Preselector** is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the **μW Preselector's** bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1283
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1285
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1285

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: :POW:MW:PRES OFF
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB)
Preset	ON
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code>

Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state

Preset	N9041B	OFF
	N9042B+V3050A	ON
	M9410A/11A	ON
State Saved	Saved in instrument state	

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced [:SENSe]:POWer[:RF]:SWPResel?	
Example	:POW:SWPR NORM :POW:SWPR?	
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1992 is OFF. The grayout message is “Unavailable unless SW Presel enabled”	
Preset	N9041B	ADVanced
	N9042B+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz

and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1291 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.7.4 BW

Opens the **BW** (Bandwidth) menu, which contains controls for the Resolution Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.7.4.1 Settings

Contains the basic Bandwidth functions. It is the only tab under **BW**.

Res BW

Sets the Resolution Bandwidth. This is the bandwidth used for the power measurement. The bandwidth is ideally wide enough to pass all the power of the bursted signal, while not being so wide that it passes noise that reduces dynamic range and the accuracy of low level measurements.

Remote Command	<code>[:SENSe]:TXPower:BANDwidth[:RESolution] <bandwidth></code> <code>[:SENSe]:TXPower:BANDwidth[:RESolution]?</code>
Example	<code>:TXP:BAND 1000</code> <code>:TXP:BAND?</code>
Preset	GSM: 510 kHz SA: 3 MHz
State Saved	Yes
Min	1 kHz
Max	Hardware Dependent: <ul style="list-style-type: none"> - RF Input: <ul style="list-style-type: none"> - No Option = 10 MHz - WB (25 MHz or wider) = Hardware Option Limit - I/Q Input (for I+jQ): <ul style="list-style-type: none"> - No Option = 20 MHz - Option B25 = 50 MHz
Annotation	In the lower left corner of the screen, "Res BW <value>" indicates the current setting of resolution bandwidth

Backwards `[:SENSe]:TXPower:BWIDth[:RESolution]`
 Compatibility
 SCPI

RBW Filter Type

Besides the familiar Gaussian filter shape, there are certain special filter types, such as Flat Top, that are desirable under certain conditions.

Remote Command `[:SENSe]:TXPower:BANDwidth:TYPE GAUSSian | FLATtop`
`[:SENSe]:TXPower:BANDwidth:TYPE?`

Example `:TXP:BAND:TYPE GAUS`
`:TXP:BAND:TYPE?`

Notes
 Selects the type of filter: either **GAUSSian** or Flat (**FLATtop**). Gaussian is the best choice when looking at the overall burst or the rising and falling edges, as it has excellent pulse response. This measurement does not trade off time domain accuracy vs. noise, just total power accuracy vs. noise level. If you want to precisely examine just the useful part of the burst, choose Flat. This is an advanced control that normally does not need to be changed. Setting this to a value other than the factory default may cause invalid measurement results

- **FLATtop** – a filter with a flat amplitude response, which provides the best amplitude accuracy
- **GAUSSian** – a filter with Gaussian characteristics, which provides the best pulse response

Preset **GAUSSian**

State Saved Yes

Range **GAUSSian|FLATtop**

Backwards `[:SENSe]:TXPower:BWIDth:TYPE`
 Compatibility
 SCPI

3.7.5 Display

Opens the **Display** Menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.7.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

Remote Command	<code>:DISPlay:TXPower:BARGraph[:STATe] ON OFF 1 0</code> <code>:DISPlay:TXPower:BARGraph[:STATe]?</code>
Example	<code>:DISP:TXP:BARG ON</code> <code>:DISP:TXP:BARG?</code>
Preset	OFF
State Saved	Yes
Range	ON OFF

3.7.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The Burst Power measurement has one view, the "[Normal](#)" on page 1294 View.

Normal

Windows: "[Graph](#)" on page 1238, "[Metrics](#)" on page 1240

Dual window view of the graph and the metrics.

The **Normal** View is a multiple-window View. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send: <code>:DISP:VIEW:ADV:SEL "Trace Zoom"</code>

because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu

You *cannot* use the legacy View parameter (which in this case would be **TZOOM**) with

:DISP:VIEW:ADV:SEL

<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:

:DISP:VIEW:ADV:SEL "Trace Zoom"

:DISP:VIEW:ADV:SEL "TRACE ZOOM"

If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"

If the display is disabled (via **:DISP:ENAB OFF**) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Backwards Compatibility SCPI	The legacy node :DISPlay:VIEW[:SElect] is retained for backwards compatibility, but it only supports predefined views
------------------------------	--

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	:DISPlay:VIEW:ADVanced:NAME <alphanumeric>
Example	:DISP:VIEW:ADV:NAME "Baseband" Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <alphanumeric> name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via :DISP:ENAB OFF) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p>

If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
---------	-------------------------------------

Notes	Disabled if there are no User Views
-------	-------------------------------------

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:CAT?</code>
---------	----------------------------------

Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement
-------	--

Example:

`"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"`

No distinction is made between Predefined and User Views

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: <code>"Baseband,myView1,yourView1"</code> If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2004), then query the list of available Views, the result is undefined

3.7.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	<code>ON</code>
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the <code>WINDow</code> , <code>TRACe</code> and <code>GRID</code> parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

	This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	ON

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON
	This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTEM:DEFAULTS MISC` or `:DISPLAY:ENABLE ON` (neither `*RST` nor `:SYSTEM:PRESET` enable the display)
- and you are using either the `:SYSTEM:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPLAY:VIEW:ADVANCED:SELECT</code>
Rename User View	<code>:DISPLAY:VIEW:ADVANCED:RENAME</code>
Delete User View	<code>:DISPLAY:VIEW:ADVANCED:DELETE</code>
Create User View	<code>:DISPLAY:VIEW:ADVANCED:NAME</code>
Select Screen	<code>:INSTRUMENT:SCREEN:SELECT</code>
Delete Screen	<code>:INSTRUMENT:SCREEN:DELETE</code>
Delete All But This Screen	<code>:INSTRUMENT:SCREEN:DELETE:ALL</code>
Add Screen	<code>:INSTRUMENT:SCREEN:CREATE</code>
Rename Screen	<code>:INSTRUMENT:SCREEN:RENAME</code>
Sequencer On/Off	<code>:SYSTEM:SEQUENCER</code>

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

Remote Command	<code>:DISPlay:ENABle OFF ON 0 1</code>
Example	<code>:DISP:ENAB OFF</code>
Couplings	<code>:DISP:ENAB OFF</code> turns Backlight OFF and <code>:DISP:ENAB ON</code> turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code>
Preset	<code>ON</code> Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code>
State Saved	Not saved in instrument state
Backwards Compatibility Notes	<code>:SYST:PRES</code> no longer turns on <code>:DISPlay:ENABle</code> as it did in legacy analyzers

3.7.6 Freq

Contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.7.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, there will be a **Global** tab in the **"Meas Setup" on page 1317** menu.

Center Frequency sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Frequency is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz. When you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

- ["RF Center Freq" on page 1305](#)
- ["Ext Mix Center Freq" on page 1306](#)
- ["I/Q Center Freq" on page 1307](#)
- ["Center Frequency Presets" on page 1304](#)

Remote Command	<code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer?</code>
Example	<code>:FREQ:CENT 50 MHz</code> Sets Center Frequency to 50 MHz <code>:FREQ:CENT UP</code> Increments the Center Frequency by the value of CF Step <code>:FREQ:CENT?</code> Returns the current value of Center Frequency
Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: For RF input it is equivalent to <code>:FREQ:RF:CENT</code> For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code> For External Mixer it is equivalent to <code>:FREQ:EMIX:CENT</code> Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g. MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1304 and "RF Center Freq" on page 1305 and "Ext Mix Center Freq" on page 1306 and "I/Q Center Freq" on page 1307
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1304 and "RF Center Freq" on page 1305 and "I/Q Center Freq" on page 1307
Status Bits/OPC dependencies	Non-overlapped

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

Specifies the RF Center Frequency. Sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command `[:SENSe] :FREQuency:RF:CENTer <freq>`
`[:SENSe] :FREQuency:RF:CENTer?`

Example `:FREQ:RF:CENT 30 MHz`
`:FREQ:RF:CENT?`

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

Notes	This command is the same in all modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See tables in " Center Frequency Presets " on page 1304 above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See tables in " Center Frequency Presets " on page 1304 above Basically instrument maximum frequency - 5 Hz

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing. So you will return to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, so the span setting from the other input will be retained. Therefore, the instrument returns to the span setting from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominalMax Freq of the highest harmonic range in the Harmonic Table. The Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table ($\text{Span} = \text{Stop Freq} - \text{Start Freq}$), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz

State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQuency :IQ :CENTer ?</code>
Example	<code>:FREQ :IQ :CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for "**Center Frequency**" on page 1302 and start and stop frequency functions. Once a step size has been selected and the Center Frequency function is active, the step keys (and the **UP | DOWN** parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code> <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO ?</code>
Example	<code>:FREQ :CENT :STEP 500 MHz</code> <code>:FREQ :CENT UP</code> increases the current center frequency value by 500 MHz <code>:FREQ :CENT :STEP ?</code> <code>:FREQ :CENT :STEP :AUTO ON</code>

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

:FREQ:CENT:STEP:AUTO?	
Notes	Preset and Max values are depending on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto ON
State Saved	Saved in instrument state
Min/Max	-/+ (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Freq Offset

Enables you to set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a Mode Preset or set the frequency offset to 0 Hz.

See "[More Information](#)" on page 1309

Remote Command	<code>[:SENSe]:FREQuency:OFFSet <freq></code> <code>[:SENSe]:FREQuency:OFFSet?</code>
Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values are dependent on Hardware Options
Dependencies	Only appears in Spectrum Analyzer Mode Freq Offset is not available in External Mixing. In this case the Freq Offset control is grayed-out and displays a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input
Preset	See " Center Frequency Presets " on page 1304
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation,

	below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:X[:SCALE]:OFFSet</code> This version of the command is in the instrument for compatibility across platforms and is not recommended for new development

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE

If a trace is exported with a nonzero Freq Offset, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want Freq Offset to be 0, otherwise the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.

3.7.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.7.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

In any menu tab that displays **Select Marker**, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is performed, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.7.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Time

Sets the Marker Time in the current marker X-Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	<code>:CALCulate:TXPower:MARKer[1] 2 ... 12:X <real></code> <code>:CALCulate:TXPower:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:TXP:MARK3:X 0</code> <code>:CALC:TXP:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X-Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time . If the marker is Off the response is Not A Number (NAN)
Couplings	Max value would be changed by Sweep Time parameter value
Preset	After a preset, all Markers are turned OFF , so a Marker X Axis Value query will return Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph
Backwards Compatibility SCPI	<code>:CALCulate:BPOwer:MARKer[1] 2 ... 12:X</code> Included for backwards compatibility. Not recommended for use in new designs

Marker X Axis Position (Remote Command Only)

Sets the marker X position in trace points. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	<code>:CALCulate:TXPower:MARKer[1] 2 ... 12:X:POStion <real></code> <code>:CALCulate:TXPower:MARKer[1] 2 ... 12:X:POStion?</code>
Example	<code>:CALC:TXP:MARK10:X:POS 500</code> <code>:CALC:TXP:MARK10:X:POS?</code>
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . If the marker is Off the response is not a number
Couplings	Max value would be changed by Sweep/Meas Time parameter value
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query will return a not a number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Backwards Compatibility SCPI	<code>:CALCulate:BPOwer:MARKer[1] 2 ... 12:X:POStion</code> Included for backwards compatibility only. Not recommended for use in new designs

Marker Y Axis Value (Remote Command Only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

The "result" of a marker is the value that is displayed on the second line of the Marker Result block. To properly interpret the returned value, the remote programmer must also know what the instrument's Y-Axis Unit is set to as described below.

A marker can have up to two results, only one of which is displayed or returned on a query, as follows:

- Absolute result** Every marker has an absolute result and it is simply:
- For Normal and Delta markers, the Y Axis value of the trace point the marker is currently on
 - The absolute result is displayed in the result block or returned on a query unless the marker control mode is **Delta**
- Relative result** If a marker's control mode is **Delta**, the relative result is displayed in the result block or returned on a query. This is the ratio of the Absolute Result of a delta marker to the Absolute Result of its reference marker. The ratio is expressed in dB

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

Remote Command	:CALCulate:TXPower:MARKer[1] 2 ... 12:Y?
Example	:CALC:TXP:MARK11:Y?
Notes	Returns the marker Y-Axis result. If the marker is Off the response is Not A Number
Preset	0
State Saved	No
Backwards Compatibility SCPI	:CALCulate:TXPower:MARKer[1] 2 ... 12:FUNCTION:RESult? :CALCulate:BPOwer:MARKer[1] 2 ... 12:FUNCTION:RESult? :CALCulate:BPOwer:MARKer[1] 2 ... 12:Y? Included for backwards compatibility only. Not recommended for use in new designs

Marker Mode

Sets the marker control mode to **Normal**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	:CALCulate:TXPower:MARKer[1] 2 ... 12:MODE POSition DELTa OFF :CALCulate:TXPower:MARKer[1] 2 ... 12:MODE?
Example	:CALC:TXP:MARK:MODE OFF :CALC:TXP:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELTA OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph
Backwards Compatibility SCPI	:CALCulate:BPOwer:MARKer[1] 2 ... 12:MODE Included for backwards compatibility. Not recommended for use in new designs

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it in **Normal** mode and places it at the center of the screen.

Example	<code>:CALC:TXP:MARK3:STAT ON</code> <code>:CALC:TXP:MARK3:STAT?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:CALCulate:BPOwer:MARKer[1] 2 ... 12:STATe</code> Included for backwards compatibility only. Not recommended for use in new designs <code>:CALCulate:TXPower:MARKer[1] 2 ... 12:STATe OFF ON 0 1</code> <code>:CALCulate:TXPower:MARKer[1] 2 ... 12:STATe?</code>

Delta Marker (Reset Delta)

Pressing this control has exactly the same effect as pressing the **Delta** selection on the **"Marker Mode" on page 1312** radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	<code>:CALCulate:TXPower:MARKer:AOff</code>
Example	<code>:CALC:TXP:MARK:AOff</code>
Backwards Compatibility SCPI	<code>:CALCulate:BPOwer:MARKer:AOff</code> Included for backwards compatibility only. Not recommended for use in new designs

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By “equal X-Axis movement” we mean that we preserve the difference between each marker’s X-Axis value (in the fundamental x-axis units of the trace that marker is on) and the X-Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off screen.

Remote Command	:CALCulate:TXPower:MARKer:COUPle[:STATe] ON OFF 1 0 :CALCulate:TXPower:MARKer:COUPle[:STATe]?
Example	:CALC:TXP:MARK:COUP ON :CALC:TXP:MARK:COUP?
Preset	OFF Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.7.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search. Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Time

Sets the marker time in the current marker X-Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

This is the same as "**Marker Time**" on page 1310 on the **Settings** tab.

Peak Search

Pressing this control moves the selected marker to the trace point that has the maximum y-axis value for that marker’s trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a **Peak Search**.

Remote Command	<code>:CALCulate:TXPower:MARKer[1] 2 ... 12:MAXimum</code>
Example	<p><code>:CALC:TXP:MARK2:MAX</code></p> <p><code>:SYST:ERR?</code></p> <p>can be used to query the errors to determine if a peak is found. The message “No peak found” (-200) will be returned after an unsuccessful search</p>
Notes	<p>Sending this command selects the subcoded marker</p> <p>In WCDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored</p>

Marker Delta

Pressing this control has exactly the same effect as pressing the “Delta” selection on the **"Marker Mode" on page 1312** radio button on the **Settings** tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker’s control mode to Delta without having to access two separate menus.

3.7.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Time

Sets the Marker Time in the current marker X-Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

This is the same as the **"Marker Time" on page 1310** control on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:TXPower:MARKer[1] 2 ... 12:REFerence <integer></code> <code>:CALCulate:TXPower:MARKer[1] 2 ... 12:REFerence?</code>
Example	<code>:CALC:TXP:MARK:REF 10</code> <code>:CALC:TXP:MARK:REF?</code>
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” The query returns a single value (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Fixed or Normal mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by Restore Mode Defaults . This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	<code>:CALCulate:TXPower:MARKer[1] 2 ... 12:TRACe RFENvelope MAXHold MINHold</code> <code>:CALCulate:TXPower:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:TXP:MARK:TRAC MAXH</code> <code>:CALC:TXP:MARK:TRAC?</code>
Dependencies	If Max Hold under Trace is Off, Max Hold is grayed out
Preset	RFENvelope
State Saved	Yes
Range	RF Envelope Max Hold RF Envelope Min Hold RF Envelope
Backwards Compatibility SCPI	<code>:CALCulate:BPOwer:MARKer[1] 2 ... 12:TRACe</code> Included for backwards compatibility only. Not recommended for use in new designs

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as the "Marker Settings Diagram" on page 1313 control on the **Settings** tab.

3.7.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.7.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Avg/Hold Num

Specifies the number of data acquisition that will be averaged. After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote Command	<code>[:SENSe] :TXPower :AVERage :COUNT <integer></code>
Example	<code>:TXP :AVER :COUN 100</code> <code>:TXP :AVER :COUN ?</code>
Preset	50
State Saved	Yes
Min/Max	1/10000
Backwards Compatibility SCPI	<code>[:SENSe] :BPOwer :AVERage :COUNT</code> Included for backwards compatibility. Not recommended for use in new designs

Averaging On/Off

Turns averaging on or off for the Burst Power measurement

Remote Command	<code>[:SENSe] :TXPower :AVERage [:STATe] OFF ON 0 1</code> <code>[:SENSe] :TXPower :AVERage [:STATe] ?</code>
Example	<code>:TXP :AVER :0</code> <code>:TXP :AVER ?</code>

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

Preset	ON
Range	OFF ON
Backwards Compatibility SCPI	[:SENSe] :BPOWer :AVERAge [:STATe]

Avg Mode

Selects the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached.

Control	SCPI	Mode
Exponential	EXPOntial	After the average count is reached, each successive data acquisition is exponentially weighted and combined with the existing average
Repeat	REPeat	After reaching the average count, the averaging is reset and a new average is started

Remote Command	[:SENSe] :TXPower :AVERAge :TCONtrol EXPOnential REPeat [:SENSe] :TXPower :AVERAge :TCONtrol?
Example	:TXP :AVER :TCON REP :TXP :AVER :TCON?
Preset	EXPOntial
State Saved	Yes
Range	EXPOntial REPeat
Backwards Compatibility SCPI	[:SENSe] :BPOWer :AVERAge :TCONtrol Included for backwards compatibility. Not recommended for use in new designs

Avg Type

Specifies the type of trace and result averaging to use.

Control Selection	SCPI	Type
Power Average (RMS)	RMS	True power averaging that is equivalent to taking the RMS value of the voltage. It is the most accurate type of averaging
Log-Power Average (Video)	LOG	Simulates the traditional spectrum analyzer type of averaging by averaging the log of the power

Control Selection	SCPI	Type
None	MAXimum	The maximum values are retained during the averaging cycle
None	MINimum	The minimum values are retained during the averaging cycle

SA, GSM Mode

Remote Command	[:SENSe]:TXPower:AVERage:TYPE LOG MAXimum MINimum RMS [:SENSe]:TXPower:AVERage:TYPE?
Example	:TXP:AVER:TYPE LOG :TXP:AVER:TYPE?
Notes	Maximum Minimum are selected only via SCPI
Couplings	Selecting MAXimum MINimum forces Max Hold Trace or and Min Hold Trace to be visible. Measure Trace stays in RMS or Video average state
Preset	RMS
State Saved	Yes
Range	Power Average(RMS) Log-Power Average (Video)
Backwards Compatibility SCPI	[:SENSe]:BPOwer:AVERage:TYPE Included for backwards compatibility. Not recommended for use in new designs

Threshold Level

When "[Meas Method](#)" on [page 1323](#) is set to Above Threshold Lvl, the mean carrier power is calculated based on the trace above the threshold level. The threshold level is displayed in dB (relative to the measured carrier) or dBm (absolute).

A green line in the grid is displayed at the Y position associated with the current threshold level value. Its state is controlled by the On/Off state of the 'Display Line' under "[Display](#)" on [page 1293](#).

Remote Command	[:SENSe]:TXPower:THReshold <real> [:SENSe]:TXPower:THReshold?
Example	:TXP:THR 0 :TXP:THR?
Notes	Use " Threshold Type " on page 1320 to specify whether this command sets an absolute or a relative power level Suffixes dB and dBm are allowed, but do not change the state of Threshold Type
Preset	SA: -30.0 GSM: -20.0
State Saved	Yes

3 Spectrum Analyzer Mode
3.7 Burst Power Measurement

Min/Max	SA, GSM Relative: -100/0 dB Absolute: -100/100 dBm
Annotation	Both (Rel Abs) threshold level are displayed on the 2nd window If Threshold Type is set to Absolute, relative value is calculated from reference power level If Threshold Type is set to Relative, absolute value is calculated from reference power level
Backwards Compatibility SCPI	<code>[:SENSe] :BPoWer :THReshold</code> Included for backward compatibility. Not recommended for use in new designs

Threshold Type

Remote Command	<code>[:SENSe] :TXPower :THReshold :TYPE ABSolute RELative</code> <code>[:SENSe] :TXPower :THReshold :TYPE?</code>
Example	<code>:TXP :THR :TYPE ABS</code> <code>:TXP :THR :TYPE?</code>
Preset	<code>RELative</code>
Range	<code>ABSolute RELative</code>
Backwards Compatibility SCPI	<code>[:SENSe] :BPoWer :THReshold :TYPE</code>

IF Gain

Used to set the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

This only applies to the RF input. It does not apply to baseband I/Q input.

Remote Command	<code>[:SENSe] :TXPower :IF :GAIN [:STATe] ON OFF 1 0</code> <code>[:SENSe] :TXPower :IF :GAIN [:STATe]?</code> <code>[:SENSe] :TXPower :IF :GAIN :AUTO [:STATe] ON OFF 1 0</code> <code>[:SENSe] :TXPower :IF :GAIN :AUTO [:STATe]?</code>
Example	<code>:TXP :IF :GAIN ON</code> <code>:TXP :IF :GAIN?</code> <code>:TXP :IF :GAIN :AUTO OFF</code> <code>:TXP :IF :GAIN :AUTO?</code>
Notes	ON = high gain OFF = low gain
Dependencies	IF Gain is not available when IQ Input is selected The IF Gain control has no effect when the U7227A USB Preamplifier is connected. This is not

	<p>annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control</p> <p>This control is not available in VXT models M9421A/10A/11A, EXM, or UXM</p>
Couplings	<p>Sending this command sets this function to Man</p> <p>Auto sets IF Gain to High Gain under any of the following conditions:</p> <p>The input attenuator is set to 0 dB, or the preamp is turned on or the Max Mixer Level is -20 dBm or lower</p> <p>For other conditions, Auto sets IF Gain to Low Gain</p>
Preset	<p>OFF</p> <p>OFF</p>
State Saved	Saved in instrument state
Range	Low Gain High Gain

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Dependencies	Does not appear in GSM/EDGE Mode
--------------	----------------------------------

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1322 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument

Compatibility
Notes

parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does *not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)

- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Returns parameters for this measurement to their factory default settings.

Remote Command :CONFigure:TXPower

Example :CONF:TXP

3.7.8.2 Meas Method

Lets you choose and configure the Measurement Method.

Meas Method

There are two options for this parameter:

Above Threshold Level	THReshold	This measurement algorithm is used to capture a time record, and average only those points in the time record that exceed the user-specified threshold level. No attempt is made to position the burst, or to calculate/display burst widths. This can be used to measure continuous signals, or bursted signals where the Measured Burst Width algorithm is too restrictive
Measured Burst Width	BWIDth	This measurement algorithm uses the threshold level to calculate the burst center, and average those points that lie within a user-specified burst width that is centered upon the burst. The burst width parameter is described in more detail below

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

Remote Command	<code>[:SENSe]:TXPower:METhod THReshold BWIDth</code> <code>[:SENSe]:TXPower:METhod?</code>
Example	<code>:TXP:METh BWID</code> <code>:TXP:METh?</code>
Dependencies	Only appears in Spectrum Analyzer and GSM/EDGE Modes
Preset	<code>THReshold</code>
State Saved	Yes
Range	Above Threshold Lvl Burst Width
Backwards Compatibility SCPI	<code>[:SENSe]:BPOwer:METhod</code>

Burst Width Auto Detection

Turns Burst Width Auto Detection on or off.

Remote Command	<code>[:SENSe]:TXPower:BURSt:AUTO ON OFF 1 0</code> <code>[:SENSe]:TXPower:BURSt:AUTO?</code>
Example	<code>:TXP:BURSt:AUTO 1</code> <code>:TXP:BURSt:AUTO?</code>
Preset	<code>ON</code>
State Saved	Yes
Backwards Compatibility SCPI	<code>[:SENSe]:BPOwer:BURSt:AUTO</code>

Burst Width

When "[Burst Width Auto Detection](#)" on [page 1324](#) is **OFF**, you may enter a fixed-time value in seconds, or alternatively specify the burst width as a percentage of the last measured burst width (result in bottom-left corner of second window).

Remote Command	<code>[:SENSe]:TXPower:BURSt:WIDTh <time></code> <code>[:SENSe]:TXPower:BURSt:WIDTh?</code>
Example	<code>:TXP:BURSt:WIDTh 10</code> <code>:TXP:BURSt:WIDTh?</code> <code>:TXP:BURSt:AUTO 0</code> <code>:TXP:BURSt:AUTO?</code>
Dependencies	Grayed-out if " Meas Method " on page 1323 is 'Above Threshold Lvl' Gray-out message: 'Settings Conflict; Meas Method must be Measured Burst Width'

Couplings	Max value depends on Sweep Time, Res BW and RBW filter type
Preset	SA, GSM: 255.6 us
State Saved	Yes
Min/Max	100.0 ns/50 s

3.7.8.3 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	<code>[:SENSe]:RADio:STANdard[:SElect] NONE JSTD IS95a IS97D IS98D GSM W3GPP C2000MC1 C20001X NADC PDC BLUEtooth TETRa WL802DOT11A WL802DOT11B WL802DOT11G HIPERLAN2 DVBTLSN DVBTGPN DVBTIPN FCC15 SDMBSE UWBINDOOR LTEB1M4 LTEB3M LTEB5M LTEB10M LTEB15M LTEB20M WL11N20M WL11N40M WL11AC20M WL11AC40M WL11AC80M WL11AC160M WL11AX20M WL11AX40M WL11AX80M WL11AX160M WL11BE20M WL11BE40M WL11BE80M WL11BE160M WL11BE320M WL11AD2G WL11AY2G16 WL11AY4G32 WL11AY6G48 WL11AY8G64 NR5GFR1B100M</code> <code>[:SENSe]:RADio:STANdard[:SElect]?</code>
Example	<code>:RAD:STAN NONE</code> <code>:RAD:STAN?</code>
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	<code>[:SENSe]:RADio:STANdard:DEVIce BTS MS</code> <code>[:SENSe]:RADio:STANdard:DEVIce?</code>
Example	<code>:RAD:STAN:DEV MS</code> <code>:RAD:STAN:DEV?</code>

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules

3GPP W-CDMA	Command Example	:RAD:STAN W3GPP	
	IBW	5 MHz	
	Span	7.5 MHz	
	RBW	240 kHz	
	VBW	Auto rules	
	RRC Filter	Off	
3GPP LTE 1.4 MHz	RRC Filter Alpha	0.22	
	Command Example	:RAD:STAN LTEB1M4	
	IBW	1.4 MHz	
	Span	2.1 MHz	
	RBW	Auto rules	
	VBW	Auto rules	
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M	
	IBW	3 MHz	
	Span	4.5 MHz	
	RBW	Auto rules	
	VBW	Auto rules	
	Command Example	:RAD:STAN LTEB5M	
3GPP LTE 5 MHz	IBW	5 MHz	
	Span	7.5 MHz	
	RBW	Auto rules	
	VBW	Auto rules	
	3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
		IBW	10 MHz
Span		15 MHz	
RBW		Auto rules	
VBW		Auto rules	
3GPP LTE 15 MHz		Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz	
	Span	22.5 MHz	
	RBW	Auto rules	
	VBW	Auto rules	

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules
PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN?

	Query always returns IS97D
IBW	1.23 MHz
Span	1.845 MHz
RBW	24kHz
VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	<code>[:SENSe]:RADio:STANdard:BAND:CLASs BC0 BC1</code> <code>[:SENSe]:RADio:STANdard:BAND:CLASs?</code>
Example	<code>:RAD:STAN:BAND:CLAS BC0</code> <code>:RAD:STAN:BAND:CLAS?</code>
Preset	<code>BC0</code>
State Saved	Saved in instrument state
Range	0 (800 MHz Band) 1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	<code>:RAD:STAN WL802DOT11A</code>
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11g	Command Example	<code>:RAD:STAN WL802DOT11G</code>
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11b	Command Example	<code>:RAD:STAN WL802DOT11B</code>
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11n 40 MHz	Command Example	:RAD:STAN WL11N40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
WLAN 802.11ac 20 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
WLAN 802.11ac 80 MHz	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 80 MHz	Command Example	:RAD:STAN WL11BE80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 160 MHz	Command Example	:RAD:STAN WL11BE160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.7 Burst Power Measurement

WLAN 802.11be 320 MHz	Command Example	:RAD:STAN WL11BE320M
	IBW	320 MHz
	Span	480 MHz
	RBW	100 kHz
WLAN 802.11ad 2 GHz	Command Example	:RAD:STAN WL11AD2G
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
WLAN 802.11ay 2.16 GHz	Command Example	:RAD:STAN WL11AY2G16
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
WLAN 802.11ay 4.32 GHz	Command Example	:RAD:STAN WL11AY4G32
	IBW	4.32 GHz
	Span	6.48 GHz
	RBW	1 MHz
WLAN 802.11ay 6.48 GHz	Command Example	:RAD:STAN WL11AY6G48
	IBW	6.48 GHz
	Span	9.72 GHz
	RBW	1 MHz
WLAN 802.11ay 8.64 GHz	Command Example	:RAD:STAN WL11AY8G64
	IBW	8.64 GHz
	Span	12.96 GHz

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is **NONE**, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as **:CONF** allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to **NONE**.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to **NO**, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to **YES**, all measurements and standard selections are enabled, so you can select any combination.

NOTE

If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	<code>[:SENSe]:RADio:STANdard:EAMeas YES NO</code> <code>[:SENSe]:RADio:STANdard:EAMeas?</code>

3.7.8.4 Global

The controls in this menu apply to all Modes in the instrument.

3 Spectrum Analyzer Mode
 3.7 Burst Power Measurement

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "[Restore Defaults](#)" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code> <code>:INSTrument:COUPle:FREQuency:CENTer?</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATe]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the

Global EMC Std, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPlE:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Global Limit Lines (Freq and Amptd)

When this control is set to **ALL**, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global Settings**, while **Global Limit Lines** is **ALL**, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to **NONE**, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is **ALL**, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to **NONE** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:LLINe ALL NONE</code> <code>:INSTRument:COUPlE:LLINe?</code>
Example	<code>:INST:COUP:LLIN ALL NONE</code> <code>:INST:COUP:LLIN?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRUMENT:COUPLE:FREQUENCY:BAND:EXTEND 0 1 ON OFF :INSTRUMENT:COUPLE:FREQUENCY:BAND:EXTEND?
Example	:INST:COUP:FREQ:BAND:EXT 1 :INST:COUP:FREQ:BAND:EXT?
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTRUMENT:COUPLE:DEFAULT
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBAL:DEFAULT

3.7.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.7.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Sets the sweep time to capture and show on screen.

Remote Command	<code>[:SENSe]:TXPower:SWEp:TIME <time></code> <code>[:SENSe]:TXPower:SWEp:TIME?</code>
Example	<code>:TXP:SWE:TIME 10</code> <code>:TXP:SWE:TIME?</code>
Dependencies	Only appears in Spectrum Analyzer Mode
Preset	640 us
State Saved	Yes
Min	1.0e-6
Max	50

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1344

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting:

-
- A line with an arrow is **Single**
 - A loop with an arrow is **Continuous**
-

Backwards
Compatibility
Notes

X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and **INIT:CONT ON**) switched to continuous measurement, but never restarted a measurement and never reset a sweep

X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	<p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 2039 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single**

does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 1346

Remote Command	<code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (<code>INTEGRity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set
Backwards	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command

Compatibility Notes	restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well
---------------------	---

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the alignment finishes *before* the abort function is performed, so `:ABORT` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORT</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORT</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (INTEGRITY sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORT</code> , the Abort command will cause the <code>*OPC</code> query to return true

3.7.9.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Enables you to set the display X Reference Value.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:RLEVel <time></code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:RLEVel?</code>
Example	<code>:DISP:TXP:WIND:TRAC:X:RLEV 1s</code> <code>:DISP:TXP:WIND:TRAC:X:RLEV?</code>
Couplings	If X "Auto Scaling" on page 1350 is ON, this value is automatically determined by the measurement result. When you set a value manually, X Auto Scaling automatically changes to OFF
Preset	0.000 s
State Saved	Saved in instrument state
Min/Max	-10.0 s / 10.0s
Annotation	<value> s bottom left of graph
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:RLEVel</code>

Scale/Div

Enables you to set the display X scale/division value.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:PDIVision <time></code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:PDIVision?</code>
Example	<code>:DISP:TXP:WIND:TRAC:X:PDIV 1ms</code> <code>:DISP:TXP:WIND:TRAC:X:PDIV?</code>
Couplings	If X "Auto Scaling" on page 1350 is ON, this value is automatically determined by the measurement result. When you set a value manually, X Auto Scaling automatically changes to OFF
Preset	640.0 us
State Saved	Saved in instrument state
Min	1.00 ns
Max	1.0 s
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:PDIVision</code>

Ref Position

Sets the reference position for the X axis to Left, Center or Right.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:RPOSition LEFT CENTER RIGHT</code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:RPOSition?</code>
Example	<code>:DISP:TXP:WIND:TRAC:X:RPOS LEFT</code> <code>:DISP:TXP:WIND:TRAC:X:RPOS?</code>
Preset	<code>LEFT</code>
State Saved	Saved in instrument state
Range	<code>LEFT CENTer RIGHT</code>
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:RPOSition</code>

Auto Scaling

Toggles the scale coupling function On or Off.

Remote Command	<code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:COUPlE 0 1 OFF ON</code> <code>:DISPlay:TXPower:WINDow[1]:TRACe:X[:SCALe]:COUPlE?</code>
Example	<code>:DISP:TXP:WIND:TRAC:X:COUP OFF</code> <code>:DISP:TXP:WIND:TRAC:X:COUP?</code>
Couplings	When ON , and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set the value of either "Scale/Div" on page 1242 or "Ref Value" on page 1242 manually, Auto Scaling automatically changes to OFF
Preset	<code>ON</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>
Backwards Compatibility SCPI	<code>:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPlE</code>

3.7.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

3.7.10.1 Trace Control

The controls on this tab allow you to select display of the Max Hold trace and the Min Hold Trace.

Max Hold Trace

Enables you to select visible/invisible Max Hold Trace.

Remote Command	:DISPlay:TXPower:WINDow[1]:TRACe:MAXHold[:STATe] ON OFF 1 0 :DISPlay:TXPower:WINDow[1]:TRACe:MAXHold[:STATe]?
Example	:DISP:TXP:WIND:TRAC:MAXH ON :DISP:TXP:WIND:TRAC:MAXH?
Couplings	Selecting [:SENSe]:TXPower:AVERage:TYPE MAXimum forces this parameter to ON
Preset	OFF
State Saved	Yes
Range	ON OFF
Backwards Compatibility SCPI	:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:MAXHold[:STATe]

Min Hold Trace

Enables you to select visible/invisible Min Hold Trace.

Remote Command	:DISPlay:TXPower:WINDow[1]:TRACe:MINHold[:STATe] ON OFF 1 0 :DISPlay:TXPower:WINDow[1]:TRACe:MINHold[:STATe]?
Example	:DISP:TXP:WIND:TRAC:MINH ON :DISP:TXP:WIND:TRAC:MINH?
Couplings	Selecting [:SENSe]:TXPower:AVERage:TYPE MINimum forces this parameter to ON
Preset	OFF
State Saved	Yes
Range	ON OFF
Backwards Compatibility SCPI	:DISPlay:TXPower:VIEW[1]:WINDow[1]:TRACe:MINHold[:STATe]

3.8 Spurious Emissions Measurement

The Spurious Emissions measurement identifies and determines the power level of spurious emissions in certain frequency bands.

Measurement Commands

The general functionality of "CONFigure" on page 2753, "INITiate" on page 2754, "FETCh" on page 2754, "MEASure" on page 2756, and "READ" on page 2755 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF: <Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the **NDEFault** node to the command, which prevents a measurement preset after a measurement switch.

The tables below list measurement commands for this measurement.

Command	Function
<code>:INITiate:SPURious</code>	Initiates a trigger cycle for the SPUR measurement, but does not return any data. You must then use <code>:FETC:SPUR[n]?</code> to retrieve data
<code>:CONFigure?</code>	Does not change any measurement settings
<code>:CONFigure:SPURious</code>	Returns the long form name of current measurement, in this case, SPURious
<code>:CONFigure:SPURious</code>	Selects SPUR measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1471
<code>:CONFigure:SPURious:NDEFault</code>	Selects SPUR measurement <i>without</i> affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of **n**.

Command	Function
<code>:FETCh:SPURious[n]?</code>	Retrieves the data defined by n
<code>:MEASure:SPURious[n]?</code>	Switches to SPUR measurement, restores default values, starts the measurement, then retrieves the data defined by n
<code>:READ:SPURious[n]?</code>	Starts the measurement, then retrieves the data defined by n

Remote Command Results

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value **n**. Note that these queries are *not* available when viewing the Range Table.

The value of the constant **SCPI_NAN**, mentioned below, is 9.91E37.

n	Return Value
1 or omitted	Returns a variable-length (1 + 6 * Spurs – up to 1201 entries) comma-separated list containing detailed information in the following format: Number of spurs in following list (Integer) <i>[Repeat the following for each spur]</i> <ul style="list-style-type: none"> - Spur # - Range # Spur was located (Integer) - Frequency of Spur (Hz, Float64) - Amplitude of Spur (dBm, Float32) - Absolute Limit (dBm, Float32) - Pass or Fail (1 0, Boolean)
2 – 21 (Average Trace)	Regardless of the Trace selection, returns a comma-separated list of the average trace data for the selected range (where range number = n – 1) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element
22	Returns the number of spurs found for the selected Measured Trace
23 – 42 (Average Trace)	Regardless of the Trace selection, returns a comma-separated list of the average trace data for the selected range (where range number = n – 22) using Detector 2. If selected range is not active or Detector 2 selection is off, SCPI_NAN is returned for each trace data element
43 – 62 (Maximum Hold Trace)	Regardless of the Trace selection, returns a comma-separated list of the maximum hold trace data for the selected range (where range number = n – 42) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element
63 – 82 (Minimum Hold Trace)	Regardless of the Trace selection, returns a comma-separated list of the minimum hold trace data for the selected range (where range number = n – 62) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element
83-102	Reserved
103-122	Reserved
123-142 (Clear/Write Trace)	Regardless of the Trace selection, returns a comma-separated list of the clear/write trace data for the selected range (where range number = n – 122) using Detector 1. If selected range is not active, SCPI_NAN is returned for each trace data element
143-162 (Clear/Write Trace)	Regardless of the Trace selection, returns a comma-separated list of the clear/write trace data for the selected range (where range number = n – 142) using Detector 2. If selected range is not active or Detector 2 selection is off, SCPI_NAN is returned for each trace data element
163-182 (Trace 1)	Returns a comma-separated list of the trace data of Trace 1 for the selected range (where range number = n – 162). If selected range is not active, SCPI_NAN is returned for each trace data element
183-202 (Trace 2)	Returns a comma-separated list of the trace data of Trace 2 for the selected range (where range number = n – 182). If selected range is not active, SCPI_NAN is returned for each trace data element
203-222 (Trace 3)	Returns a comma-separated list of the trace data of Trace 3 for the selected range (where range number = n – 202). If selected range is not active, SCPI_NAN is returned for each trace data element
223	Returns " Marker Table " on page 1358 data as a series of comma separated values in the following form:

n	Return Value
	<Marker Number>, <Marker Trace>, <X>, <Y>, <Reserved>, <Reserved>
	Only markers that are enabled are included. <Reserved> items are returned as SCPI_NAN
	The data is returned in the current sort order as displayed in the Marker Table

3.8.1 Views

This measurement has two predefined views:

#	Name	SCPI
1	"Graph + Metrics" on page 1411	RESult
2	"All Ranges" on page 1411	ALL

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change, depending on which window is selected.

Remote Command	:DISPlay:SPURious:VIEW[:SElect] RESult ALL :DISPlay:SPURious:VIEW[:SElect]?
Example	:DISP:SPUR:VIEW RANG :DISP:SPUR:VIEW?
Preset	RESult
State Saved	No
Range	Graph + Metrics All Ranges

3.8.1.1 Graph + Metrics

Windows: "Graph" on page 1355, "Table" on page 1356

Select Graph + Metrics to view measurement results.

- The upper window displays a trace of the range that contains the currently selected spur
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	:DISP:SPUR:VIEW RES
---------	---------------------

3.8.1.2 All Ranges

Windows: ["Graph" on page 1355](#),

Select All Ranges to view measurement results for all the ranges.

- The upper window displays a merged trace of all the ranges
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example `:DISP:SPUR:VIEW ALL`

3.8.2 Windows

The following windows are available in this measurement:

1. ["Graph" on page 1355](#)
2. ["Table" on page 1356](#)
3. ["All Range Table" on page 1357](#)
4. ["Gate" on page 1358](#)
5. ["Marker Table" on page 1358](#)

The **Gate** Window is available only when ["Gate View On/Off" on page 2686](#) is **ON** in **Gate Settings** under **Trigger**.

3.8.2.1 Graph

Window #1 & #3

Appears in several Views, as follows:

View	Size	Position
Graph + Metrics	Three fifth, full width	Top
All Ranges	Three fifth, full width	Top
Gate View	One third, full width	Middle

When Graph + Metrics is selected

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

When All Ranges is selected

3.8.2.2 Table

Window #2

The spurs listed are within the current value of the Marker Peak Excursion setting of the absolute limit. All the spurs listed passed. Any spur that has failed the absolute limit has an 'F' beside it.

Result	Units	Min	Max
Spur	N/A	0	200
Range	N/A	1	20
Frequency	Hz	Analyzer Min	Analyzer Max
Amplitude	dBm	Analyzer Min	Analyzer Max
Limit	dBm	-200	50

3.8.2.4 Gate

Window #5

Turning on "[Gate View On/Off](#)" on page 2686 displays the **Gate** Window, which allows you to see your gating signal at the same time as the measured data.

Views in which the **Gate** window appears:

View	Size	Position
Gate View	One third, full width	Top

3.8.2.5 Marker Table

Window# 6

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.8.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.8.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	<code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real></code> <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:SPUR:WIND:TRAC:Y:RLEV 10 dBm</code> <code>:DISP:SPUR:WIND:TRAC:Y:RLEV?</code>
Couplings	When "Auto Scaling" on page 1366 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to "Ref Value" on page 1359
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-/+250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	<code>[:SENSe]:SPURious:POWer[:RF]:LEVel</code> <code>:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel</code>

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	<code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl></code> <code>:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?</code>
Example	<code>:DISP:SPUR:WIND:TRAC:Y:PDIV 10 dB</code> <code>:DISP:SPUR:WIND:TRAC:Y:PDIV?</code>
Couplings	Coupled to "Scale Range" on page 1556 as follows Scale/Div = Scale Range/10 (number of divisions) When "Auto Scaling" on page 1366 is ON, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to OFF

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

Preset	Automatically calculated
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	<code>:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:PDIVision</code>

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace <code><meas></code> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALE]:RANGe <rel_amp1></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALE]:RANGe?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to Scale/Div as follows Scale Range = $\text{Scale/Div} * 10$ (number of divisions) When you change this value, Auto Scaling automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "[Amplitude Data Query and Y Axis Unit](#)" on page 1363 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "[Transducer Unit](#)" on page 1364 below.

Remote Command	:UNIT:POWer DBM DBMV DBMA V W A DBUV DBUA DBPW DBUVM DBUAM DBPT DBG :UNIT:POWer?
Example	:UNIT:POW dBmV :UNIT:POW? See also " Remote Interface Examples " on page 1362 below
Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and DBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: <ul style="list-style-type: none"> - The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out - If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the Trace, Normalize menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	:UNIT:POW DBM	Y Axis Unit is set to dBm
dBmV	:UNIT:POW DBMV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBMA	Y Axis Unit is set to dBmA
W	:UNIT:POW W	Y Axis Unit is set to W
V	:UNIT:POW V	Y Axis Unit is set to V
A	:UNIT:POW A	Y Axis Unit is set to A
dBmV	:UNIT:POW DBUV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

Unit	Example	Notes
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 1364 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If <code>:CORR:CSET:ANT?</code> returns <code>NOC</code> (for No Conversion), you are using a normal Y Axis dBuA. If it returns <code>UA</code> , you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1364
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1364
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1364
dBG	:UNIT:POW	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative

Unit	Example	Notes
(Transducer Unit)	DBG	to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1364
dBmA (Transducer Unit)	:UNIT:POW DBUA	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1364 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If <code>:CORR:CSET:ANT?</code> returns <code>NOC</code> (for No Conversion), you are using a normal Y-Axis dBuA. If it returns <code>UA</code> , you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE

The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.

Transducer Unit

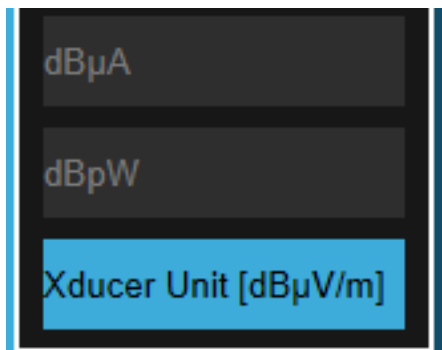

Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though **DBUV** had been sent as the terminator.

When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:

And on the control it looks like this:

NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
DBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns the **Ref Level Offset** on and off. Setting a specific value turns **Ref Level Offset** ON.

Remote Command	<code>:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet <rel_aml></code> <code>:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet?</code>
Example	Sets Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB is assumed: <code>:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7</code>
Dependencies	Appears only in SA Mode
Preset	0 dBm

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

State Saved	Saved in instrument state
Min	Variable. Limited to values that keep the reference level within the range -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as "Ref Offset <value>" to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown
Auto Function	
Remote Command	:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF ON 0 1 :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?
Example	Turn Ref Level Offset ON: :DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON
Preset	OFF

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Preset	TOP
State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON :DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:SPUR:WIND:TRAC:Y:COUP OFF :DISP:SPUR:WIND:TRAC:Y:COUP?
Couplings	When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of " Scale/Div " on page 1359, " Ref Value " on page 1359 or " Scale Range " on page 1556, Auto Scaling automatically changes to OFF When Auto Scaling is OFF , the measurement uses the current reference level settings When Auto Scaling is ON , the instrument automatically sets the reference level such that the absolute limit is positioned two divisions down from the top of the display. This is the most useful setting when searching for spurs. The algorithm used for determining the ref level is Ref Level = Absolute Limit + (2 *

	Scale/Div). All other reference level settings are left as the current base instrument settings
Preset	1
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	[:SENSe] : SPURious : POWer [:RF] : RANGe : AUTO :DISPlay : SPURious : VIEW[1] : WINDow[1] : TRACe : Y [:SCALe] : COUPlE

3.8.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 1367](#)
- See ["Single-Attenuator Configuration" on page 1368](#)

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten

In the **Amplitude**, "**Y Scale**" on page 1951 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten

"Total Atten above 50 GHz" followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "**Internal Preamp**" on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "**Attenuator Configurations and Auto/Man**" on page 1372

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1960 See " Attenuator Configurations and Auto/Man " on page 1372 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level , Int Preamp ,

External Gain, Ref Level Offset, Max Mixer Level, μ W Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto)

- In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "**Full Range Atten**" on page 1956 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto)

In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input

For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB

Preset	Auto The Auto value is 10 dB						
State Saved	Saved in instrument state						
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						

Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB

Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the "soft" attenuation is at 14 dB (see below for definition of "soft" attenuation)</p>
------------	--

When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1954, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 1370 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1960 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 1375](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1981 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the</p>

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1982 is **ON**, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 1375
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected **IFBW** for measurements that support **IFBW** (for example, **Waveform** measurement across all Modes that support it). In certain models (such as **N9042B** & **N9032B**), **IFBW** values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of

3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1376](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1959](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 1379

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECTrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>	
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>	
Notes	The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined	
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1960 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 1377 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

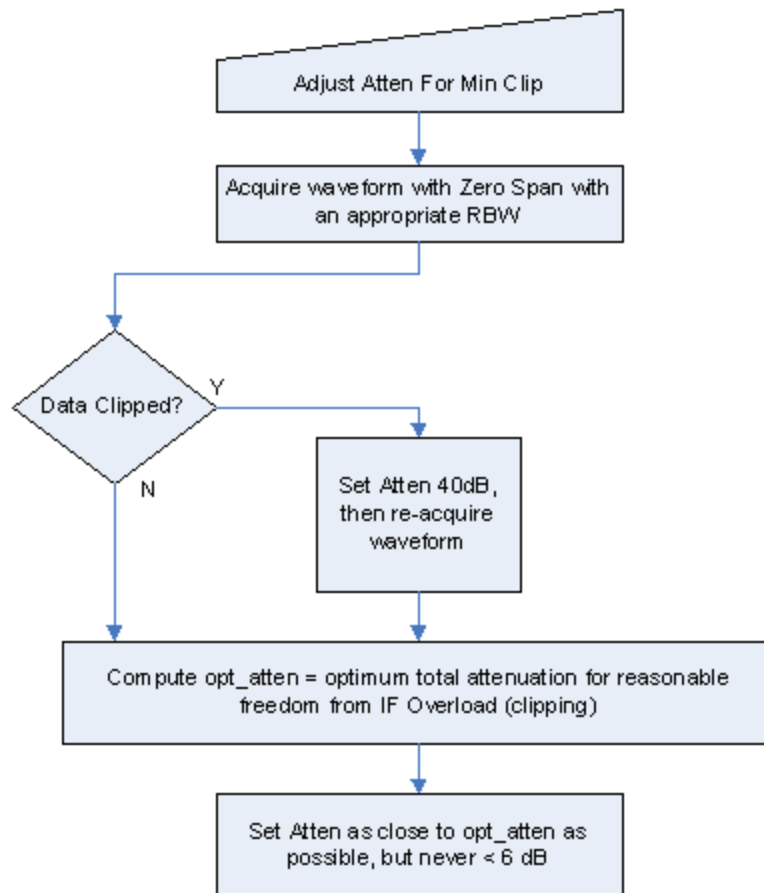

Notes	ON aliases to "Elec Atten Only" (<code>:POW:RANG:OPT:ATT ELEC</code>) OFF aliases to "Off" (<code>:POW:RANG:OPT:ATT OFF</code>)
-------	--

	<code>:POW:RANG:AUTO?</code> returns true if <code>:POW:RANG:OPT:ATT</code> is not OFF
Backwards	<code>[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0</code>
Compatibility	<code>[:SENSe]:POWer[:RF]:RANGe:AUTO?</code>
SCPI	

Adjustment Algorithm

The algorithms for the adjustment are documented below:

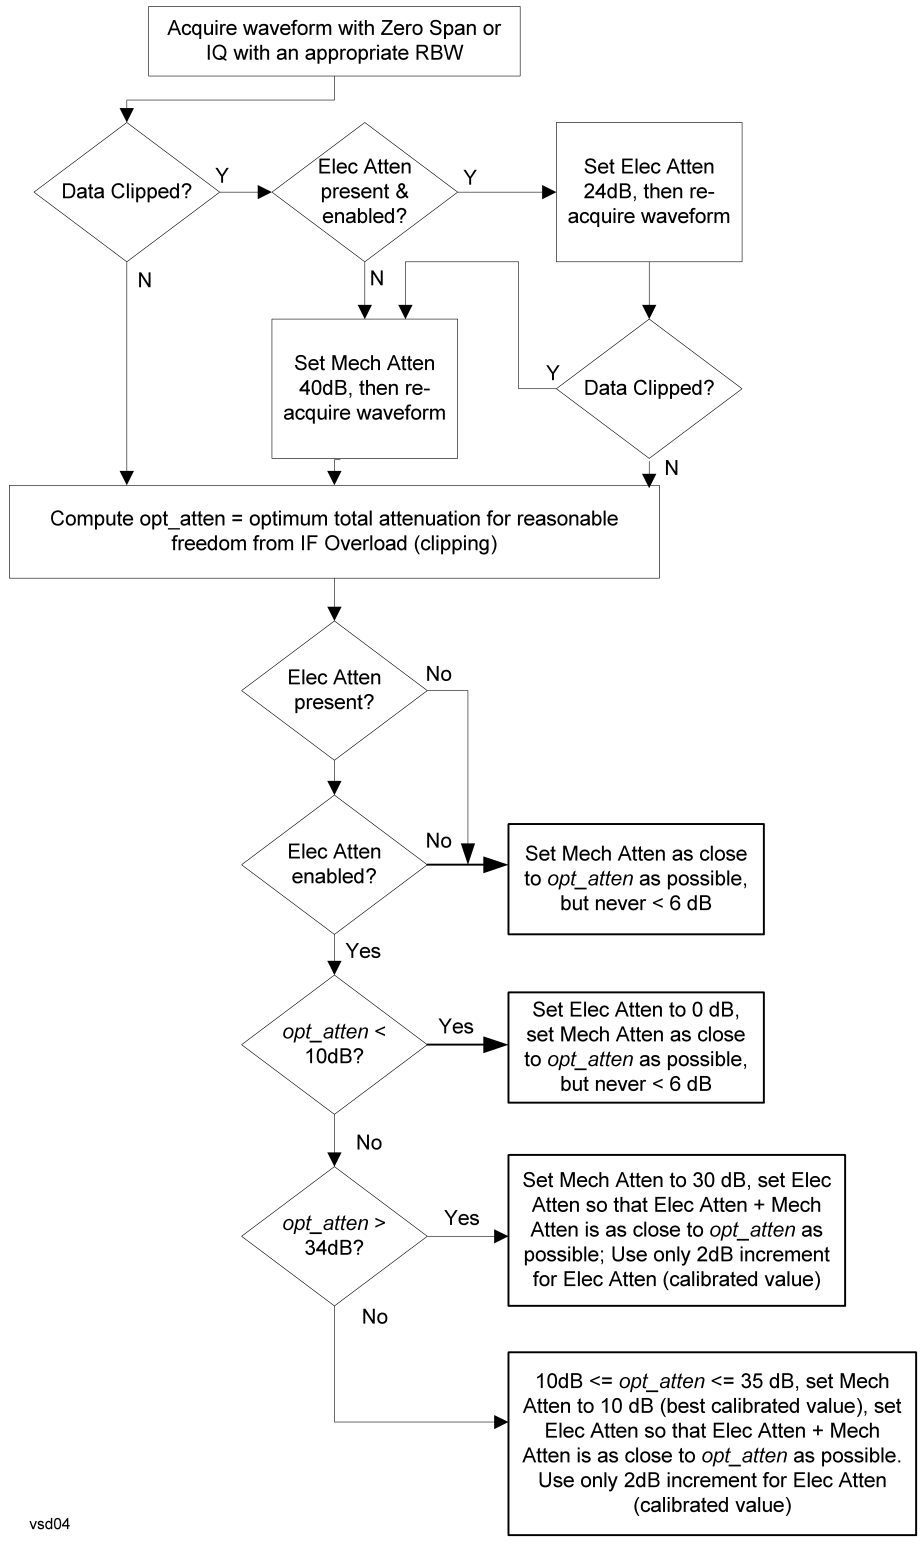

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1377 selection is Mech + Elec Atten:

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

vsd04

"Pre-Adjust for Min Clipping" on page 1377 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "[Max Mixer Lvl Rules](#)" on page 1969.

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real></code> <code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?</code>
Example	<code>:POW:MIX:RANG -15 dBm</code> <code>:POW:MIX:RANG?</code>
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Lets you optimize the Max Mixer Level setting for certain kinds of measurements.

NORMal	The historical, and thus backwards compatible, setting range (-50 to 0 dBm) and default setting (-10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression will be negligible
TOI	Allows a range of settings of the "Max Mixer Level" on page 1969, -50 to -10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, -25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
COMPression	Allows a range of settings of the Max Mixer Level, -10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, -3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	-10	-50	0
TOI	TOI-limited dynamic range	-25	-50	-10
COMPression	Compression-limited dynamic range	-3	-10	+30

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal TOI COMPression</code> <code>[:SENSe]:POWer[:RF]:MIXer:RULEs?</code>
Example	<code>:POW:MIX:RULE:COMP</code>
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	NORM

3.8.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe] :POWer [:RF] :RANGe <real></code> <code>[:SENSe] :POWer [:RF] :RANGe ?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG ?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting.
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe] :POWer [:RF] :RANGe :OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements.

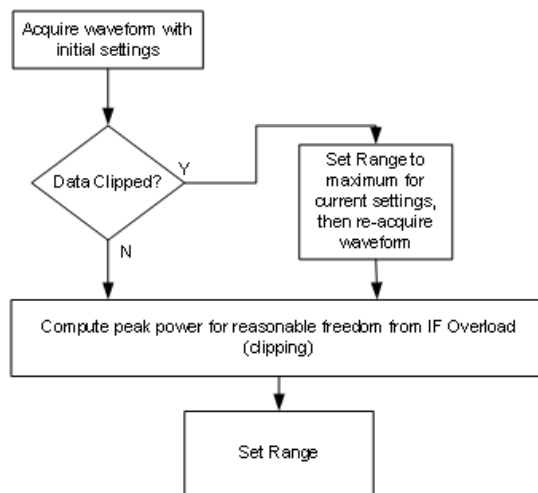

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
----------------	--

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

Example	<code>:POW:RANG:PAR 12 dB</code>	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.8.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1992](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1979](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 1388](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the

	centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1979
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to :READ or :MEASure queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1978 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code>

	<code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example,

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	LOW
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation

says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"
When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1981. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with "[Internal Preamp](#)" on page 1981, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 1392

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>

--------------	--

Preset	<code>OFF</code>
--------	------------------

State Saved	Saved in State
-------------	----------------

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB  
Pre: Int on, LNA on  
μW Path: LNP, On  
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB  
Pre: Int off, LNA on  
μW Path: LNP, On  
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the **μW Preselector** is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the **μW Preselector's** bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1397
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1399
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1399

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: :POW:MW:PRES OFF
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB)
Preset	ON
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code>

	N9042B+V3050A	ON
	M9410A/11A	ON
State Saved	Saved in instrument state	

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced [:SENSe]:POWer[:RF]:SWPreSel?	
Example	:POW:SWPR NORM :POW:SWPR?	
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1992 is OFF. The grayout message is “Unavailable unless SW Presel enabled”	
Preset	N9041B	ADVanced
	N9042B+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow** – a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz

and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1405 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.8.4 BW

There is no **BW** functionality in this measurement.

3.8.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.8.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View, or Window.

Center Frequency On/Off

Turns the display of **Center Frequency** on the **Meas Bar** On or Off.

Remote Command	<code>:DISPlay:SPURious:FREQuency:CENTer[:STATe] ON OFF 1 0</code>
Example	<code>:DISP:SPUR:FREQ:CENT ON</code> <code>:DISP:SPUR:FREQ:CENT?</code>
Preset	<code>ON</code>
State Saved	Yes

3.8.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code>
Example	<code>:DISP:GRAT OFF</code>

Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code>
----------------	---

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

	<code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	<code>ON</code>

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SElect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DElete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SElect
Delete Screen	:INSTrument:SCReen:DElete
Delete All But This Screen	:INSTrument:SCReen:DElete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.8.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

This measurement has two predefined views:

#	Name	SCPI
1	"Graph + Metrics" on page 1411	RESult
2	"All Ranges" on page 1411	ALL

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change, depending on which window is selected.

Remote Command	<code>:DISPlay:SPURious:VIEW[:SElect] RESult ALL</code> <code>:DISPlay:SPURious:VIEW[:SElect]?</code>
Example	<code>:DISP:SPUR:VIEW RANG</code> <code>:DISP:SPUR:VIEW?</code>
Preset	<code>RESult</code>
State Saved	No
Range	Graph + Metrics All Ranges

Graph + Metrics

Windows: ["Graph" on page 1355](#), ["Table" on page 1356](#)

Select Graph + Metrics to view measurement results.

- The upper window displays a trace of the range that contains the currently selected spur
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	<code>:DISP:SPUR:VIEW RES</code>
---------	----------------------------------

All Ranges

Windows: ["Graph" on page 1355](#),

Select All Ranges to view measurement results for all the ranges.

- The upper window displays a merged trace of all the ranges
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	<code>:DISP:SPUR:VIEW ALL</code>
---------	----------------------------------

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
----------------	--

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOom</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node</p> <pre>:DISP:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISP:VIEW:ADV:NAME <alphanumeric></code>
Example	<pre>:DISP:VIEW:ADV:NAME "Baseband"</pre> <p>Creates a new View named Baseband from the current View, and selects it as the current View</p>

Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> already exists” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>
-------	---

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN “Baseband”</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <code><alphanumeric></code> already exists” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELete</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DELeTe:ALL</code>
Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example:</p> <p><code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p>

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2004), then query the list of available Views, the result is undefined</p>

3.8.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some settings in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by ["Meas Preset" on page 1471](#). For example, ["Center Frequency" on page 1440](#) is the same for all measurements – it does not change as you change measurements.

3.8.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, display span is held constant (see ["Range Settings" on page 1436](#)).

The **Center Frequency** setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

frequency value. If this is the case, then a **Global** tab appears in the **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Remote Command	<code>[:SENSe]:FREQuency:CENTer <freq></code> <code>[:SENSe]:FREQuency:CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of " CF Step " on page 1420: <code>:FREQ:CENT UP</code> Return the current value of Center Frequency : <code>:FREQ:CENT?</code>
Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF:CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code> - For External Mixer it is equivalent to <code>:FREQ:EMIX:CENT</code> Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Dependencies	Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	Depends on instrument maximum frequency, Mode, measurement, and selected input See " Center Frequency Presets " on page 1417, " RF Center Freq " on page 1419, " Ext Mix Center Freq " on page 1419, " I/Q Center Freq " on page 1420 and " VXT Models with Radio Heads/CIU Frequency Range " on page 1418
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, Mode, measurement, and selected input See " Center Frequency Presets " on page 1417, " RF Center Freq " on page 1419, " I/Q Center Freq " on page 1420 and " VXT Models with Radio Heads/CIU Frequency Range " on page 1418
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :RF :CENTer <freq></code> <code>[:SENSe] :FREQuency :RF :CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the stop frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See " Center Frequency Presets " on page 1417 above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See " Center Frequency Presets " on page 1417 above. Basically, instrument maximum frequency -5 Hz If the knob or step keys are being used, also depends on span (see " Range Settings " on page 1436)

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :EMIXer :CENTer <freq></code> <code>[:SENSe] :FREQuency :EMIXer :CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having switched to one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the Center Frequency that you had. However, span (" Range " on page 1435) is not an input-dependent parameter, so the instrument returns to the span from the previous input, limited as necessary by the current mixer setup
Preset	When Mode Preset is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

setup. Similarly, the stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. **Center Frequency** thus presets to the point arithmetically equidistant from these two frequencies

Note that, if the current measurement has a limited span/range available to it, and cannot achieve the span shown in the table (**Range** = Stop Freq – Start Freq), the instrument uses the maximum span the measurement allows, and still sets **Center Frequency** to the midpoint of the start and stop Freq values in the Harmonic Table

When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose start and stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after **Restore Input/Output Defaults**, if you go to External Mixing and do **Mode Preset** while in Spectrum Analyzer Mode, the resulting **Center Frequency** is 33.25 GHz

State Saved	Yes
Min	The minimum frequency in the currently selected mixer band +5 Hz If the knob or step keys are being used, also depends on Range
Max	The maximum frequency in the currently selected mixer band –5 Hz If the knob or step keys are being used, also depends on Range

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQUency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQUency :IQ :CENTer ?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	–/+40.049995 MHz

CF Step

Changes the step size for "**Center Frequency**" on page 1440. Once a step size has been selected and the center frequency function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code>
Example	Increase the current center frequency value by 500 MHz: <code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Not available in MSR, LTE-A FDD/TDD and 5G NR Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up -arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Couplings	When auto-coupled, CF Step size is set to 10% of Range
Preset	Auto
State Saved	Saved in instrument state
Min/Max	-/+ (the maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF Step range of +/- 27 GHz. Note that this is the maximum frequency, given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP :AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO ?</code>
Example	<code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO ?</code>
Preset	ON

Freq Offset

Lets you set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform **Mode Preset**, or set the frequency offset to 0 Hz.

For more details, see "[More Information](#)" on page 1422

Remote Command	<code>[:SENSe] :FREQuency :OFFSet <freq></code> <code>[:SENSe] :FREQuency :OFFSet ?</code>
Example	<code>:FREQ:OFFS 10 MHz</code>

	<code>:FREQ:OFFS?</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Appears only in SA Mode Freq Offset is not available in External Mixing. In this case the Freq Offset control is grayed-out and displays a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input
Preset	See " Center Frequency Presets " on page 1441
State Saved	Saved in instrument state
Min/Max	-/+500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	<code>:DISP:WINDow[1]:TRACe:X[:SCALE]:OFFSet</code> The DISP version of the command is supported for compatibility across platforms and is not recommended for new development

More Information

This command does not affect any bandwidths, nor the settings of relative frequency parameters such as delta markers or span (range). It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by **Freq Offset**. Changing the offset, even on a trace that is not updating immediately changes all the above, without taking new data.

NOTE

If a trace is exported with a nonzero **Freq Offset**, the exported data contains the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want **Freq Offset** to be 0, or the offset will be applied again to data that is already offset. No such care need be taken when saving a State+Trace file, because the data and state are saved together.

3.8.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.8.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

On any menu tab that displays **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done, or a Band Function is turned on, or for Signal Track, or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.8.7.2 Settings

The controls on this tab include the **Marker** active function and a radio button selection for the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode is **OFF**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** (**POSition**) or **DELTA**.

Remote Command	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:SPUR:MARK2:X 25 kHz</code> <code>:CALC:SPUR:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is Normal , or the offset from the marker’s reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned OFF , so Marker X-Axis Value query returns Not A Number (NAN)

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

State Saved	Saved in instrument state
Min/Max	-/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X:POStion <real></code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:X:POStion?</code>
Example	<code>:CALC:SPUR:MARK10:X:POS 300</code> <code>:CALC:SPUR:MARK10:X:POS?</code>
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is OFF , the response is Not A Number
Preset	After a preset, all markers are turned OFF , so Marker X-Axis Value query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	-/+9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y Axis unit.

Remote Command	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:Y?</code>
Example	<code>:CALC:SPUR:MARK11:Y?</code>
Notes	Returns the marker Y-Axis result, if the control mode is Normal or Delta . If the marker is OFF , the response is Not A Number In the Complex Spectrum measurement, when the marker is on and Marker Trace is set to IQ, it returns I and Q values Case #1 - MarkerTrace SPEC, I or Q: returns a single double value <ul style="list-style-type: none"> - <code>>:CALC:SPEC:MARK1:Y?</code> - <code>-2.402406506109E+001</code> Case #2 - MarkerTrace IQ: returns a double array of two values, the first is I, and the second is Q <ul style="list-style-type: none"> - <code>>:CALC: SPEC:MARK1:Y?</code>

	- -3.006944493834E-003,+9.9870666467354E-004
	The IQ selection is for backward compatibility purposes. It is recommended that the users use the I and/or Q selection instead
Preset	Result dependent on Marker setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:SPURious:MARKer[1] 2 ... 12:FUNction:RESult?

Marker Mode

Sets the marker control mode to **POSition** (Normal), **DELta**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **POSition** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:MODE POSition DELTa OFF :CALCulate:SPURious:MARKer[1] 2 ... 12:MODE?
Example	:CALC:SPUR:MARK:MODE POS :CALC:SPUR:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition DELta OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is **OFF** to **ON** (1) puts it in **POSition** mode and places it at the center of the screen.

Example	:CALC:SPUR:MARK3:STAT 1
---------	--------------------------------

	<code>:CALC:SPUR:MARK3:STAT?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	OFF ON
Backwards	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:STATe OFF ON 0 1</code>
Compatibility SCPI	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:STATe?</code>

Delta Marker (Reset Delta)

Pressing this control has exactly the same effect as selecting **Delta** in "**Marker Mode**" on page 1425. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	<code>:CALCulate:SPURious:MARKer:AOFF</code>
Example	<code>:CALC:SPUR:MARK:AOFF</code>

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental x-axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	<code>:CALCulate:SPURious:MARKer:COUPle[:STATe] ON OFF 1 0</code> <code>:CALCulate:SPURious:MARKer:COUPle[:STATe]?</code>
Example	<code>:CALC:SPUR:MARK:COUP ON</code> <code>:CALC:SPUR:MARK:COUP?</code>

Preset	OFF Preset by Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.8.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search. Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on [page 1423](#) on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum y-axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum
Example	:CALC:SPUR:MARK2:MAX :SYST:ERR? can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was **OFF**, then it is turned on as a **POSITION** marker and a peak search is performed.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum:NEXT
Example	:CALC:SPUR:MARK2:MAX:NEXT
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker.

If the selected marker was **OFF**, then it is turned on as a **POSITION** marker and a peak search is performed.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum:RIGHT
Example	:CALC:SPUR:MARK2:MAX:RIGH
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker.

If the selected marker was **OFF**, then it is turned on as a **POSITION** marker and a peak search is performed.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:MAXimum:LEFT
Example	:CALC:SPUR:MARK2:MAX:LEFT
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is **OFF**, it is turned **ON** before the minimum search is performed.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:MINimum
Example	:CALC:SPUR:MARK:MIN
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Fixed** or **Normal** if it is not already on. (These markers may be on two different traces.)

If the selected marker is **OFF**, a **Delta** type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	:CALCulate:SPURious:MARKer[1] 2 ... 12:PTPeak
Example	:CALC:SPUR:MARK:PTP
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	Pk-Pk Search is not available when Coupled Markers is ON
Couplings	The selected marker becomes a Delta marker if not already in Delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this control has the same effect as selecting **Delta** in "**Marker Mode**" on [page 1425](#) on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search, and change the marker's control mode to **Delta**, without having to access two separate menus.

3.8.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on page 1423 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** control. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:REFerence <integer></code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:REFerence?</code>
Example	<code>:CALC:SPUR:MARK3:REF 5</code> <code>:CALC:SPUR:MARK:REF?</code>
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself, so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	If the reference marker is off it is turned on in Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults . This is not reset by Marker Off , All Markers Off , or Preset
State Saved	Saved in instrument state. Not affected by Markers Off , hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace

that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **OFF**, it moves the marker from the trace it was on to the new trace. If the marker is **OFF**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	<code>:CALCulate:SPURious:MARKer[1] 2 ... 12:TRACe:ATTached TRACe1 TRACe2 TRACe3</code> <code>:CALCulate:SPURious:MARKer[1] 2 ... 12:TRACe:ATTached?</code>
Example	<code>:CALC:SPUR:MARK2:TRAC:ATT TRAC2</code> <code>:CALC:SPUR:MARK2:TRAC:ATT?</code>
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of Marker Trace is not affected by " Auto Couple " on page 2017 Sending the remote command causes the addressed marker to become selected
Preset	<code>TRACe1</code>
State Saved	Saved in instrument state
Range	<code>TRACe1 TRACe2 TRACe3</code>

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "**Marker Settings Diagram**" on page 1426 under **Settings**.

3.8.8 Meas Setup

Contains functions for setting up the measurement parameters, and for setting up parameters global to all measurements in the Mode.

3.8.8.1 Settings

Contains frequently-used **Meas Setup** functions, to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep.

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

Remote Command	<code>[:SENSe]:SPURious:AVERage:COUNT <integer></code> <code>[:SENSe]:SPURious:AVERage:COUNT?</code>
Example	<code>:SPUR:AVER:COUN 2500</code> <code>:SPUR:AVER:COUN?</code>
Preset	10
State Saved	Saved in instrument state
Min/Max	1/10000

Averaging On/Off

Turns Averaging on or off.

NOTE

In this measurement, the **Average Type** is preset to the **Log-Pwr Avg (Video)** method. Other averaging methods are not available.

Remote Command	<code>[:SENSe]:SPURious:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:SPURious:AVERage[:STATe]?</code>
Example	<code>:SPUR:AVER ON</code> <code>:SPUR:AVER?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF

Average Mode

Lets you set the Averaging Mode. Options are:

- **EXPonential**: The measurement averaging continues using the specified number of averages to compute each averaged value. The average will be displayed at the end of each sweep
- **REPeat**: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	<code>[:SENSe]:SPURious:AVERage:TCONtrol EXPonential REPeat</code> <code>[:SENSe]:SPURious:AVERage:TCONtrol?</code>
Example	<code>:SPUR:AVER:TCON REP</code> <code>:SPUR:AVER:TCON?</code>
Preset	EXPonential

State Saved	Saved in instrument state
Range	EXP ponential REP eat

Average Type

Enables you to control the way averaging is done by choosing one of the following averaging scales: Log-Power (Video) or Power (RMS).

There are three different averaging processes in the measurement, and all of them are affected by this setting: Trace Averaging, the Average detector, and VBW filtering.

Control Selection	SCPI	Type
Log-Pwr (Video)	LOG	Simulates the traditional spectrum analyzer type of averaging by averaging the log of the power
Power (RMS)	RMS	True power averaging that is equivalent to taking the RMS value of the voltage. This is the most accurate type of averaging

Remote Command	[:SENSe]:SPURious:AVERage:TYPE LOG RMS [:SENSe]:SPURious:AVERage:TYPE?
Example	:SPUR:AVER:TYPE LOG :SPUR:AVER:TYPE?
Couplings	Sending this command will affect the VBW Average Type
Preset	LOG
State Saved	Yes
Range	Log-Pwr (Video) Power (RMS)

Meas Type

Selects either [EXAM](#)ine or [FULL](#) measurement type. This parameter is coupled to "[Average Mode](#)" on page 1432. Therefore, if the [EXAM](#)ine measurement type is selected, the measurement sets the Average Mode to exponential. If the [FULL](#) measurement type is selected, the measurement sets the Average Mode to repeat. The behavior of each measurement type is described in the table below. When averaging is on, trace averaging is used as each active range is measured. Averaging is not used at any other time.

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

Type	Single		Continuous	
	No Spurs Found	Spurs Found	No Spurs Found	Spurs Found
EXAMine	All active ranges are measured. On completion the measurement is set to the idle state and the 'No Spurs' happening is displayed	All active ranges are measured, and the spurs found reported. On completion the measurement is set to the idle state and the trace containing the worst spur restored. The spur control is enabled. A marker is also added which is set to the frequency of the worst spur	All active ranges are measured. On completion the SA remains set to last range checked with an active trace and the 'No Spurs' happening is displayed	All active ranges are measured, and the spurs found reported. On completion the SA is set to the range containing the worst spur found and continually sweeps this range. Note that the trace is continually updated but the metrics results aren't updated until restart to keep the initial results as references. Use marker readouts to refer the latest results. The spur control is enabled. A marker is also added which is set to the frequency of the worst spur
FULL	All active ranges are measured. On completion measurement is set to idle state and the 'No Spurs' happening is displayed	All active ranges are measured, and spurs found reported. On completion the measurement is set to the idle state, displaying the trace of the last active range	Measurement continually cycles through all active ranges	All active ranges are measured, and spurs found reported. On each cycle of the active ranges the spurs found are reset. This ensures any remote queries

	Single		Continuous

Preset	EXAMine			
State Saved	Saved in instrument state			
Range	EXAMine FULL			

Spur

Displays any spurs found. Only enabled when the measurement type is set to **EXAMine**, and turns on upon completion of a measurement. Once the **Spur** control has been enabled, you can view any spur. The measurement sets the instrument to the range in which the currently selected spur was found. The range settings only change if the spur selected is in a range that is different from the current range settings. A marker is used to identify the currently selected spur on the trace.

Remote Command	[:SENSe]:SPURious:SPUR <integer> [:SENSe]:SPURious:SPUR?
Example	:SPUR:SPUR 55 :SPUR:SPUR?
Preset	1
State Saved	No
Min/Max	1/200

Range

Selects the sweep range of the display trace. **Marker** operation, such as peak search is performed in the selected range.

For more details, see ["Range Settings" on page 1436](#).

Preset	1
State Saved	No
Min/Max	1/20

Spur Report Mode

Selects the spurious report mode. Options are:

Limit Line Test	LIMTest	Report only spurs above the limit line. Any spurs reported will cause the measurement to fail. See Abs Start Limit for more information
All Spurs	ALL	Report all spurs detected by Peak Threshold and Peak Excursion
Minimum Margin	MMARgin	Report only the spur with the minimum margin from the limit line. For the spur above the limit, its margin is defined as the negative margin. If there are more than one spurs above the limit, only one spur with the largest negative margin is reported

Remote Command	<code>[:SENSe]:SPURious:REPT:MODE ALL LIMTest MMARgin</code> <code>[:SENSe]:SPURious:REPT:MODE?</code>
Example	<code>:SPUR:REPT:MODE LIMT</code> <code>:SPUR:REPT:MODE?</code>
Dependencies	MMARgin is available only when option N9060A-7FP is installed
Preset	ALL
State Saved	Saved in instrument state
Range	All Spurs Limit Test Minimum Margin

Range Settings

This dialog enables you to set range parameters. As you change values, the instrument settings are updated with the new parameter values.

In SA Mode, and most other Modes, each **Range** is defined by its Start Freq and Stop Freq. The index tabs that appear on the left side of this dialog let you change different sets of **Range** parameters; the **Ranges** themselves (Start Freq and Stop Freq) are the same in each of these tabs. In some measurements, **Center Frequency** and **Span** are also shown, but these depend on the Start Freq and Stop Freq parameters for each **Range**.

In MSR Mode, each **Range** is defined by the parameters under the **Frequency** Index tab. The parameters for each **Range** are defined using the other index tabs, tied to the **Frequency** tab by the **Range** number, which appears in the leftmost column of each table.

Each **Range** has an **Enabled** checkbox, which lets you decide whether to use the **Range** or not. The checkbox state is the same for all tabs.

Bandwidth

Lets you set RBW and VBW parameters for each range, as well as Filter Type. The **Bandwidth** tab appears in all Modes except MSR.

Frequency Range

Allows you to switch the displayed **Frequency Range** columns. When **ALL** is selected, Start Frequency, Stop Frequency, Center Frequency, and Span are displayed.

This control appears only in instruments with a 4U size front panel.

Remote Command	<code>:DISP:SPURious:VIEW:RANGe:TABLe:FMODe ALL SSTop CSPan</code>
Example	<code>:DISP:SPUR:VIEW:RANG:TABL:FMOD ALL</code> <code>:DISP:SPUR:VIEW:RANG:TABL:FMOD?</code>
Preset	<code>SSTop</code>
State Saved	Saved in instrument state
Range	All Start/Stop Frequency Center Frequency/Span

Enabled

Turns on/off each Range. If Range is **ON**, it will be used as part of the measurement. If it is **OFF**, it will be excluded. This parameter can send up to 20 values. The location in the list sent corresponds to the range number. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:STATe ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0, ON OFF 1 0</code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:STATe?</code>

State Saved	Yes
Min/Max	-79999990/Hardware Dependent: <ul style="list-style-type: none"> - Option 503: 3.7 GHz - Option 508: 8.5 GHz - Option 513: 13.8 GHz - Option 526: 27.0 GHz

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, display span is held constant (see "[Range Settings](#)" on page 1436).

The **Center Frequency** setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, then a **Global** tab appears in the **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Remote Command	<code>[:SENSe] :FREQuency :CENTer <freq></code> <code>[:SENSe] :FREQuency :CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code>

	<p>Increment Center Frequency by the value of "CF Step" on page 1420: :FREQ:CENT UP</p> <p>Return the current value of Center Frequency: :FREQ:CENT?</p>
Notes	<p>This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input</p> <ul style="list-style-type: none"> - For RF input it is equivalent to :FREQ:RF:CENT - For I/Q input it is equivalent to :FREQ:IQ:CENT - For External Mixer it is equivalent to :FREQ:EMIX:CENT <p>Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated</p>
Dependencies	Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	<p>Depends on instrument maximum frequency, Mode, measurement, and selected input</p> <p>See "Center Frequency Presets" on page 1441, "RF Center Freq" on page 1443, "Ext Mix Center Freq" on page 1444, "I/Q Center Freq" on page 1445 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1443</p>
State Saved	Saved in instrument state
Min/Max	<p>Depends on instrument maximum frequency, Mode, measurement, and selected input</p> <p>See "Center Frequency Presets" on page 1441, "RF Center Freq" on page 1443, "I/Q Center Freq" on page 1445 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1443</p>
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :RF :CENTer <freq></code> <code>[:SENSe] :FREQuency :RF :CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the stop frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

Preset	See "Center Frequency Presets" on page 1441 above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See "Center Frequency Presets" on page 1441 above. Basically, instrument maximum frequency –5 Hz If the knob or step keys are being used, also depends on span (see "Range Settings" on page 1436)

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQUency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQUency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having switched to one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the Center Frequency that you had. However, span ("Range" on page 1435) is not an input-dependent parameter, so the instrument returns to the span from the previous input, limited as necessary by the current mixer setup
Preset	When Mode Preset is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited span/range available to it, and cannot achieve the span shown in the table (Range = Stop Freq – Start Freq), the instrument uses the maximum span the measurement allows, and still sets Center Frequency to the midpoint of the start and stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose start and stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after Restore Input/Output Defaults , if you go to External Mixing and do Mode Preset while in Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band +5 Hz If the knob or step keys are being used, also depends on Range
Max	The maximum frequency in the currently selected mixer band –5 Hz If the knob or step keys are being used, also depends on Range

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe]:FREQuency:IQ:CENTer <freq></code> <code>[:SENSe]:FREQuency:IQ:CENTer?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	-/+40.049995 MHz

Span

Sets the span of the instrument. This parameter can send up to 20 values. The location where the span occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:SPAN <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:SPAN?</code>
Example	<code>:SPUR:FREQ:SPAN 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz</code> <code>:SPUR:FREQ:SPAN?</code>
Preset	(Preset of Stop Freq) - (Preset of Start Freq)
State Saved	No
Min/Max	0Hz/Instrument maximum frequency + 80MHz

Res BW

Sets the resolution bandwidth of the instrument. This parameter can send up to 20 values.

	1, OFF ON 0 1, OFF ON 0 1	
	[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth[:RESolution]:AUTO?	
Example	:SPUR:BWID:AUTO ON, ON, ON, OFF, OFF, OFF, OFF, OFF, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, ON, ON :SPUR:BWID:AUTO?	
Preset	SA Mode	OFF, OFF, OFF, OFF, OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
	WCDMA Mode	OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
	LTE, LTEAFDD, LTETDD, LTEATDD, 5G NR Modes	OFF, OFF, OFF, OFF, OFF, OFF, OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
	WLAN Mode	OFF, OFF, OFF, OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
	MSR Mode	OFF, OFF, OFF, OFF, OFF, OFF, OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
State Saved	Saved in instrument state	
Backwards Compatibility SCPI	[:SENSe]:SPURious[:RANGe][:LIST]:BWiDth[:RESolution]:AUTO	

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer number. It shows a ratio between Integration BW and Resolution BW of the measurement result:

$$\text{Integ BW} = \text{Meas BW} * \text{Resolution BW}$$

Integration BW is desired resolution bandwidth and Resolution BW is actual bandwidth for sweep. Measurement sweeps with Resolution BW and **Meas BW** compensates sweep resolution bandwidth to Integration BW.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

Remote Command	[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:IMULTi <integer>, ... [:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:IMULTi?	
Example	:SPUR:BAND:IMUL 1,1,1,1,1,1 :SPUR:BAND:IMUL?

State Saved	Saved in instrument state
Range	Gaussian (Normal) Flattop
Backwards Compatibility SCPI	<pre>[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:SHAPE</pre>

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See "**Enabled**" on page 1437

Frequency Type

Selects the frequency type as either **ABSolute** or **OFFSet**:

ABSolute The frequency range is determined by Abs Start Freq and Abs Stop Freq. Absolute and offset frequencies are not coupled

OFFSet The frequency range is determined based on Offset Start Freq and Offset Stop Freq. Abs Start Freq and Abs Stop Freq are coupled with the offset parameters and show the actual frequency ranges. The following coupling equations are used to calculate Abs Start Freq and Abs Stop Freq

When Offset Side is Negative:

$$[\text{Abs Start Freq}] = [\text{OB Start Freq}] - [\text{Offset Stop Freq}]$$

$$[\text{Abs Stop Freq}] = [\text{OB Start Freq}] - [\text{Offset Start Freq}]$$

When Offset Side is Positive:

$$[\text{Abs Start Freq}] = [\text{OB Stop Freq}] + [\text{Offset Start Freq}]$$

$$[\text{Abs Stop Freq}] = [\text{OB Stop Freq}] + [\text{Offset Stop Freq}]$$

When changing OB Start/Stop Freq, Abs Start/Stop Freq is changed and Offset Start/Stop Freq remains unchanged.

When changing Offset Start/Stop Freq, Abs Start/Stop Freq is changed and OB Start/Stop Freq remains unchanged.

Remote Command	<pre>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:TYPE ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet, ABSolute OFFSet</pre>
Example	<pre>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:TYPE? :SPUR:FREQ:TYPE OFFS, OFFS, ABS, ABS, ABS :SPUR:FREQ:TYPE?</pre>
Couplings	<p>Freq Type automatically changes to OFFSet when you change a value of Offset Start Freq, Offset Stop Freq or Offset Side, and automatically changes to ABSolute when you change a value of Abs Start Freq or Abs Stop Freq</p>
Preset	<pre>ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute,</pre>

	<code>ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute</code>

Range	<code>ABSolute OFFSet</code>

Abs Start Freq

Sets the start frequency of the instrument. This parameter can send up to 20 values. The location where the start frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

This parameter is coupled with either Offset Start Freq or Offset Stop Freq. The coupling equations are shown in ["Enabled" on page 1450](#).

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQUency:STARt <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQUency:STARt?</code>

Abs Stop Freq

Sets the stop frequency of the instrument. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with.

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

This parameter is coupled with either ["Offset Start Freq" on page 1452](#) or ["Offset Stop Freq" on page 1453](#). The coupling equations are shown in ["Enabled" on page 1450](#).

The location of where the stop frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STOP <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STOP?</code>
Example	<code>:SPUR:FREQ:STOP 150kHz, 30MHz, 1GHz, 2.1GHz, 2.1GHz, 2.1774GHz, 2.18GHz, 12.75GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz</code> <code>:SPUR:FREQ:STOP?</code>

Offset Start Freq

Sets the range frequency as offset from one of the operating band edges. This parameter can send up to 20 values. The location where the start frequency occurs in the list sent to the measurement corresponds to the range the value is associated with. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

This parameter is coupled with either ["Abs Start Freq" on page 1451](#) or ["Abs Stop Freq" on page 1451](#) using the coupling equations shown in ["Enabled" on page 1450](#).

This value is clipped to keep Abs Start/Stop Freq within the available frequency range. This clipping applies even when OB Start Freq, OB Stop Freq or Offset Side is changed.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STARt <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STARt?</code>

Preset	10 MHz, 20 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz
State Saved	Saved in instrument state
Min/Max	-80 MHz/SA Max Freq - 10Hz (Hardware Dependent)

Offset Stop Freq

Sets the range frequency as offset from one of operating band edges. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with.

The location of where the stop frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

This parameter is coupled with either ["Abs Start Freq" on page 1451](#) or ["Abs Stop Freq" on page 1451](#) using the coupling equations shown in ["Enabled" on page 1450](#).

This value is clipped to keep Abs Start/Stop Freq inside the available frequency range. This clipping applies even when OB Start Freq, OB Stop Freq or Offset Side is changed.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STOP <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STOP?</code>

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:ATTenuation:AUTO OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1, OFF ON 0 1</code>
Example	<code>:SPUR:ATT:AUTO 0,0</code> <code>:SPUR:ATT:AUTO?</code>
Preset	ON, ON
State Saved	Saved in instrument state
Range	Auto Man

IF Gain

Same as the IF Gain column under the **Atten** tab. See ["IF Gain" on page 1457](#).

Detector/Sweep

Lets you set Sweep, IF Gain, and Detector parameters for each Range.

Frequency Range

Allows you to switch the displayed **Frequency Range** columns. When **ALL** is selected, Start Frequency, Stop Frequency, Center Frequency, and Span are

displayed.

This control appears only in instruments with a 4U size front panel.

Remote Command	<code>:DISPlay:SPURious:VIEW:RANGe:TABLE:FMODE ALL SStop CSPan</code> <code>:DISPlay:SPURious:VIEW:RANGe:TABLE:FMODE?</code>
Example	<code>:DISP:SPUR:VIEW:RANG:TABL:FMOD ALL</code> <code>:DISP:SPUR:VIEW:RANG:TABL:FMOD?</code>
Preset	<code>SStop</code>
State Saved	Saved in instrument state
Range	All Start/Stop Frequency Center Frequency/Span

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See "[Enabled](#)" on page 1437.

Start Freq

Same as the Start Freq column under the **Bandwidth** tab. See "[Start Freq](#)" on page 1438. This column does not appear in MSR mode.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** tab. See "[Stop Freq](#)" on page 1439. This column does not appear in MSR mode.

Center Frequency

Same as the Center column under the **Bandwidth** index tab. See "[Center Frequency](#)" on page 1455.

Span

Same as the Span column under the **Bandwidth** tab. See "[Span](#)" on page 1445. This column does not appear in MSR mode.

Sweep Time

Sets the **Sweep Time** mode of the instrument. This can be **Auto**, where the instrument determines the optimum setting, or **Manual**, where you determine the setting.

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME?</code>
Example	<code>:SPUR:SWE:TIME 10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10</code> <code>:SPUR:SWE:TIME?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	1.0E-3/2.0E+3
Auto Function	
Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME:AUTO OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1,OFF ON 0 1</code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME:AUTO?</code>
Example	<code>:SPUR:SWE:TIME:AUTO</code> <code>ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON</code> <code>:SPUR:SWE:TIME:AUTO?</code>
Preset	<code>ON, ON</code>
State Saved	Saved in instrument state
Range	<code>OFF ON</code>

Points

Sets the number of points per sweep for the measurement. This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

The Points mode can be manual, where you determine the setting or auto, where the instrument determines the number of trace points to ensure the sweep points resolution equals RBW/2. This is calculated using the following algorithm:

$$\text{Points} = (\text{Stop Freq} - \text{Start Freq}) / (\text{ResBW} / 2)$$

Limits

Lets you set Start and Stop Limits and Threshold values for each Range.

Frequency Range

Same as **Frequency Range** under the **Bandwidth** tab. See "[Frequency Range](#)" on [page 1460](#). This control does not appear in MSR mode.

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See "[Enabled](#)" on [page 1437](#).

Start Freq

Same as the Start Freq column under the **Bandwidth** tab. See "[Start Freq](#)" on [page 1438](#). This column does not appear in MSR.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** tab. See "[Stop Freq](#)" on [page 1439](#). This column does not appear in MSR.

Center Frequency

Same as the Center column under the **Bandwidth** tab. See "[Center Frequency](#)" on [page 1455](#). This column does not appear in MSR mode.

Span

Same as the Span column under the **Bandwidth** tab. See "[Span](#)" on page 1445. This column does not appear in MSR mode.

Abs Start Limit

Determines the limit above which spurs will report a failing. If Abs Stop Limit Mode is set to **Auto**, this is coupled to **Abs Stop Limit** to make a flat limit line. If set to **Man**, Abs Start Limit and Abs Stop Limit can take different values to make a sloped limit line.

If the Limit Line Test parameter is off, then any spurs that are found to be above the current 'Peak Excursion' are added to the results table. From these spurs, the amplitude is checked using the abs limit start and abs limit stop parameters, then the limit is calculated. An 'F' is appended to the amplitude value of the spur if the measured amplitude is above the limit. If the Limit Line Test is on, only the spurs whose amplitudes exceed the limit are reported.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<pre>:CALCulate:SPURious[:RANGE][:LIST]:LIMit:ABSolute[:UPPer]:DATA[:START] <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl> :CALCulate:SPURious[:RANGE][:LIST]:LIMit:ABSolute[:UPPer]:DATA[:START]?</pre>
Example	<pre>:CALC:SPUR:LIM:ABS:DATA 0,0 :CALC:SPUR:LIM:ABS:DATA?</pre>

	-50dBm, -50dBm WLAN Mode: -36dBm, -36dBm, -36dBm, -30dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Abs Stop Limit

Determines the limit above which spurs will report a failing. If Abs Stop Limit Mode is set to **Auto**, this is coupled to **Abs Start Limit** to make a flat limit line. If set to **Man**, Abs Start Limit and Abs Stop Limit can take different values to make a sloped limit line.

Abs Stop Limit Mode, when set to Couple, couples Abs Start Limit and Abs Stop Limit to make a flat limit line. If set to Man, Abs Start and Abs Stop can take different values to make a sloped limit line.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query for this parameter always returns 20 values.

Remote Command	<code>:CALCulate:SPURious[:RANGE][:LIST]:LIMit:ABSolute[:UPPer]:DATA:STOP <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl></code> <code>:CALCulate:SPURious[:RANGE][:LIST]:LIMit:ABSolute[:UPPer]:DATA:STOP?</code>

State Saved	Saved in instrument state
Min/Max	0.0 dB/100.0 dB

Pk Threshold

Sets the minimum amplitude of signals that can be identified as peaks. For example, if a value of -90 dBm is selected, only peaks that rise and fall more than the peak excursion value which are above -90 dBm are identified.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	<code>[:SENSe]:SPURious[:RANGe][:LIST]:PEAK:THReshold <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real></code> <code>[:SENSe]:SPURious[:RANGe][:LIST]:PEAK:THReshold?</code>

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1470 below.

Remote Command	:COUPl ^e ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does *not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command **:CONFigure:SPURious**

Example **:CONF:SPUR**

Fast Spurious Meas (Remote Command only)

This command is the backward compatibility command for the Fast Spurious Measurement. Since this command is another representation of Spurious Report Mode, it is coupled with that command.

- When set to **ON**, only spurs above the limit line are reported. This is the same as Spurious Report Mode **LIMTest**

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

- When set to **OFF**, all detected spurs are reported. This is the same as Spurious Report Mode **ALL**

Remote Command	<code>[:SENSe]:SPURious:FSMeas ON OFF 1 0</code> <code>[:SENSe]:SPURious:FSMeas?</code>
Example	<code>:SPUR:FSM ON</code> <code>:SPUR:FSM?</code>
Couplings	If <code>:SPUR:REPT:MODE</code> is ALL , this parameter is OFF If <code>:SPUR:REPT:MODE</code> is LIMTest , this parameter is ON
Preset	OFF
State Saved	Saved in instrument state

3.8.8.2 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	<code>[:SENSe]:RADio:STANdard[:SElect] NONE JSTD IS95a IS97D IS98D GSM W3GPP C2000MC1 C20001X NADC PDC BLUEtooth TETRa WL802DOT11A WL802DOT11B WL802DOT11G HIPERLAN2 DVBTLSN DVBTGPN DVBTIPN FCC15 SDBSE UWBINDOOR LTEB1M4 LTEB3M LTEB5M LTEB10M LTEB15M LTEB20M WL11N20M WL11N40M WL11AC20M WL11AC40M WL11AC80M WL11AC160M WL11AX20M WL11AX40M WL11AX80M WL11AX160M WL11BE20M WL11BE40M WL11BE80M WL11BE160M WL11BE320M WL11AD2G WL11AY2G16 WL11AY4G32 WL11AY6G48 WL11AY8G64 NR5GFR1B100M</code> <code>[:SENSe]:RADio:STANdard[:SElect]?</code>
Example	<code>:RAD:STAN NONE</code> <code>:RAD:STAN?</code>
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station

(BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	<code>[:SENSe]:RADio:STANdard:DEVice BTS MS</code> <code>[:SENSe]:RADio:STANdard:DEVice?</code>
Example	<code>:RAD:STAN:DEV MS</code> <code>:RAD:STAN:DEV?</code>
Preset	<code>BTS</code>
State Saved	Saved in instrument state
Range	<code>BTS MS</code>

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
FCC Part15 Subpart F	RRC Filter	On
	RRC Filter Alpha	0.35
	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
----------	-----------------	---------------

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
3GPP W-CDMA	VBW	Auto rules
	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
3GPP LTE 1.4 MHz	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
3GPP LTE 5 MHz	VBW	Auto rules
	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
3GPP LTE 10 MHz	RBW	Auto rules
	VBW	Auto rules
	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
3GPP LTE 3 MHz	Span	7.5 MHz
	RBW	Auto rules
	VBW	Auto rules
	Command Example	:RAD:STAN LTEB10M
3GPP LTE 5 MHz	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules

3 Spectrum Analyzer Mode
3.8 Spurious Emissions Measurement

3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D
		:RAD:STAN IS98D
		:RAD:STAN IS95C
		:RAD:STAN?
		Query always returns IS97D
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	<code>[:SENSe]:RADio:STANdard:BAND:CLASs BC0 BC1</code> <code>[:SENSe]:RADio:STANdard:BAND:CLASs?</code>
Example	<code>:RAD:STAN:BAND:CLAS BC0</code> <code>:RAD:STAN:BAND:CLAS?</code>
Preset	<code>BC0</code>
State Saved	Saved in instrument state
Range	0 (800 MHz Band) 1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is **NONE**, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as **:CONF** allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to **NONE**.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to **NO**, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to **YES**, all measurements and standard selections are enabled, so you can select any combination.

NOTE

If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	[:SENSe]:RADio:STANdard:EAMeas YES NO [:SENSe]:RADio:STANdard:EAMeas?
Example	:RAD:STAN:EAM YES :RAD:STAN:EAM?
Preset	NO
State Saved	Saved in instrument state
Range	YES NO

3.8.8.3 Advanced

Contains controls for setting advanced functions of the instrument.

This tab does not appear in VXT.

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer), support two states of NFE, Full and Adaptive. The **ON** state (in Modes that do not support Adaptive NFE) matches the **FULL** state (in Modes that *do* support Adaptive NFE).

In **ON** or **FULL** NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact in having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, therefore it does nothing when **External Mixing** is selected.

In Modes that support Adaptive NFE, the default state of NFE is **Adaptive**. In Modes that do not support Adaptive NFE, the default state of NFE is **OFF**. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was **OFF** for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On/Off** to **Full/Adaptive/Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes which support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON` plus
`:CORRection:NOISe:FLOor:ADAPtive ON`

Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOor ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor?</code>
Example	<code>:CORR:NOIS:FLO ON</code>
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect)
Couplings	If NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed If NFE is enabled via SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive
State Saved	No
Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?</code>
Example	First turn NFE on, this is Full mode <code>:CORR:NOIS:FLO ON</code> Then set it to Adaptive <code>:CORR:NOIS:FLO:ADAP ON</code>
Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command is accepted without error, but has no effect
Couplings	Sending <code>:CORR:NOIS:FLO ON</code> turns NFE Adaptive OFF for backwards compatibility, so to turn

	Adaptive on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE,

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you Cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

3.8.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in

when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:FREQuency:CENTer ALL NONE</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATe]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPle:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Global Limit Lines (Freq and Amptd)

When this control is set to **ALL**, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global Settings**, while **Global Limit Lines** is **ALL**, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to **NONE**, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is **ALL**, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to **NONE** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPle:LLINe ALL NONE</code> <code>:INSTRument:COUPle:LLINe?</code>
Example	<code>:INST:COUP:LLIN ALL NONE</code> <code>:INST:COUP:LLIN?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:FREQuency:BAND:EXTend 0 1 ON OFF</code> <code>:INSTrument:COUPle:FREQuency:BAND:EXTend?</code>
Example	<code>:INST:COUP:FREQ:BAND:EXT 1</code> <code>:INST:COUP:FREQ:BAND:EXT?</code>
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	<code>:INSTrument:COUPle:DEFault</code>
Example	<code>:INST:COUP:DEF</code>
Backwards Compatibility SCPI	<code>:GLOBal:DEFault</code>

3.8.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.8.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1494

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping
-----------------	--

	<p>See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>
Single Mode	<p>The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average, Max Hold, or Min Hold</p>

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 2039 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/hold sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 1496

Remote Command	<code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (<code>INTEgrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** > 1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue

Event	Trace Effect
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when **:ABORT** is sent, the alignment finishes *before* the abort function is performed, so **:ABORT** does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an **:INIT:IMM** command is received.

Remote Command	:ABORT
Example	:ABOR
Notes	<p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The STATUS:OPERation register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATUS:QUEStionable register bit 9 (INTegrity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p>

3.8.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Type

Sets the **Sweep Type** of the spurious measurement to either **Auto** or **Swept**.

When in **Auto**, the selections of swept type of ranges are governed by the Best Speed Sweep Type Rule, and FFT analysis might be chosen for some ranges if it speeds up the measurement.

Remote Command	[:SENSe] :SPURious [:RANGe] :ALL :SWEep :TYPE :AUTO OFF ON 0 1
----------------	---

	<code>[:SENSe] : SPURious [:RANGe] : ALL : SWEep : TYPE : AUTO ?</code>
Example	<code>: SPUR : ALL : SWE : TYPE : AUTO 1</code> <code>: SPUR : ALL : SWE : TYPE : AUTO ?</code>
Dependencies	Available only when Option N9060A-7FP is installed
Preset	ON
State Saved	Saved in instrument state
Range	Auto Swept
Annotation	When in Auto , and the instrument is in FFT analysis, an indicator, “FFT” is displayed at the right bottom of range spectrum trace window

Sweep Time Rules

Switches the instrument between **NORMa1** and **ACCuracy** sweep states.

Setting **Auto Sweep Time** to **Accy** (**ACCuracy**) results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the **Preset** state, instrument amplitude accuracy specifications do not apply.

Remote Command	<code>[:SENSe] : SPURious : SWEep : TIME : AUTO : RULEs NORMa1 ACCuracy</code> <code>[:SENSe] : SPURious : SWEep : TIME : AUTO : RULEs ?</code>
Example	<code>: SPUR : SWE : TIME : AUTO : RUL ACC</code> <code>: SPUR : SWE : TIME : AUTO : RUL ?</code>
Notes	This command is implemented as <code>[:SENSe] : SPURious [:RANGe] [:LIST] : SWEep : TIME : AUTO : RULEs</code> to avoid illegal SCPI node definition, so this command should be used as <code>[:SENSe] : SPURious : SWEep : TIME : AUTO : RULEs</code>
Dependencies	Does not appear in SA Mode in VXT
Preset	NORMa1
State Saved	Saved in instrument state
Range	NORMa1 ACCuracy

IF Dithering

Lets you turn **IF Dithering** on or off. **IF Dithering** is a technique used in unpreselected instruments (such as Keysight’s modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	<code>[:SENSe]:SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe]:SWEep:IF:DITHer?</code>
Dependencies	Only appears in SA Mode in VXT models
Preset	OFF
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. IF Protection is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	<code>[:SENSe]:SWEep:IMAGeProt OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeProt?</code>
Dependencies	Only appears in SA Mode in VXT model M9421A
Preset	ON
State Saved	Saved in instrument state

3.8.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The "**Trace Control**" on page 1926 tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points* - 1) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator

The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

The Invalid Data Indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE

The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.

Trace right-click menu

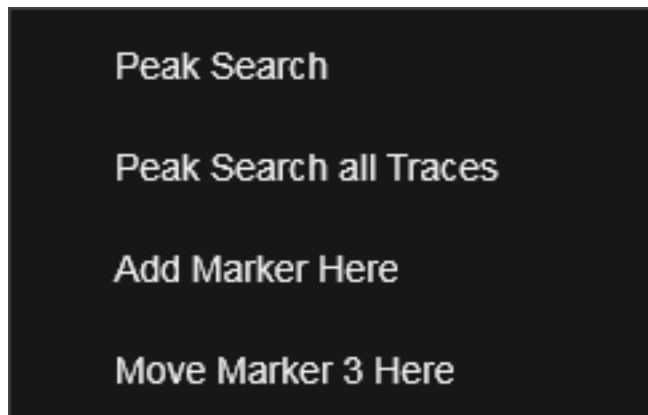

If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:

If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on [page 1927](#). **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on [page 1740](#) type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:

In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT's, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^), which moves across the bottom of the graticule showing the current trace point.

Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:

Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

W	Clear/Write
A	Trace Average
M	Max Hold
m	Min Hold

If the letter is white, it means the trace is being updated (**Update = ON**); if the letter is dimmed, it means the trace is not being updated (**Update = OFF**). A strikethrough indicates that the trace is blanked (**Display = OFF**). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

N	Normal
A	Average
P	peak
p	negative peak
S	Sample
Q	Quasi Peak
E	EMI Average
R	RMS Average
f	math function

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is **ON**, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the **"Math Function"** on page 1743.

The detector labels are:

NORM	Normal
PEAK	Peak
SAMP	Sample
NPEAK	Negative Peak
RMS	Average detector with Power Average (RMS)
LG AVG	Average detector with Log-Pwr Average
VAVG	Average detector with Voltage Average
QPEAK	Quasi Peak
EMI AVG	EMI Average
RMS AVG	RMS Average

The trace math labels are:

PDIF	Power Difference
PSUM	Power Sum
LOFF	Log Offset
LDIF	Log Difference

3.8.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the Trace menu
Dependencies	For the Swept SA measurement: <ul style="list-style-type: none"> - In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View - When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled
Preset	Trace 1
State Saved	Yes

3.8.10.2 Trace Control

The controls on this tab allow you to set the "**Trace Type**" on page 1927 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "**View/Blank**" on page 1740 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITe	:TRAC2:TYPE WRIT	See: "Clear/Write" on page 1511
Trace Average	AVERage	:TRAC2:TYPE AVER	See: "Trace Average" on page 1511
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: "Max Hold" on page 1512
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: "Min Hold" on page 1512

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "**View/Blank**" on page 1740 state must be set to **Active (Update: ON, Display: ON)** for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "**Trace Mode Backwards Compatibility Commands**" on page 1509

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITe AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITe AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre>
Couplings	<p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe] : <meas> : DETector : AUTO ?</code>), Detector (<code>[:SENSe] : <meas> : DETector [:FUNCTION] ?</code>) switches aligning with the switch of this parameter: "NORMal" with WRITe (Clear Write), "AVERage" with AVERage, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold</p>
Preset	<p>Swept SA and Monitor Spectrum: WRITe</p> <p>All other measurements: AVERage</p> <p>Following Preset, all traces are cleared (all trace points set to mintracevalue)</p>
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "[View/Blank](#)" on page 1740.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The **:TRACe:MODE** command is retained for backwards compatibility, and the **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay** commands introduced for ongoing use. The old Trace Modes are selected using **:TRAC:MODE**, whose parameters are mapped into calls to **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay**, and the old global Averaging command **[:SENSe]:AVERage[:STATe]** is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or **:INIT:IMM**, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	WRITE
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK :TRACe[1] 2 ... 6:MODE?
Backwards Compatibility Notes	<p>The legacy :TRACe:MODE command is retained for backwards compatibility. In conjunction with the legacy :AVERage command, it works as follows:</p> <ul style="list-style-type: none"> – :AVERage ON OFF sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the [:SENSe]:AVERage[:STATe] command description below – :TRACe:MODE WRITE sets :TRACe:TYPE WRITE (Clear/Write) unless average is true, in which case it sets it to :TRACe:TYPE AVERage. It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace – :TRACe:MODE MAXHold sets :TRACe:TYPE MAXHold (Max Hold). It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	<code>OFF</code>
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	<code>[:SENSe]:AVERAge[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERAge[:STATe]?</code>
Backwards Compatibility Notes	<p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERAge[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERAge[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p>

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

3 Spectrum Analyzer Mode

3.8 Spurious Emissions Measurement

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1927 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write:** Clear and Write
- **Trace Average:** Restart Averaging
- **Max Hold:** Restart Max Hold
- **Min Hold:** Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF ; Display ON
Blank	Update OFF ; Display OFF
Background	Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

3 Spectrum Analyzer Mode
 3.8 Spurious Emissions Measurement

See: "[More Information](#)" on page 1515

Notes	For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 1514 and " Trace Display State On/Off " on page 1514 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	<p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending <code>[:SENS] :DET :TRAC</code>) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 1743 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p>

Trace Update State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode): <code>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 ... 6:UPDate[:STATe]?</code></p> <p>For all other measurements: <code>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</code></p> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 2 inactive (stop updating): <code>:TRAC2:UPD 0</code></p>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode): <code>1 0 0 0 0 0</code> ON for Trace 1; OFF for 2–6</p> <p>For all other measurements: <code>1 0 0</code> ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode): <code>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</code></p> <p>For all other measurements:</p>
----------------	--

	<pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 1 visible:</p> <pre>:TRAC2:DISP 1</pre> <p>Blank trace 3:</p> <pre>:TRAC3:DISP 3</pre>
Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <pre>1 0 0 0 0 0</pre> <p>ON for Trace 1; OFF for 2–6</p> <p>For all other measurements:</p> <pre>1 0 0</pre> <p>ON for Trace 1; OFF for 2 & 3</p>
State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the **:SENSE** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.8.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1750 controls.

- See "How trace math is processed" on page 1520

Remote Command For option details, see "Trace Math Options" on page 1518

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate:MATH? <trace_num>
```

where <trace_num> is any one of:

```
TRACe1|...|TRACe6
```

For all other measurements:

```
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

<meas> is the identifier for the current measurement, and

<trace_num> is any one of:

```
TRACe1|TRACe2|TRACe3
```

Note that the format of the **TRACe<n>** parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACe3,PDIF,TRACe1,TRACe2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACe3,PSUM,TRACe1,TRACe2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACe3,LOFF,TRACe1,TRACe2,-6.00,0
```

	<p>Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB</p> <p><code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code></p> <p>Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm</p> <p><code>:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0</code></p> <p>Turns off trace math for trace 1</p>
Notes	<p>The Trace Math Function command has 6 main set of parameters:</p> <ul style="list-style-type: none"> - Set 1 defines the “result trace”: <code>TRACE1 ... TRACE6</code> -Set 2 defines the “function”: <code>PDIFference PSUM LOFFset LDIFference OFF</code> - Set 3 is a “trace operand” (1): <code>TRACE1 ... TRACE6</code> - Set 4 is a “trace operand” (2): <code>TRACE1 ... TRACE6</code> - Set 5 defines the “Log Offset” (in dB) - Set 6 defines the “Log Difference Reference” (in dBm) <p>Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function</p> <p>The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message</p> <p>The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas</p>
Dependencies	<p>Trace Math is not available if Normalize is on</p> <p>Trace Math is not available if Signal ID is on</p> <p>None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on</p>
Couplings	When a math function is changed for a trace, that trace is set to Display = ON ; and Update = ON
Preset	<p>For Swept SA Measurement (in SA Mode):</p> <p><code>OFF,TRACE5,TRACE6,0,0 OFF,TRACE6,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0 </code> <code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE4,0,0 OFF,TRACE4,TRACE5,0,0</code></p> <p>For all other measurements:</p> <p><code>OFF,TRACE2,TRACE3,0,0 OFF,TRACE3,TRACE1,0,0 OFF,TRACE1,TRACE2,0,0</code></p>
State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) - 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	<p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre>
Notes	See " Math Function " on page 1743 for how to specify Operands 1 and 2 using :CALCulate:MATH
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: <code>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</code>
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	-100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: <code>:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00</code>
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.8.10.4 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **"To Trace" on page 1752** when a **"Copy" on page 1752** or **"Exchange" on page 1753** is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 1752** when a **"Copy" on page 1752** or **"Exchange" on page 1753** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 1752** and **"To Trace" on page 1752** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`

For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`

where `<meas>` is the identifier for the current measurement

Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1,TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>,<dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`

For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1752 and "To Trace" on page 1752 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	<p>For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code></p> <p>For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code></p> <p>where <code><meas></code> is the identifier for the current measurement</p> <p>Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement</p>
Example	<p>Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1,TRACE2</code></p>
Notes	<p>The command is of the form: <code>:TRACe:EXCHange <trace_1>,<trace_2></code></p>
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	<code>:TRACe[:<meas>]:PRESet:ALL</code>
Example	<code>:TRAC:PRE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

Remote Command	<code>:TRACe[:<meas>]:CLEar:ALL</code>
Example	<code>:TRAC:CLE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

3.8.10.5 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	<pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre>
Example	<pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre>
Dependencies	In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled
Preset	TRACe1
State Saved	No
Range	Trace 1 Trace 2 Trace 3

3.9 SEM Measurement

The Spectrum Emission Mask measurement analyzes spurious signal levels in up to six pairs of offset frequencies and relates them to the carrier power.

SEM Measurement Commands

The following commands and queries can be used to configure the measurement, then retrieve measurement results:

The general functionality of ["CONFigure" on page 2753](#), ["INITiate" on page 2754](#), ["FETCh" on page 2754](#), ["MEASure" on page 2756](#), and ["READ" on page 2755](#) are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF : <measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

```
:CONFigure:SEMask
:CONFigure:SEMask:NDEFault
:INITiate:SEMask
:FETCh:SEMask[n]?
:MEASure:SEMask[n]?
:READ:SEMask[n]?
```

Remote Command Results Overview

The following table provides an overview of the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`. For Mode-specific details, click on the appropriate link for each `n` value.

Offsets that are turned off (inactive) return -999.0 or `NAN` when their results are queried via SCPI. The value of `NAN` is 9.91E+37.

n	Results
1	Result summary (Offsets A - F) Note that n = 1 returns results of 6 offsets (Offset A to F) See "Results for n = 1" on page 1529
2	Displayed frequency domain spectrum trace data for Trace 1 See "Results for n = 2-4" on page 1530
3	Displayed frequency domain absolute limit trace data See "Results for n = 2-4" on page 1530
4	Displayed frequency domain relative limit trace data

3 Spectrum Analyzer Mode
3.9 SEM Measurement

n	Results
	See "Results for n = 2-4" on page 1530
5	Offset abs power, Offset abs PSD, Offset abs peak power depending on "Measurement Type" on page 1700 (Offset A- L) See "Results for n = 5" on page 1530
6	Offset rel power, Offset rel PSD, Offset rel peak power depending on "Measurement Type" on page 1700 (Offset A- L) See "Results for n = 6" on page 1531
7, 8	Offset pass/fail (Offset A- L) See "Results for n = 7-11" on page 1532
9	Offset peak power freq (Offset A- L) See "Results for n = 7-11" on page 1532
10	Offset abs peak power (Offset A- L) See "Results for n = 7-11" on page 1532
11	Offset rel peak power (Offset A- L) See "Results for n = 7-11" on page 1532
12	Peak power of the signal in the ref channel when "Measurement Type" on page 1700 is Spectrum Peak Reference See "Results for n = 12" on page 1534
13	Ref channel summary Available only in LTEAFDD, LTEATDD, MSR and 5GNR Modes
14	Offset result summary (Offset A- L) See "Results for n = 14" on page 1534
15	Offset limit margins (Offset A- L) See "Results for n = 15" on page 1535
16	Carrier powers Available only in LTEAFDD, LTEATDD, MSR, 5GNR, and WLAN Modes
17	Displayed frequency domain combined limit trace data Available only in LTEAFDD, LTEATDD, MSR and 5GNR Modes
18	Displayed frequency domain spectrum trace data for Trace 2 See "Results for n = 18-20" on page 1536
19	Displayed frequency domain spectrum trace data for Trace 3 See "Results for n = 18-20" on page 1536
20	Displayed frequency domain absolute 2 limit trace data See "Results for n = 18-20" on page 1536
21	Result Summary (Offset A – L, Outer and Inner) Available only in LTEAFDD, LTEATDD, and 5GNR Modes
22	Offset pass/fail (Offset A- L) Available only in LTEAFDD, LTEATDD, and 5GNR Modes

3.9.1 Results for n = 1

For WLAN Mode, these results apply to all standards *except* 802.11ac/ax (80+80MHz).

Returns 82 comma-separated scalar results, in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 6 (A-F).

#	Item	Unit, if any
1	Reserved for future use, returns -999.0	
2	Power ^(*1) at the center frequency (reference) area	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz Others: dBm
3~4	Reserved for future use, returns -999.0	
5	Peak frequency in the center frequency (reference) area	Hz
6~10	Reserved for future use, returns -999.0	
11	Relative integrated power on the negative offset A	When "Measurement Type" on page 1700 is PSD Ref: dB
10k + 11, k = 0	Returns -999.0 when "Measurement Type" on page 1700 is Spectrum Peak Ref	When Total Power Ref: dBc
12	Absolute integrated power on the negative offset A	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz
10k + 12, k = 0	Returns -999.0 when "Measurement Type" on page 1700 is Spectrum Peak Ref	When Total Power Ref: dBm
13	Relative peak power on the negative offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBc
10k + 13, k = 0		Others: dB
14	Absolute peak power on the negative offset A	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz
10k + 14, k = 0		Others: dBm
15	Peak power offset frequency from the center or carrier edge frequency in the negative offset A	Hz
10k + 15, k = 0	Depends on the setting of "Offset Freq Define" on page 1642	
16	Relative integrated power on the positive offset A	When "Measurement Type" on page 1700 is PSD Ref: dB
10k + 16, k = 0	Returns -999.0 when "Measurement Type" on page 1700 is Spectrum Peak Ref	Others: dBc
17	Absolute integrated power on the positive offset A	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz
10k + 17, k = 0	Returns -999.0 when "Measurement Type" on page 1700 is Spectrum Peak Ref	Others: dBm
18	Relative peak power on the positive offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBc
10k + 18, k = 0		Others: dB

3 Spectrum Analyzer Mode
3.9 SEM Measurement

#	Item	Unit, if any
19 10k + 19, k = 0	Absolute peak power on the positive offset A	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz Others: dBm
20 10k + 20, k = 0	Peak power offset frequency from the center or carrier edge frequency in the positive offset A Depends on the setting of "Offset Freq Define" on page 1642	Hz

70 10k + 20, k = 5	Peak power offset frequency from the center or carrier edge frequency in the positive offset F Depends on the setting of "Offset Freq Define" on page 1642	Hz
71 2k + 71, k = 0	Minimum margin from limit line on the negative offset A	dB
72 2k + 72, k = 0	Minimum margin from limit line on the positive offset A	dB

82 2k + 72, k = 5	Minimum margin from limit line on the positive offset F	dB

*1: Absolute power when "Measurement Type" on page 1700 is Total Power Ref or PSD Ref; Peak power when "Measurement Type" on page 1700 is Spectrum Peak Ref

3.9.2 Results for n = 2-4

n	Data
2	Returns the displayed frequency domain spectrum trace data for Trace 1 separated by commas
3	Returns the displayed frequency domain absolute limit trace data separated by commas
4	Returns the displayed frequency domain relative limit trace data separated by commas

3.9.3 Results for n = 5

Returns comma-separated scalar values of the absolute integrated power when "Measurement Type" on page 1700 is Total Power Ref or PSD Ref and the absolute peak power when "Measurement Type" on page 1700 is Spectrum Peak Ref of the segment frequencies

The length of the result depends on the number of available offset (See "[Number of Offsets](#)" on page 1536)

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L).

#	Item
1	Depends on " Measurement Type " on page 1700: <ul style="list-style-type: none"> - Total power reference (dBm) - Power spectral density reference (dBm/Hz) - Spectrum peak power reference (dBm)
2	Reserved for future use, returns -999.0
3	Power ^(*1) at negative offset A
2k + 3, k = 0	
4	Power ^(*1) at positive offset A
2k + 4, k = 0	

26	Power ^(*1) at positive offset L
2k + 4, k = 11	

*1: Absolute integrated power when "[Measurement Type](#)" on page 1700 is Total Power Ref or PSD Ref; Absolute peak power when "[Measurement Type](#)" on page 1700 is Spectrum Peak Ref

3.9.4 Results for n = 6

When "[Measurement Type](#)" on page 1700 is Total Power Ref or PSD Ref, returns comma-separated scalar values (in dBc or dBc/Hz) of the integrated power relative to the carrier at the segment frequencies

When "[Measurement Type](#)" on page 1700 is Spectrum Peak Ref, returns comma-separated scalar values (in dB) of the peak power relative to the carrier at the segment frequencies

The length of the result depends on the number of available offset (See "[Number of Offsets](#)" on page 1536)

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "[Non-Contiguous Meas Region](#)" on page 1622 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

3 Spectrum Analyzer Mode
3.9 SEM Measurement

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L).

#	Item
1	Reserved for future use, returns -999.0
2	Reserved for future use, returns -999.0
3	Power ^(*1) at negative offset A
2k + 3, k = 0	
4	Power ^(*1) at positive offset A
2k + 4, k = 0	

26	Power ^(*1) at positive offset L
2k + 4, k = 11	

*1: Relative integrated power when "Measurement Type" on page 1700 is Total Power Ref or PSD Ref; Relative peak power when "Measurement Type" on page 1700 is Spectrum Peak Ref

3.9.5 Results for n = 7-11

n	Data																				
7, 8	<p>Returns comma-separated pass/fail test results (0 = passed, or 1 = failed) determined by testing the minimum margin point from the limit line that is determined each offset's Limits setting. The length of the result depends on the number of available offset (See "Number of Offsets" on page 1536)</p>																				

n Data

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 1622 is set to **Outer** or **Outer & Inner** (5G NR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

#	Item
1	Reserved for future use, returns -999.0
2	Reserved for future use, returns -999.0
3	Negative offset A
$2k + 3, k = 0$	
4	Positive offset A
$2k + 4, k = 0$	
---	---
26	Positive offset L
$2k + 4, k = 11$	

10 Returns comma-separated scalar values (in dBm) of the absolute peak power of the segment frequencies. The length of the result depends on the number of available offset (See "Number of Offsets" on page 1536)

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 1622 is set to **Outer** or **Outer & Inner** (5G NR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

#	Item
1	Reserved for future use, returns -999.0
2	Reserved for future use, returns -999.0
3	At negative offset A
$2k + 3, k = 0$	
4	At positive offset A
$2k + 4, k = 0$	
---	---
26	At positive offset L
$2k + 4, k = 11$	

11 Returns comma-separated scalar values in dBc (dB if **MeasType** = PSD) of the peak power relative to the carrier at the segment frequencies. The length of the result depends on the number of available offset (See "Number of Offsets" on page 1536)

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 1622 is set to **Outer** or **Outer & Inner** (5G NR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

n	Data
	#
	Item
1	Reserved for future use, returns -999.0
2	Reserved for future use, returns -999.0
3	At negative offset A
$2k + 3, k = 0$	
4	At positive offset A
$2k + 4, k = 0$	

26	At positive offset L
$2k + 4, k = 11$	

3.9.6 Results for n = 12

When "Measurement Type" on page 1700 is Spectrum Peak reference, returns the peak power of the signal in the ref channel

Otherwise, the value returned is -999.0

3.9.7 Results for n = 14

Returns comma-separated scalar results

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 1622 is set to **Outer** or **Outer & Inner** (5G NR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L)

#	Item	Unit
1	Relative integrated power on the negative offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBc
$10k + 1, k = 0$	Returns NaN when "Measurement Type" on page 1700 is Spectrum Peak Ref	When PSD: dB
2	Absolute integrated power on the negative offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBm
$10k + 2, k = 0$	Returns NaN when "Measurement Type" on page 1700 is Spectrum Peak Ref	When PSD: dBm/Hz
3	Relative peak power on the negative offset A	When "Measurement Type" on page 1700 is Total Power Ref PSD: dBc
$10k + 3, k$		

#	Item	Unit
=0		Others: dB
4	Absolute peak power on the negative offset A	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz
10k + 4, k = 0		Others: dBm
5	Peak power offset frequency from the center or carrier edge frequency in the negative offset A	Hz
10k + 5, k = 0	Depends on the setting of "Offset Freq Define" on page 1642	
6	Relative integrated power on the positive offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBc
10k + 6, k = 0	Returns NaN when "Measurement Type" on page 1700 is Spectrum Peak Ref	When PSD: dB
7	Absolute integrated power on the positive offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBm
10k + 7, k = 0	Returns NaN when "Measurement Type" on page 1700 is Spectrum Peak Ref	When PSD: dBm/Hz
8	Relative peak power on the positive offset A	When "Measurement Type" on page 1700 is Total Power Ref: dBc
10k + 8, k = 0		Others: dB
9	Absolute peak power on the positive offset A	When "Measurement Type" on page 1700 is PSD Ref: dBm/Hz
10k + 9, k = 0		Others: dBm
10	Peak power offset frequency from the center or carrier edge frequency in the positive offset A	Hz
10k + 10, k = 0	Depends on the setting of "Offset Freq Define" on page 1642	

120	Peak power offset frequency from the center or carrier edge frequency in the positive offset L	Hz
10k + 10, k = 11	Depends on the setting of "Offset Freq Define" on page 1642	

If the result is not available, NaN (9.91E+37) is returned

3.9.8 Results for n = 15

Results available only when "Measurement Type" on page 1700 is Total Power Reference.

Returns comma-separated scalar results

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 1622 is set to **Outer** or **Outer & Inner** (5G NR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

3 Spectrum Analyzer Mode
3.9 SEM Measurement

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L).

#	Item	Unit
1	Minimum margin from limit line on the negative offset A	dB
2k + 1, k = 0		
2	Minimum margin from limit line on the positive offset A	dB
2k + 2, k = 0		
3	Minimum margin from limit line on the negative offset B	dB
2k + 1, k = 1		
4	Minimum margin from limit line on the positive offset B	dB
2k + 2, k = 1		

24	Minimum margin from limit line on the positive offset L	dB
2k + 2, k = 11		

3.9.9 Results for n = 18-20

n	Return Value
18	Returns the displayed frequency domain spectrum trace data for Trace 2 separated by commas
19	Returns the displayed frequency domain spectrum trace data for Trace 3 separated by commas
20	Returns the displayed frequency domain absolute 2 limit trace data, separated by commas

3.9.10 Number of Offsets

The number of available offsets varies depending on the mode and option as below.

Mode	Number of available offsets
MSR LTEAFDD, LTEATDD, 5G NR	12 (Offset A to L)
WLAN	14 (Offset A to N)
Other Modes with option: N9060A-7FP, N9060B-2FP, N9060C-2FP, N9060EM1D, N9060EM1E, or N90EMP SMB	12 (Offset A to L)
Other Modes without option N9060A-7FP, N9060B-2FP, N9060C-2FP, N9060EM1D, N9060EM1E, or N90EMP SMB	6 (Offset A to F)

3.9.11 Views

All Modes provide three predefined views. In MSR, LTE-Advanced FDD/TDD and 5G NR Modes, there is also a fourth predefined view. The views are listed in the table

below.

In the following table:

- The Enumerated ID is used with `:DISP:SEM:VIEW`
- The Numeric ID is used with `:DISP:SEM:VIEW:NSEL`

View Name	Enumerated ID	Numeric ID	Details
"Abs Pwr Freq" on page 1538	APFReq	1	Displays the absolute power levels in dBm and the corresponding frequencies in the text window
"Rel Pwr Freq" on page 1538	RPFReq	2	Displays the relative power levels in dBc and the corresponding frequencies in the text window
"Integrated Power" on page 1538	IPOwer	3	Displays the absolute and relative power levels integrated throughout the bandwidths between the start and stop frequencies in the text window

View Selection by Name

Remote Command	<code>:DISPlay:SEMask:VIEW[:SElect] APFReq RPFReq IPOwer CINformation</code> <code>:DISPlay:SEMask:VIEW[:SElect]?</code>
Example	<code>:DISP:SEM:VIEW IPOW</code> <code>:DISP:SEM:VIEW?</code>
Dependencies	In SA Mode, when Radio Standard is set to WLAN, <code>IPOwer</code> is not available <code>CINformation</code> is available only in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	<code>APFReq</code> unless noted below <code>RPFReq</code> WLAN
State Saved	Saved in instrument state
Range	Abs Pwr Freq Rel Pwr Freq Integrated Power Carrier Info

Views Selection by Number

Remote Command	<code>:DISPlay:SEMask:VIEW:NSElect <integer></code> <code>:DISPlay:SEMask:VIEW:NSElect?</code>
Example	<code>:DISP:SEM:VIEW:NSEL 2</code> <code>:DISP:SEM:VIEW:NSEL?</code>
Dependencies	In SA Mode, when Radio Standard is set to WLAN, Option 3 is not available Option 4 is available only in MSR, LTE-Advanced FDD/TDD and 5G NR Modes

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Preset	1 unless noted below: 2 WLAN
State Saved	Saved in instrument state
Min/Max	MSR, LTEAFDD, LTEATDD, 5G NR Modes 1/4 All other Modes 1/3

3.9.11.1 Abs Pwr Freq

Displays the absolute power levels in dBm and the corresponding frequencies in the text window.

Windows: "Graph" on page 1539, "Table" on page 1544

Example `:DISP:SEM:VIEW APFR`

3.9.11.2 Rel Pwr Freq

Displays the relative power levels in dBc and the corresponding frequencies in the text window.

Windows: "Graph" on page 1539, "Table" on page 1544

Example `:DISP:SEM:VIEW RPFR`

3.9.11.3 Integrated Power

Displays the absolute and relative power levels integrated throughout the bandwidths between the start and stop frequencies in the text window.

Windows: "Graph" on page 1539, "Table" on page 1544

Example `:DISP:SEM:VIEW IPOW`

3.9.12 Windows

There are four available window types:

- In all Modes, the "Graph" on page 1539 and "Table" on page 1544 windows are available
- When **Gate View** is on, the "Gate" on page 1554 window is available

This section describes the windows.

3.9.12.1 Graph

Used to display the spectrum being measured by the SEM measurement.

This window appears in several Views, as follows:

View	Size	Position
Abs Pwr Freq	Three fifth, full width	Top
Rel Pwr Freq	Three fifth, full width	Top
Integrated Power	Three fifth, full width	Top
Gate View	One third, full width	Middle

The Graph differs depending on which View you are in. The views differ depending on the setting of the measurement type ("**Measurement Type**" on page 1700) under the **Meas Setup** menu

Graph Window in Abs Pwr Freq View

Corresponding Trace yellow - Combined trace from carrier and each offset

Abs Peak Pwr & Freq (Total Pwr Ref)

Abs Peak Pwr & Freq (PSD Ref)

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Abs Peak Pwr & Freq (Spectrum Pk Ref)

Graph Window in Rel Pwr Freq View

Corresponding Trace yellow - Combined trace from carrier and each offset

Rel Peak Pwr & Freq (Total Pwr Ref)

Rel Peak Pwr & Freq (PSD Ref)

Rel Peak Pwr & Freq (Spectrum Pk Ref)

Graph Window in Integrated Power View

Corresponding Trace yellow - Combined trace from carrier and each offset

Integrated Power (Total Pwr Ref)

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Integrated Power (PSD Ref)

Integrated Power (Spectrum Pk Ref)

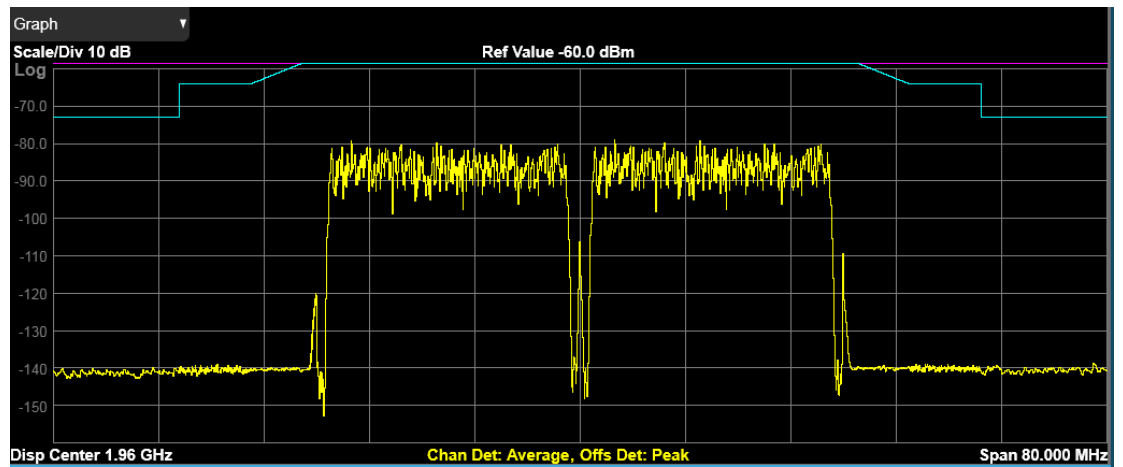

Graph Window in Carrier Info View

Sets the display to the carrier info view. The views differ depending on the setting of "Measurement Type" on page 1700.

Spectrum trace (Total Pwr Ref)

Spectrum trace (PSD Ref)

Spectrum trace (Spectrum Pk Ref)

3 Spectrum Analyzer Mode
3.9 SEM Measurement

3.9.12.2 Table

Displays textual results for the measurement. The Table differs depending on which View you are in.

The views differ depending on the setting of "Measurement Type" on page 1700.

View	Size	Position
Abs Pwr Freq	Two fifth, full width	Bottom
Rel Pwr Freq	Two fifth, full width	Bottom
Integrated Power	Two fifth, full width	Bottom
Gate View	One third, full width	Bottom

Table Window in Abs Pwr Freq View

Name (Measurement Type)	Unit, if any	Corresponding Results
Power		n = 1 2nd element Absolute power at the reference area
Reference		In multi-carrier applications, this column displays which carrier is reference carrier
PSD Ref (PSD Ref)		n = 5 1st element Power spectral density reference at the reference area
Spectrum Peak ref (Spectrum Pk Ref)		n = 5 1st element Spectrum peak power reference at the reference area

Name (Measurement Type)	Unit, if any	Corresponding Results
Measure Trace		See "Measure Trace" on page 1754
Start Freq	Hz	Start frequency for offset
Stop Freq	Hz	Stop frequency for offset
Integ BW	Hz	Measurement bandwidth for offset
Lower Peak (Total Power Ref, Spectrum Pk Ref)	dBm	Absolute peak power on minimum margin point of the negative offset
Lower (PSD Ref)	dBm/Hz	Absolute power spectrum density of the negative offset
Lower Δ lim	dB	Minimum margin from limit line which is decided by Fail Mask setting on the negative offset
Lower Freq	Hz	Frequency on minimum margin point of the negative offset
Upper Peak (Total Power Ref, Spectrum Pk Ref)	dBm	Absolute peak power on minimum margin point of the positive offset
Upper (PSD Ref)	dBm/Hz	Absolute power spectrum density of the positive offset
Upper Δ lim	dB	Minimum margin from limit line which is decided by Fail Mask setting on the positive offset
Upper Freq	Hz	Frequency on minimum margin point of the positive offset

When Measurement Type is Total Power Ref

Modes other than MSR, LTE-Advanced FDD/TDD and 5G NR

2 Table		Power				Measure Trace

Table Window in Integrated Power View

Name (Measurement Type)	Unit, if any	Corresponding Results
Power		n = 1 2nd element Absolute power at the reference area
Reference		In multi-carrier applications, this column displays which carrier is reference carrier
PSD Ref		n = 5 1st element Power spectral density reference at the reference area
Spectrum Peak Ref		n = 5 1st element Peak power at the reference area
Measure Trace		See " Measure Trace " on page 1754
Start Freq	Hz	Start frequency for offset
Stop Freq	Hz	Stop frequency for offset
Integ BW	Hz	Measurement bandwidth for offset
Lower Integ (Total Power Ref)	dBc	Relative integrated power on the negative offset
Lower (PSD Ref)	dB	Relative power spectrum density of the negative offset
Lower Peak (Spectrum Pk Ref)	dB	Relative peak power on minimum margin point of the negative offset
Lower Δ Lim	dB	Minimum margin from limit line which is decided by Fail Mask setting on the negative offset
Lower Integ (Total Power Ref)	dBm	Absolute integrated power on the negative offset
Lower (PSD Ref)	dBm/Hz	Absolute power spectrum density of the negative offset
Lower Peak (Spectrum Pk Ref)	dBm	Absolute peak power on minimum margin point of the negative offset
Upper Integ (Total Power Ref)	dBc	Relative integrated power on the positive offset

Name (Measurement Type)	Unit, if any	Corresponding Results
Upper (PSD Ref)	dB	Relative power spectrum density of the positive offset
Upper Peak (Spectrum Pk Ref)	dB	Relative peak power on minimum margin point of the positive offset
Upper ΔLim	dB	Minimum margin from limit line which is decided by Fail Mask setting on the positive offset
Upper Integ (Total Power Ref)	dBm	Absolute integrated power on the positive offset
Upper (PSD Ref)	dBm/Hz	Absolute power spectrum density of the positive offset
Upper Peak (Spectrum Pk Ref)	dBm	Absolute peak power on minimum margin point of the positive offset

When Measurement Type is Total Power Ref:

Modes other than MSR, LTE-Advanced FDD/TDD and 5G NR

2 Table		Power		Measure Trace

Table Window in Carrier Info View

Only available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes. Carrier center frequency can be displayed in either offset or absolute frequency depending on Carrier Freq.

LTE-Advanced FDD/TDD has a different carrier info table from that in MSR in this view, which displays with measured component carrier powers and its power spectral density in the order of component carrier index in one of the view windows.

Name	Unit, if any	Corresponding Results
Total Carrier Power		The total power of all the carriers with carrier measure state set to yes. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier Integ Bw})$ multiplied by the number of carriers with carrier measure state set to yes
RF-BW		Displays the total bandwidth from the lowest carrier to uppermost carrier
Carrier Power	dBm	The power in all the currently defined carriers with measure state is on. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is $(1 + \alpha)/T$ where $T = 1/(\text{Carrier Integ Bw})$
Integration Bandwidth	Hz	Shows carrier transmission bandwidth
Filter		Displays whether RRC filter is used or not
Offset Frequency	Hz	Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed
Sub-block		Displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column will be displayed when Carrier Allocation is Non-contiguous
Measure		Indicates whether the carrier power is present or not

3 Spectrum Analyzer Mode

3.9.12.3 Gate

Allows you to see your Gating signal at the same time as the measured data. See the description under "[Gate View On/Off](#)" on page 2686 in **Trigger, Gate Settings**.

Views in which the **Gate** window appears:

View	Size	Position
Gate View	One third, full width	Top

3.9.13 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.9.13.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 1562.

Remote Command	<code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:RLEVel <real></code>
Example	<code>:DISP:SEM:WIND:TRAC:Y:RLEV 100</code> <code>:DISP:SEM:WIND:TRAC:Y:RLEV?</code>
Couplings	When "Auto Scaling" on page 1563 is ON (default), this value is automatically determined by the measurement result. If you set a value manually, Auto Scaling changes to OFF Attenuation is not coupled to Ref Value
Preset	0.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RLEVel</code>

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	<code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALE]:PDIVision <rel_ampl></code>
Example	<code>:DISP:SEM:WIND:TRAC:Y:PDIV 15dB</code> <code>:DISP:SEM:WIND:TRAC:Y:PDIV?</code>

Couplings	When " Auto Scaling " on page 1563 is ON , this value is automatically determined by the measurement result. If you set a value manually, " Auto Scaling " on page 1563 automatically changes to OFF
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision</code>

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace <meas> with the identifier for the current measurement <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl></code> <code>:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?</code>
Example	<code>:DISP:CHP:WIND:TRAC:Y:RANG 100</code> <code>:DISP:CHP:WIND:TRAC:Y:RANG?</code>
Couplings	Coupled to Scale/Div as follows Scale Range = Scale/Div * 10 (number of divisions) When you change this value, Auto Scaling automatically changes to OFF
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "[Amplitude Data Query and Y Axis Unit](#)" on page 1559 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been

set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "[Transducer Unit](#)" on page 1560 below.

Remote Command	<code>:UNIT:POWer DBM DBMV DBMA V W A DBUV DBUA DBPW DBUVM DBUAM DBPT DBG</code> <code>:UNIT:POWer?</code>
Example	<code>:UNIT:POW dBmV</code> <code>:UNIT:POW?</code> See also " Remote Interface Examples " on page 1558 below
Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and DBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: <ul style="list-style-type: none"> - The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out - If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the Trace, Normalize menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	<code>:UNIT:POW DBM</code>	Y Axis Unit is set to dBm
dBmV	<code>:UNIT:POW DBMV</code>	Y Axis Unit is set to dBmV
dBmA	<code>:UNIT:POW DBMA</code>	Y Axis Unit is set to dBmA
W	<code>:UNIT:POW W</code>	Y Axis Unit is set to W
V	<code>:UNIT:POW V</code>	Y Axis Unit is set to V
A	<code>:UNIT:POW A</code>	Y Axis Unit is set to A
dBmV	<code>:UNIT:POW</code>	Y Axis Unit is set to dBmV

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Unit	Example	Notes
	DBUV	
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 1560 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA , you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1560
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1560
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on,

Unit	Example	Notes
Unit)		and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1560
dBG (Transducer Unit)	:UNIT:POW DBG	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1560
dBmA (Transducer Unit)	:UNIT:POW DBUA	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1560 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If <code>:CORR:CSET:ANT?</code> returns <code>NOC</code> (for No Conversion), you are using a normal Y-Axis dBuA. If it returns <code>UA</code> , you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE

The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.

Transducer Unit

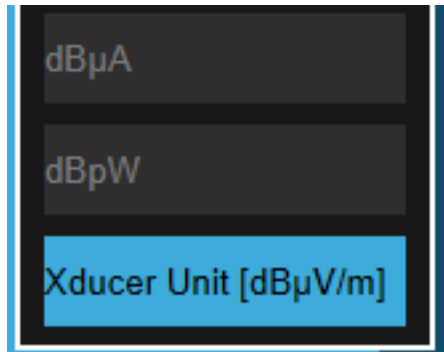

Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though **DBUV** had been sent as the terminator.

When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:

And on the control it looks like this:

NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
DBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

The on/off switch turns **Ref Level Offset** on or off. Setting a value for **Ref Level Offset** turns it **ON**.

For more on using offsets, see "[Reference Level Offset](#)" on page 210.

Remote Command	<pre>:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_amp1> :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet? :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF ON 0 1 :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?</pre>
Example	<p>Set the Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB will be assumed:</p> <pre>:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7 :DISP:WIND:TRAC:Y:RLEV:OFFS? :DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON</pre> <p>Turns the Ref Level Offset On</p>
Dependencies	This control appears only in Spectrum Analyzer Mode
Preset	0 dBm OFF
State Saved	Saved in instrument state
Min	The range for Ref Lvl Offset is variable. It is limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as "Ref Offset <value>" to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change "[Ref Value](#)" on page 1555.

Remote Command	<pre>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:RPOStion TOP CENTer BOTTOm :DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:RPOStion?</pre>
Example	<pre>:DISP:SEM:WIND:TRAC:Y:RPOS CENT :DISP:SEM:WIND:TRAC:Y:RPOS?</pre>
Preset	TOP
State Saved	Saved in instrument state
Range	TOP CENTer BOTTOm
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	<pre>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOStion</pre>

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	<code>:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 1 OFF ON</code>
Example	<code>:DISP:SEM:WIND:TRAC:Y:COUP OFF</code> <code>:DISP:SEM:WIND:TRAC:Y:COUP?</code>
Couplings	When Auto Scaling is ON , and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results. When you set the value of either Scale/Div , Ref Value , or Scale Range manually, Auto Scaling automatically changes to OFF .
Preset	1
State Saved	Saved in instrument state
Range	OFF ON
Backwards Compatibility SCPI	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle</code>

3.9.13.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "[Dual-Attenuator Configurations](#)" on page 1564
- See "[Single-Attenuator Configuration](#)" on page 1564

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

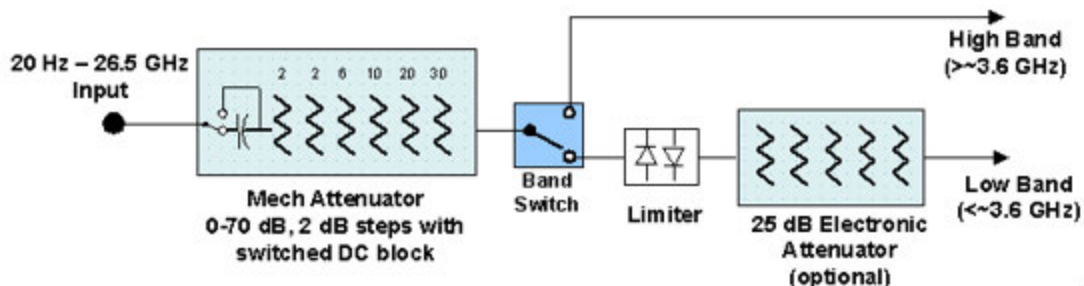

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies

In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe] :POWer [:RF] :FRATten <rel_ampl></code> <code>[:SENSe] :POWer [:RF] :FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed:

3 Spectrum Analyzer Mode

3.9 SEM Measurement

On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, **"Y Scale"** on page 1951 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, **"Internal Preamplifier"** on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See **"Attenuator Configurations and Auto/Man"** on page 1568

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of

	<p>Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1960</p> <p>See "Attenuator Configurations and Auto/Man" on page 1568 for more information on the Auto/Man functionality</p>						
Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1956 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>						
Preset	<p>Auto</p> <p>The Auto value is 10 dB</p>						
State Saved	<p>Saved in instrument state</p>						
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p>						

For example:
 Dual-Attenuator configuration:
Atten: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB
 Single-Attenuator configuration:
A: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)
 When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	<code>ON</code>

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1954, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 1566 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1960 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 1571

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_aml></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code> , and affects the total attenuation displayed on the Attenuation

3 Spectrum Analyzer Mode
 3.9 SEM Measurement

control and the Meas Bar

The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If "**Internal Preamp**" on page 1981 is **ON** (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned

If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1982 is **ON**, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 1571
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATE OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATE?</code>
Example	<code>:POW:EATT:STAT ON</code>

`:POW:EATT:STAT?`

Preset **OFF** (Disabled) for Swept SA measurement
 ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1572](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1959](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

3 Spectrum Analyzer Mode

3.9 SEM Measurement

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 1575

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECTrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>
Notes	The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1960 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 1574 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state

Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	<p>ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC)</p> <p>OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF)</p> <p>:POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF</p>
Backwards Compatibility SCPI	<p>[:SENSe] :POWer [:RF] :RANGe :AUTO ON OFF 1 0</p> <p>[:SENSe] :POWer [:RF] :RANGe :AUTO?</p>

Adjustment Algorithm

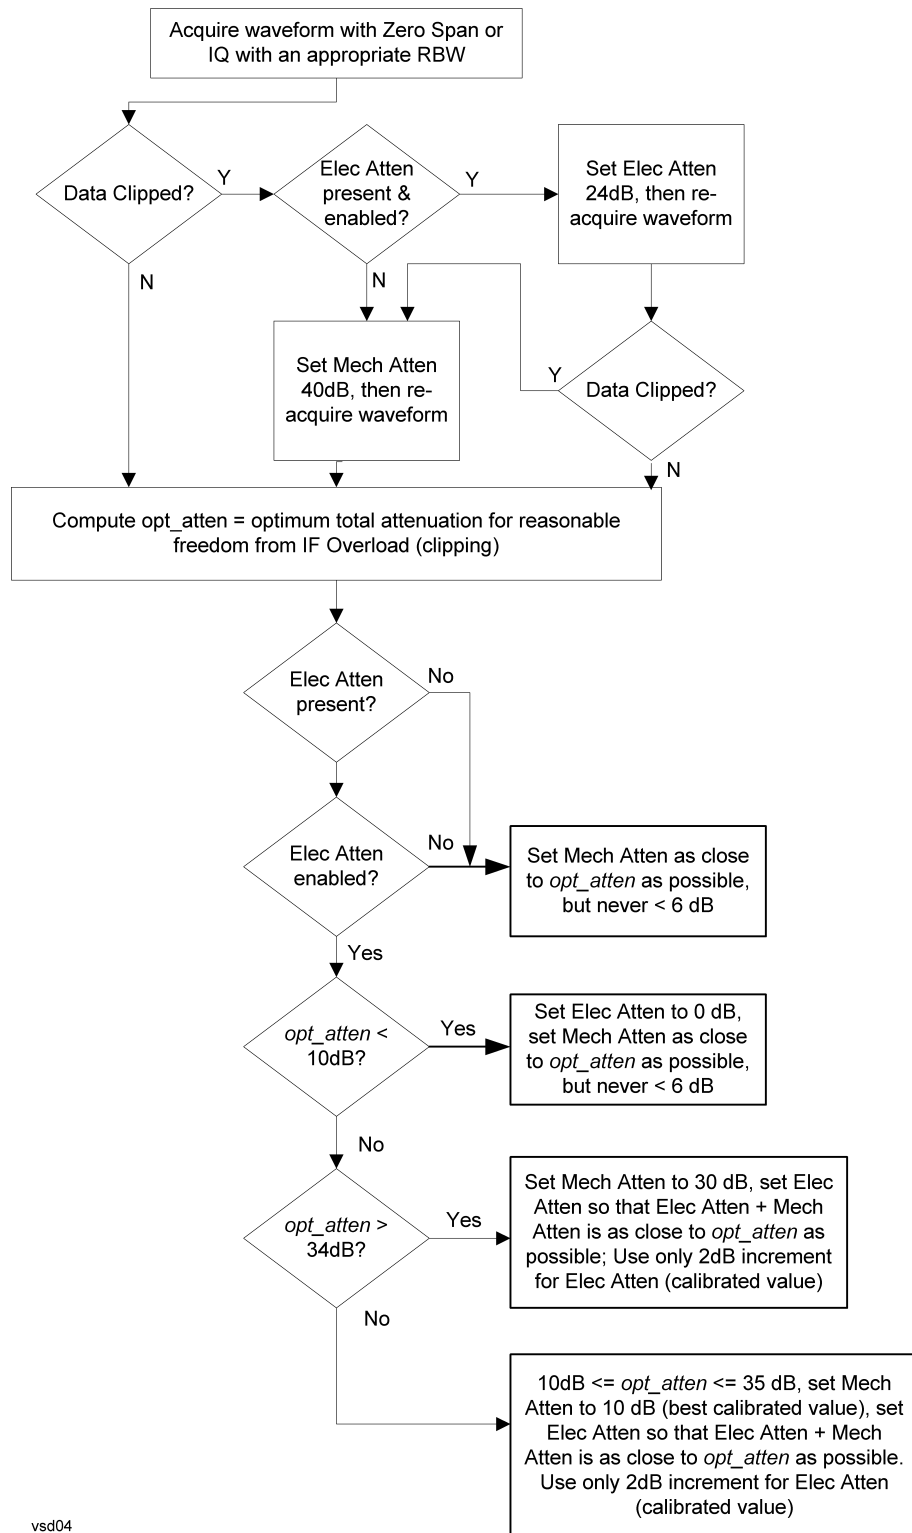

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

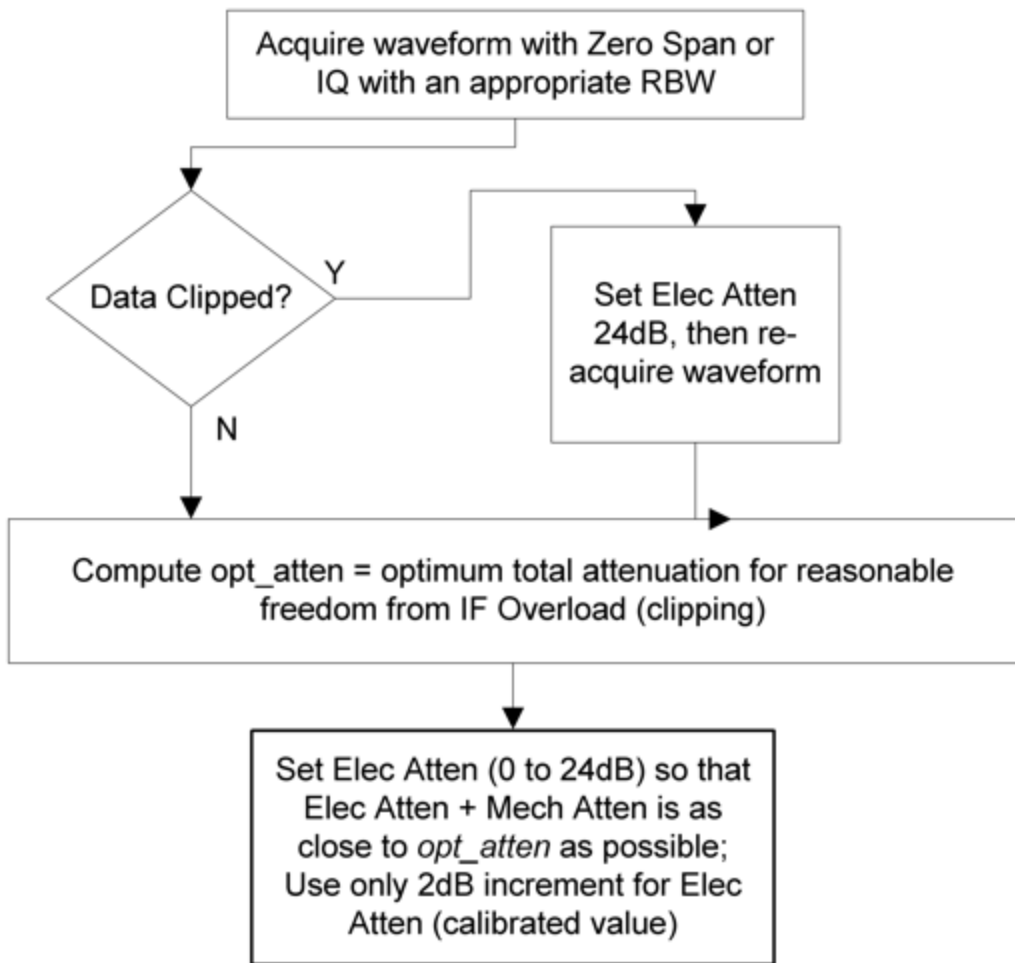

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1574 selection is Mech + Elec Atten:

vsd04

"Pre-Adjust for Min Clipping" on page 1574 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "[Max Mixer Lvl Rules](#)" on page 1969.

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real></code> <code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?</code>
Example	<code>:POW:MIX:RANG -15 dBm</code> <code>:POW:MIX:RANG?</code>

Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Lets you optimize the Max Mixer Level setting for certain kinds of measurements.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

NORMa1	The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression will be negligible
TOI	Allows a range of settings of the "Max Mixer Level" on page 1969, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
COMPRESSion	Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMa1	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPRESSion	Compression-limited dynamic range	–3	–10	+30

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RULEs NORMa1 TOI COMPRESSion</code> <code>[:SENSe]:POWer[:RF]:MIXer:RULEs?</code>
Example	<code>:POW:MIX:RULE:COMP</code>
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	NORM

3.9.13.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting.
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements.

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBined</code>
----------------	---

	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELEctrical , COMBined , and ON) are honored and all are mapped to ELEctrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>
Example	<code>:POW:RANG:PAR 12 dB</code>
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query

	via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.9.13.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1992](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1979](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 1585](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1979
Status Bits/OPC	When centering the preselector, *OPC does not return true until the process is complete and a

dependencies subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries
The **Measuring** bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "**Presel Center**" on page 1978 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	- Does not appear in CXA-m

3 Spectrum Analyzer Mode

3.9 SEM Measurement

- Does not appear in VXT Models M9410A/11A/15A/16A
- Does not appear in M9410E/11E/15E/16E
- Grayed-out if microwave preselector is off
- Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz
- Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz
- Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0
- Grayed-out in the **Spectrogram View**

Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 1978, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz"

3 Spectrum Analyzer Mode

3.9 SEM Measurement

When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "[Internal Preamp](#)" on page 1981. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with "[Internal Preamp](#)" on page 1981, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "[More Information](#)" on page 1589

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	<code>OFF</code>
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and

3 Spectrum Analyzer Mode
3.9 SEM Measurement

without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1594
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1596
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1596

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them

Low Noise Path Enable and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"

Preset	Mode	Value
	IQ Analyzer	MPB option present and licensed: MPB
	Pulse	MPB option not present and licensed: STD
	RTSA	
	Avionics	
	All other Modes	STD
	-

Couplings	See " μW Path Control Auto " on page 1591 above
Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic

range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user

interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED; Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state

Preset	N9041B	OFF
	N9042B+V3050A	ON
	M9410A/11A	ON
State Saved	Saved in instrument state	

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSE]:POWER[:RF]:SWPreSel NORMa1 ADVanced [:SENSE]:POWER[:RF]:SWPreSel?	
Example	:POW:SWPR NORM :POW:SWPR?	
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1992 is OFF. The grayout message is “Unavailable unless SW Presel enabled”	
Preset	N9041B	ADVanced
	N9042B+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPreSel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz

3 Spectrum Analyzer Mode
 3.9 SEM Measurement

and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATE] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATE]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1602 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.9.14 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth functions of the instrument.

The Resolution BW functions control filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.9.14.1 Settings

Contains basic Bandwidth functions. The only tab under **BW**.

RBW Filter Type

Selects the type of bandwidth filter that is used in Carriers and Offsets:

Option	SCPI	Behavior
Gaussian	GAUSSian	The selected filter is applied to carriers and all offsets
Flattop	FLATtop	
Auto Sense	ASENSE	<p>The filter type is automatically selected for each carrier and offset in a way such that measurement speed and accuracy are optimized</p> <p>Filter Auto Sense Rules:</p> <ul style="list-style-type: none"> - Flattop is selected when "Enable Wideband IF for FFT" on page 1721 is ON - Flattop is selected for offsets close to the reference carrier - For all other cases, Gaussian is selected

Remote Command	[:SENSe]:SEMAsk:BANDwidth:SHAPE ASENSE GAUSSian FLATtop [:SENSe]:SEMAsk:BANDwidth:SHAPE?
Example	:SEM:BAND:SHAP GAUS :SEM:BAND:SHAP?
Preset	ASENSE
State Saved	Saved in instrument state
Range	Auto Sense (each offset and carrier) Gaussian (all offsets and carriers) Flattop (all offsets and carriers)

3.9.15 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.9.15.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Limit Lines

Toggles Limit Lines display for this measurement On or Off.

Remote Command	<code>:CALCulate:SEMAsk:LLINe:STATe ON OFF 1 0</code> <code>:CALCulate:SEMAsk:LLINe:STATe?</code>
Example	<code>:CALC:SEM:LLIN:STAT OFF</code> <code>:CALC:SEM:LLIN:STAT?</code>
Preset	ON
State Saved	Saved in instrument state
Range	ON OFF

3.9.15.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON

State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code>
	This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>

Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	ON

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SElect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DElete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SElect
Delete Screen	:INSTrument:SCReen:DElete
Delete All But This Screen	:INSTrument:SCReen:DElete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.9.15.3 View

See "Views" on page 1536

3.9.16 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the **Center Freq** setting is the same for all measurements – it does not change as you change measurements.

3.9.16.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed, and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

This setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global Center Frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you go back to the RF Input, **Center Frequency** returns to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See also:

- ["I/Q Center Freq" on page 1614](#)

Remote Command `[:SENSe] :FREQuency:CENTer <freq>`
 `[:SENSe] :FREQuency:CENTer?`

Example Set **Center Frequency** to 50 MHz:
 `:FREQ:CENT 50 MHz`

 Increment **Center Frequency** by the value of ["CF Step" on page 1614](#):
 `:FREQ:CENT UP`

 Return the current value of **Center Frequency**:

3 Spectrum Analyzer Mode

3.9 SEM Measurement

:FREQ:CENT?	
Notes	<p>Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input:</p> <ul style="list-style-type: none"> - For RF input, equivalent to :FREQ:RF:CENT - For I/Q input, equivalent to :FREQ:IQ:CENT - For External Mixer, equivalent to :FREQ:EMIX:CENT <p>Preset and Max values are dependent on Hardware Options If no terminator (for example. MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated</p>
Dependencies	Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	<p>Depends on instrument maximum frequency, Mode, measurement, and selected input</p> <p>See "Center Frequency Presets" on page 1610, and "RF Center Freq" on page 1612,, "Ext Mix Center Freq" on page 1613, "I/Q Center Freq" on page 1614 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1612</p>
State Saved	Saved in instrument state
Min/Max	<p>Depends on instrument maximum frequency, Mode, measurement, and selected input</p> <p>See "Center Frequency Presets" on page 1610, "RF Center Freq" on page 1612, "I/Q Center Freq" on page 1614 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1612</p>
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz

Tracking Generator Frequency Limits (CXA only)

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the selected input at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently-selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning

Preset	See " Center Frequency Presets " on page 1610 above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See " Center Frequency Presets " on page 1610 above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on Span

Ext Mix Center Freq

Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the selected input at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing, so you will return to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, so the Span setting from the other input will be retained. Therefore, the instrument retains the Span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. Center Frequency thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table ($\text{Span} = \text{Stop Freq} - \text{Start Freq}$), the instrument uses the maximum Span the measurement allows, and still sets Center Frequency to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after Restore Input/Output Defaults , if you switch to External Mixing and do a Mode Preset while in Spectrum Analyzer Mode, the resulting Center Frequency is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the selected input at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:IQ:CENTer <freq></code> <code>[:SENSe] :FREQuency:IQ:CENTer?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for "**Center Frequency**" on page 1609, and start and stop frequency functions. Once a step size has been selected and the **Center Frequency** function is active, the step keys (and the **UP | DOWN** parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	<code>[:SENSe] :FREQuency:CENTer:STEP[:INCRement] <freq></code> <code>[:SENSe] :FREQuency:CENTer:STEP[:INCRement]?</code> <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO?</code>
Example	<code>:FREQ:CENT:STEP 500 MHz</code> increases the current center frequency value by 500 MHz <code>:FREQ:CENT UP</code> <code>:FREQ:CENT:STEP?</code> <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Not available in the MSR, LTE-A FDD/TDD and 5G NR Modes If the electronic/soft attenuator is enabled, any attempt to change the value of the Center Frequency

	>3.6 GHz by pressing the Up -arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto ON
State Saved	Saved in instrument state
Min/Max	-/+ (The maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Freq Offset

Sets a frequency offset value, to compensate for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a **Mode Preset** or set the frequency offset to 0 Hz.

See "[More Information](#)" on page 1616

Remote Command	<code>[:SENSe] :FREQuency :OFFSet <freq></code> <code>[:SENSe] :FREQuency :OFFSet?</code>
Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Appears only in the Spectrum Analyzer Mode Not available in External Mixing. In this case the control is grayed-out and displays a value of zero. However, the value of Center Frequency Offset that was set for the RF Input is retained and restored when you switch back to the RF Input
Preset	0 Hz
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, “Freq Offset <value>” appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped

Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:X[:SCALe]:OFFSet</code> The DISPlay version of the command is supported for compatibility across platforms. It is not recommended for new development
------------------------------	--

Backwards Compatibility Notes	In pre-X-Series instruments, Frequency Offset could not be adjusted by the knob or step keys. That is no longer the case Some previous spectrum analyzers did not adjust frequency counter results for the Frequency Offset. X-Series <i>does</i> adjust the frequency counter for the offset
-------------------------------	--

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by **Freq Offset**. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE

If a trace is exported with a nonzero **Freq Offset**, the exported data contains the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want **Freq Offset** to be 0, or the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file, because the data and state are saved together.

3.9.17 Marker

Enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects Marker 1, sets it to **Normal (POSiTion)** and places it at the center of the display. If the selected marker is **OFF**, it is set to **Normal** and placed at the center of the screen, on the trace determined by the **Marker Trace** rules.

3.9.17.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

In any menu that includes **Select Marker**, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal marker

3.9.17.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. Has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal**.

Remote Command	<code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X <freq></code> <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X?</code>
Example	<code>:CALC:SEM:MARK3:X 1.0 GHz</code> <code>:CALC:SEM:MARK3:X?</code>
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X-Axis value if the control mode is Normal , or the offset from the marker's reference marker if the control mode is Delta . The query is returned in the fundamental units for the current marker X-Axis scale: Hz for Frequency and Inverse Time , seconds for Period and Time
Preset	After a preset, all markers are turned OFF , so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for

setting the value of the marker.

Remote Command	<code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X:POSition <real></code> <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:X:POSition?</code>
Example	<code>:CALC:SEM:MARK10:X:POS 1001</code> <code>:CALC:SEM:MARK10:X:POS?</code>
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is Normal , or the offset from the marker's reference marker in trace points if the control mode is Delta . The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is Off , the response is Not A Number
Preset	After a preset, all markers are turned OFF , so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y-Axis value in the current marker Y Axis unit.

Remote Command	<code>:CALCulate:SEMask:MARKer[1] 2 ... 12:Y?</code>
Example	<code>:CALC:SEM:MARK11:Y?</code>
Notes	The query returns the marker Y-Axis result, if the control mode is Normal . If the marker is Off , the response is Not A Number
Preset	Result depends on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	<code>:CALCulate:SEMask:MARKer[1] 2 ... 12:FUNCTION:RESult?</code>

Marker Mode

Sets the marker control mode to **POSition** (**Normal**) or **OFF**.

If the selected marker is **OFF**, pressing **Marker** sets it to **POSition** and places it at the center of the screen, on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area. If the current control mode for the measurement is **OFF**, there is no active function, and the active function is turned off.

Remote Command	<code>:CALCulate:SEMask:MARKer[1] 2 ... 12:MODE POSition OFF</code>
----------------	---

Command	:CALCulate:SEMask:MARKer[1] 2 ... 12:MODE?
Example	:CALC:SEM:MARK:MODE POS :CALC:SEM:MARK:MODE?
Notes	Default Active Function: the active function for the selected marker's current control mode. If the current control mode is OFF , there is no active function, and the active function is turned off
Preset	OFF OFF OFF OFF OFF OFF OFF OFF OFF OFF OFF OFF
State Saved	Saved in instrument state
Range	POSITION OFF
Annotation	Mkr# <X value> and <Marker value> upper right of graph

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:SEMask:MARKer:AOFF
Example	:CALC:SEM:MARK:AOFF

Couple Markers

When this function is **ON**, moving any marker causes an equal X-Axis movement of every other marker that is not **OFF**. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental X-Axis units of the trace that marker is on) and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	:CALCulate:SEMask:MARKer:COUple[:STATe] ON OFF 1 0 :CALCulate:SEMask:MARKer:COUple[:STATe]?
Example	:CALC:SEM:MARK:COUP ON :CALC:SEM:MARK:COUP?
Preset	OFF Preset by Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.9.17.3 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as ["Marker Frequency" on page 1617](#) in the **Settings** tab.

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not **OFF**, it moves the marker from the trace it was on to the new trace. If the marker is **OFF** it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	<code>:CALCulate:SEMask:MARKer[1] 2 ... 12:TRACe 1 2 3</code> <code>:CALCulate:SEMask:MARKer[1] 2 ... 12:TRACe?</code>
Example	<code>:CALC:SEM:MARK2:TRAC 2</code> <code>:CALC:SEM:MARK2:TRAC?</code>
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of Marker Trace is not affected by "Auto Couple" on page 2017 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

3.9.18 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.9.18.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Toggles averaging On or Off, in addition to enabling you to set the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the average mode (termination control) setting determines the average action.

In the remote mode, use ["Averaging On/Off" on page 1621](#) to turn Averaging on or off.

Remote Command	<code>[:SENSe]:SEMAsk:AVERage:COUNT <integer></code> <code>[:SENSe]:SEMAsk:AVERage:COUNT?</code>
Example	<code>:SEM:AVER:COUN 100</code> <code>:SEM:AVER:COUN?</code>
Preset	10
State Saved	Saved in instrument state
Min/Max	1/10000

Averaging On/Off

Turns Averaging on or off.

NOTE

In this measurement, **Average Type** is preset to the [Log-Pwr Avg \(Video\)](#) method. Other averaging methods are not available.

Remote Command	<code>[:SENSe]:SEMAsk:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:SEMAsk:AVERage[:STATe]?</code>
Example	<code>:SEM:AVER ON</code> <code>:SEM:AVER?</code>
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF

Meas Method

Sets the measurement method:

Method	Option	Description
Integration BW	0 OFF	Enables you to set the channel integration bandwidth
RRC Weighted	1 ON	Selects Root Raised Cosine (RRC) filtering of the carriers. The a

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Method	Option	Description
		value (rolloff) for the filter is set to the value of the Filter Alpha parameter
Remote Command	<code>[:SENSe]:SEMAsk:FILTer[:RRC][:STATe] OFF ON 0 1</code> <code>[:SENSe]:SEMAsk:FILTer[:RRC][:STATe]?</code>	
Example	<code>:SEM:FILT ON</code> <code>:SEM:FILT?</code>	
Dependencies	WLAN: RRC Weight is not supported when the radio standard is WLAN 802.11ac (80+80MHz)	
Preset	SA, LTEAFDD, LTEATDD, 5G NR, WLAN, MSR Modes	OFF
	WCDMA Mode	ON
State Saved	Saved in instrument state	
Range	Integration BW RRC Weighted	

RRC Filter Alpha

Sets the alpha value for the RRC Filter.

Remote Command	<code>[:SENSe]:SEMAsk:FILTer[:RRC]:ALPHa <real></code> <code>[:SENSe]:SEMAsk:FILTer[:RRC]:ALPHa?</code>
Example	<code>:SEM:FILT:ALPH 0.3</code> <code>:SEM:FILT:ALPH?</code>
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Non-Contiguous Meas Region

Selects the region to measure for the non-contiguous frequency allocation.

Option	SCPI	Comments
Outer	<code>OUTer</code>	
Inner	<code>INNer</code>	
Outer & Inner	<code>OINNer</code>	Available only in 5G NR and LTE-Advanced FDD/TDD Modes
Remote Command	<code>[:SENSe]:SEMAsk:NCONtiguous:REGion INNer OUTer OINNer</code> <code>[:SENSe]:SEMAsk:NCONtiguous:REGion?</code>	
Example	<code>:SEM:NCON:REG INN</code>	

	:SEM:NCON:REG?
Dependencies	Available only in MSR, 5G NR and LTE-Advanced FDD/TDD Modes OINNeR is available only in 5G NR and LTE-Advanced FDD/TDD Modes
Preset	INNeR
State Saved	Yes
Range	Inner Outer Outer & Inner

Sweep Type Rules

Selects which set of rules will be used for automatic selection of "Sweep Type" on [page 1646](#) when **Sweep Type** mode is **Auto**.

Rule	Option	Description
Best Dynamic Range	DRANge	The instrument selects either swept or FFT analysis with the primary goal of dynamic range optimization. If the dynamic range of swept and FFT is very close, then it chooses the faster one. In determining the Swept or FFT setting, the auto rules use the following approach: <ul style="list-style-type: none"> - If the RBW > 210 Hz, use swept; for the RBW <= 210 Hz, use FFT - If Sweep Time Mode is Man, the Sweep Type is always Swept for backwards compatibility
Best Speed	SPEed	The instrument selects either FFT or swept analysis based on the fastest instrument speed

Remote Command	[:SENSe]:SEMAsk:SWEEp:TYPE:AUTO:RULEs SPEed DRANge [:SENSe]:SEMAsk:SWEEp:TYPE:AUTO:RULEs?
Dependencies	In modular products such as VXT, the value is always set to Best Dynamic Range and this control does not appear
Preset	DRANge
State Saved	Saved in instrument state

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the Center Frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed. For Spur Avoidance, the instrument uses a software algorithm to remove this spur from the displayed measurement data.

Some measurements allow you to turn off **Spur Avoidance**, but in this measurement it is always enabled. Therefore, the **Spur Avoidance** switch is unavailable (grayed-out) and set to **ON**.

If you press the grayed-out switch, a popup message appears stating:

Always enabled in this measurement. See manual for details

Remote Command	<code>[:SENSe]:SEMAsk:SAVoid[:STATe]?</code>
Example	<code>:SEM:SAV?</code> Always returns ON
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	ON
State Saved	Saved in instrument state
Range	ON

Offset/Limits Config Table

Enables you to set up the measurement parameters for offset pairs and to set the power limits for start and stop frequencies of the selected offsets. For example, you can assign the start and stop frequencies, select the resolution bandwidth, and set the sweep time.

Before UE, the LTE-Advanced FDD/TDD standards gave the test specification requirements for BS intra-band contiguous aggregation and intra-band non-contiguous aggregation modes. However, for UE, only the requirements of intra-band contiguous aggregation modes are defined. So, the standards don't support making the measurement in UE intra-band non-contiguous aggregation mode for LTE-Advanced FDD/TDD. As a result, the preset values of Inner Offset/Limits are temporarily set as those of Outer Offset/Limits for UE.

Limits for Inner Offsets

Since inner offsets are defined from the sub-block edges to the gap, limits from two sub-blocks overlap each other. Therefore, the limit used for inner offsets are the cumulative sum of limits from both sub-blocks. Offsets can have different RBWs, which must be compensated when accumulated.

For example, when offset A and D overlap, the limit of offset A is calculated as follows.

$$\text{Cumulated Limit of Offset A} = 10^{\frac{[\text{Offset A Limit in dBm}]}{10}} + \frac{\text{Offset A RBW}}{\text{Offset D RBW}} 10^{\frac{[\text{Offset D Limit in dBm}]}{10}}$$

The diagram below depicts what inner offset limits look like.

Offset (Bandwidth)

Enables you to set up the bandwidth measurement parameters for offset pairs. For example, you can assign the start and stop frequencies, and select the resolution bandwidth.

Offset Freq Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the "Carrier Center to Meas BW Edge" definition. LTE conformance test requires "Carrier Edge to Meas BW Center" and/or "Carrier Edge to Meas BW Edge" definition. The MSR standard requires "RF BW Edge to Meas BW Center" and/or "RF BW Edge to Meas Edge" definition.

"Meas BW Edge" means the edge frequency of resolution bandwidth closer to the carrier that is represented by Meas BW and Res BW settings. Actual center frequency of Meas BW and the limit line have 1/2 Meas BW offset when the Meas BW Edge is selected.

Note that the outermost (lowermost, uppermost) carrier at each side is determined by which carrier edge frequency is located outermost within the RF BW or each sub-block bandwidth, instead of which carrier center frequency is located outermost.

See also ["Diagrams for Offset Freq Define" on page 1628.](#)

Modes other than MSR, LTE-A, 5G NR

Options:

CTOCenter	From carrier center to the center of offset measuring filter*
CTOEdge	From carrier center to the nominal -3 dB point of the offset measuring filter* closer to the carrier
ETOCenter	From Center Frequency - Span of Ref Channel / 2 (for lower offset), Center Frequency + Span of Ref Channel / 2 (for upper offset) of the carrier closest to each offset to the center of offset measuring filter *
ETOEdge	From Center Frequency - Span of Ref Channel / 2 (for lower offset), Center Frequency + Span of Ref Channel / 2 (for upper offset) of the carrier closest to each offset to the nominal -3 dB point of the offset measuring filter * closer to the carrier

*Measuring filter = Meas BW (N) x Res BW

** RF BW = $BW_{\text{channel,CA}}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When **Number of Component Carriers** = 1, RF BW = $BW_{\text{channel}} = 2 \times F_{\text{offset,RAT}}$

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:TYPE CTOCenter CTOEdge ETOCenter ETOEdge</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:TYPE?</code>
Example	<code>:SEM:OFFS:TYPE ETOC</code> <code>:SEM:OFFS:TYPE?</code>
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS
Preset	CTOCenter
State Saved	Saved in instrument state
Range	Carrier Center to Meas BW Center Carrier Center to Meas BW Edge Carrier Edge to Meas BW Center Carrier Edge to Meas BW Edge

Mode: MSR, LTEAFDD, LTEATDD

Options:

CTOCenter	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center of offset measuring filter*
CTOEdge	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier

ETOCenter	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of offset measuring filter*
ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier
RTOCenter	From either the lower or upper RF BW** edge frequency to the center frequency of offset measuring filter*
RTOEdge	From either the lower or upper RF BW** edge frequency to the nominal -3 dB point of the offset measuring filter* closer to the carrier
RCTOCenter 5G NR Mode only	From the center frequency of RF BW to the center frequency of offset measuring filter*

*Measuring filter = Meas BW (N) x Res BW

** RF BW = $BW_{channel,CA}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When **Number of Component Carriers** = 1, RF BW = $BW_{channel} = 2 \times F_{offset,RAT}$

Diagrams for Offset Freq Define

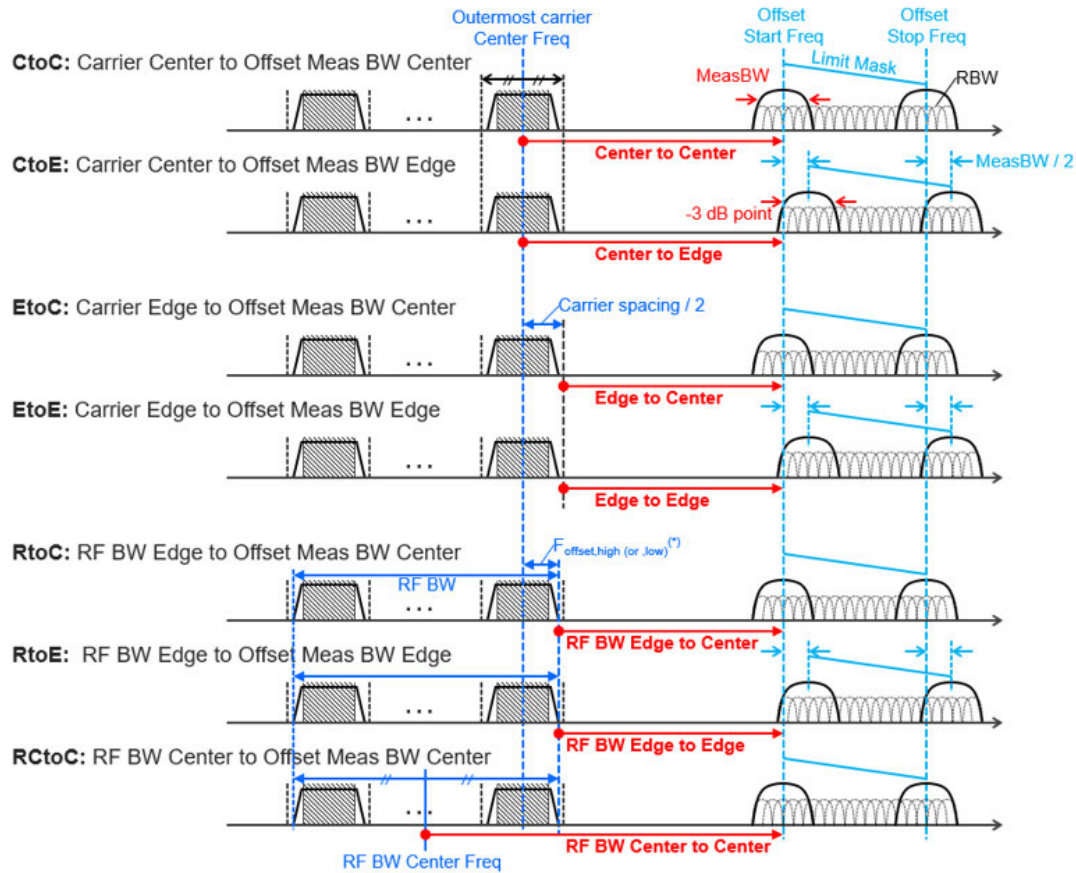

Details depend on the selected mode.

Diagrams for Modes other than MSR, LTEAFDD/LTEATDD, 5G NR

Note:
 • $MeasBW = N \times RBW$

Diagrams for MSR, LTEAFDD/LTEATDD, 5G NR

Notes:

- $MeasBW = N \times RBW$
- RF BW Edge and Outermost Carrier Edge are not always same. e.g.) 5G NR (3GPP) defines $BW_{\text{channel,CA}}$ which calculates $F_{\text{offset,high}}$ and $F_{\text{offset,low}}$ asymmetrically with SCS shift. (*) For MSR, $F_{\text{offset,high (or,low)}} = F_{\text{offset,RAT,high (or,low)}}$

Offset Detector

Enables you to control the detector for offsets. The following choices are available:

- AUTO** The detector selected depends on marker functions, trace functions, average type, and the trace averaging function
- NORMa1** The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
- AVERage** The detector determines the average of the signal within the sweep points. The

3 Spectrum Analyzer Mode
3.9 SEM Measurement

	averaging method depends upon the Average Type selection (voltage, power or log scales)
POSitive Peak	The detector determines the maximum of the signal within the sweep points
SAMPlE	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
NEGative Peak	The detector determines the minimum of the signal within the sweep points

Remote Command	<code>[:SENSe]:SEMAsk:DETEctor:OFFSet[:FUNction] AVERage NEGative NORMal POSitive SAMPlE</code> <code>[:SENSe]:SEMAsk:DETEctor:OFFSet[:FUNction]?</code> <code>[:SENSe]:SEMAsk:DETEctor:OFFSet:AUTO ON OFF 1 0</code> <code>[:SENSe]:SEMAsk:DETEctor:OFFSet:AUTO?</code>
Example	<code>:SEM:DET:OFFS AVER</code> <code>:SEM:DET:OFFS?</code> <code>:SEM:DET:OFFS:AUTO OFF</code> <code>:SEM:DET:OFFS:AUTO?</code>
Notes	When you manually select a detector (instead of selecting Auto), that detector is used regardless of other instrument settings Note that this detector setting affects all offsets; there is no per-trace detector
Couplings	See Couplings in "Trace Type" on page 1927
Preset	<code>POSitive</code> <code>ON</code>
State Saved	Saved in instrument state
Range	<code>AVERage NEGative NORMal POSitive SAMPlE</code>

Offset Average Type (Remote Command Only)

Select trace average type for the offsets.

Remote Command	<code>[:SENSe]:SEMAsk:AVERage:OFFSet:TYPE RMS LOG</code> <code>[:SENSe]:SEMAsk:AVERage:OFFSet:TYPE?</code>
Example	<code>:SEM:AVER:OFFS:TYPE LOG</code> <code>:SEM:AVER:OFFS:TYPE?</code>
Preset	<code>RMS</code>
State Saved	Saved in instrument state

Start Freq

Specifies the start frequency for the currently selected offset. Also enables you to toggle that offset between On and Off.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	<pre>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:FREQuency:STARt <freq>, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:FREQuency:STARt? [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:STATe ON OFF 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:STATe?</pre>												
Example	<pre>:SEM:OFFS2:LIST:FREQ:STAR 2.515 MHz, 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz :SEM:OFFS2:LIST:FREQ:STAR? :SEM:OFFS:LIST:STAT ON, ON, ON, OFF, OFF, OFF :SEM:OFFS:LIST:STAT?</pre>												
Notes	<p>Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes. WLAN Mode Auto Function Presets

For X Series:

Radio Std	Presets
802.11b/g(DSSS/CCK/PBCC)	ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11a/g/j/p 20MHz (OFDM/DSSS-OFDM)	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11j/p 10MHz	
802.11p 5MHz/802.11n (20MHz/40MHz)	
802.11ac/ax/be (20 MHz/ 40 MHz/ 80 MHz/ 160 MHz)	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11be (320 MHz)	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11ac/ax (80 MHz + 80 MHz)	OFF, ON, ON, ON, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.ah (1MHz/ 2MHz/ 4MHz/ 8MHz/ 16MHz)	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11af (6 MHz/ 7 MHz/ 8 MHz)	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF

For E6630A, E6640A, and M90XA:

Radio Std	Presets
802.11a/g(OFDM/DSSS-OFDM)	ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11n(20MHz/40MHz)	
802.11ac/ax/be (20 MHz/ 40 MHz/ 80 MHz/ 160 MHz)	ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11be (320 MHz)	ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11ac/ax (80 MHz + 80 MHz)	ON, ON, ON, OFF, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF
802.11af (6 MHz/ 7 MHz/ 8 MHz)	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF

Stop Freq

Specifies the stop frequency for the currently selected offset.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:FREQuency:STOP <freq>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:FREQuency:STOP?</code>
Example	<code>:SEM:OFFS:LIST:FREQ:STOP 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz, 15.0 MHz</code> <code>:SEM:OFFS:LIST:FREQ:STOP?</code>
Notes	Comma separated list of values <code>OFFSet1</code> is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS If the offset is outside of the frequency range, the result spectrum will be invalid
Couplings	Coupled to Start Freq. When Stop Freq goes below Start Freq, Start Freq is automatically adjusted to Stop Freq minus 100 Hz
Preset	When the max number of offsets is 6:

Mode	Values
SA	2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz, 15.0 MHz
WCDMA	2.715 MHz, 3.515 MHz, 4.000 MHz, 8.000 MHz, 12.50 MHz, 15.0 MHz 3.485 MHz, 7.500 MHz, 8.500 MHz, 12.00 MHz, 15.00 MHz, 18.0 MHz

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
MSR	215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz
LTEAFDD, LTEATDD	5.05 MHz, 10.05 MHz, 15 MHz, 30 MHz, 40 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz 985.0 kHz, 4.50 MHz, 5.5001 MHz, 9.50 MHz, 20 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz
5G NR	5.05 MHz, 10.05 MHz, 40 MHz, 100 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz 985.0 kHz, 4.50 MHz, 99.500 MHz, 104.5 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as

3 Spectrum Analyzer Mode
3.9 SEM Measurement

	the Offset F value
	WLAN Mode: See table of " WLAN Mode Presets " on page 1636 below
State Saved	Saved in instrument state
Min/Max	100 Hz/Depends on instrument maximum frequency. Same as the Max Span in Swept SA Measurement

WLAN Mode Presets

Radio Std	Presets
802.11a/g (OFDM/DSSS-OFDM)	11 MHz, 20 MHz, 30 MHz, 40 MHz, 100 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz
802.11n (20MHz)	
802.11b/g (DSSS/CCK/PBCC)	22 MHz, 50 MHz, 70 MHz, 90 MHz, 100 MHz, 120 MHz, 120 MHz, 120 MHz, 120 MHz, 120 MHz, 120 MHz, 120 MHz, 120 MHz
802.11n (20MHz)	11 MHz, 20 MHz, 30 MHz, 40 MHz, 100 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz
802.11n (40MHz)	21 MHz, 40 MHz, 60 MHz, 70 MHz, 100 MHz, 200 MHz, 300 MHz, 300 MHz, 300 MHz, 300 MHz, 300 MHz, 300 MHz, 300 MHz
802.11ac (20MHz)	11 MHz, 20 MHz, 30 MHz, 40 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz
802.11ac (40MHz)	21 MHz, 40 MHz, 60 MHz, 70 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz
802.11ac (80MHz)	41 MHz, 80 MHz, 120 MHz, 125 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz
802.11ac (160MHz)	81 MHz, 160 MHz, 240 MHz, 250 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz
802.11ac (80 MHz + 80MHz)	100Hz, 40 MHz, 79 MHz, 81 MHz, 161 MHz, 200 MHz, 240 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz
802.11ah (1MHz)	0.6MHz, 1 MHz, 1.5 MHz, 2.5MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz, 2.5 MHz
802.11ah (2MHz)	1.1 MHz, 2 MHz, 3 MHz, 5MHz, 5 MHz, 5 MHz, 5 MHz, 5 MHz, 5 MHz, 5 MHz, 5 MHz, 5 MHz, 5 MHz
802.11ah (4MHz)	2.1 MHz, 4 MHz, 6 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz, 10 MHz
802.11ah (8MHz)	4.1 MHz, 8 MHz, 12 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz
802.11ah (16MHz)	8.1 MHz, 16 MHz, 24 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz
802.11j/p (20MHz)	10MHz, 11 MHz, 20 MHz, 30 MHz, 50MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz
802.11j/p (10MHz)	5MHz, 5.5 MHz, 10 MHz, 15 MHz, 25MHz, 250MHz, 250MHz, 250MHz, 250 MHz, 250MHz, 250MHz, 250MHz, 250MHz

Radio Std	Presets
802.11p (5MHz)	2.5MHz, 2.75MHz, 5 MHz, 7.5 MHz, 12.5MHz, 250MHz, 250MHz, 250MHz, 250 MHz, 250MHz, 250MHz, 250MHz, 250MHz, 250MHz
802.11ax/be (20MHz)	10.5 MHz, 20 MHz, 30 MHz, 40 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz
802.11ax/be (40MHz)	20.5 MHz, 40 MHz, 60 MHz, 70 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz
802.11ax/be (80MHz)	40.5 MHz, 80 MHz, 120 MHz, 125 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz, 200 MHz
802.11ax/be (160MHz)	80.5 MHz, 160 MHz, 240 MHz, 250 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz, 400 MHz
802.11ax (80 MHz + 80MHz)	100Hz, 40 MHz, 79 MHz, 81 MHz, 161 MHz, 200 MHz, 240 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz, 250 MHz
802.11af (6MHz)	3.15MHz, 6 MHz, 9 MHz, 15MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz
802.11af (7MHz)	3.675 MHz, 7 MHz, 10.5 MHz, 17.5MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz
802.11af (8MHz)	4.2 MHz, 8 MHz, 12 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz
802.11be (320MHz)	160.5 MHz, 320 MHz, 480 MHz, 490 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz

Res BW

Specifies which Resolution BW filter to use when measuring the currently selected offset.

Offset Res BW Mode allows the instrument to determine the optimum Resolution BW filter to use when measuring the currently selected offset.. When changing the Meas BW parameter, if the Res BW needs to be changed to adhere to the rule:

$$(N \times \text{Res BW}) \leq (\text{Stop freq of the offset} - \text{Start freq of the offset}),$$

where N is the multiplier, this setting will automatically be changed to manual.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	<pre>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:BANDwidth[:RESolution] <bandwidth>, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:BANDwidth[:RESolution]? [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:BANDwidth[:RESolution]:AUTO OFF ON 1 0, ...</pre>

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer number. It shows a ratio between Integration BW and Resolution BW of the measurement result.

$$\text{Integ BW} = \text{Meas BW} * \text{Resolution BW}$$

Integration BW is desired resolution bandwidth and Resolution BW is actual bandwidth for sweep. Measurement sweeps with Resolution BW and Meas BW compensates sweep resolution bandwidth to Integration BW.

If you set this value greater than 1, you can set Resolution BW narrower to avoid carrier power leakage effect to the offset power integration.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	<p>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:BANDwidth:IMULti <integer>, ...</p> <p>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:BANDwidth:IMULti?</p>

Offset (Sweep)

Accesses a menu that enables you to set up the sweep measurement parameters for offset pairs.

Offset Freq Define

Same as **"Offset Freq Define" on page 1625** under Offset (Bandwidth).

Offset Detector

Same as "Offset Detector" on page 1629 under Offset (Bandwidth).

Start Freq

Same as "Start Freq" on page 1631 under Offset (Bandwidth).

Stop Freq

Same as "Stop Freq" on page 1635 under Offset (Bandwidth).

Sweep Time

Specifies the **Sweep Time** for the currently selected offset and enables you to toggle the Sweep Time mode between Auto and Man.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

NOTE

On non-sweeping hardware, this column is grayed out. The value shown on this column is an estimate. It is the turnaround time to complete the measurement of the entire offset span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEp:TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using **Minimum Acquisition Time**, which provides better control.

Remote Command	<pre>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME <time>, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME? [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME:AUTO ON OFF 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEp:TIME:AUTO?</pre>
Example	<pre>:SEM:OFFS2:LIST:SWE:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms :SEM:OFFS2:LIST:SWE:TIME? :SEM:OFFS2:LIST:SWE:TIME:AUTO ON, ON, ON, OFF, OFF :SEM:OFFS2:LIST:SWE:TIME:AUTO?</pre>

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Notes	Comma separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS
Dependencies	On non-sweeping hardware, this column is grayed out and the Auto/Man checkbox is invisible. The read-only value shows the estimated sweep time In those instruments, " Minimum Acquisition Time " on page 1644 is available
Couplings	When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated Modes other than LTEAFDD, LTEATDD, 5G NR, MSR, WLAN: When the max number of offsets is 6: ON, ON, ON, ON, ON, ON When the max number of offsets is 12: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON Modes LTEAFDD, LTEATDD, 5G NR, MSR: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON When the max number of offsets is 14: Mode WLAN: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
State Saved	Saved in instrument state Saved in instrument state
Range	Auto Man
Min	Other than non-sweeping hardware Depends on Sweep Type: – Sweep Type "Swept": 1 ms – Sweep Type "FFT": 100 ns Non-sweeping hardware: N/A
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Backwards Compatibility SCPI	[:SENSe] :SEMAsk:OFFSet[1] 2:LIST:SWEep[:TIME] [:SENSe] :SEMAsk:OFFSet[1] 2:LIST:SWEep[:TIME] :AUTO

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides Span into multiple chunks if needed.

Therefore, the total signal acquisition time for the entire offset span is $\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$.

When in Auto, this parameter's value is determined by other parameters, such as Offset Start, Offset Stop, RBW and VBW.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on Detector settings.

Note that the actual acquisition time for each chunk may exceed the Minimum Acquisition Time value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	<pre>[:SENSE]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME <time>, ... [:SENSE]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME? [:SENSE]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME:AUTO ON OFF 1 0, ... [:SENSE]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SWEep:ACQuisition:TIME:AUTO?</pre>
Example	<pre>:SEM:OFFS2:LIST:SWE:ACQ:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms :SEM:OFFS2:LIST:SWE:ACQ:TIME? :SEM:OFFS2:LIST:SWE:ACQ:TIME:AUTO ON, ON, ON, ON, OFF, OFF :SEM:OFFS2:LIST:SWE:ACQ:TIME:AUTO?</pre>
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Offset Start Freq, Offset Stop Freq, RBW, and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated ON
State Saved	Saved in instrument state
Min	100 ns
Max	4000 s

Sweep Time Annotation (Remote Query Only)

Returns the Sweep Time Annotation value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire offset span of each measurement cycle.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:ETIME?</code>
Example	<code>:SEM:OFFS2:LIST:SWE:ETIM?</code>
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep Type

Specifies the **Sweep Type** for the currently selected offset, and enables you to toggle the **Sweep Type** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

How to define Sweep Time and Sweep Type:

Sweep Type mode	Behavior
Auto	Sweep Type is automatically selected according to "Sweep Type Rules" on page 1623 Sweep Time is automatically calculated according to the selected Sweep Type
Man	Sweep Type is user-selected
–	

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE SWEep FFT, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE?</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE:AUTO ON OFF 1 0, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:SWEep:TYPE:AUTO?</code>
Example	<code>:SEM:OFFS2:LIST:SWE:TYPE FFT,FFT,SWE</code> <code>:SEM:OFFS2:LIST:SWE:TYPE?</code> <code>:SEM:OFFS2:LIST:SWE:TYPE:AUTO ON, ON, ON, ON, OFF, OFF</code> <code>:SEM:OFFS2:LIST:SWE:TYPE:AUTO?</code>
Notes	Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes In SA Mode, Offset sub op code 1 is used for both BTS and MS
Dependencies	Not available in modular products, such as VXT
Couplings	When Sweep Type is set manually, Sweep Type mode is set to OFF (Manual) When Sweep Type mode is Auto , Sweep Type is automatically selected according to Sweep Type

	Rules
Preset	<p>Automatically calculated</p> <p>LTEAFDD, LTEATDD, 5G NR, MSR Modes: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</p> <p>When the max number of offsets is 14: WLAN Mode: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</p> <p>All Other Modes:</p> <p>When the max number of offsets is 6: ON, ON, ON, ON, ON, ON</p> <p>When the max number of offsets is 12: ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</p>

Range	Auto Man

Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe] :SEMAsk :OFFSet [n] [:OUTer] :LIST :STATE`.

BOTH	Both of the negative (lower) and positive (upper) sidebands
NEGative	Negative (lower) sideband only
POSitive	Positive (upper) sideband only

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, and 12 values for other Modes.

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SIDE BOTH NEGative POSitive, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:SIDE?</code>
Example	<code>:SEM:OFFS:LIST:SIDE BOTH, NEG, NEG, POS, POS, POS</code> <code>:SEM:OFFS:LIST:SIDE?</code>
Notes	Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS

Limits

Enables you to set the power limits for start and stop frequencies of the selected offsets.

Start Freq

Same as "Start Freq" on page 1631 under **Offset (Bandwidth)**.

Stop Freq

Same as "Stop Freq" on page 1635 under **Offset (Bandwidth)**.

Abs Start

Sets the absolute power level limit at the start frequency for the selected offset. The absolute power level limit ranges from -200 to +50 dBm.

The fail condition for each offset channel is set remotely by
`[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:TEST`.

You can turn off (not use) specific offset channels remotely with
`[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATE`.

The query returns values currently set to the absolute power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:START:ABSolute <real>, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:START:ABSolute?</code>

Abs Stop

Sets the absolute power level limit at the stop frequency for the selected offset. The absolute power level limit ranges from -200 to +50 dBm. You can also toggle this function between **Couple** (**COUPl**e = **ON**) and **Manual** (**COUPl**e = **OFF**). If set to **Couple**, the **Abs Stop** power level limit is coupled to **Abs Start** to result in a flat limit line. If set to **Man**, **Abs Start** and **Abs Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop absolute power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values

3 Spectrum Analyzer Mode
3.9 SEM Measurement

remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<pre>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:STOP:ABSolute <real>, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:STOP:ABSolute? [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:STOP:ABSolute:COUPle ON OFF 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:STOP:ABSolute:COUPle?</pre>
Example	<pre>:SEM:OFFS:LIST:STOP:ABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm :SEM:OFFS1:LIST:STOP:ABS? :SEM:OFFS:LIST:STOP:ABS:COUP ON, OFF, ON, ON, ON, ON :SEM:OFFS:LIST:STOP:ABS:COUP?</pre>
Notes	<p>Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS</p>
Couplings	Coupled to Abs Start if Auto is selected, that is, the Stop value is equal to the Start value
Preset	When the max number of offsets is 6:

Mode	Values
SA	-14.00 dBm, -26.00 dBm, -26.00 dBm, -13.00 dBm, -13.00 dBm, -13.00 dBm
WCDMA	-12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm -69.6 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm
LTE, LTETDD	-12.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD	-12.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
5G NR	-12.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -22.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
MSR	-12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

WLAN Mode: See the table of "[WLAN Mode Presets](#)" on page 1653 below

When the max number of offsets is 6:

Mode	Values
SA	ON, OFF, ON, ON, ON, ON
WCDMA	ON, OFF, ON, ON, ON, ON ON, ON, ON, ON, ON, ON
LTE, LTE-TDD	OFF, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTE-AFDD, LTE-A-TDD, 5G NR	OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
MSR	ON, OFF, OFF, OFF, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, OFF, OFF, OFF, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

Rel Start

Sets a relative power level limit at the start frequency for the selected offset. The relative power level limit ranges from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet[n] [:OUTer]:LIST:TEST` for each offset channel test.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n] [:OUTer]:LIST:STATE`.

The query returns values currently set to the relative power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2 [:OUTer]:LIST:START:RCARrier <rel_ampl>, ... [:SENSe]:SEMAsk:OFFSet[1] 2 [:OUTer]:LIST:START:RCARrier?</code>
Example	<code>:SEM:OFFS:LIST:STAR:RCAR -30, -30, -30, -30, -30, -30</code> <code>:SEM:OFFS:LIST:STAR:RCAR?</code>
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA mode, Offset sub op code 1 is used for both BTS and MS
Preset	When the max number of offsets is 6:

Rel Stop

Sets a relative power level limit at the stop frequency for the selected offset. The relative power level limit ranges from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet[n] [:OUTer]:LIST:TEST` for each offset channel.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n] [:OUTer]:LIST:STATe`.

The query returns values currently set to the offset stop relative power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<pre>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:RCARrier <rel_ampl>, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:RCARrier? [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:RCARrier:COUPle ON OFF 1 0, ... [:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:RCARrier:COUPle?</pre>						
Example	<pre>:SEM:OFFS:LIST:STOP:RCAR -30, -30, -30, -30, -30, -30 :SEM:OFFS:LIST:STOP:RCAR? :SEM:OFFS:LIST:STOP:RCAR:COUP ON, ON, ON, ON, ON, ON :SEM:OFFS:LIST:STOP:RCAR:COUP?</pre>						
Notes	<p>Comma-separated list of values</p> <p>OFFSet 1 is for BTS, 2 for MS. Default is BTS</p> <p>Note that Offset sub op code 2 is supported only in Modes other than SA. In SA mode, Offset sub op code 1 is used for both BTS and MS</p>						
Couplings	Coupled to Rel Start if "Auto" is selected, that is, Start is made the same as Stop

Fail Mask

Selects one of the logics for fail conditions between the measurement results and the test limits:

3 Spectrum Analyzer Mode
3.9 SEM Measurement

- **ABSolute** and **RELative** both check the results against the respective limit
- **OR** checks against both limits, failing if either of the limits is broken
- **AND** only displays a fail if both of the limits are broken

The absolute or relative power limit value for each offset channel can be set remotely with `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:ABSolute` or `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n][:OUTer]:LIST:STATe`.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:TEST ABSolute AND OR RELative, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:TEST?</code>												
Example	<code>:SEM:OFFS:LIST:TEST ABS, ABS, ABS, ABS, ABS, ABS</code> <code>:SEM:OFFS:LIST:TEST?</code>												
Notes	Comma-separated list of values Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS

Show Abs2 Limit

Shows or hides Abs2 limit parameters.

Remote Command	<code>:DISPlay:SEMask:OFFSet:SABSolute ON OFF 1 0</code> <code>:DISPlay:SEMask:OFFSet:SABSolute?</code>
Example	<code>:DISP:SEM:OFFS:SABS 1</code> <code>:DISP:SEM:OFFS:SABS?</code>
Preset	0
State Saved	Yes
Range	ON OFF

Abs2 Start

Sets the 2nd absolute power level limit at the start frequency for the selected offset, ranging from -200 to +50 dBm.

The fail condition for each offset channel is set remotely using:

```
[ :SENSe ] :SEMask:OFFSet[n] [ :OUTer ] :LIST:TEST:SABSolute
```

You can turn off (not use) specific offset channels remotely using:

```
[ :SENSe ] :SEMask:OFFSet[n] [ :OUTer ] :LIST:STATE
```

The query returns values currently set to the 2nd absolute power test limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values

remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STARt:SABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STARt:SABSolute?</code>
Example	<code>:SEM:OFFS:LIST:STAR:SABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS:LIST:STAR:SABS?</code>
Notes	Comma-separated list of values OFFSet1 is for BTS, 2 for MS. Default is BTS
Preset	For WLAN Mode: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For other Modes: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm
State Saved	Saved in instrument state
Min	-200 dBm
Max	50 dBm

Abs2 Stop

Sets the 2nd absolute power level limit at the stop frequency for the selected offset, ranging from -200 to +50 dBm. You can also toggle this function between **Couple** and **Manual**. If **Couple = ON**, the **Abs2 Stop** power level limit is coupled to "**Abs2 Start**" on page 1661, resulting in a flat limit line. If set to **Man (Couple = OFF)**, **Abs2 Start** and **Abs2 Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop absolute2 power limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute?</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute:COUPlE ON OFF 1 0, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2[:OUTer]:LIST:STOP:SABSolute:COUPlE?</code>
Example	<code>:SEM:OFFS:LIST:STOP:SABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS:LIST:STOP:SABS?</code>

	<code>:SEM:OFFS:LIST:STOP:SABS:COUP ON, ON, ON, ON, ON, ON</code> <code>:SEM:OFFS:LIST:STOP:SABS:COUP?</code>
Notes	Comma separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Couplings	Coupled to Abs2 Start if Auto is selected, that is, the Stop value is equal to the Start value
Preset	For WLAN Mode: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For other Modes: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For WLAN Mode: <code>ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</code> For other Modes: <code>ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</code>
State Saved	Saved in instrument state Saved in instrument state
Range	Auto Man
Min	-200 dBm
Max	50 dBm

Fail Mask2

Selects the logic operation for fail conditions between the measurement results and the test limits:

(Primary Fail Mask selection) OR Abs2	OR	Checks against both Primary and Abs2 limits. The test fails if either of the limits is broken
(Primary Fail Mask selection) AND Abs2	AND	Checks against both Primary and Abs2 limits. The test fails if both of the limits are broken
Abs2 Disabled	OFF	Fail Mask2 is disabled

Note that the Primary Fail Mask selection is set by **"Fail Mask"** on page 1659.

Examples:

- when Fail Mask is Abs **AND** Rel and Fail Mask2 is **OR** Abs2, “(Abs AND Rel) OR Abs2” is displayed in the column
- when Fail Mask is Absolute and Fail Mask2 is And Abs2, “(Absolute) AND Abs2” is displayed in the column

You can turn off (not use) specific offset channels remotely using:

3 Spectrum Analyzer Mode
3.9 SEM Measurement

`[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATE`

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:TEST:SABSoLute AND OR OFF, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2[:OUTer]:LIST:TEST:SABSoLute?</code>
Example	<code>:SEM:OFFS:LIST:TEST:SABS AND, AND, OR, OFF, OFF, OFF</code> <code>:SEM:OFFS:LIST:TEST:SABS?</code>
Notes	Comma-separated list of values
Preset	For WLAN: <code>OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF</code> For other Modes: <code>OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF</code>
State Saved	Saved in instrument state
Range	OR Abs2 AND Abs2 Abs2 Disabled

Offset Freq Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “Carrier Center to Meas BW Edge” definition, and LTE conformance test requires “Carrier Edge to Meas BW Center” and/or “Carrier Edge to Meas BW Edge” definition. MSR standard requires “RF BW Edge to Meas BW Center” and/or “RF BW Edge to Meas Edge” definition.

“Meas BW Edge” means the edge frequency of resolution bandwidth closer to the carrier that is represented by Meas BW and Res BW settings. Actual center frequency of Meas BW and the limit line have ½ Meas BW offset when the Meas BW Edge is selected.

Option	SCPI	Definition
Carrier Center to Meas BW Center	<code>CTOCenter</code>	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center of offset measuring filter*
Carrier Center to Meas BW Edge	<code>CTOEdge</code>	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier
Carrier	<code>ETOCenter</code>	From the lowermost carrier center frequency - spacing of this

Option	SCPI	Definition
Edge to Meas BW Center		carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of offset measuring filter*
Carrier Edge to Meas BW Edge	ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier
Sub-block Edge to Meas BW Center	STOCenter	From either the lower or upper sub-block edge frequency to the center frequency of offset measuring filter*
Sub-block Edge to Meas BW Edge	STOEdge	From either the lower or upper sub-block edge frequency to the nominal -3 dB point of the offset measuring filter* closer to the carrier
Sub-block Center to Meas BW Center	SCTOCenter	From the center frequency of sub-block to the center frequency of offset measuring filter*
5G NR Mode only		

*Measuring filter = Meas BW (N) x Res BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the **Number of Component Carriers** within each sub-block = 1, sub-block (bandwidth) = $BW_{channel} = 2 \times F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 1667.

Mode: MSR, LTEAFDD, LTEATDD

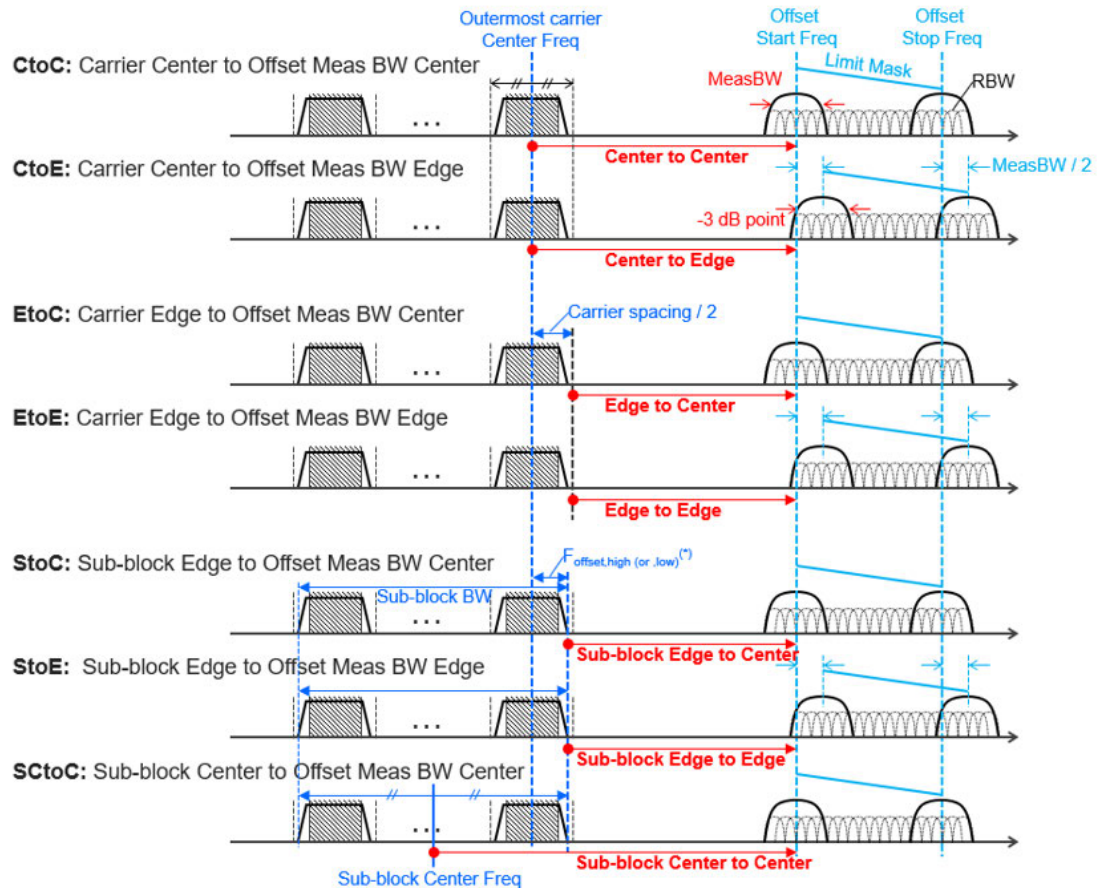

Remote Command	<code>[:SENSe] :SEMAsk :OFFSet [1] 2 :INNeR :TYPE CTOCenter CTOEdge ETOCenter ETOEdge STOCenter STOEdge</code>
Example	<code>[:SENSe] :SEMAsk :OFFSet [1] 2 :INNeR :TYPE ?</code> <code>:SEM :OFFS :INN :TYPE ETOC</code> <code>:SEM :OFFS :INN :TYPE ?</code>
Preset	STOCenter
State Saved	Saved in instrument state
Range	Carrier Center to Meas BW Center Carrier Center to Meas BW Edge Carrier Edge to Meas BW Center Carrier Edge to Meas BW Edge Sub-block Edge to Meas BW Center Sub-block Edge to Meas BW Edge

 3.9 SEM Measurement

Mode: 5G NR

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:TYPE CTOCenter CTOEdge ETOCenter ETOEdge STOCenter STOEdge SCTOCenter</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:TYPE?</code>
Example	<code>:SEM:OFFS:INN:TYPE ETOC</code> <code>:SEM:OFFS:INN:TYPE?</code>
Preset	<code>STOCenter</code>
State Saved	Saved in instrument state
Range	Carrier Center to Meas BW Center Carrier Center to Meas BW Edge Carrier Edge to Meas BW Center Carrier Edge to Meas BW Edge Sub-block Edge to Meas BW Center Sub-block Edge to Meas BW Edge Sub-block Center to Meas BW Center

Diagrams for Offset Freq Define

Notes:

- $MeasBW = N \times RBW$
- Sub-block Edge and Outermost Carrier Edge in the Sub-block are not always same. e.g.) 5G NR (3GPP) defines $BW_{channel,block}$ which calculates $F_{offset,high}$ and $F_{offset,low}$ asymmetrically with SCS shift.
(*) For MSR, $F_{offset,high (or ,low)} = F_{offset,RAT,high (or ,low)}$

Offset Detector

See "Offset Detector" on page 1629.

Cumulate Mask

Selects whether inner offset limit masks are cumulated or not.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASK[:STATe] ON OFF 0 1</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASK[:STATe]?</code>
Example	<code>:SEM:OFFS:INN:CMAS 0</code> <code>:SEM:OFFS:INN:CMAS?</code>
Notes	OFFSet 1 is for BTS, 2 for MS. Default is BTS
Preset	1 0
State Saved	Yes
Range	ON OFF

Cumulate Mask Stop Frequency

Specifies stop frequency of summing limit masks. For outside of the stop frequency, the limit masks are not cumulated.

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASK:FREQuency:STOP <freq></code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:CMASK:FREQuency:STOP?</code>
Example	<code>:SEM:OFFS:INN:CMAS:FREQ:STOP 500E6</code> <code>:SEM:OFFS:INN:CMAS:FREQ:STOP?</code>
Notes	OFFSet 1 is for BTS, 2 for MS. Default is BTS
Dependencies	Valid only when " Cumulate Mask " on page 1667 is ON
Preset	10.5 MHz
State Saved	Yes
Min/Max	0 Hz/10 GHz

Start Freq

Specifies the start frequency for the currently selected offset. Also, enables you to toggle that offset between On and Off. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:FREQuency:STARt <freq>, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:FREQuency:STARt?</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STATe ON OFF 1 0, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STATe?</code>
Example	<code>:SEM:OFFS2:INN:LIST:FREQ:STAR 2.515 MHz, 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz</code> <code>:SEM:OFFS2:INN:LIST:FREQ:STAR?</code>

	<code>:SEM:OFFS:INN:LIST:STAT ON, ON, ON, OFF, OFF, OFF</code> <code>:SEM:OFFS:INN:LIST:STAT?</code>																
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS If the offset is outside the frequency range, the result spectrum will be invalid																
Couplings	Coupled to " Stop Freq " on page 1669. If Start Freq exceeds Stop Freq , Stop Freq is automatically adjusted to (Start Freq + 100 Hz)																
Preset	<table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>MSR</td> <td>15 kHz, 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz 15 kHz, 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz</td> </tr> <tr> <td>5G NR</td> <td>50 kHz, 5.05 MHz, 10.5 MHz, 40.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz 15.00 kHz, 1.5 MHz, 5.5 MHz, 100.50 MHz, 105.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz</td> </tr> <tr> <td>LTEAFDD, LTEATDD</td> <td>50 kHz, 5.05 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz 15.00 kHz, 1.5 MHz, 5.5 MHz, 6.5 MHz, 10 MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz</td> </tr> <tr> <th>Mode</th> <th>Values</th> </tr> <tr> <td>MSR</td> <td>ON, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF</td> </tr> <tr> <td>5GNR</td> <td>ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF</td> </tr> <tr> <td>LTEAFDD LTEATDD</td> <td>ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF</td> </tr> </tbody> </table>	Mode	Values	MSR	15 kHz, 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz 15 kHz, 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz	5G NR	50 kHz, 5.05 MHz, 10.5 MHz, 40.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz 15.00 kHz, 1.5 MHz, 5.5 MHz, 100.50 MHz, 105.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz	LTEAFDD, LTEATDD	50 kHz, 5.05 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz 15.00 kHz, 1.5 MHz, 5.5 MHz, 6.5 MHz, 10 MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz	Mode	Values	MSR	ON, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF	5GNR	ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF	LTEAFDD LTEATDD	ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF

Min/Max	100 Hz/Depends on instrument maximum frequency. Same as the Max Span on Swept SA Measurement								

Res BW

Specifies which Resolution BW filter to use when measuring the currently selected offset.

Offset Res BW Mode allows the instrument to determine the optimum Resolution BW filter to use when measuring the currently selected offset. using front panel and all the offsets using SCPI. When changing the Meas BW parameter, if the Res BW needs to be changed to adhere to the rule:

$$(N \times \text{Res BW}) \leq (\text{Stop freq of the offset} - \text{Start freq of the offset}),$$

where N is the multiplier, this setting will automatically be changed to manual.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<code>[:SENSe] :SEMAsk :OFFSet [1] 2 :INNeR :LIST :BANDwidth [:RESolution] <bandwidth>, ...</code>
----------------	--

	<pre>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:BANDwidth[:RESolution]? [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:BANDwidth[:RESolution]:AUTO OFF ON 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:BANDwidth[:RESolution]:AUTO?</pre>

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer, which defines a ratio between Integration BW and **Res BW** of the measurement result:

Integration BW = Meas BW * "Res BW" on page 1670

Integration BW is the desired resolution bandwidth, and **Res BW** is the actual bandwidth for sweep. Measurement sweeps with **Res BW**, and **Meas BW** compensates sweep resolution bandwidth to Integration BW.

If you set this parameter greater than 1, you can set **Res BW** narrower to avoid carrier power leakage effect to the offset power integration.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:BANDwidth:IMULti <integer>, ...</code> <code>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:BANDwidth:IMULti?</code>						
Example	<code>:SEM:OFFS2:INN:LIST:BAND:IMUL 1,1,1,1,1,1</code> <code>:SEM:OFFS2:INN:LIST:BAND:IMUL?</code>						
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS						
Couplings	This parameter must adhere to the rule: (N x Res BW) <= (Stop freq of the offset - Start freq of the offset), where N is the multiplier If Res BW is changed, the multiplier changes to conform to the rule						
Preset	<table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>MSR</td> <td>1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1</td> </tr> <tr> <td>LTEAFDD, LTEATDD, 5G NR</td> <td>2, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1 2, 2, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1</td> </tr> </tbody> </table>	Mode	Values	MSR	1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1	LTEAFDD, LTEATDD, 5G NR	2, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1 2, 2, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1

Start Freq

Same as ["Start Freq" on page 1668](#), under **Inner Offset (BW)**

Stop Freq

Same as ["Stop Freq" on page 1669](#), under **Inner Offset (BW)**

Sweep Time

Specifies the sweep time for the currently selected offset and enables you to toggle the **Sweep Time** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

NOTE

On non-sweeping hardware, this column is grayed-out. The value shown on this column is an estimate of the turnaround time to complete the measurement of the entire offset span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same **Sweep Time** as you would for sweeping hardware, send `[:SENSe]:SEMAsk:OFFSet [1]|2:INNeR:LIST:SWEEp:TIME <time>`. The measurement emulates the **Sweep Time** effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using "**Minimum Acquisition Time**" on page 1675, which provides better control.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet [1] 2:INNeR:LIST:SWEEp:TIME <time>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet [1] 2:INNeR:LIST:SWEEp:TIME?</code> <code>[:SENSe]:SEMAsk:OFFSet [1] 2:INNeR:LIST:SWEEp:TIME:AUTO ON OFF 1 0, ...</code> <code>[:SENSe]:SEMAsk:OFFSet [1] 2:INNeR:LIST:SWEEp:TIME:AUTO?</code>						
Example	<code>:SEM:OFFS2:INN:LIST:SWE:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms</code> <code>:SEM:OFFS2:INN:LIST:SWE:TIME?</code> <code>:SEM:OFFS2:INN:LIST:SWE:TIME:AUTO ON, ON, ON, ON, OFF, OFF</code> <code>:SEM:OFFS2:INN:LIST:SWE:TIME:AUTO?</code>						
Notes	OFFSet 1 is for BTS, 2 for MS. Default is BTS						
Dependencies	On non-sweeping hardware, this column is grayed-out and the Auto/Man checkbox is invisible. The read-only column shows estimated sweep time In those instruments, " Minimum Acquisition Time " on page 1675 is available						
Couplings	When you manually set a value while in Auto , the state automatically changes to Man						
Preset	Automatically calculated						
	<table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>MSR</td> <td>ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</td> </tr> <tr> <td>LTEAFDD, LTEATDD, 5G NR</td> <td>ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</td> </tr> </tbody> </table>	Mode	Values	MSR	ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON	LTEAFDD, LTEATDD, 5G NR	ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON

<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr style="background-color: #cccccc;"> <th style="text-align: left;">Sweep Type</th> <th style="text-align: left;">Min/Max</th> </tr> </thead> <tbody> <tr> <td>Swept</td> <td>1ms/10 s</td> </tr> <tr> <td>FFT</td> <td>100ns/10 s</td> </tr> </tbody> </table>		Sweep Type	Min/Max	Swept	1ms/10 s	FFT	100ns/10 s
Sweep Type	Min/Max						
Swept	1ms/10 s						
FFT	100ns/10 s						

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides **Span** into multiple chunks if needed. Therefore, the total signal acquisition time for the entire offset span is:

$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$.

When in **Auto**, this parameter's value is determined by other parameters, such as **Offset Start**, **Offset Stop**, **RBW** and **VBW**.

You can manually increase this parameter value from this **Auto** value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	<pre>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEep:ACQuisition:TIME <time>, ... [:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEep:ACQuisition:TIME? [:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEep:ACQuisition:TIME:AUTO ON OFF 1 0, ... [:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEep:ACQuisition:TIME:AUTO?</pre>
Example	<pre>:SEM:OFFS2:INN:LIST:SWE:ACQ:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms :SEM:OFFS2:INN:LIST:SWE:ACQ:TIME?</pre>

	<code>:SEM:OFFS2:INN:LIST:SWE:ACQ:TIME:AUTO ON, ON, ON, OFF, OFF</code> <code>:SEM:OFFS2:INN:LIST:SWE:ACQ:TIME:AUTO?</code>
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Offset Start Freq , Offset Stop Freq , RBW , and VBW when in the Auto state When you manually set a value while in Auto , the state automatically changes to Man
Preset	Automatically calculated ON
State Saved	Saved in instrument state
Min	100 ns
Max	4000 s

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire offset span of each measurement cycle.

Remote Command	<code>[:SENSe] :SEMAsk:OFFSet[1] 2:INNER:LIST:SWEep:ETIME?</code>
Example	<code>:SEM:OFFS2:INN:LIST:SWE:ETIM?</code>
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep Type

Specifies the **Sweep Type** for the currently selected offset and enables you to toggle **Sweep Type** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

How to define Sweep Time and Sweep Type

Sweep Type Mode	Behavior
Auto	Sweep Type is automatically selected depending on Rules Sweep Time is automatically calculated, according to the selected Sweep Type
Man	Sweep Type is user-selected
–	

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEEp:TYPE SWEEp FFT, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEEp:TYPE?</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEEp:TYPE:AUTO ON OFF 1 0, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:SWEEp:TYPE:AUTO?</code>
Example	<code>:SEM:OFFS2:INN:LIST:SWE:TYPE FFT,FFT,SWE</code> <code>:SEM:OFFS2:INN:LIST:SWE:TYPE?</code> <code>:SEM:OFFS2:INN:LIST:SWE:TYPE:AUTO ON, ON, ON, ON, OFF, OFF</code> <code>:SEM:OFFS2:INN:LIST:SWE:TYPE:AUTO?</code>
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Dependencies	Not available in modular products, such as VXT
Couplings	When Sweep Type is set manually, Sweep Type Mode is set to MANua1 When Sweep Type Mode is Auto , Sweep Type is automatically selected according to " Sweep Type Rules " on page 1623
Preset	Automatically calculated <code>ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON</code>
State Saved	Saved in instrument state
Range	Auto Man

Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:SEMAsk:OFFSet [n]:INNeR:LIST:STATe`.

BOTH	Both sides in the sub-block gap are enabled.
NEGative	The upper side in the sub-block gap only (i.e., negative sideband of the upper sub-block) is enabled
POSitive	The lower side in the sub-block gap only (i.e., positive sideband of the lower sub-block) is enabled.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Modes.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Start Freq

Same as "Start Freq" on page 1668 under Inner Offset (BW)

Stop Freq

Same as "Stop Freq" on page 1669 under Inner Offset (BW)

Abs Start

Sets the absolute power level limit at the start frequency for the selected inner offset, ranging from -200 to +50 dBm.

The fail condition for each inner offset channel is set remotely by `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:TEST`.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:STATE`.

The query returns values currently set to the absolute power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:STARt:ABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:STARt:ABSolute?</code>

Abs Stop

Sets the absolute power level limit at the stop frequency for the selected inner offset, ranging from -200 to +50 dBm. You can also toggle this function between **Couple** (`COUPle = ON`) and **Manual** (`COUPle = OFF`). If set to **Couple**, the Abs Stop power level limit is coupled to Abs Start to result in a flat limit line. If set to **Man**, Abs Start and Abs Stop take different values to result in a sloped limit line.

The query returns values currently set to the inner offset stop absolute power limits.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<pre>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:ABSolute <real>, ... [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:ABSolute? [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:ABSolute:COUPle ON OFF 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:ABSolute:COUPle?</pre>

Rel Start

Sets a relative power level limit at the start frequency for the selected inner offset, ranging from -200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMAsk:OFFSet [n]:INNeR:LIST:TEST` for each inner offset channel test.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:STATe`.

The query returns values currently set to the relative power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:START:RCARrier <rel_amp1>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:START:RCARrier?</code>
Example	<code>:SEM:OFFS:INN:LIST:STAR:RCAR -30, -30, -30, -30, -30, -30</code> <code>:SEM:OFFS:INN:LIST:STAR:RCAR?</code>
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Preset	0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB

Min/Max	-200 dB/50 dB

Fail Mask

Selects one of the logics for fail conditions between the measurement results and the test limits:

- **ABSolute** and **RELative** both check the results against the respective limit
- **OR** checks against both limits, failing if either of the limits is broken
- **AND** only displays a fail if both of the limits are broken

The absolute or relative power limit value for each inner offset channel can be set remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:ABSolute` or `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:RCARrier`.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:STATe`.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:TEST ABSolute AND OR RELative, ...</code>
----------------	--

	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:TEST?</code>
Example	<code>:SEM:OFFS:INN:LIST:TEST ABS, ABS, ABS, ABS, ABS, ABS</code> <code>:SEM:OFFS:INN:LIST:TEST?</code>

Range	Absolute Relative Abs AND Rel Abs OR Rel

Show Abs2 Limit

Same as ["Show Abs2 Limit" on page 1683](#) under Limits.

Abs2 Start

Sets the 2nd absolute power level limit at the start frequency for the selected inner offset, ranging from -200 to +50 dBm.

The fail condition for each inner offset channel is set remotely using:

`[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:TEST:SABSolute`

You can turn off (not use) specific inner offset channels remotely using:

`[:SENSe]:SEMAsk:OFFSet[n]:INNeR:LIST:STATe`

The query returns values currently set to the 2nd absolute power test limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

Remote Command	<code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:START:SABSolute <real>, ...</code> <code>[:SENSe]:SEMAsk:OFFSet[1] 2:INNeR:LIST:START:SABSolute?</code>
Example	<code>:SEM:OFFS:INN:LIST:STAR:SABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm</code> <code>:SEM:OFFS:INN:LIST:STAR:SABS?</code>
Notes	Comma-separated list of values <code>OFFSet</code> 1 is for BTS, 2 for MS. Default is BTS
Preset	0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm
State Saved	Saved in instrument state
Min	-200 dBm
Max	50 dBm

Abs2 Stop

Sets the 2nd absolute power level limit at the stop frequency for the selected inner offset, ranging from -200 to +50 dBm. You can also toggle this function between **Couple** and **Manual**. If set to **Couple = ON**, the **Abs2 Stop** power level limit is coupled to "**Abs2 Start**" on page 1683, resulting in a flat limit line. If set to **Man (Couple = OFF)**, **Abs2 Start** and **Abs2 Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop 2nd absolute power limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

Remote Command	<pre>[:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:SABSolute <real>, ... [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:SABSolute? [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:SABSolute:COUPle ON OFF 1 0, ... [:SENSe]:SEMask:OFFSet[1] 2:INNeR:LIST:STOP:SABSolute:COUPle?</pre>
Example	<pre>:SEM:OFFS:INN:LIST:STOP:SABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm :SEM:OFFS:INN:LIST:STOP:SABS? :SEM:OFFS:INN:LIST:STOP:SABS:COUP ON, ON, ON, ON, ON, ON :SEM:OFFS:INN:LIST:STOP:SABS:COUP?</pre>
Notes	<p>Comma-separated list of values</p> <p>OFFSet 1 is for BTS, 2 for MS. Default is BTS</p>
Couplings	Coupled to Abs Start if Auto is selected, that is, the Stop value is equal to the Start value
Preset	<pre>0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON</pre>
State Saved	<p>Saved in instrument state</p> <p>Saved in instrument state</p>
Range	Auto Man
Min	-200 dBm
Max	50 dBm

Fail Mask2

Selects one of the logical operations for fail conditions between the measurement results and the test limits:

(Primary Fail Mask selection) OR Abs2	OR	Checks against both Primary and Abs2 limits. The test fails if either of the limits is broken
(Primary Fail Mask selection) AND Abs2	AND	Checks against both Primary and Abs2 limits. The test fails if both of the limits are broken
Abs2 Disabled	OFF	Fail Mask2 is disabled

For examples, see ["Fail Mask2" on page 1663](#).

Note that the Primary Fail Mask selection is set by ["Fail Mask" on page 1682](#).

You can turn off (not use) specific inner offset channels remotely using:

`[:SENSe] :SEMAsk :OFFSet [n] :INNER :LIST :STATE`

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

Remote Command	<code>[:SENSe] :SEMAsk :OFFSet [1] 2 :INNER :LIST :TEST :SABSolute AND OR OFF, ...</code> <code>[:SENSe] :SEMAsk :OFFSet [1] 2 :INNER :LIST :TEST :SABSolute?</code>
Example	<code>:SEM:OFFS:INN:LIST:TEST:SABS AND, AND, OR, OFF, OFF, OFF</code> <code>:SEM:OFFS:INN:LIST:TEST:SABS?</code>
Notes	Comma-separated list of values
Preset	<code>OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF</code>
State Saved	Saved in instrument state
Range	OR Abs2 AND Abs2 Abs2 Disabled

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1686 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth

- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	<code>:CONFigure:SEMAsk</code>
Example	<code>:CONF:SEM</code>
Couplings	Restores all measurement parameters to their default values

3.9.18.2 Carrier

Used to set up parameters that define how the reference channel is measured.

Integ BW

Specifies the integration bandwidth used to calculate the power in the reference channel.

Remote Command	<code>[[:SENSe]:SEMAsk:BANDwidth[1]]2:INTEgration <bandwidth></code>
----------------	--

802.11a/g (OFDM/DSSS-OFDM)	18 MHz
802.11n/ac (20 MHz)	
802.11b/g (DSSS/CCK/PBCC)	22 MHz
802.11n (40MHz)/ 802.11ac (40 MHz)	38 MHz
802.11ac (80 MHz)	78 MHz
802.11ac (160 MHz)	158 MHz
802.11ac (80 MHz + 80 MHz)	78 MHz
802.11ah (1 MHz)	0.9 MHz
802.11ah (2 MHz)	1.8 MHz
802.11ah (4 MHz)	3.8 MHz
802.11ah (8 MHz)	7.8 MHz

Radio Std	Presets
802.11ah (16 MHz)	15.8 MHz
802.11j/p (20 MHz)	18 MHz
802.11j/p (10 MHz)	9 MHz
802.11p (5 MHz)	4.5 MHz
802.11ax/be (20 MHz)	19.5 MHz
802.11ax/be (40 MHz)	39.0 MHz
802.11ax/be (80 MHz)	79.0 MHz
802.11ax/be (160 MHz)	159.0 MHz
802.11be (320 MHz)	319.0 MHz
802.11ax (80 MHz + 80 MHz)	79.0 MHz
802.11af (6 MHz)	5.7 MHz
802.11af (7 MHz)	6.65 MHz
802.11af (8 MHz)	7.6 MHz

Span

Specifies the span used to calculate the power in the reference channel.

Remote Command	<pre>[:SENSe]:SEMAsk:FREQuency[1] 2:SPAN <freq> [:SENSe]:SEMAsk:FREQuency[1] 2:SPAN? [:SENSe]:SEMAsk:FREQuency[1] 2:SPAN:AUTO ON OFF 1 0 [:SENSe]:SEMAsk:FREQuency[1] 2:SPAN:AUTO?</pre>
Example	<pre>:SEM:FREQ:SPAN 3MHz :SEM:FREQ:SPAN? :SEM:FREQ:SPAN:AUTO OFF :SEM:FREQ:SPAN:AUTO?</pre>
Notes	<p>Frequency sub op code, 1 is for BTS, 2 for MS. Default is BTS</p> <p>Note that Frequency sub op code 2 is supported only in non-SA Modes. In SA Mode, Frequency sub op code 1 is used for both BTS and MS</p> <p>If the ref channel is outside the frequency range, the result spectrum will be invalid</p>
Dependencies	<p>Not shown in MSR Mode</p> <p>In order to maintain backwards compatible with legacy LTE FDD/TDD Modes, the channel span key is supported in LTE & LTE-A converged application. The Auto/Man toggle is added to this key. This key is enabled and can be changed only in single carrier. The span state is always Auto in Multi-carriers</p> <p>Span Auto/Man state is only available in LTE/LTE-Advanced FDD/TDD and 5G NR Modes</p>
Couplings	<p>Range 1 kHz to 50 MHz (although restricted by Chan Integ BW). If you set the channel Span lower than channel Integ BW, they will both track each other. As you increase the channel Span, Integ BW also increases if it is less than 1/10 of the channel Span</p>

3 Spectrum Analyzer Mode
3.9 SEM Measurement

For WLAN 802.11ac (80 + 80 MHz), the channel span is coupled with the difference between the center frequencies of the two carriers. When the difference is either less than 80 MHz, or greater than 565 MHz, a "setting conflict" error message is displayed

Chan Span = Carrier Spacing + Chan IntegBW

When the state of Span is **Auto**, the span value is automatically determined by multi-carrier configuration. Otherwise, the span value depends on user input

When the span value is set manually, the state of span is automatically changes to **Man**

This key is enabled and can be changed only in single carrier. The span state is always **Auto** in Multi-carriers

Preset	Mode	Value

802.11af (6 MHz)	5.7 MHz
802.11af (7 MHz)	6.65 MHz
802.11af (8 MHz)	7.6 MHz

Sweep Time

Used to calculate the power in the reference channel. **Sweep Time** can be set manually or put into **Auto** mode.

For instruments with non-sweeping acquisitions, such as VXT, the time value is the acquisition time for an individual FFT segment, not the cumulated time for all FFT segments in the channel.

NOTE

On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate, which is the turnaround time to complete the measurement of the entire carrier span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same **Sweep Time** as you would for sweeping hardware, send `[:SENSe] :SEMAsk :SWEep [1] | 2 :TIME <time>`. The measurement emulates the **Sweep Time** effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using "**Minimum Acquisition Time**" on page 1692, which provides better control.

Remote Command `[:SENSe] :SEMAsk :SWEep [1] | 2 :TIME <time>`
`[:SENSe] :SEMAsk :SWEep [1] | 2 :TIME ?`
`[:SENSe] :SEMAsk :SWEep [1] | 2 :TIME :AUTO OFF | 0 | ON | 1`
`[:SENSe] :SEMAsk :SWEep [1] | 2 :TIME :AUTO ?`

Example `:SEM:SWE:TIME 9ms`
`:SEM:SWE:TIME ?`
`:SEM:SWE:TIME:AUTO OFF`
`:SEM:SWE:TIME:AUTO ?`

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Notes	Sub op code 1 is for BTS, 2 for MS. Default is BTS Note that Sweep sub op code 2 is supported only in non-SA Modes. In SA Mode, Sweep sub op code 1 is used for both BTS and MS						
Dependencies	On non-sweeping hardware, this control is grayed out and the Auto/Man checkbox is invisible. The read-only value shows the estimated sweep time In those instruments, " Minimum Acquisition Time " on page 1692 is available						
Couplings	When the time is set manually, Auto is set to OFF If state is Auto , coupled with Channel Detector selection, Channel Resolution BW , Channel Video BW When set to Auto , the Time is automatically calculated						
Preset	Automatically calculated ON						
State Saved	Saved in instrument state Yes						
Range	OFF ON						
Min	Sweeping hardware Depends on Channel " Sweep Type " on page 1694: <table border="1" data-bbox="406 940 1404 1066"> <thead> <tr> <th>Sweep Type</th> <th>Min</th> </tr> </thead> <tbody> <tr> <td>Swept</td> <td>1 ms</td> </tr> <tr> <td>FFT</td> <td>100 ns</td> </tr> </tbody> </table> Non-sweeping hardware: N/A	Sweep Type	Min	Swept	1 ms	FFT	100 ns
Sweep Type	Min						
Swept	1 ms						
FFT	100 ns						
Max	Sweeping hardware: 4000 s Non-sweeping hardware: N/A						
Backwards	<code>[:SENSe] :SEMAsk:SWEEp[1] 2 [:TIME]</code>						
Compatibility SCPI	<code>[:SENSe] :SEMAsk:SWEEp[1] 2 [:TIME] :AUTO</code>						

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides **Span** into multiple chunks if needed. Therefore, the total signal acquisition time for the entire carrier span is:

$$\sim(\sim\text{Minimum Acquisition Time}) * (\text{The number of chunks})$$

When in **Auto**, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this **Auto** value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	<code>[:SENSe] :SEMAsk :SWEep :ACQuisition :TIME <time></code> <code>[:SENSe] :SEMAsk :SWEep :ACQuisition :TIME?</code> <code>[:SENSe] :SEMAsk :SWEep :ACQuisition :TIME :AUTO OFF ON 0 1</code> <code>[:SENSe] :SEMAsk :SWEep :ACQuisition :TIME :AUTO?</code>
Example	<code>:SEM :SWE :ACQ :TIME 500 ms</code> <code>:SEM :SWE :ACQ :TIME?</code> <code>:SEM :SWE :ACQ :TIME :AUTO OFF</code> <code>:SEM :SWE :ACQ :TIME :AUTO?</code>
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Span , RBW , and VBW when in the Auto state If you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated ON
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire carrier span of each measurement cycle.

Remote Command	<code>[:SENSe] :SEMAsk :SWEep :ETIMe?</code>
Example	<code>:SEM :SWE :ETIM?</code>
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep Type

Sets the **Sweep Type** used to calculate the power in the reference channel. **Sweep Type** can be set manually or put into **Auto** mode.

How to define Channel Sweep Time and Channel Sweep Type:

Channel Sweep Type Mode	Behavior
Auto	Channel Sweep Type is automatically selected depending on Sweep Type Rules Channel Sweep Time is automatically calculated depending on the selected sweep type
Man	Channel Sweep Type is user-selected
–	

Remote Command	<code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE SWEEp FFT</code> <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE?</code> <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE:AUTO OFF 0 ON 1</code> <code>[:SENSe]:SEMAsk:SWEEp[1] 2:TYPE:AUTO?</code>
Example	<code>:SEM:SWE:TYPE FFT</code> <code>:SEM:SWE:TYPE?</code> <code>:SEM:SWE:TYPE:AUTO OFF</code> <code>:SEM:SWE:TYPE:AUTO?</code>
Notes	Sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Sweep sub op code 2 is supported only in non-SA Modes. In SA Mode, Sweep sub op code 1 is used for both BTS and MS
Dependencies	Grayed-out in VXT models M9410A/11A
Couplings	If Sweep Type is set manually, Sweep Type mode is set to MANua1 When Channel Sweep Type mode is Auto , Sweep Type is automatically selected according to Sweep Type Rules
Preset	Automatically calculated ON
State Saved	Saved in instrument state Yes
Range	OFF ON

Res BW

Sets the resolution bandwidth used to calculate the power in the reference channel. The Channel Resolution BW can be set manually or put into auto mode.

MSR Auto RBW:

In the MSR Mode, resolution bandwidth is predefined for each radio format. When carriers are configured with multiple radio formats, the narrowest RBW is selected.

Radio Format		RBW (kHz)
LTE	1.4 MHz	13 kHz
	3 MHz	27 kHz
	5 MHz	47 kHz
	10 MHz	91 kHz
	15 MHz	150 kHz
	20 MHz	180 kHz
	200 kHz (NB-IoT, only available in FDD)	10 kHz
W-CDMA		75 kHz

5G NR Auto RBW:

Radio Format		RBW
5G NR	5 MHz	47 kHz
	10 MHz	91 kHz
	15 MHz	150 kHz
	20 MHz	180 kHz
	25 MHz	240 kHz
	30 MHz	270 kHz
	35 MHz	330 kHz
	40 MHz	390 kHz
	45 MHz	430 kHz
	50 MHz	470 kHz
	60 MHz	560 kHz
	70 MHz	680 kHz
	80 MHz	750 kHz
	90 MHz	820 kHz
	100 MHz	910 kHz
200MHz	1.8 MHz	
400 MHz	3 MHz	

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Radio Format	RBW
800 MHz	3 MHz
1600 MHz	3 MHz
2000 MHz	3 MHz

In the LTE-Advanced (both FDD and TDD) and 5G NR modes, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, which is listed above. When **Res BW** mode is **Auto**, the narrowest RBW is selected.

Remote Command	<pre>[:SENSe]:SEMask:BANDwidth[1] 2[:RESolution] <bandwidth> [:SENSe]:SEMask:BANDwidth[1] 2[:RESolution]? [:SENSe]:SEMask:BANDwidth[1] 2[:RESolution]:AUTO OFF ON 1 0 [:SENSe]:SEMask:BANDwidth[1] 2[:RESolution]:AUTO?</pre>												
Example	<pre>:SEM:BAND 100 kHz :SEM:BAND? :SEM:BAND:AUTO ON :SEM:BAND:AUTO?</pre>												
Notes	<p>Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS</p> <p>Note that Bandwidth sub op code 2 is supported only in non-SA modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS</p>												
Couplings	<p>If Res BW is set manually, Channel Resolution BW mode is set to MANual</p> <p>Coupled with Channel Detector selection, Channel Sweep Time and Channel Video BW</p> <p>When set to Auto, the resolution bandwidth is automatically calculated</p>												
Preset	<table border="1"> <thead> <tr> <th>Mode</th> <th>Values</th> </tr> </thead> <tbody> <tr> <td>SA</td> <td>100 kHz</td> </tr> <tr> <td>WCDMA</td> <td>75 kHz</td> </tr> <tr> <td>LTE, LTETDD, MSR, LTEAFDD, LTEATDD</td> <td>Auto (47 kHz)</td> </tr> <tr> <td>5G NR</td> <td>Auto</td> </tr> <tr> <td>WLAN</td> <td>100 kHz</td> </tr> </tbody> </table> <p>ON</p>	Mode	Values	SA	100 kHz	WCDMA	75 kHz	LTE, LTETDD, MSR, LTEAFDD, LTEATDD	Auto (47 kHz)	5G NR	Auto	WLAN	100 kHz

Channel Detector

Accesses a menu of functions that enable you to control the detectors for reference channel. The following choices are available:

AUTO	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function
NORMal	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
AVERage	The detector determines the average of the signal within the sweep points. The averaging method depends upon the Average Type selection (voltage, power or log scales)
POSitive Peak	The detector determines the maximum of the signal within the sweep points
SAMPle	The detector indicates the instantaneous level of the signal at the center of the

NEGative sweep points represented by each display point
Peak The detector determines the minimum of the signal within the sweep points

Remote Command	<code>[:SENSe]:SEMask:DETECTOR:CARRier[:FUNCTION] AVERage NEGative NORMal POSitive SAMPlE</code> <code>[:SENSe]:SEMask:DETECTOR:CARRier[:FUNCTION]?</code> <code>[:SENSe]:SEMask:DETECTOR:CARRier:AUTO ON OFF 1 0</code> <code>[:SENSe]:SEMask:DETECTOR:CARRier:AUTO?</code>
Example	<code>:SEM:DET:CARR NEG</code> <code>:SEM:DET:CARR?</code> <code>:SEM:DET:CARR:AUTO OFF</code> <code>:SEM:DET:CARR:AUTO?</code>
Notes	When you manually select a detector (instead of selecting Auto), that detector is used regardless of other instrument settings Note: This detector setting affects the reference channel. There is no per-trace detector
Couplings	See Couplings in "Trace Type" on page 1927
Preset	<code>AVERage</code> <code>ON</code>
State Saved	Saved in instrument state
Range	<code>AVERage NEGative NORMal POSitive SAMPlE</code>

Reference Carrier Average Type (Remote Command Only)

Select trace average type for the reference carrier.

Remote Command	<code>[:SENSe]:SEMask:AVERage:CARRier:TYPE RMS LOG</code> <code>[:SENSe]:SEMask:AVERage:CARRier:TYPE?</code>
Example	<code>:SEM:AVER:CARR:TYPE LOG</code> <code>:SEM:AVER:CARR:TYPE?</code>
Preset	<code>RMS</code>
State Saved	Saved in instrument state

Offset/Limits Config Table

This function is the same as ["Offset/Limits Config Table" on page 1624](#) under the ["Settings" on page 1620](#) tab.

Sets the power reference in the carrier that will be used to compute the relative values for the offsets.

3.9.18.3 Reference

Lets you set the Reference Power and parameters related to the Reference Power for SEM measurements.

Measurement Type

Accesses a menu that enables you to select one of the following measurement reference types:

Total Pwr Ref	TPRef	Sets the reference to the total carrier power and the measured data is shown in dBc and dBm
PSD Ref	PSDRef	Sets the reference to the mean power spectral density of the carrier and the measured data is shown in dB and dBm/Hz
Spectrum Peak Ref	SPRef	Sets the reference to the spectrum peak power of the carrier and the measured data is shown in dB and dBm

Remote Command	<code>[:SENSe]:SEMAsk:TYPE PSDRef TPRef SPRef</code> <code>[:SENSe]:SEMAsk:TYPE?</code>
Example	<code>:SEM:TYPE PSDR</code> <code>:SEM:TYPE?</code>
Preset	WLAN Mode: SPRef All other Modes: TPRef
State Saved	Saved in instrument state
Range	Total Pwr Reference PSD Reference Spectrum Peak Reference

Reference Power

Toggles between Measured Power (**ON**) and Manual Power (**OFF**) for Total Power Ref, PSD Ref, and Spectrum Peak Ref.

Remote Command	<code>[:SENSe]:SEMAsk:CARRier:AUTO[:STATe] OFF ON 1 0</code> <code>[:SENSe]:SEMAsk:CARRier:AUTO[:STATe]?</code>
Example	Set to Manual: <code>:SEM:CARR:AUTO OFF</code> Set to Measured: <code>:SEM:CARR:AUTO ON</code> <code>:SEM:CARR:AUTO?</code>
Notes	Available for all "Measurement Type" on page 1700s

Dependencies	Not available in MSR, LTEAFDD, LTEATDD, and 5G NR Modes
Preset	ON
State Saved	Saved in instrument state Saved in instrument state
Range	Auto Man

Total Power Ref

Sets the power in the carrier (ref channel) that is used to compute the relative power values for the offsets. For modes other than MSR, LTEAFDD, LTEATDD, and 5G NR, when **"Reference Power" on page 1700** is set to Measured, this value is set to the measured carrier reference power. When set to Manual, the result takes on the last measured value, or can be manually entered.

For WLAN 802.11ac (80 MHz + 80 MHz), the higher of the power readouts of the two carriers is used for computing the relative power values for the offset.

Remote Command	<code>[:SENSe]:SEMAsk:CARRier[:POWer] <real></code> <code>[:SENSe]:SEMAsk:CARRier[:POWer]?</code>
Example	<code>:SEM:CARR 100dBm</code> <code>:SEM:CARR?</code>
Notes	The min and max values given are for "Measurement Type" on page 1700 = Total Pwr Ref
Couplings	Coupled with Measurement Type . Active when Measurement Type is set to Total Power Ref. Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, the control is active when Measurement Type is set to Total Power and Power Ref is set to Manual
Preset	Measured carrier reference power
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Annotation	Value is displayed on the left top of the Results window with the Channel Integ BW

PSD Ref

Sets the power spectral density in the carrier that is used to compute the relative power spectral density values for the offsets when **"Measurement Type" on page 1700** is set to PSD Ref. When the state is set to **Auto**, this will be set to the measured carrier power spectral density.

For WLAN 802.11ac (80 MHz + 80 MHz), the higher of the power density readouts of the two carriers is used for computing the relative PSD values for the offset.

Remote	<code>[:SENSe]:SEMAsk:CARRier:CPSD <real></code>
--------	---

3 Spectrum Analyzer Mode
3.9 SEM Measurement

Command	<code>[:SENSe]:SEMAsk:CARRier:CPSD?</code>
Example	<code>:SEM:CARR:CPSD -80</code> <code>:SEM:CARR:CPSD?</code>
Notes	Although the default value is defined, the value is recalculated by the measurement result just after completing the measurement Carrier sub op code. 1 for BTS, 2 for MS. Default is BTS
Couplings	Coupled with " Measurement Type " on page 1700. Active if Measurement Type is PSD. Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, active when Measurement Type is PSD and Power Ref is Manual
Preset	Measured carrier PSD reference power
State Saved	Saved in instrument state
Min/Max	-200/200
Annotation	Value is displayed on the right top of the Results window. If Meas Type selection is PSD Ref, the string is "PSD Ref" with BOLD font, otherwise, hide annotation

Spectrum Pk Ref

Sets the spectrum peak power in the carrier that is used to compute the relative power spectral density values for the offsets when "**Measurement Type**" on page 1700 is Spectrum Peak. When the state is set to **Auto**, this is set to the measured carrier spectrum peak power. When set to **Manual**, the result takes on the last measured value, or can be manually entered

Remote Command	<code>[:SENSe]:SEMAsk:CARRier:PEAK[:POWer] <real></code> <code>[:SENSe]:SEMAsk:CARRier:PEAK[:POWer]?</code>
Example	<code>:SEM:CARR:PEAK -80</code> <code>:SEM:CARR:PEAK:POWER?</code>
Notes	Although the default value is defined, the value is recalculated by the measurement result just after completing the measurement Carrier sub op code. 1 for BTS, 2 for MS. Default is BTS
Couplings	Coupled with " Measurement Type " on page 1700. Active when Measurement Type is "Spectrum Peak Ref". Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, active when Measurement Type is Spectrum Peak Ref and Power Ref is Manual
Preset	Measured carrier Spectrum Peak reference power
State Saved	Saved in instrument state
Min/Max	-200/200
Annotation	Value is displayed on the right top of the Results window. If Meas Type selection is Spectrum Peak Ref, the string is "Spectrum Peak Ref" with BOLD font, otherwise, hide annotation

Offset/Limits Config Table

This function is the same as "Offset/Limits Config Table" on page 1624 under the "Settings" on page 1620 tab.

Sets the power reference in the carrier that will be used to compute the relative values for the offsets.

3.9.18.4 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	<pre>[:SENSe]:RADio:STANdard[:SElect] NONE JSTD IS95a IS97D IS98D GSM W3GPP C2000MC1 C20001X NADC PDC BLUEtooth TETRa WL802DOT11A WL802DOT11B WL802DOT11G HIPERLAN2 DVBTLSN DVBTGPN DVBTIPN FCC15 SDMBSE UWBINDOOR LTEB1M4 LTEB3M LTEB5M LTEB10M LTEB15M LTEB20M WL11N20M WL11N40M WL11AC20M WL11AC40M WL11AC80M WL11AC160M WL11AX20M WL11AX40M WL11AX80M WL11AX160M WL11BE20M WL11BE40M WL11BE80M WL11BE160M WL11BE320M WL11AD2G WL11AY2G16 WL11AY4G32 WL11AY6G48 WL11AY8G64 NR5GFR1B100M [:SENSe]:RADio:STANdard[:SElect]?</pre>
Example	<pre>:RAD:STAN NONE :RAD:STAN?</pre>
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state
<p>The Radio column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the Radio column:</p>

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
FCC Part15 Subpart F	RRC Filter	On
	RRC Filter Alpha	0.35
	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
----------	-----------------	---------------

3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
3GPP W-CDMA	VBW	Auto rules
	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
3GPP LTE 1.4 MHz	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
3GPP LTE 5 MHz	VBW	Auto rules
	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
3GPP LTE 10 MHz	RBW	Auto rules
	VBW	Auto rules
	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
3GPP LTE 1.4 MHz	Span	7.5 MHz
	RBW	Auto rules
	VBW	Auto rules
	Command Example	:RAD:STAN LTEB10M
3GPP LTE 3 MHz	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.9 SEM Measurement

3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules

PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN? Query always returns IS97D
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	<code>[:SENSe]:RADio:STANdard:BAND:CLASs BC0 BC1</code> <code>[:SENSe]:RADio:STANdard:BAND:CLASs?</code>
Example	<code>:RAD:STAN:BAND:CLAS BC0</code> <code>:RAD:STAN:BAND:CLAS?</code>
Preset	<code>BC0</code>
State Saved	Saved in instrument state
Range	0 (800 MHz Band) 1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.9 SEM Measurement

WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11b	VBW	Auto rules
	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
WLAN 802.11n 20 MHz	RBW	100 kHz
	VBW	Auto rules
	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
WLAN 802.11n 40 MHz	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
	Command Example	:RAD:STAN WL11N40M
WLAN 802.11ac 20 MHz	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11ac 80 MHz	VBW	Auto rules
	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
WLAN 802.11ac 80 MHz	RBW	100 kHz
	VBW	Auto rules
	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
WLAN 802.11ac 80 MHz	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
	Command Example	:RAD:STAN WL11AC80M

WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is **NONE**, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as **:CONF** allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to **NONE**.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to **NO**, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to **YES**, all measurements and standard selections are enabled, so you can select any combination.

NOTE

If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	<code>[:SENSe]:RADio:STANdard:EAMeas YES NO</code> <code>[:SENSe]:RADio:STANdard:EAMeas?</code>
Example	<code>:RAD:STAN:EAM YES</code> <code>:RAD:STAN:EAM?</code>
Preset	NO
State Saved	Saved in instrument state
Range	YES NO

3.9.18.5 Advanced

Contains controls for setting advanced instrument functions.

This tab does not appear in EXM, VXT.

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The **ON** state (in Modes that do not support Adaptive NFE) matches the FULL state (in Modes that *do* support Adaptive NFE).

In **ON** or FULL NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This usually reduces the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with Average Type set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension ON**.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, therefore it does nothing when External Mixing is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive. In Modes that do not support Adaptive NFE, the default state of NFE is OFF. Prior to the introduction of Adaptive NFE (firmware version A. 18.00), the default state of NFE was OFF for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from On|Off to Full|Adaptive|Off. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes which support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON` plus
`:CORRection:NOISe:FLOor:ADAPtive ON`

Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOor ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor?</code>
Example	<code>:CORR:NOIS:FLO ON</code>
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the remote command will be accepted without error (but has no effect)
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled via SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset . Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive
State Saved	No
Remote Command	<code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON OFF 1 0</code> <code>[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?</code>
Example	First turn NFE on, this is FULL mode: <code>:CORR:NOIS:FLO ON</code> Then set it to Adaptive: <code>:CORR:NOIS:FLO:ADAP ON</code>
Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the remote command is accepted without error (but has no effect)
Couplings	Sending <code>:CORR:NOIS:FLO ON</code> turns NFE Adaptive OFF for backwards compatibility. To turn Adaptive ON , you must issue the commands in the proper order, as shown in the example above

Preset	Not affected by Mode Preset , but set to ON at startup and by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is **Average**, and the Average Type is set to **Power**.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. **Peak** detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. **Negative peak** detection is not very useful, either. **Sample** detection works well but is never better than the average detector because it does not smooth as well. The **Normal** detector is a combination of peak and negative peak behaviors and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, the power scale (Average Type = **Power**) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with

the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement – those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you **Cancel**, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Enable Wideband IF for FFT

When **OFF**, the maximum FFT BW is limited to 40 MHz. When **ON**, FFT with more wideband IF is supported depending on the instrument. For example, the max FFT BW is 510 MHz with option B5X. When ON for R10/R20/R40, the max FFT BW is 1GHz.

3 Spectrum Analyzer Mode
3.9 SEM Measurement

When this parameter is on and the following conditions are met, the measurement is performed with a single I/Q acquisition.

- Stop Freq of the outermost Offset range is within the available IQ acquisition BW
- Same RBW, VBW, Detector Type settings across all Offset ranges and Carrier
- Sweep Type = FFT and Sweep Time = Auto across all Offset ranges and Carrier

Remote Command	<code>[:SENSe]:SEMask:WBFFt:ENABle ON OFF 1 0</code> <code>[:SENSe]:SEMask:WBFFt:ENABle?</code>
Example	<code>:SEM:WBFF:ENAB 1</code> <code>:SEM:WBFF:ENAB?</code>
Dependencies	The maximum FFT BW depends on the μ W preselector and the current frequency. In hi-band, the μ W preselector must be disabled to apply the FFT with wideband IF. Otherwise, the maximum FFT BW is limited to 40 MHz
Preset	OFF
State Saved	Saved in instrument state
Range	ON OFF

3.9.18.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:FREQuency:CENTer ALL NONE</code> <code>:INSTRument:COUPlE:FREQuency:CENTer?</code>
Example	<code>:INST:COUP:FREQ:CENT ALL</code> <code>:INST:COUP:FREQ:CENT?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	<code>:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF</code> <code>:GLOBal:FREQuency:CENTer[:STATe]?</code>

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:EMC:STANdard ALL NONE</code> <code>:INSTRument:COUPlE:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Global Limit Lines (Freq and Amptd)

When this control is set to **ALL**, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global Settings**, while **Global Limit Lines** is **ALL**, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to **NONE**, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is **ALL**, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to **NONE** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:LLINe ALL NONE :INSTrument:COUPle:LLINe?
Example	:INST:COUP:LLIN ALL NONE :INST:COUP:LLIN?
Preset	Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:FREQuency:BAND:EXTend 0 1 ON OFF :INSTrument:COUPle:FREQuency:BAND:EXTend?
Example	:INST:COUP:FREQ:BAND:EXT 1 :INST:COUP:FREQ:BAND:EXT?

Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTrument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.9.19 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.9.19.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1726

Remote Command	:INITiate:CONTinuous OFF ON 0 1 :INITiate:CONTinuous?
Example	Put instrument into Single measurement operation: :INIT:CONT 0 :INIT:CONT OFF Put instrument into Continuous measurement operation: :INIT:CONT 1

3 Spectrum Analyzer Mode
3.9 SEM Measurement

	:INIT:CONT ON
Preset	ON Note that :SYST:PRES sets :INIT:CONT to ON , but *RST sets :INIT:CONT to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and INIT:CONT ON) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold
Single Mode	The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num , then the count stops incrementing, and the instrument stops sweeping See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the

current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See ["Restart" on page 2039](#) for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See ["More Information" on page 1728](#)

Remote Command	<code>:INITiate[:IMMEDIATE]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement

Status Bits/OPC dependencies	<p>This is an Overlapped command</p> <p>The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATUS:QUESTionable register bit 9 (INTEgrity sum) is cleared</p> <p>The SWEEPING bit is set</p> <p>The MEASURING bit is set</p>
Backwards Compatibility Notes	<p>For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write, but did not restart Max Hold and Min Hold</p> <p>In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average, but MaxHold and MinHold traces as well</p>

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous

value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORt</code>
Example	<code>:ABOR</code>
Notes	If <code>:INIT:CONT</code> is ON , then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If <code>:INIT:CONT</code> is OFF , then <code>:INIT:IMM</code> is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, <code>:ABORt</code> is equivalent to the Restart key Not all measurements support this command
Status Bits/OPC dependencies	The <code>STATus:OPERation</code> register bits 0 through 8 are cleared, <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUEStionable</code> register bit 9 (INTEGRity sum) is cleared Since all the bits that feed into OPC are cleared by <code>:ABORt</code> , the Abort command will cause the *OPC

query to return true

3.9.19.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the X reference value.

Remote Command	<code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:RLEVel <freq></code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:RLEVel?</code>
Example	<code>:DISP:SEM:WIND:TRAC:X:RLEV 10</code> <code>:DISP:SEM:WIND:TRAC:X:RLEV?</code>
Couplings	If " Auto Scaling " on page 1563 is ON , this value is automatically determined by the measurement result. If you set this value manually, Auto Scaling automatically changes to OFF
Preset	1.0 GHz
State Saved	Saved in instrument state
Min	-1000 GHz
Max	1000 GHz
Backwards Compatibility SCPI	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALE]:RLEVel</code>

Scale/Div

Sets the horizontal scale.

Remote Command	<code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:PDIVision <freq></code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALE]:PDIVision?</code>
Example	<code>:DISP:SEM:WIND:TRAC:X:PDIV 500</code> <code>:DISP:SEM:WIND:TRAC:X:PDIV?</code>
Couplings	If Auto Scaling is ON , this value is automatically determined by the measurement result. When you set this value manually, Auto Scaling automatically changes to OFF
Preset	Automatically Calculated
State Saved	Yes Saved in instrument state
Min	1 Hz
Max	100 GHz
Backwards	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALE]:PDIVision</code>

Compatibility
SCPI

Ref Position

Sets the reference position for the X axis to Left, Center or Right.

Remote Command	<code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:RPOsition LEFT CENTer RIGHt</code> <code>:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:RPOsition?</code>
Example	<code>:DISP:SEM:WIND:TRAC:X:RPOS LEFT</code> <code>:DISP:SEM:WIND:TRAC:X:RPOS?</code>
Preset	<code>CENTer</code>
State Saved	Saved in instrument state
Range	Left Center Right
Backwards Compatibility	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:RPOsition</code>

Range	<code>OFF ON</code>
Backwards Compatibility	<code>:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle</code>
SCPI	

3.9.19.3 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Points

Sets the number of points displayed in the traces. The current value of points is displayed in the bottom-right corner of the display.

Remote Command	<code>[:SENSe]:SEMAsk:SWEep:POINTs <integer></code> <code>[:SENSe]:SEMAsk:SWEep:POINTs?</code>
Example	<code>:SEM:SWE:POIN 4001</code> <code>:SEM:SWE:POIN?</code>
Preset	2001
State Saved	Saved in instrument state
Min	201
Max	10001
Annotation	On second line of annotations in bottom right corner

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	<code>[:SENSe]:SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe]:SWEep:IF:DITHer?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	<code>[:SENSe]:SWEep:IMAGeprot OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeprot?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT model M9421A
Preset	ON
State Saved	Saved in instrument state

3.9.20 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write**, **Trace Average**, **Max Hold**, **Min Hold**) and **View/Blank** setting for the selected trace.

3.9.20.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the Trace menu
Dependencies	For the Swept SA measurement: <ul style="list-style-type: none"> - In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View - When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when Meas Method is RBW , FAST or FPOwer , Select Trace is disabled
Preset	Trace 1
State Saved	Yes

3.9.20.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1927 and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "[View/Blank](#)" on page 1740 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITE	:TRAC2:TYPE WRIT	See: " Clear/Write " on page 1738
Trace Average	AVERage	:TRAC2:TYPE AVER	See: " Trace Average " on page 1738
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: " Max Hold " on page 1739
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: " Min Hold " on page 1740

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "[View/Blank](#)" on page 1740 state must be set to **Active** (**Update: ON**, **Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "[Trace Mode Backwards Compatibility Commands](#)" on page 1736

Remote
Command

For Swept SA Measurement (in SA Mode):
:TRACe[1]|2|...|6:TYPE WRITE | AVERage | MAXHold | MINHold
:TRACe[1]|2|...|6:TYPE?

For all other measurements:
:TRACe[1]|2|3:<meas>:TYPE WRITE | AVERage | MAXHold | MINHold
:TRACe[1]|2|3:<meas>:TYPE?

where <meas> is the identifier for the current measurement

Example	<code>:TRAC:TYPE WRIT</code> <code>:TRAC:TYPE?</code>
Couplings	Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected When Detector setting is "Auto" (<code>[:SENSe] : <meas> : DETector : AUTO ?</code>), Detector (<code>[:SENSe] : <meas> : DETector [:FUNctIon] ?</code>) switches aligning with the switch of this parameter: "NORMal" with <code>WRITe</code> (Clear Write), "AVERage" with <code>AVERage</code> , "POSitive (peak)" with <code>MAXHold</code> , and "NEGative (peak)" with <code>MINHold</code>
Preset	Swept SA and Monitor Spectrum: <code>WRITe</code> All other measurements: <code>AVERage</code> Following Preset , all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "**View/Blank**" on page 1740.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPly` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPly`, and the old global Averaging command `[:SENSe] : AVERage [:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart, Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	<code>WRITe</code>
--------	--------------------

State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	<code>:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK</code> <code>:TRACe[1] 2 ... 6:MODE?</code>
Backwards Compatibility Notes	<p>The legacy <code>:TRACe:MODE</code> command is retained for backwards compatibility. In conjunction with the legacy <code>:AVERage</code> command, it works as follows:</p> <ul style="list-style-type: none"> - <code>:AVERage ON OFF</code> sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the <code>[:SENSe]:AVERage[:STATe]</code> command description below - <code>:TRACe:MODE WRITE</code> sets <code>:TRACe:TYPE WRITE</code> (Clear/Write) unless average is true, in which case it sets it to <code>:TRACe:TYPE AVERage</code>. It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE MAXHold</code> sets <code>:TRACe:TYPE MAXHold</code> (Max Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE MINHold</code> sets <code>:TRACe:TYPE MINHold</code> (Min Hold). It also sets <code>:TRACe:UPDate ON</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE VIEW</code> sets <code>:TRACe:UPDate OFF</code>, <code>:TRACe:DISPlay ON</code>, for the selected trace - <code>:TRACe:MODE BLANK</code> sets <code>:TRACe:UPDate OFF</code>, <code>:TRACe:DISPlay OFF</code>, for the selected trace <p>The query returns the same value as <code>:TRACe:TYPE?</code>, meaning that if you set <code>:TRACe:MODE:VIEW</code> or <code>:TRACe:MODE:BLANK</code>, the query response will not be what you sent</p> <p><code>:TRACe[n]:MODE</code> was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new <code>:TRACe:TYPE</code> command should be used in the future, but <code>:TRACe:MODE</code> is retained to provide backwards compatibility</p> <p>In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has</p> <p>As the Average/Hold Number now affects Min Hold and Max Hold, the operations that restart Averaging (for example, the Restart key) now also restart Min Hold and Max Hold</p> <p>As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does</p> <p>Also, previous to X-Series:</p> <ul style="list-style-type: none"> - Pressing Max Hold while already in Max Hold (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence - Changing the vertical scale (Log/Lin or dB/div) of the display restarted Max Hold and Min Hold. This is no longer the case
Preset	OFF
State Saved	The state of Average is saved in Instrument State for ghosting purposes

Backwards Compatibility SCPI	<code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code>
Backwards Compatibility Notes	<p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write</p>

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **AvgHold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1927 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active Update and Display both **ON**

View	Update OFF ; Display ON
Blank	Update OFF ; Display OFF
Background	Update ON , Display OFF Allows a trace to be blanked <i>and</i> continue to update “in the background”, which was not possible in the past

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: "[More Information](#)" on page 1742

Notes	For the commands to control the two variables, Update and Display, see " Trace Update State On/Off " on page 1741 and " Trace Display State On/Off " on page 1742 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	<p>Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in Active (Update ON and Display ON), even if that trace type was already selected</p> <p>Selecting a detector for a trace (pressing the key or sending <code>[:SENS] :DET :TRAC</code>) puts the trace in Active (UpdateON and DisplayON), even if that detector was already selected</p> <p>Selecting a "Math Function" on page 1743 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in Active (UpdateON and DisplayON), even if that Math Mode was already selected</p> <p>Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a Copy or a participant in an Exchange</p>

Trace Update State On/Off

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 ... 6:UPDate[:STATe]?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe] ON OFF 1 0</pre> <pre>:TRACe[1] 2 3:<meas>:UPDate[:STATe]?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<p>Make trace 2 inactive (stop updating):</p> <pre>:TRAC2:UPD 0</pre>

Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	For Swept SA Measurement (in SA Mode): <code>1 0 0 0 0 0</code> ON for Trace 1; OFF for 2–6 For all other measurements: <code>1 0 0</code> ON for Trace 1; OFF for 2 & 3
State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode): <code>:TRACe[1] 2 ... 6:DISPlay[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 ... 6:DISPlay[:STATe]?</code> For all other measurements: <code>:TRACe[1] 2 3:<meas>:DISPlay[:STATe] ON OFF 1 0</code> <code>:TRACe[1] 2 3:<meas>:DISPlay[:STATe]?</code> where <meas> is the identifier for the current measurement
----------------	---

Example	Make trace 1 visible: <code>:TRAC2:DISP 1</code> Blank trace 3: <code>:TRAC3:DISP 3</code>
---------	---

Couplings	Whenever you set Update to ON for any trace, the Display is set to ON for that trace
Preset	For Swept SA Measurement (in SA Mode): <code>1 0 0 0 0 0</code> ON for Trace 1; OFF for 2–6 For all other measurements: <code>1 0 0</code> ON for Trace 1; OFF for 2 & 3
State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the **:SENSe** system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.9.20.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "**Operand 1 / Operand 2**" on page 1750 controls.

- See "**How trace math is processed**" on page 1748

Remote Command	<p>For option details, see "Trace Math Options" on page 1745</p> <p>For Swept SA Measurement (in SA Mode):</p> <pre style="font-family: monospace; font-size: 0.9em;">:CALCulate:MATH <trace_num>, PDIFference PSUM LOFFset LDIFference OFF, <trace_num>, <trace_num>, <real>,<real> :CALCulate:MATH? <trace_num></pre> <p>where <trace_num> is any one of:</p> <pre style="font-family: monospace; font-size: 0.9em;">TRACE1 ... TRACE6</pre> <p>For all other measurements:</p> <pre style="font-family: monospace; font-size: 0.9em;">:CALCulate:<meas>:MATH <trace_num>, PDIFference PSUM LOFFset </pre>
----------------	--

3 Spectrum Analyzer Mode
3.9 SEM Measurement

```
LDIFference | OFF, <trace_num>, <trace_num>, <real>, <real>  
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

<meas> is the identifier for the current measurement, and

<trace_num> is any one of:

TRACe1|TRACe2|TRACe3

Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB

```
:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00
```

Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm

```
:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0
```

Turns off trace math for trace 1

Notes

The Trace Math Function command has 6 main set of parameters:

- Set 1 defines the "result trace":

```
TRACE1 |...| TRACE6
```

-Set 2 defines the "function":

```
PDIFference |PSUM|LOFFset|LDIFference|OFF
```

- Set 3 is a "trace operand" (1):

```
TRACE1 |...| TRACE6
```

- Set 4 is a "trace operand" (2):

```
TRACE1 |...| TRACE6
```

- Set 5 defines the "Log Offset" (in dB)

- Set 6 defines the "Log Difference Reference" (in dBm)

Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function

The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message

	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas
Dependencies	Trace Math is not available if Normalize is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = ON ; and Update = ON
Preset	For Swept SA Measurement (in SA Mode): <code>OFF, TRACE5, TRACE6, 0, 0 OFF, TRACE6, TRACE1, 0, 0 OFF, TRACE1, TRACE2, 0, 0 </code> <code>OFF, TRACE2, TRACE3, 0, 0 OFF, TRACE3, TRACE4, 0, 0 OFF, TRACE4, TRACE5, 0, 0</code> For all other measurements: <code>OFF, TRACE2, TRACE3, 0, 0 OFF, TRACE3, TRACE1, 0, 0 OFF, TRACE1, TRACE2, 0, 0</code>
State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An "f" is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) - 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is **mintracevalue**.

Power Sum (Op1 + Op2)

Calculates a power sum between the **First Trace** operand and the **Second Trace** operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = 10 \log(10(1/10)(\text{FirstTrace}) + 10(1/10)(\text{SecondTrace}))$$

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

Log Offset (Op1 + Offset)

Calculates a log offset from the **First Trace** operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the **Offset** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = \text{FirstTrace} + \text{Offset}$$

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in the trace operand is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the **Second Trace** operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the **First Trace** operand and the **Second Trace** operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

$$\text{DestinationTrace} = (\text{FirstTrace} - \text{SecondTrace}) + \text{Reference}$$

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at -5 dBm, and the reference is -25 dBm, then the destination trace will be -15 dBm.

Example: If the first operand trace 1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in **FirstTrace** is equal to **maxtracevalue**, the resultant point is also **maxtracevalue**.

If a point in **FirstTrace** is equal to **mintracevalue**, the resultant point is also **mintracevalue**.

If neither of the above is true for a given point, then:

- If that point in **SecondTrace** is equal to **maxtracevalue**, the resultant point is **mintracevalue**.
- If that point in **SecondTrace** is equal to **mintracevalue**, the resultant point is **maxtracevalue**.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for **Trace 1**, then **Trace 2**, then **Trace 3**, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for **Trace 1**, **Trace 2** is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is **ON** for **Trace 4**, and its operand traces are **Trace 2** and **Trace 3**, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for **Trace 4**. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, **Trace 1** can be an average trace, which can be fed with an offset to **Trace 2**, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math **ON**, the Operand traces should have *lower* numbers than the trace (for example, using **Trace 4** as an operand for **Trace 1** will cause the data coming from **Trace 4** to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent **:CALCulate:MATH** command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	<p>The following examples are for the Swept SA measurement</p> <p>Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:</p> <pre>:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0</pre> <p>Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:</p> <pre>:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0</pre>
Notes	See " Math Function " on page 1743 for how to specify Operands 1 and 2 using :CALCulate:MATH
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
---------	--

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

State Saved	The Log Offset value for each trace is saved in Instrument State
-------------	--

Min	-100 dB
-----	---------

Max	100 dB
-----	--------

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm:
---------	--

```
:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00
```

State Saved	The Log Difference reference value for each trace is saved in instrument state
-------------	--

Min/Max	Same as reference level
---------	-------------------------

3.9.20.4 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **"To Trace" on page 1752** when a **"Copy" on page 1752** or **"Exchange" on page 1753** is performed

Preset 1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 1752** when a **"Copy" on page 1752** or **"Exchange" on page 1753** is performed

Preset 2

Copy

Executes a Trace Copy based on the **"From Trace" on page 1752** and **"To Trace" on page 1752** parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command For Swept SA Measurement (in SA Mode):
`:TRACe:COPIY TRACE1 | ... | TRACE6, TRACE1 | ... | TRACE6`

For all other measurements:
`:TRACe:<meas>:COPIY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`

where `<meas>` is the identifier for the current measurement

Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On
`:TRAC:COPIY TRACE1,TRACE3`

Notes The command is of the form:
`:TRACe:COPIY <source_trace>,<dest_trace>`

Dependencies When Signal ID is on, this key is grayed-out

Couplings The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset For Swept SA Measurement (in SA Mode):
`TRACE1, TRACE2`

For all other measurements:
`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1752 and "To Trace" on page 1752 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	<p>For Swept SA Measurement (in SA Mode): <code>:TRACe:EXCHange TRACE1 ... TRACE6, TRACE1 ... TRACE6</code></p> <p>For all other measurements: <code>:TRACe:<meas>:EXCHange TRACe1 TRACe2 TRACe3, TRACe1 TRACe2 TRACe3</code></p> <p>where <code><meas></code> is the identifier for the current measurement</p> <p>Note that the format of the <code>:TRACe<n></code> parameter differs from that for the Swept SA Measurement</p>
Example	<p>Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: <code>:TRAC:EXCH TRACE1,TRACE2</code></p>
Notes	<p>The command is of the form: <code>:TRACe:EXCHange <trace_1>,<trace_2></code></p>
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	<code>:TRACe[:<meas>]:PRESet:ALL</code>
Example	<code>:TRAC:PRE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update = OFF**.

Remote Command	<code>:TRACe[:<meas>]:CLEar:ALL</code>
Example	<code>:TRAC:CLE:ALL</code>
Dependencies	When Signal ID is on, this key is grayed-out

3.9.20.5 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a **:READ** or **:FETCh** query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	<pre>:CALCulate:<meas>:MTRace TRACe1 TRACe2 TRACe3 :CALCulate:<meas>:MTRace? <meas> is the identifier for the current measurement; any one of CHPower ACPower OBWidth SEMask SPURious PVTime</pre>
Example	<pre>Channel Power :CALC:CHP:MTR TRAC1 :CALC:CHP:MTR?</pre>
Dependencies	In the ACP measurement, this control is grayed-out when Meas Method is set to RBW or FAST , and only Trace 1 is enabled
Preset	TRACe1
State Saved	No
Range	Trace 1 Trace 2 Trace 3

3.10 TOI Measurement

IMPORTANT This measurement is not supported in VXT models M9410A/11A/15A/16A.

The TOI measurement allows a simple (one-button) measurement of the third-order intercept of a two-tone signal. It also allows a more accurate (zero-span) measurement of that signal.

Measurement Commands

These commands are used to initialize the measurement, and to retrieve results.

All returned frequencies are affected by Frequency Offset, and all absolute amplitudes are affected by Ref Level Offset. Amplitudes are returned in dBm regardless of the Y Axis Unit.

For more information see ["Measurement Details" on page 1757](#).

For measurement results and views, see ["Views" on page 1758](#).

The general functionality of ["CONFigure" on page 2753](#), ["INITiate" on page 2754](#), ["FETCh" on page 2754](#), ["MEASure" on page 2756](#), and ["READ" on page 2755](#) are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

<code>:INITiate:TOI</code>		Initiates a trigger cycle for the measurement, but does not return any data Does not change any measurement settings
<code>:CONFigure:TOI</code>		Selects the measurement with Meas Setup settings in their preset states. This is the same as "Meas Preset" on page 1831
<code>:CONFigure:TOI:NDEFault</code>		Selects TOI measurement <i>without</i> affecting settings
<code>:CONFigure?</code>		Returns the name of the measurement: TOI

The following queries are used to retrieve data. The type of data returned depends on the value of **n**.

Command	n	Return Value
<code>:FETCh:TOI[n]?</code>	0	Returns the trace data, in interleaved X/Y pairs
<code>:MEASure:TOI[n]?</code>		
<code>:READ:TOI[n]?</code>		
<code>:FETCh:TOI[n]?</code>	1	Returns 6 scalar results, in the following order
<code>:MEASure:TOI[n]?</code>		
<code>:READ:TOI[n]?</code>		

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Command	n	Return Value																																										
		<table border="1"> <thead> <tr> <th>#</th> <th>Item</th> <th>Unit</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>The worst-case Output Intercept Power value</td> <td>dBm</td> </tr> <tr> <td>2</td> <td>The worst-case Output Intermod Point</td> <td>Hz</td> </tr> <tr> <td>3</td> <td>The lower Output Intercept Power value</td> <td>dBm</td> </tr> <tr> <td>4</td> <td>The lower Output Intermod Point</td> <td>Hz</td> </tr> <tr> <td>5</td> <td>The upper Output Intercept Power value</td> <td>dBm</td> </tr> <tr> <td>6</td> <td>The upper Output Intermod Point</td> <td>Hz</td> </tr> </tbody> </table>	#	Item	Unit	1	The worst-case Output Intercept Power value	dBm	2	The worst-case Output Intermod Point	Hz	3	The lower Output Intercept Power value	dBm	4	The lower Output Intermod Point	Hz	5	The upper Output Intercept Power value	dBm	6	The upper Output Intermod Point	Hz

<code>:READ:TOI:IP3?</code>																																												

Backwards Compatibility SCPI

Each of the following commands translates to the equivalent :TOI command.

Backwards Compatibility Command	Current Command
<code>:CONFigure:TOINtercept</code>	<code>:CONFigure:TOI</code>
<code>:CONFigure:TOINtercept:NDEFault</code>	<code>:CONFigure:TOI:NDEFault</code>
<code>:INITiate:TOINtercept</code>	<code>:INITiate:TOI</code>
<code>:FETCh:TOINtercept[n]?</code>	<code>:FETCh:TOI[n]?</code>

Backwards Compatibility Command	Current Command
:MEASure:TOINtercept[n]?	:MEASure:TOI[n]?
:READ:TOINtercept[n]?	:READ:TOI[n]?
:FETCh:TOINtercept[n]:IP3?	:FETCh:TOI:IP3?
:MEASure:TOINtercept[n]:IP3?	:MEASure:TOI:IP3?
:READ:TOINtercept[n]:IP3?	:READ:TOI:IP3?

Measurement Details

The TOI measurement begins by taking a sweep using the current center frequency and span. It chooses the two highest peaks as the lower and upper tone frequencies, F_{Lower} and F_{Upper} . Then the third-order intermod frequencies are computed as:

$$f_{Lower} = 2F_{Lower} - F_{Upper}$$

$$f_{Upper} = 2F_{Upper} - F_{Lower}$$

The power is then measured at the four frequencies (unless either intermod frequency falls outside the span).

The third order intercept level is defined (all values expressed in dBm) as:

$$TOI_{Lower} = \frac{P_{Upper}}{2} + P_{Lower} - \frac{P_{LowerIntermod}}{2}$$

$$TOI_{Upper} = \frac{P_{Lower}}{2} + P_{Upper} - \frac{P_{UpperIntermod}}{2}$$

The third order delta level is defined (all values expressed in dBm) as:

$$\Delta_{Lower} = P_{LowerIntermod} - \frac{2 \times P_{Lower} + P_{Upper}}{3}$$

$$\Delta_{Upper} = P_{UpperIntermod} - \frac{2 \times P_{Upper} + P_{Lower}}{3}$$

Both values are computed, and the TOI is reported as the worst of the two measurements.

There are two approaches to TOI measurement acquisition. The first approach is a simple method to use a single sweep. This method gives the quickest approximate

measurement and highest usability. (The span must be sufficient to encompass both the lower and upper intermod frequencies.)

The second approach is to supplement the above with zero-span acquisitions at the intermod frequencies. Because we spend the majority of our acquisition time at key frequencies, this technique gives more accurate measurement of low-power intermodulation distortion signals.

3.10.1 Views

The TOI measurement has two predefined views, both of which are multiple-window views. When in a multiple window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

The table below shows the Views and Windows for this measurement:

View	Result
"Normal" on page 1758	"Graph" on page 1759 "Metrics" on page 1760
"Zero Span" on page 1759	"Graph" on page 1759 "Metrics" on page 1760

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the View description.

Remote Command	<code>:DISPlay:VIEW[:SElect] NORMal ZSPan</code>
Example	<code>:DISP:VIEW ZSP</code>
Preset	<code>NORMal</code>
State Saved	Saved in instrument state

3.10.1.1 Normal

Windows:

- "Graph" on page 1759
- "Metrics" on page 1760

Multiple-window view of the frequency domain.

Example	<code>:DISP:VIEW NORM</code>
---------	------------------------------

3.10.1.2 Zero Span

Windows:

- "Graph" on page 1759
- "Metrics" on page 1760

Multiple-window view of the zero span.

Example :DISP:VIEW NORM

3.10.2 Windows

The following windows are available in this measurement:

- | | |
|---|------------------------|
| 1 | "Graph" on page 1759 |
| 2 | "Metrics" on page 1760 |

3.10.2.1 Graph

Window #1

This is the fundamental window used in the TOI measurement view. It displays Amplitude versus frequency information. The data and graticule are identical to those for the Swept SA measurement, except that the base and intermod peaks are annotated with a number in white:

1. lower intermod
2. lower base
3. upper base
4. upper intermod

The **Graph** window appears in both views, as follows:

View	Size	Position
"Normal" on page 1758	Half height, full width	Top
"Zero Span" on page 1759	Half height, full width	Top

When zero-span measurement is on, the intercept frequencies are measured in zero span (typically with a lower resolution bandwidth), and the results of that measurement are superimposed on the graticule in the form of a blue box displayed behind the trace data. The box has 50% transparency, height equal to the power

measured by the zero-span measurement, and width equal to twice the resolution bandwidth.

3.10.2.2 Metrics

Window #2

The TOI Metrics result is displayed in a table below the graticule. The TOI number is the worse (lower) of the two calculated intercept points, while the Δ is the worse (higher) of the measured dBc values.

Absolute amplitude results are presented in the current Y Axis Unit.

3.10.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.10.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	<code>:DISPlay:TOI:VIEW:WINDow:TRACe:Y[:SCALE]:RLEVel <amplitude></code>
Example	<code>:DISP:TOI:VIEW:WIND:TRAC:Y:RLEV -10 dBm</code> <code>:DISP:TOI:VIEW:WIND:TRAC:Y:RLEV?</code>
Couplings	"Attenuation" on page 1954 is coupled to Ref Value "Ref Level Offset" on page 1766 affects Ref Value
Preset	0 dBm
State Saved	Saved in instrument state

Min/Max	-/+250.00 dBm
Annotation	Ref <value> top left of graph

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

In measurements that support both Log and Lin scales, this function is only available when Display Scale (Log) is selected, and the vertical scale is power. When Display Scale (Lin) is selected, **Scale/Div** is grayed out.

For the Harmonics measurement: The displayed Scale/Div is identical for all harmonics displayed.

Remote Command	<code>:DISPlay:TOI:VIEW:WINDow:TRACe:Y[:SCALE]:PDIVision <relative amplitude></code> <code>:DISPlay:TOI:VIEW:WINDow:TRACe:Y[:SCALE]:PDIVision?</code>
Example	<code>:DISP:TOI:VIEW:WIND:TRAC:Y:PDIV 5</code> <code>:DISP:TOI:VIEW:WIND:TRAC:Y:PDIV?</code>
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph ! all measurements unless noted

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "[Amplitude Data Query and Y Axis Unit](#)" on page 1764 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

3 Spectrum Analyzer Mode
3.10 TOI Measurement

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "[Transducer Unit](#)" on page 1765 below.

Remote Command	:UNIT:POWer DBM DBMV DBMA V W A DBUV DBUA DBPW DBUVM DBUAM DBPT DBG :UNIT:POWer?
Example	:UNIT:POW dBmV :UNIT:POW? See also " Remote Interface Examples " on page 1763 below
Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and DBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: <ul style="list-style-type: none"> - The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out - If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the Trace, Normalize menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	:UNIT:POW DBM	Y Axis Unit is set to dBm
dBmV	:UNIT:POW DBMV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBMA	Y Axis Unit is set to dBmA
W	:UNIT:POW W	Y Axis Unit is set to W
V	:UNIT:POW V	Y Axis Unit is set to V
A	:UNIT:POW A	Y Axis Unit is set to A
dBmV	:UNIT:POW DBUV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit

Unit	Example	Notes
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 1765 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If <code>:CORR:CSET:ANT?</code> returns <code>NOC</code> (for No Conversion), you are using a normal Y Axis dBuA. If it returns <code>UA</code> , you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1765
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1765
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1765
DBG	:UNIT:POW	Sets the amplitude unit for the selected amplitude scale (log/lin) to DBG (dB relative

Unit	Example	Notes
(Transducer Unit)	DBG	to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1765
dBmA (Transducer Unit)	:UNIT:POW DBUA	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1765 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If <code>:CORR:CSET:ANT?</code> returns <code>NOC</code> (for No Conversion), you are using a normal Y-Axis dBuA. If it returns <code>UA</code> , you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE

The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.

Transducer Unit

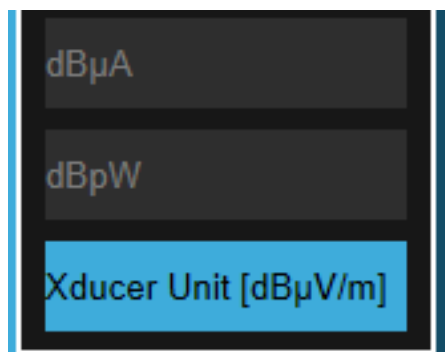

Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, DBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though **DBUV** had been sent as the terminator.

When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:

And on the control it looks like this:

NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
DBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns **Ref Level Offset** on or off. Setting a specific value turns **Ref Level Offset ON**.

Remote Command	:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet <rel_ampl> :DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet?
Example	Set Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB is assumed: :DISP:WIND:TRAC:Y:RLEV:OFFS 12.7 :DISP:WIND:TRAC:Y:RLEV:OFFS?
Preset	0 dBm

State Saved	Saved in instrument state
Min	Variable. Limited to values that keep the reference level within the range -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown Auto Function
Remote Command	<code>:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet:STATe OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:Y[:SCALE]:RLEVel:OFFSet:STATe?</code>
Example	<code>:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON</code> Turns Ref Level Offset On
Preset	<code>OFF</code>

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	<code>:DISPlay:TOI:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RPOsition TOP CENTer BOTTom</code> <code>:DISPlay:TOI:VIEW[1]:WINDow[1]:TRACe:Y[:SCALE]:RPOsition?</code>
Example	<code>:DISP:TOI:VIEW:WIND:TRAC:Y:RPOS BOTT</code> <code>:DISP:TOI:VIEW:WIND:TRAC:Y:RPOS?</code>
Preset	<code>TOP</code>
State Saved	Saved in instrument state
Range	<code>TOP CENTer BOTTom</code>
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Ref Position

3.10.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

3 Spectrum Analyzer Mode
 3.10 TOI Measurement

- See "Dual-Attenuator Configurations" on page 1768
- See "Single-Attenuator Configuration" on page 1769

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command `[:SENSe]:POWer[:RF]:FRATten <rel_amp1>`
`[:SENSe]:POWer[:RF]:FRATten?`

Example `:POW:FRAT 14`

3 Spectrum Analyzer Mode
3.10 TOI Measurement

:POW:FRAT?	
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1951 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary: - Total Atten below 50 GHz: 30 dB - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "**Internal Preamp**" on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "**Attenuator Configurations and Auto/Man**" on page 1772

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1960 See "Attenuator Configurations and Auto/Man" on page 1772 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1956 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>
Preset	Auto The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased

3 Spectrum Analyzer Mode

3.10 TOI Measurement

Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
<p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>		
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p>	
<p>Auto Function</p>

Example	<p>Turn Auto Mech AttenON:</p> <pre>:POW:ATT:AUTO ON</pre>	
Dependencies	<p>:POW:ATT:AUTO is only available in measurements that support Auto, such as Swept SA</p>	
Preset	<p>ON</p>	

Attenuator Configurations and Auto/Man

As described under ["Attenuation" on page 1954](#), there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using ["Mech Atten" on page 1770](#) (or **:POW:ATT**) as the “main” attenuation; and the attenuation that is set by **:POW:EATT** as the “soft” attenuation (**:POW:EATT** is honored even in

the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1960 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "[More Information](#)" on page 1775

Remote Command `[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
`[:SENSe]:POWer[:RF]:EATTenuation?`

Example `:POW:EATT 10`
`:POW:EATT?`

Notes Electronic Attenuation's specification is defined only when **Mech Atten** is 6 dB

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no “electronic attenuator”; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a “soft” attenuation. The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Attenuation control or :POW:ATT, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1981 is ON (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1982 is ON, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5GNR Mode - Power vs. Time and Transmit Power measurement in GSM/EDGE Mode - Burst Power measurement in Spectrum Analyzer Mode <p>The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement</p>
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 1775
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	<p>Dual-Attenuator configuration: 24 dB</p> <p>Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	<code>OFF</code> (Disabled) for Swept SA measurement <code>ON</code> (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1776](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1959](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or

3 Spectrum Analyzer Mode

3.10 TOI Measurement

knob, and it behaves as it normally would in manual mode

- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-

decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its "Auto" setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code>

	<code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 1779

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to <code>COMBined</code>
Elec Atten Only	<code>ELECTrical</code>	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	<code>COMBined</code>	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>
Notes	The parameter option <code>ELECTrical</code> sets this function to ON in Single-Attenuator models The parameter option <code>COMBined</code> is mapped to <code>ELECTrical</code> in Single-Attenuator models. If you send <code>COMBined</code> , it sets the function to ON and returns <code>ELEC</code> to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to <code>COMBined</code>
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1960 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 1778 is grayed-out

	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

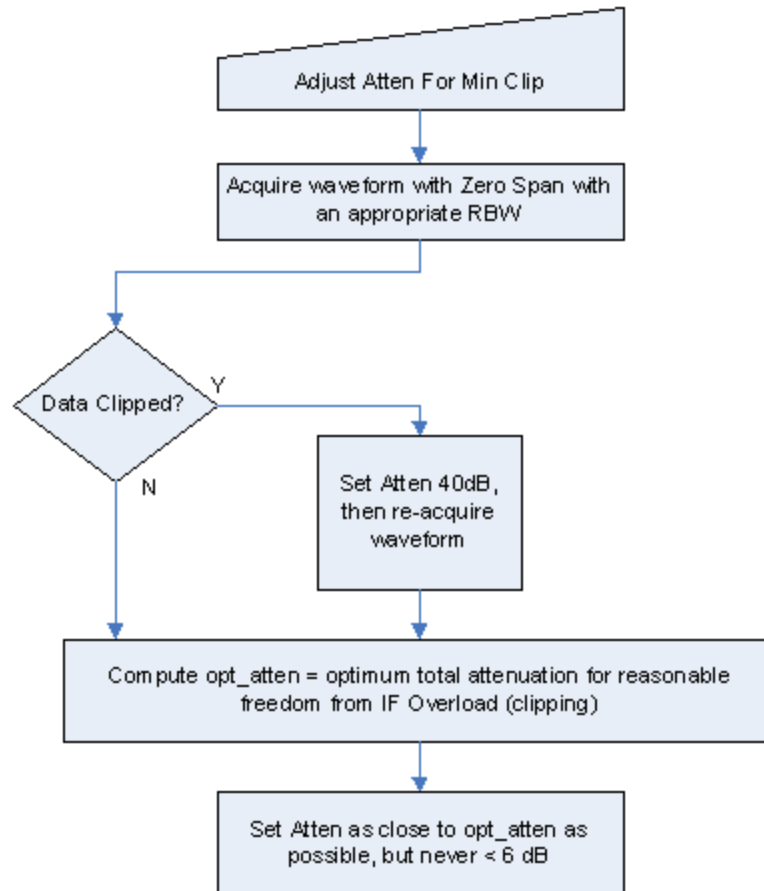

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF	
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?	

Adjustment Algorithm

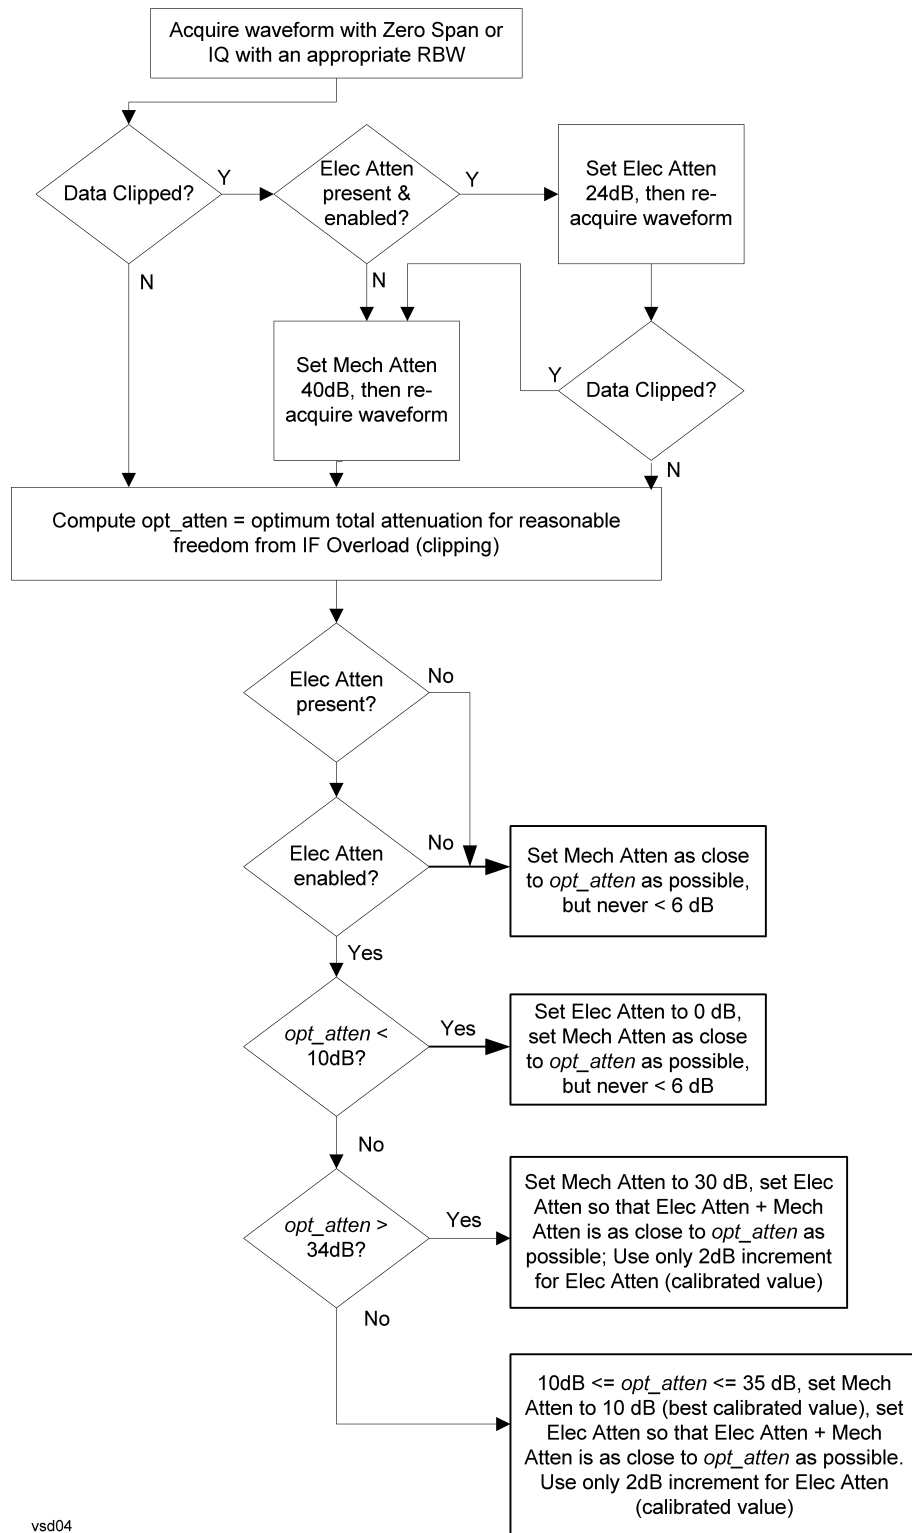

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1778 selection is Mech + Elec Atten:

vsd04

"Pre-Adjust for Min Clipping" on page 1778 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.10.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>	
Example	<code>:POW:RANG:PAR 12 dB</code>	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.10.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1992 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "[Preselector Adjust](#)" on page 1979 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "[Proper Preselector Operation](#)" on page 1787.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1979
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

3 Spectrum Analyzer Mode
 3.10 TOI Measurement

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1978 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz

State Saved	The Preselector Adjust value set by " Presel Center " on page 1978, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	LOW
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	OFF

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1981. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with "Internal Preamp" on page 1981, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 1791

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and Internal Preamp. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of Internal Preamp does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1796
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1798
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1799

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>														
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>														
Notes	<p>When "Presel Center" on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>														
Dependencies	<p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</p>

Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON OFF 1 0</code> <code>[:SENSe]:POWer[:RF]:MW:PATH:AUTO?</code>
Example	<code>:POW:MW:PATH:AUTO ON</code> <code>:POW:MW:PATH:AUTO?</code>
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See " μW Path Control Auto " on page 1794 above
Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μ W Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and **"Y Scale"** on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPrese1:STATe 0 1 ON OFF</code> <code>[:SENSe]:POWer[:RF]:SWPrese1:STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPreSel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

3 Spectrum Analyzer Mode
3.10 TOI Measurement

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF. The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1805 below

3.10.4 BW

Opens the bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.10.4.1 Settings

Contains the basic bandwidth functions. In this measurement, it is the only tab under **BW**.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	<code>[:SENSe]:TOI:BANDwidth BWIDth[:RESolution] <freq></code> <code>[:SENSe]:TOI:BANDwidth BWIDth[:RESolution]?</code>
Example	<code>:TOI:BWID 10 kHz</code> <code>:TOI:BWID?</code>
Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depends on the current bandwidth type
Couplings	"Sweep Time" on page 1836 is coupled to RBW. As RBW changes, Sweep Time (if set to Auto) changes to maintain amplitude calibration "Video BW" on page 1807 is coupled to RBW. As the resolution bandwidth changes, the Video BW (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When Res BW is set to Auto, the resolution bandwidth is auto-coupled to Span . The ratio of Span/Res BW is approximately 106:1 when auto coupled. When Res BW is set to Man , and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings For this measurement, Res BW can be auto-coupled to Span via "Span:3dB RBW" on page 1809. This auto-coupled RBW will not exceed 3 MHz
Preset	Auto (unless noted in the table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent -3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than -3 dB Gaussian
Annotation	A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility this command supports both <code>BANDwidth</code> and <code>BWIDth</code> forms

Auto Function

Remote Command	<code>[:SENSe]:TOI:BANDwidth BWIDth[:RESolution]:AUTO ON OFF 1 0</code> <code>[:SENSe]:TOI:BANDwidth BWIDth[:RESolution]:AUTO?</code>
Example	<code>:TOI:BAND:AUTO ON</code> <code>:TOI:BAND:AUTO?</code>

Video BW

Lets you change the instrument post-detection filter (**VBW** or “video bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by the **VBW:3 dB RBW** control. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing **"Auto Couple"** on page 2017 or by performing a **Preset**.

Remote Command	<code>[:SENSe]:TOI:BANDwidth BWIDth:VIDeo <freq></code> <code>[:SENSe]:TOI:BANDwidth BWIDth:VIDeo?</code>
Example	<code>:TOI:BAND:VID 1 KHZ</code> <code>:TOI:BAND:VID?</code>
Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Couplings	Normally coupled to RBW . If VBW is set to Auto, then VBW changes as RBW changes, to maintain the ratio set by "VBW:3dB RBW" on page 1808 (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)
Preset	Auto
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command supports both BANDwidth and BWIDth forms

Auto Function

Remote Command	<code>[:SENSe]:TOI:BANDwidth:VIDeo:AUTO OFF ON 0 1</code> <code>[:SENSe]:TOI:BANDwidth:VIDeo:AUTO?</code>
Example	<code>:TOI:BAND:VID:AUTO OFF</code> <code>:TOI:BAND:VID:AUTO?</code>
Preset	ON

VBW:3dB RBW

Selects the ratio between the video bandwidth and the equivalent 3 dB resolution bandwidth to be used for setting **VBW** when **VBW** is in **Auto**.

VBW:3dB RBW (Auto) selects automatic coupling of the VBW:3 dB RBW ratio to the optimal value based on other instrument settings. To decouple the ratio, press the **Auto/Man** toggle on **VBW:3 dB RBW**, or simply enter a different value for **VBW:3 dB RBW**.

When **VBW:3dB RBW** is manually selected, it may be returned to the coupled state by setting the toggle on **VBW:3 dB RBW** back to **Auto**. This may also be done by pressing "**Auto Couple**" on page 2017 or by performing a **Preset**.

Remote Command	<code>[:SENSe]:TOI:BANDwidth:VIDeo:RATio <real></code> <code>[:SENSe]:TOI:BANDwidth:VIDeo:RATio?</code>
Example	<code>:TOI:BAND:VID:RAT 2</code> <code>:TOI:BAND:VID:RAT?</code>
Preset	1
State Saved	Saved in instrument state
Min	0.00001
Max	3000000
Backwards Compatibility Notes	For backwards compatibility this command supports both BANDwidth and BWIDth forms

Auto Function

Remote Command	<code>[:SENSe]:TOI:BANDwidth:VIDeo:RATio:AUTO OFF ON 0 1</code> <code>[:SENSe]:TOI:BANDwidth:VIDeo:RATio:AUTO?</code>
Example	<code>:TOI:BAND:VID:RAT:AUTO 0</code> <code>:TOI:BAND:VID:RAT:AUTO?</code>
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:SFRequency:BWIDth:VIDeo:RATio:AUTO</code>

Span:3dB RBW

Selects the ratio between span and resolution bandwidth.

Normally, **Span:3dB RBW (Auto)** selects a Span:3 dB RBW ratio of 106:1. If you manually enter the ratio, the toggle on **Span:3dB RBW** changes to **Man**. This enables you to manually select ratios more suitable for certain measurements.

When **Span:3dB RBW** is manually selected, it may be returned to the coupled state by setting the toggle on **RBW:3 dB RBW** back to **Auto**. This may also be done by pressing "**Auto Couple**" on page 2017 or by performing a **Preset**.

Remote Command	<code>[:SENSe]:TOI:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <integer></code> <code>[:SENSe]:TOI:FREQuency:SPAN:BANDwidth[:RESolution]:RATio?</code>
Example	<code>:TOI:FREQ:SPAN:BAND:RAT 106</code>
Notes	The values shown in this table reflect the conditions after a Mode Preset
Preset	106
State Saved	Saved in instrument state
Min	2
Max	10000

3.10.5 Display

Opens the **Display** Menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.10.5.1 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

3 Spectrum Analyzer Mode

3.10 TOI Measurement

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	<code>ON</code>

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither

***RST** nor **:SYSTem:PRESet** enable the display)

- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending **:SYSTem:DEFaults MISC** or **:DISPlay:ENABle ON** (neither ***RST** nor **:SYSTem:PRESet** enable the display)
- and you are using either the **:SYSTem:KLOCK** command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SElect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELeTe
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SElect
Delete Screen	:INSTrument:SCReen:DELeTe
Delete All But This Screen	:INSTrument:SCReen:DELeTe:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC , but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.10.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 1758

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre> <p>If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>
Backwards Compatibility SCPI	<p>The legacy node</p> <pre>:DISPlay:VIEW[:SElect]</pre> <p>is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to

be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	<code>:DISPlay:VIEW:ADVanced:NAME <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:NAME "Baseband"</code> Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <code><alphanumeric></code> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot

rename a Predefined View” is generated

If the display is disabled (via **:DISP:ENAB OFF**) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	:DISPlay:VIEW:ADVanced:DElete
----------------	--------------------------------------

Example	:DISP:VIEW:ADV:DEL
---------	---------------------------

Notes	<p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <alphanumeric> is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated</p> <p>If the display is disabled (via :DISP:ENAB OFF) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>
-------	--

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	:DISPlay:VIEW:ADVanced:DElete:ALL
----------------	--

Example	:DISP:VIEW:ADV:DEL:ALL
---------	-------------------------------

Notes	Disabled if there are no User Views
-------	-------------------------------------

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, **:DISPlay:VIEW[:SElect]** and **:DISPlay:VIEW:NSEL**, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p>

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2004), then query the list of available Views, the result is undefined</p>

3.10.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**. For example, the **Center Frequency** setting is the same for all measurements – it does not change as you change measurements.

3.10.6.1 Settings

Contains the basic **Frequency** functions.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, **Span** is held constant.

The **Center Frequency** setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set the value for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input; **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See "[Center Frequency Presets](#)" on page 1819

Remote Command	<code>[:SENSe] :FREQuency:CENTer <freq></code> <code>[:SENSe] :FREQuency:CENTer?</code>
Example	Set Center Frequency to 50 MHz: <code>:FREQ:CENT 50 MHz</code> Increment Center Frequency by the value of " CF Step " on page 1825 <code>:FREQ:CENT UP</code> Return the current value of Center Frequency : <code>:FREQ:CENT?</code>
Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: <ul style="list-style-type: none"> - For RF input it is equivalent to <code>:FREQ:RF:CENT</code> - For I/Q input it is equivalent to <code>:FREQ:IQ:CENT</code> - For External Mixer it is equivalent to <code>:FREQ:EMIX:CENT</code> <p>Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated</p>

Dependencies	Limited if Span is such that the range of the instrument is exceeded
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See " Center Frequency Presets " on page 1819
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See " Center Frequency Presets " on page 1819
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting **Span**, **Center Frequency** is held constant, which means that both Start Frequency and Stop Frequency will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

Remote Command	<code>[:SENSe] :TOI :FREQuency :SPAN <freq></code> <code>[:SENSe] :TOI :FREQuency :SPAN?</code>
Example	<code>:TOI :FREQ :SPAN 26.490000 GHz</code> <code>:TOI :FREQ :SPAN?</code>
Dependencies	If the electrical attenuator is enabled, any attempt to set Span such that the stop frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch that bypasses the RF Preselector above 3.6 GHz
Couplings	Affects RBW, sweep time, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) Any value of Center Frequency or Span that is within the frequency range of the instrument is allowed <i>when</i> the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed When using the knob or the step up/down keys or the UP DOWN keywords in SCPI, the value that is being changed, that is, Center Frequency or Span , is limited so that the other parameter is not forced to a new value
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input
State Saved	Saved in instrument state
Min	10 Hz
Max	Depends on instrument maximum frequency, mode, measurement, and selected input Note that, if Source Mode is set to Tracking , the effective instrument maximum Span may be limited by the source maximum frequency
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display
Backwards	<code>[:SENSe] :TOI ntercept :FREQuency :SPAN</code>

Span Presets

The following table provides the Span Presets for the Spectrum Analyzer mode, and the Max Span, for the various frequency options:

Freq Option	Span after Mode Preset	Max Span (can't set higher than this)
503 (all but CXA)	3.59 GHz	3.7 GHz
503 (CXA), F03 (CXA-m)	2.99 GHz	3.08 GHz
507 (all but CXA)	6.99 GHz	7.1 GHz
507 (CXA), F07 (CXA-m)	7.49 GHz	7.575 GHz
508 (all but MXE)	8.39 GHz	8.5 GHz
508 (MXE)	3.59 GHz	8.5 GHz
513, F13	13.59 GHz	13.8 GHz
526 (all but CXA and MXE)	26.49 GHz	27.0 GHz
526 (MXE)	3.59 GHz	27.0 GHz
526 (CXA), F26 (CXA-m)	26.49 GHz	26.55 GHz
543	42.99 GHz	
544	43.99 GHz	44.5 GHz
550	49.99 GHz	52 GHz

Input 2:

Model	Span after Mode Preset	Max Span (can't set higher than this)
CXA opt C75	1.499 GHz	1.58 GHz
MXE	1 GHz	1.000025 GHz

Note that if you are in External Mixing, the maximum **Span** is Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Auto Tune

This is an immediate action control. When it is pressed, it causes the instrument to change "**Center Frequency**" on page 1818 to the strongest signal in the tunable span of the instrument, excluding the LO. It is designed to quickly get you to the most likely signal(s) of interest, with no signal analysis knowledge required. As such, there are no configurable parameters for this feature. There are only preselected values that work in most real-world situations.

NOTE

Auto Tune performs a Preset as part of its function, so it always returns you to the **Normal** View and a preset state, although it leaves the AC/DC coupling and **Single/Cont** state unaffected.

NOTE

You will see an hourglass, and you may see a slight pause, until the signal of interest is presented at midscreen.

Remote Command `[:SENSe]:TOI:FREQuency:TUNE:IMMediate`

Example `:TOI:FREQ:TUNE:IMM`

There are several phases of operation for **AutoTune**, which happen in sequential order. Each is described below.

Step	Phase	Notes
1	Initial setup	We record the initial state of 'single/continuous' and 'AC/DC'. The instrument is then preset, and placed in single sweep mode with 10000 sweep points. The recorded state of 'AC/DC' is then restored. If the instrument is set to DC coupling, we set the start frequency to 100 kHz to potentially capture the low frequency signals of interest
2	Search for two peaks	We set the peak detector and single sweep, then look for peaks with a threshold of -40 dBm and a peak excursion of 20 dBm. Look for a second peak within 2 GHz and 10 dB from the first peak If no such peaks are found, issue a "peak not found" message and terminate the auto tune algorithm If one such peak is found, narrow the span to equal the RBW, set the center frequency to the largest peak location, and remeasure. Repeat up to four times until two peaks are found. If no second peak is found in 4 zooms, issue a "peak not found" message and terminate the auto tune algorithm Note that there is a coupling between the number of zooms required and the resolution bandwidth; 1/100th assumes the preset condition of $RBW = \text{Span} / 106$
3	Position the two peaks	Set the span to 4 times the difference between the two peaks, and the center frequency to the midpoint between the two peaks Adjust the reference level to 3 dB higher than the highest peak, rounded to the nearest 5 dB Remeasure, and once again set the span to 4 times the difference between the two peaks, and the center frequency to the midpoint between the two peaks
4	Final Presentation	If the instrument had been in Continuous sweep prior to executing the auto tune, we restore that state now. Set the number of sweep points back to preset condition

Lower Tone

Sets the lower of the two base frequencies for TOI measurement.

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Normally, the lower base frequency is set by choosing the lower in frequency of the two highest peaks on the trace. When in **Manual** mode, the measurement frequency is fixed.

When zero-span measurement is turned on, a frequency count is required to accurately calculate the needed intermodulation frequencies. Thus, the measurement will be slightly faster if you switch the lower base frequency to manual.

Remote Command	<code>[:SENSe] :TOI :FREQuency :BASE :LOWer <freq></code> <code>[:SENSe] :TOI :FREQuency :BASE :LOWer ?</code>
Example	<code>:TOI :FREQ :BASE :LOW 13.2500000 GHz</code>
Notes	Forces measurement restart
Couplings	In Auto mode, after each sweep the lower frequency base is set to the lower in frequency of the two highest peaks within the span. If there is no peak or only one peak within the span, the lower frequency base is set to NaN If you set Lower Frequency Tone \geq Upper Frequency Tone, the Upper Frequency Tone changes to 1 Hz greater than Lower Frequency Tone If in Auto when Zero-Span measurement is on, a frequency count is run at the lower frequency base so that we can more accurately calculate the intermod frequency. This is necessary since the Resolution Bandwidth of the intermod measurement will likely be significantly lower than the main sweep RBW Affected by " Freq Offset " on page 1826 When the lower frequency tone auto is changed, the upper frequency tone auto is set to the same value
Preset	Determined by trace data
Min	10 Hz
Max	The maximum value for this parameter is the maximum frequency of the instrument minus 1 kHz Auto Function
Remote Command	<code>[:SENSe] :TOI :FREQuency :BASE :LOWer :AUTO OFF ON 0 1</code> <code>[:SENSe] :TOI :FREQuency :BASE :LOWer :AUTO ?</code>
Example	<code>:TOI :FREQ :BASE :LOW :AUTO ON</code>
Preset	ON

Upper Tone

Sets the upper of the two base frequencies for TOI measurement.

Normally, the upper base frequency is set by choosing the higher in frequency of the two highest peaks on the trace. When in **Manual** mode, the measurement frequency is fixed.

When zero-span measurement is turned on, a frequency count is required to accurately calculate the needed intermodulation frequencies. Thus, the

measurement will be slightly faster if you switch the lower base frequency to manual.

Remote Command	<code>[:SENSe] :TOI :FREQuency :BASE :UPPer <frequency></code> <code>[:SENSe] :TOI :FREQuency :BASE :UPPer ?</code>
Example	<code>:TOI :FREQ :BASE :UPP 13.2600000 GHz</code>
Notes	Forces measurement restart
Couplings	<p>If you set Upper Frequency Tone <= Lower Frequency Tone, the Lower Frequency Tone will change to 1 Hz less than Upper Frequency Tone</p> <p>In Auto, after each sweep the upper frequency base is set to the upper in frequency of the two highest peaks within the span. If there is no peak or only one peak within the span, the lower frequency base is set to NaN</p> <p>If in Auto when Zero-Span measurement is on, a frequency count is run at the upper frequency base so that we can more accurately calculate the intermod frequency. This is needed since the Resolution Bandwidth of the intermod measurement will likely be significantly lower than the main sweep RBW</p> <p>Affected by "Freq Offset" on page 1826</p> <p>When the upper frequency tone auto is changed, the lower frequency tone auto is set to the same value</p>
Preset	13.2600000 GHz
Min	11 Hz
Max	The maximum frequency of the instrument
	Auto Function
Remote Command	<code>[:SENSe] :TOI :FREQuency :BASE :UPPer :AUTO OFF ON 0 1</code> <code>[:SENSe] :TOI :FREQuency :BASE :UPPer :AUTO ?</code>
Example	<code>:TOI :FREQ :BASE :UPP :AUTO ON</code>
Preset	ON

CF Step

Changes the step size for "**Center Frequency**" on page 1818, and start and stop frequency functions. Once a step size has been selected and the **Center Frequency** function is active, the step keys (and the **UP | DOWN** parameters from remote commands) change **Center Frequency** by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] ?</code>
Example	<code>:FREQ :CENT :STEP 500 MHz</code> <code>:FREQ :CENT UP</code> increases the current Center Frequency value by 500 MHz

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Notes	Preset and Max values depend on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of Center Frequency >3.6 GHz by pressing the Up -arrow key fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Couplings	When auto-coupled, CF Step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min/Max	- /+(the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	<code>[:SENSe] :FREQuency:CENTer:STEP:AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency:CENTer:STEP:AUTO?</code>
Example	<code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Preset	ON

Freq Offset

Lets you set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a **Mode Preset** or set the frequency offset to 0 Hz.

See "[More Information](#)" on page 1827.

Remote Command	<code>[:SENSe] :FREQuency:OFFSet <freq></code> <code>[:SENSe] :FREQuency:OFFSet?</code>
Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values depend on Hardware Options
Dependencies	Not available in External Mixing. In this case, the Freq Offset control is grayed out and shows a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input
Preset	See " Center Frequency Presets " on page 1819

State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	<code>:DISPly:WINDow[1]:TRACe:X[:SCALE]:OFFSet</code> The DISPly version of the command is supported for compatibility across platforms, but is not recommended for new developments
Backwards Compatibility Notes	In pre-X-Series instruments, Freq Offset could not be adjusted by the knob or step keys. That is no longer the case

More Information

This command does not affect any bandwidths, nor the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by **Freq Offset**. Changing the offset, even on a trace that is not updating, immediately changes all the above, without taking new data

3.10.7 Marker

There is no **Marker** functionality in this measurement.

3.10.8 Meas Setup

Accesses a menu panel that allows averaging control, and enables zero-span measurements for increased accuracy.

3.10.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

When **Average/Hold** is turned on, at each frequency a specified number of sweeps is taken, and the data in those sweeps averaged for the purposes of establishing the measurement.

Remote Command	<code>[:SENSe]:TOI:AVERage:COUNT <integer></code> <code>[:SENSe]:TOI:AVERage:COUNT?</code>
Example	<code>:TOI:AVER:COUN 20</code>
Preset	10
Min	1
Max	10000
Annotation	In the Meas Bar
Backwards Compatibility SCPI	<code>[:SENSe]:TOINtercept:AVERage:COUNT</code>

Auto Function

Remote Command	<code>[:SENSe]:TOI:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:TOI:AVERage[:STATe]?</code>
Preset	OFF
Backwards Compatibility SCPI	<code>[:SENSe]:TOINtercept:AVERage[:STATe]</code>

Averaging On/Off

Turns Averaging on or off.

NOTE

In this measurement, the **Average Type** is preset to the **Log-Pwr Avg (Video)** method. Other averaging methods are not available.

Remote Command	<code>[:SENSe]:TOI:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:TOI:AVERage[:STATe]?</code>
Example	<code>:TOI:AVER OFF</code> <code>:TOI:AVER?</code>
Preset	ON
State Saved	Yes
Range	OFF ON

Average Mode

Selects the termination control used for the averaging function when averaging the trace. This determines the action after the specified number of measurements (**Avg/Hold Num**) is reached.

EXP ponential	Each successive data acquisition after the average count is reached is exponentially weighted and combined with the existing average. Exponential averaging weights new data more than old data, which facilitates tracking of slow-changing signals. The average is displayed at the end of each sweep
RE Peat	After reaching the " Avg/Hold Num " on page 1828, all previous result data is cleared, and the average count set back to 1

Remote Command	<code>[[:SENSe]:TOI:AVERage:TCONtrol EXPponential REPeat [:SENSe]:TOI:AVERage:TCONtrol?</code>
Example	<code>:TOI:AVER:TCON EXP</code>
Preset	<code>EXP</code>
Range	<code>EXPponential REPeat</code>
Backwards Compatibility SCPI	<code>[[:SENSe]:TOINtercept:AVERage:TCONtrol</code>

Meas Setup Summary Table

Lets you view and access many **Meas Setup** parameters on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "**Measurement-Specific Details**" on page 1830 below.

Remote Command	<code>:COUPle ALL</code>
Example	<code>:COUP ALL</code>

Backwards Compatibility SCPI :COUPLE ALL | NONE

Backwards Compatibility Notes :COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** does *not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio

- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Initiates the first sweep. Returns Meas Local variables in the current measurement to their preset values (many of which are determined from the results of the first sweep).

Remote Command `:CONFigure:TOI`

3.10.8.2 Zero Span

Contains **Meas Setup** functions that enable you to control Zero-Span measurement parameters.

Zero-Span Measurement

Zero-Span Measurement uses two additional zero-span sweeps – one at each intermodulation product – to significantly increase the accuracy and the dynamic range of the TOI measurement. Zero-span measurement cannot be used on signals that vary rapidly in frequency.

Remote Command `[:SENSe]:TOI:ZSPan:STATe ON | OFF | 1 | 0`
`[:SENSe]:TOI:ZSPan:STATe?`

Example `:TOI:ZSP:STAT OFF`

Notes	Forces a measurement restart
Preset	OFF
Range	ON OFF

Zero-Span RBW

Zero-Span RBW is the resolution bandwidth used when making the zero-span intermod measurements when "**Zero-Span Measurement**" on page 1831 is **ON**. The **Zero-Span RBW** is typically smaller than the main resolution bandwidth, although it must still be large enough to accommodate three times the width of the intermodulation products.

The required frequency accuracy of the lower and upper base frequencies increases when **Zero-Span RBW** decreases. For this reason, frequency counting is used when the lower and upper base frequencies are in auto mode. For optimum measurement speed, set the lower and upper base frequencies explicitly.

Remote Command	<code>[[:SENSe]:TOI:ZSPan:BANDwidth BWIDth <frequency></code> <code>[[:SENSe]:TOI:ZSPan:BANDwidth BWIDth?</code>
Example	<code>:TOI:ZSP:BAND 300 kHz</code>
Notes	Forces a measurement restart
Couplings	When Auto is on, Zero-Span RBW is one step down from the measurement RBW
Preset	3 MHz
Min	1 Hz
Max	8 MHz
	Auto Function

Remote Command	<code>[[:SENSe]:TOI:ZSPan:BANDwidth BWIDth:AUTO OFF ON 0 1</code> <code>[[:SENSe]:TOI:ZSPan:BANDwidth BWIDth:AUTO?</code>
Example	<code>:TOI:ZSP:BAND:AUTO ON</code>
Preset	ON

Dwell Time

This is the sweep time used when making the zero-span intermod measurements when "**Zero-Span Measurement**" on page 1831 is **ON**. Additional sweep time gives better noise performance.

Remote Command	<code>[[:SENSe]:TOI:ZSPan:SWEEp:TIME <time></code> <code>[[:SENSe]:TOI:ZSPan:SWEEp:TIME?</code>
Example	<code>:TOI:ZSP:SWE:TIME 66.24 ms</code>

Couplings	If ZS Sweep Time Auto is ON , Dwell Time is the same as the measurement sweep time
Preset	Depends upon the maximum span of the instrument; see " Sweep Time " on page 1836 for more information
Min	100 us
Max	4000 s
	Auto Function
Remote Command	<code>[:SENSe] :TOI :ZSPan :SWEep :TIME :AUTO OFF ON 0 1</code> <code>[:SENSe] :TOI :ZSPan :SWEep :TIME :AUTO?</code>
Example	<code>:TOI :ZSP :SWE :TIME :AUTO ON</code>
Preset	ON

3.10.8.3 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:FREQuency:CENTer ALL NONE :INSTrument:COUPle:FREQuency:CENTer?
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQuency:CENTer[:STATe] 1 0 ON OFF :GLOBal:FREQuency:CENTer[:STATe]?

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:EMC:STANdard ALL NONE :INSTrument:COUPle:EMC:STANdard?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Global Limit Lines (Freq and Amptd)

When this control is set to **ALL**, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use

Global Limit Lines, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global** Settings, while **Global Limit Lines** is **ALL**, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to **NONE**, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is **ALL**, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to **NONE** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:LLINe ALL NONE</code> <code>:INSTRument:COUPlE:LLINe?</code>
Example	<code>:INST:COUP:LLIN ALL NONE</code> <code>:INST:COUP:LLIN?</code>
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTRument:COUPlE:FREQuency:BAND:EXTend 0 1 ON OFF</code> <code>:INSTRument:COUPlE:FREQuency:BAND:EXTend?</code>
Example	<code>:INST:COUP:FREQ:BAND:EXT 1</code> <code>:INST:COUP:FREQ:BAND:EXT?</code>
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTrument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.10.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time, Continuous/Single, Pause/Resume, X Scale** and **Number of Points**.

3.10.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

NOTE

In instruments without sweeping hardware this control may be labeled Acquisition Time

When **Sweep Time** is in **Auto**, the instrument computes a time that will give accurate measurements based on other settings of the instrument, such as **RBW** and **VBW**.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will come on if the **Sweep Time** you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning appears in the Status Bar at the bottom of the screen if the manual **Sweep Time** entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed **Sweep Time** provides accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning **Sweep Time** to **Auto**; by entering a longer **Sweep Time**; or by choosing a wider **RBW** and/or **VBW**.

Remote Command	<code>[:SENSe] :TOI :SWEep :TIME <time></code> <code>[:SENSe] :TOI :SWEep :TIME ?</code>
Example	Set Sweep Time to 1 ms: <code>:TOI :SWE :TIME 1ms</code>
Dependencies	In certain instruments without sweeping hardware, such as VXT, this control is grayed-out, and the Auto/Man toggle disappears
Couplings	Coupled to RBW when Sweep Time is set to Auto ; in this case the sweep time is changed as RBW changes, to maintain amplitude calibration Also coupled to " Video BW " on page 1807. As VBW changes, Sweep Time (when set to Auto) changes to maintain amplitude calibration. This occurs because of common hardware between the two circuits
Preset	Depends on the maximum span of the instrument
State Saved	Saved in instrument state
Min	1 ms
Max	4000 s
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the <code>STATUS:QUESTIONable:INTEgrity:UNCalibrated</code> register

Auto Function

Remote Command	<code>[:SENSe] :TOI :SWEep :TIME :AUTO OFF ON 0 1</code> <code>[:SENSe] :TOI :SWEep :TIME :AUTO ?</code>
Example	<code>:TOI :SWE :TIME :AUTO OFF</code> <code>:TOI :SWE :TIME :AUTO ?</code>
Preset	<code>ON</code>

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1838

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold
-----------------	---

Single Mode The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping

See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep

The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 2039 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

3 Spectrum Analyzer Mode
3.10 TOI Measurement

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 1840

Remote Command	<code>:INITiate[:IMMediate]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATUS:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATUS:QUESTionable</code> register bit 9 (<code>INTEgrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold

Event	Trace Effect
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORT` is sent, the

alignment finishes *before* the abort function is performed, so **:ABORt** does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an **:INIT:IMM** command is received.

Remote Command	:ABORt
Example	:ABOR
Notes	<p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, :ABORt is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The STATUS:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATUS:QUESTionable register bit 9 (INTEgrity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORt, the Abort command will cause the *OPC query to return true</p>

3.10.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as **Sweep Rules**.

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

3 Spectrum Analyzer Mode
3.10 TOI Measurement

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys *cannot* be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

Remote Command	<code>[:SENSe]:TOI:SWEep:POINts <integer></code> <code>[:SENSe]:TOI:SWEep:POINts?</code>
Example	<code>:TOI:SWE:POIN 1001</code> <code>:TOI:SWE:POIN?</code>
Dependencies	Not available when Signal ID is ON in External Mixing Neither the knob nor the step keys can be used to change this value. If it is attempted, a warning is given Grayed-out in measurements that do not support swept
Couplings	Whenever the number of sweep points change: <ul style="list-style-type: none"> - All trace data is erased - Any traces with Update Off will also switch to Display Off - Sweep Time is re-quantized - Any limit lines that are on will be updated - If "Averaging On/Off" on page 1828 is ON, averaging/hold starts over <p>The resolution of setting the sweep time depends on the number of points selected</p>
Preset	1001
State Saved	Saved in instrument state
Min	1
Max	100,001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	<code>[:SENSe]:SWEep:IF:DITHer OFF ON 0 1</code> <code>[:SENSe]:SWEep:IF:DITHer?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	OFF
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	<code>[:SENSe]:SWEep:IMAGeProt OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeProt?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	ON
State Saved	Saved in instrument state

3.10.10 Trace

The controls in this menu let you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The ["Trace Control" on page 1926](#) tab contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.10.10.1 Trace Control

The controls on this tab allow you to set the ["Trace Type" on page 1927](#) and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are described fully in the "[View/Blank](#)" on page 1740 control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

Selects trace max hold characteristics.

There are two trace Types: **Clear/Write** and **Max Hold**, as described below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected nonetheless clears the trace and begins rewriting it.

Value	SCPI	Notes
"Clear/Write" on page 1846	<code>WRITE</code>	Each trace update replaces the old data in the trace with new data Selecting Clear/Write clears the trace and initiates a new sweep
"Max Hold" on page 1847	<code>MAXHold</code>	The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data Selecting Max Hold clears the trace, initiates a new sweep, and restarts the hold sequence
Remote Command	<code>:TRACe:TOI:TYPE WRITE MAXHold</code>	
Example	Set Trace Type to Clear/Write : <code>:TRAC:TOI:TYPE WRIT</code> Set Trace Type to Max Hold : <code>:TRAC:TOI:TYPE MAXHold</code>	
Preset	Clear Write	

Trace Writing Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data. Pressing **Clear/Write**, or sending `:TRAC:TYPE WRIT`, sets the trace type to **Clear/Write** and causes the trace to be cleared, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single**, the sweep does not start until **Restart** is pressed.

When in **Clear/Write**, if a measurement-related instrument setting is changed when the instrument is sweeping, a new sweep is initiated but the trace is not cleared. While the sweep always uses the peak detector, in zero-span measurement the average detector is used, and the metrics are calculated using the average of the zero-span data.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under "**Avg/Hold Num**" on page 1828 in **Meas Setup**.

Pressing **Max Hold**, or sending `:TRAC:TYPE MAXH`, sets the trace type to **Max Hold**, causes the trace to be cleared, and causes the **Max Hold** sequence to be (re)started, even if you are already in **Max Hold**. The max hold trace uses peak detection; in zero-span measurement the metrics are calculated using the peak value of the zero-span data.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "**Trace Type**" on page 1927 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

3.11 Harmonics Measurement

IMPORTANT This measurement is not supported in VXT models M9410A/11A/15A/16A.

The Harmonics measurement allows a simple (one-button) measurement of the harmonics of a specified carrier frequency.

At each cycle, the instrument will do a zero-span measurement at the fundamental and at each harmonic frequency. With that information, it will calculate and report each harmonic in dBc, and will also calculate and report the total harmonic distortion.

In most use cases, this approach is sufficient. In cases where a specialized harmonic measurement is required, such as measuring the harmonics of a baseband amplifier when looking at the carrier signal, the user may separately specify the parameters of each harmonic measurement.

For measurement results and views, see ["Views" on page 1850](#).

Harmonics Measurement Commands

These commands are used to initialize the measurement, and to retrieve results.

The general functionality of ["CONFigure" on page 2753](#), ["INITiate" on page 2754](#), ["FETCh" on page 2754](#), ["MEASure" on page 2756](#), and ["READ" on page 2755](#) are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

<code>:INITiate:HARMonics</code>	Initiates a trigger cycle for the measurement, but does not return any data Does not change any measurement settings
<code>:CONFigure:HARMonics</code>	Selects the measurement with Meas Setup settings in their preset states. This is the same as "Meas Preset" on page 1917
<code>:CONFigure:HARMonics:NDEFault</code>	Selects the HARM measurement <i>without</i> affecting settings
<code>:CONFigure?</code>	Returns the name of the measurement: HARM

The queries listed below retrieve each harmonic measurement, and the Total Harmonic Distortion calculated from the measurement. Returned amplitudes are in fixed units, and do not honor the Y Axis Unit setting. Returned absolute amplitudes are affected by ["Ref Level Offset" on page 1858](#), and returned absolute frequencies are affected by ["Freq Offset" on page 1908](#).

Command	Return Value
<code>:FETCh:HARMonics:AMPLitude:ALL?</code>	Returns the amplitude values of the first 10 harmonics
<code>:MEASure:HARMonics:AMPLitude:ALL?</code>	The first value (for the fundamental) is measured in dBm. The remaining harmonics are measured in dBc (relative to the fundamental). If fewer

Command	Return Value
:READ:HARMonics:AMPLitude:ALL?	than 10 harmonics are measured, zero is returned for any harmonic not measured
:FETCh:HARMonics:DISToRtion?	Returns the computed total harmonic distortion as a percentage
:MEASure:HARMonics:DISToRtion?	
:READ:HARMonics:DISToRtion?	
:FETCh:HARMonics:FREQuency:ALL?	Returns the frequency values of the first 10 harmonics in Hz
:MEASure:HARMonics:FREQuency:ALL?	The first value returned is the fundamental. If fewer than 10 harmonics are measured, zero is returned for any harmonic not measured
:READ:HARMonics:FREQuency:ALL?	
:FETCh:HARMonics:FUNDamental?	Returns the frequency of the fundamental in Hz
:MEASure:HARMonics:FUNDamental?	
:READ:HARMonics:FUNDamental?	

Some results queries support a numeric suffix, *n*, as below:

Command	n	Return Value
:FETCh:HARMonics:AMPLitude[n]?	1– 10	Returns the amplitude values of the specified harmonic
:MEASure:HARMonics:AMPLitude[n]?		If n = 1 is specified, the return value is in dBm. Otherwise, the returned value is in dBc (relative to the fundamental)
:READ:HARMonics:AMPLitude[n]?		
:FETCh:HARMonics:FREQuency[n]?	1– 10	Returns the frequency of the specified harmonic in Hz
:MEASure:HARMonics:FREQuency[n]?		If n = 1 is specified, the fundamental frequency is returned
:READ:HARMonics:FREQuency[n]?		
:FETCh:HARMonics[n]?	1– 2	For n = 1, or n not specified, returns the computed total harmonic distortion as a percentage
:MEASure:HARMonics[n]?		
:READ:HARMonics[n]?		For n = 2, returns the computed total harmonic distortion in dBc

Harmonic Measurement Details

First Sweep

The first sweep of the harmonics measurement is used to find the fundamental frequency and bandwidth.

First Sweep Initiation

The first sweep is not used when the range table is turned on, or when all parameters are in “Manual” mode. It is only used when at least one of the following parameters is in “Sense” mode:

1. Fundamental frequency
2. Resolution Bandwidth

3 Spectrum Analyzer Mode

3.11 Harmonics Measurement

If one of the above parameters is in “Sense”, the first sweep occurs when any of the following happen:

1. We first enter the measurement
2. After a preset
3. When a parameter change causes a measurement restart in continuous sweep mode
4. When the user initiates a sweep.

First Sweep Action

If Fundamental Frequency is set to “Sense”, the first sweep sets the fundamental frequency to the largest amplitude signal between 10 MHz and half the bandwidth of the spectrum analyzer. We should span zoom (or frequency count) to give us a good measurement of the fundamental frequency.

If Resolution Bandwidth is set to “Sense”, the first sweep sets the resolution bandwidth to the lowest available Resolution Bandwidth greater than the 3.5 times the 99% occupied bandwidth of the signal, to a minimum of 30 Hz. By default, the video bandwidth and sweep time are coupled to those parameters, and all harmonic parameters are coupled to the fundamental parameters.

Note that, even though the automatic RBW is limited to a minimum of 30 Hz, the actual value measured should be retained. When multiplying the RBW for the 2nd and subsequent harmonics, use the maximum of the calculated value and 30 Hz.

For example, assume that the occupied bandwidth calculation results in desired RBW of 12 Hz. The fundamental RBW will use 30 Hz, the second harmonic RBW will use 30 Hz. The calculated RBW for the third and subsequent harmonics exceeds 30 Hz, so we should use the calculated value when measuring those harmonics.

3.11.1 Views

There is only one predefined view for this measurement (**Normal**), which displays zero-span traces corresponding to the fundamental and the measured harmonics. **Normal** is a multiple-window View. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the view description.

The table below shows the View and Windows used for this Measurement:

View	Result Windows
Normal	Graph Metrics

When a measurement restart requires an auto tune, this view is displayed without table data or traces, and the fundamental frequency is displayed as “---”. As the data is collected, the data is displayed appropriately.

Example `:DISP:VIEW NORM`

3.11.2 Windows

The following windows are available in this measurement.

3.11.2.1 Graph

This is the fundamental window in the **Normal** view.

The fundamental and each harmonic is measured at zero span, and the measured trace is displayed in the appropriate column within the graticule (thus, the graticule shows the most recent measurement of each harmonic).

The Graph window appears as follows:

View	Size	Position
Normal	Full height, two thirds width	Right

3.11.2.2 Metrics

The frequency and measured power at each harmonic are displayed in a result table, along with the Total Harmonic Distortion (THD).

The Metrics window appears as follows:

View	Size	Position
Normal	Full height, One third width	Left

3.11.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.11.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	<code>:DISPlay:HARMonics:VIEW:WINDow:TRACe:Y[:SCALe]:RLEVel <amplitude></code> <code>:DISPlay:HARMonics:VIEW:WINDow:TRACe:Y[:SCALe]:RLEVel?</code>
Example	<code>:DISP:HARM:VIEW:WIND:TRAC:Y:RLEV -10 dBm</code> <code>:DISP:HARM:VIEW:WIND:TRAC:Y:RLEV?</code>
Preset	0.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current "Y Axis Unit" on page 1853.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

This function is only available when a logarithmic **Y Axis Unit** is selected and the vertical scale is power. When a linear **Y Axis Unit** is selected, **Scale/Div** is grayed out.

For this measurement, the displayed **Scale/Div** is identical for all harmonics displayed.

Remote Command	<code>:DISPlay:HARMonics:VIEW:WINDow:TRACe:Y[:SCALe]:PDIVision <relative amplitude></code> <code>:DISPlay:HARMonics:VIEW:WINDow:TRACe:Y[:SCALe]:PDIVision?</code>
----------------	--

Example	<code>:DISP:HARM:VIEW:WIND:TRAC:Y:PDIV 5</code>
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph ! all measurements unless noted

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in ["Amplitude Data Query and Y Axis Unit" on page 1856](#) below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see ["Transducer Unit" on page 1856](#) below.

Remote Command	<code>:UNIT:POWer DBM DBmV dBmA V W A DBUV DBUA DBPW DBUVM DBUAM DBPT DBG</code> <code>:UNIT:POWer?</code>
Example	<code>:UNIT:POW dBmV</code> <code>:UNIT:POW?</code> See also "Remote Interface Examples" on page 1854 below
Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and DBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: <ul style="list-style-type: none"> - The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out - If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before

3 Spectrum Analyzer Mode
 3.11 Harmonics Measurement

	the Transducer Unit was applied is restored
	When Normalize is ON (in the Trace, Normalize menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	:UNIT:POW DBM	Y Axis Unit is set to dBm
dBmV	:UNIT:POW DBMV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBMA	Y Axis Unit is set to dBmA
W	:UNIT:POW W	Y Axis Unit is set to W
V	:UNIT:POW V	Y Axis Unit is set to V
A	:UNIT:POW A	Y Axis Unit is set to A
dBmV	:UNIT:POW DBUV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes

Unit	Example	Notes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 1856 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1856
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1856
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1856
dBG (Transducer Unit)	:UNIT:POW DBG	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1856
dBmA (Transducer Unit)	:UNIT:POW DBUA	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 1856 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y-Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE

The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.

Transducer Unit

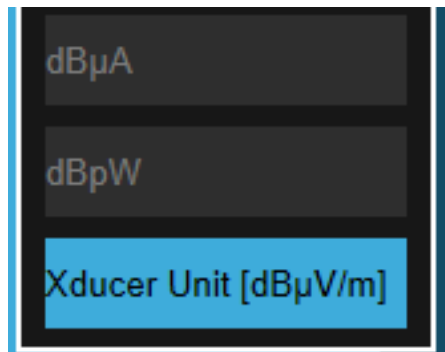

Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though **DBUV** had been sent as the terminator.

When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:

And on the control it looks like this:

NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output, Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
DBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The **On/Off** switch turns **Ref Level Offset** on or off. Setting a specific value turns **Ref Level Offset** **ON**.

Remote Command	<code>:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_amp></code> <code>:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?</code>
Example	<code>:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7</code> <code>:DISP:WIND:TRAC:Y:RLEV:OFFS?</code> Sets the Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB will be assumed
Preset	0 dBm
State Saved	Saved in instrument state
Min	The range is variable. It is limited to values that keep the reference level within the range -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Auto Function

Remote Command	<code>:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?</code>
Example	<code>:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON</code> Turns the Ref Level Offset On
Preset	OFF

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	<code>:DISPlay:HARMonics:VIEW:WINDow:TRACe:Y[:SCALe]:RPOSition TOP CENTer BOTTOm</code> <code>:DISPlay:HARMonics:VIEW:WINDow:TRACe:Y[:SCALe]:RPOSition?</code>
Example	<code>:DISP:HARM:VIEW:WIND:TRAC:Y:RPOS BOTT</code>
Preset	<code>TOP</code>
State Saved	Saved in instrument state
Range	<code>TOP CENTer BOTTOm</code>
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Ref Position

3.11.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations" on page 1860](#)
- See ["Single-Attenuator Configuration" on page 1860](#)

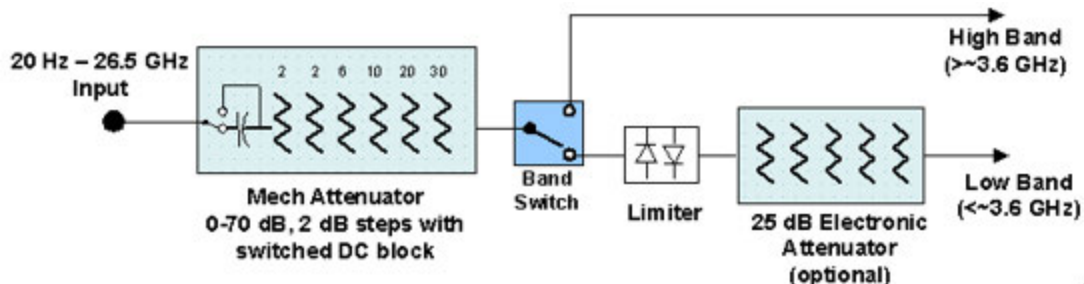

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe] :POWer [:RF] :FRATten <rel_ampl></code> <code>[:SENSe] :POWer [:RF] :FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and "Mech Atten" on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF , and the Input Port is RF Input 2 , and the Full Range Attenuator is installed:

3 Spectrum Analyzer Mode

3.11 Harmonics Measurement

On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, **"Y Scale"** on page 1951 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, **"Internal Preamplifier"** on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See **"Attenuator Configurations and Auto/Man"** on page 1864

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of

	<p>Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1960</p> <p>See "Attenuator Configurations and Auto/Man" on page 1864 for more information on the Auto/Man functionality</p>						
Couplings	<p>If the RF Input Port is the RF Input:</p> <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1956 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) <p>In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>						
Preset	<p>Auto</p> <p>The Auto value is 10 dB</p>						
State Saved	Saved in instrument state						
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>						
Max	<table border="1"> <tr> <td>CXA Option 503 or 507</td> <td>50 dB</td> </tr> <tr> <td>EXA</td> <td>60 dB</td> </tr> <tr> <td>All other models</td> <td>70 dB</td> </tr> </table> <p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	CXA Option 503 or 507	50 dB	EXA	60 dB	All other models	70 dB
CXA Option 503 or 507	50 dB						
EXA	60 dB						
All other models	70 dB						
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p>						

For example:
 Dual-Attenuator configuration:
Atten: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB
 Single-Attenuator configuration:
A: 24 dB (e14)
 Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)
 When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:ATTenuation:AUTO?</code>
Example	Turn Auto Mech Atten ON: <code>:POW:ATT:AUTO ON</code>
Dependencies	<code>:POW:ATT:AUTO</code> is only available in measurements that support Auto , such as Swept SA
Preset	<code>ON</code>

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1954, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 1862 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1960 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 1867](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_aml></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code> , and affects the total attenuation displayed on the Attenuation

3 Spectrum Analyzer Mode
 3.11 Harmonics Measurement

control and the Meas Bar

The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If "**Internal Preamp**" on page 1981 is **ON** (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out

If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned

If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence

If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

If "**LNA**" on page 1982 is **ON**, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be **OFF** and grayed-out. This coupling works in the following modes/measurements:

- Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes
- Transmit On|Off Power measurement in 5GNR Mode
- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 1867
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe] :POWer [:RF] :EATTenuation :STATE OFF ON 0 1</code> <code>[:SENSe] :POWer [:RF] :EATTenuation :STATE?</code>
Example	<code>:POW:EATT:STAT ON</code>

:POW:EATT:STAT?

Preset **OFF** (Disabled) for Swept SA measurement
 ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See ["Using the Electronic Attenuator: Pros and Cons" on page 1868](#) for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See ["Attenuator Configurations and Auto/Man" on page 1959](#)

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

3 Spectrum Analyzer Mode

3.11 Harmonics Measurement

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "[Adjust Atten for Min Clipping](#)" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "[Adjustment Algorithm](#)" on page 1871

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECTrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Example	<code>:POW:RANG:OPT:ATT OFF</code> <code>:POW:RANG:OPT:ATT?</code>
Notes	The parameter option ELECTrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECTrical in Single-Attenuator models. If you send COMBined , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when " Elec Atten " on page 1960 is OFF or grayed-out, " Pre-Adjust for Min Clipping " on page 1870 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state

Range	Dual-Attenuator models:	Off Elec Atten Only Mech + Elec Atten
	Single-Attenuator models:	Off On

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1870 selection is Mech + Elec Atten:

"Pre-Adjust for Min Clipping" on page 1870 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.11.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe <real></code> <code>[:SENSe]:POWer[:RF]:RANGe?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency . The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTrical COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTrical , COMBined , and ON) are honored and all are mapped to ELECTrical , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>	
Example	<code>:POW:RANG:PAR 12 dB</code>	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>

Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.11.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "[Software Preselection](#)" on page 1992 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "**Preselector Adjust**" on page 1979 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "**Proper Preselector Operation**" on page 1879.

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off <ul style="list-style-type: none"> - If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken - Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz - Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in " Preselector Adjust " on page 1979
Status Bits/OPC dependencies	When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to <code>:READ</code> or <code>:MEASure</code> queries The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

3 Spectrum Analyzer Mode
 3.11 Harmonics Measurement

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1978 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz

State Saved	The Preselector Adjust value set by " Presel Center " on page 1978, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	<code>:POW:GAIN OFF</code>	
Low Band	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND LOW</code>	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	<code>:POW:GAIN ON</code> <code>:POW:GAIN:BAND FULL</code>	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:BAND LOW FULL</code> <code>[:SENSe]:POWer[:RF]:GAIN:BAND?</code>
Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	LOW
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	OFF

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to ["Internal Preamp" on page 1981](#). LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, LNA can be turned on *together* with ["Internal Preamp" on page 1981](#), although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see ["More Information" on page 1883](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When LNA is installed, the preamp annotation changes to show the state of both LNA and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if LNA is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21–26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1888
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1890
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1891

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>														
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>														
Notes	<p>When "Presel Center" on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control</p> <p>The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>														
Dependencies	<p>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing</p> <ul style="list-style-type: none"> - The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed - The μW Preselector Bypass selection does not appear unless Option MPB is present and licensed - The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP <p>In any of these cases, if the required options are not present and the SCPI command is sent, error - 241, "Hardware missing; Option not installed" is generated</p> <p>Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them</p> <p>Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</p>

Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μ W Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON OFF 0 1</code> <code>[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

3 Spectrum Analyzer Mode
 3.11 Harmonics Measurement

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPreSel:STATe 0 1 ON OFF</code>	
	<code>[:SENSe]:POWer[:RF]:SWPreSel:STAT?</code>	
Example	<code>:POW:SWPR:STAT 1</code>	
	<code>:POW:SWPR:STAT?</code>	
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements	
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state	
Preset	N9041B	OFF
	N9042B+V3050A	ON
	M9410A/11A	ON
State Saved	Saved in instrument state	

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel NORMa1 ADVanced</code> <code>[:SENSe]:POWer[:RF]:SWPResel?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF . The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B ADVanced N9042B+V3050A NORMa1
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow**– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

3 Spectrum Analyzer Mode
 3.11 Harmonics Measurement

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	<code>[:SENSe]:POWer[:RF]:SWPResel:BW NORMa1 NARRow</code> <code>[:SENSe]:POWer[:RF]:SWPResel:BW?</code>
Example	<code>:POW:SWPR:BW NARR</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when " Software Preselection " on page 1992 is OFF. The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled
Preset	N9041B NORMa1 N9042B+V3050A NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1897 below

State Saved Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.11.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types: Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation to a rectangular filter.

3.11.4.1 Settings

Contains the basic bandwidth functions. In most measurements it is the only tab under **BW**.

Res BW

Sets the Resolution Bandwidth (RBW) used in measuring the fundamental signal. Second and subsequent harmonics by default use a multiple of the resolution bandwidth proportional to their frequency multiplier. Only Gaussian RBW filters are enabled and the list of allowable RBW values matches those of the Spectrum Analyzer measurement.

In this measurement, the resolution bandwidth is *not* autocoupled to span. If **Auto** is on, the resolution bandwidth is automatically determined from the first sweep when the measurement is restarted.

Only Gaussian RBW filters are enabled.

Remote Command	<code>[[:SENSe]:HARMonics:BANDwidth BWIDth[:RESolution] <freq>[:SENSe]:HARMonics:BANDwidth BWIDth[:RESolution]?</code>
Example	<code>:HARM:BWID 10 kHz</code> <code>:HARM:BWID?</code>
Notes	Forces measurement restart
Preset	The bandwidth found by the first sweep. The resulting value will vary, depending upon the input signal
Min	1 Hz
Max	8 MHz
	Auto Function
Remote Command	<code>[[:SENSe]:HARMonics:BANDwidth BWIDth[:RESolution]:AUTO OFF ON 0 1[:SENSe]:HARMonics:BANDwidth BWIDth[:RESolution]:AUTO?</code>
Preset	ON (Sense)

Video BW (Remote Command only)

For backwards compatibility, the instrument accepts but ignores this command. There is no setting of the video bandwidth, since we are using single-point averaging of a zero-span measurement. When the average detector is selected, the video bandwidth is not used. When the peak detector is selected, the video bandwidth is set to instrument maximum.

Preset	50 MHz
Min	50 MHz
Max	50 MHz
Backwards	<code>[[:SENSe]:HARMonics:BANDwidth BWIDth:VIDeo <frequency></code>

Compatibility SCPI	<code>[:SENSe]:HARMonics:BANDwidth BWIDth:VIDeo?</code>
	Auto Function
Preset	<code>ON</code>
Backwards Compatibility SCPI	<code>[:SENSe]:HARMonics:BANDwidth BWIDth:VIDeo:AUTO OFF ON 0 1</code> <code>[:SENSe]:HARMonics:BANDwidth BWIDth:VIDeo:AUTO?</code>

3.11.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.11.5.1 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	<code>ON</code>
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the <code>WINDow</code> , <code>TRACe</code> and <code>GRID</code> parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	ON

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	<code>:DISPlay:VIEW:ADVanced:SElect</code>
Rename User View	<code>:DISPlay:VIEW:ADVanced:REName</code>
Delete User View	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Create User View	<code>:DISPlay:VIEW:ADVanced:NAME</code>

Name	Command
Select Screen	:INSTRUMENT:SCREEN:SElect
Delete Screen	:INSTRUMENT:SCREEN:DELeTe
Delete All But This Screen	:INSTRUMENT:SCREEN:DELeTe:ALL
Add Screen	:INSTRUMENT:SCREEN:CREate
Rename Screen	:INSTRUMENT:SCREEN:REName
Sequencer On/Off	:SYSTEM:SEQuencer

Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTEM:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.11.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "[Views](#)" on page 1850.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	:DISPlay:VIEW:ADVanced:SElect <alphanumeric> :DISPlay:VIEW:ADVanced:SElect?
Example	Select Baseband as the current View :DISP:VIEW:ADV:SEL "Baseband"
Notes	You must be in the measurement whose View you are trying to set to send the command. You can only

set Views for the current measurement using this command

For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:

```
:DISP:VIEW:ADV:SEL "Trace Zoom"
```

because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu

You *cannot* use the legacy View parameter (which in this case would be **TZOom**) with

```
:DISP:VIEW:ADV:SEL
```

<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:

```
:DISP:VIEW:ADV:SEL "Trace Zoom"
```

```
:DISP:VIEW:ADV:SEL "TRACE ZOOM"
```

If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"

If the display is disabled (via **:DISP:ENAB OFF**) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Backwards Compatibility SCPI	The legacy node :DISP:VIEW[:SElect] is retained for backwards compatibility, but it only supports predefined views
------------------------------	---

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	:DISP:VIEW:ADV:NAME <alphanumeric>
Example	:DISP:VIEW:ADV:NAME "Baseband"
Notes	Creates a new View named Baseband from the current View, and selects it as the current View <alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <alphanumeric> name already exists as a View, the error message "-224, Illegal parameter value;

View <alphanumeric> already exists” is generated

If the display is disabled (via **:DISP:ENAB OFF**) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	:DISPlay:VIEW:ADVanced:REName <alphanumeric>
Example	:DISP:VIEW:ADV:REN “Baseband”
Notes	<p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <alphanumeric> specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated</p> <p>If the display is disabled (via :DISP:ENAB OFF) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	:DISPlay:VIEW:ADVanced:DElete
Example	:DISP:VIEW:ADV:DEL
Notes	<p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <alphanumeric> is not present in the list of View names, the error message “-224, Illegal</p>

parameter value; View <alphanumeric> does not exist” is generated
 If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated
 If the display is disabled (via **:DISP:ENAB OFF**) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	:DISPlay:VIEW:ADVanced:DELeTe:ALL
Example	:DISP:VIEW:ADV:DEL:ALL
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, **:DISPlay:VIEW[:SElect]** and **:DISPlay:VIEW:NSEL**, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	:DISPlay:VIEW:ADVanced:CATalog?
Example	:DISP:VIEW:ADV:CAT?
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement Example: "Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1" No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via :DISP:ENAB OFF), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2004), then query the list of available Views, the result is undefined</p>

3.11.6 Frequency

Contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by ["Meas Preset" on page 1917](#). For example, **Center Frequency** is the same for all measurements – it does not change as you change measurements.

3.11.6.1 Settings

Contains the basic **Frequency** functions.

Fundamental

Sets the frequency of the fundamental measured signal. By default, other harmonic measurements will be measured at multiples of the specified fundamental frequency.

If **Auto** is on, the fundamental is determined from the first sweep (["Harmonic Measurement Details" on page 1849](#)) whenever the measurement is restarted. If **Manual**, the first sweep is still taken to determine the resolution bandwidth.

Remote Command	<code>[:SENSe] :HARMonics:FREQuency:FUNDamental <freq></code> <code>[:SENSe] :HARMonics:FREQuency:FUNDamental?</code>
----------------	--

3 Spectrum Analyzer Mode
3.11 Harmonics Measurement

Example	<code>:HARM:FREQ:FUND 1 GHZ</code> <code>:HARM:FREQ:FUND?</code>
Notes	Forces measurement restart
Dependencies	Sense is not available for VXT
Couplings	Affected by " Freq Offset " on page 1908
Preset	The frequency found when initiating an Auto Tune from the current measurement condition
Min	1 Hz
Max	Half the maximum available instrument frequency
Auto Function	
Remote Command	<code>[:SENSe]:HARMonics:FREQuency:FUNDamental:AUTO OFF ON 0 1</code> <code>[:SENSe]:HARMonics:FREQuency:FUNDamental:AUTO?</code>
Preset	ON

Freq Step

Lets you change the step size for the fundamental frequency. Once a step size has been selected and the fundamental frequency function is active, the step keys (and the **UP | DOWN** parameters for **Fundamental Frequency** from remote commands) change frequency by the step-size value.

Remote Command	<code>[:SENSe]:HARMonics:FREQuency:STEP[:INCRement] <freq></code> <code>[:SENSe]:HARMonics:FREQuency:STEP[:INCRement]?</code>
Example	<code>:HARM:FREQ:STEP 1 MHZ</code> <code>:HARM:FREQ:STEP?</code>
Preset	1 GHz
Min	1 Hz
Max	Set by the instrument maximum frequency

Freq Offset

Enables you to set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a Mode Preset or set the frequency offset to 0 Hz.

Remote Command	<code>[:SENSe]:FREQuency:OFFSet <freq></code> <code>[:SENSe]:FREQuency:OFFSet?</code>
----------------	--

Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values are dependent on Hardware Options
Dependencies	Freq Offset is not available in External Mixing. In this case the Freq Offset control is grayed-out and shows a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	-/+500 GHz
Annotation	If Freq Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:X[:SCALE]:OFFSet</code> The DISP lay version of the command is supported for compatibility across platforms. It is not recommended for new development
Backwards Compatibility Notes	In pre-X-Series instruments, Freq Offset could not be adjusted by the knob or step keys. That is no longer the case Some previous spectrum analyzers did not adjust frequency counter results for Freq Offset . X-Series does adjust the frequency counter for the offset

3.11.7 Marker

There is no **Marker** functionality in this measurement.

3.11.8 Meas Setup

Accesses a menu panel for averaging control and customization of measurements.

3.11.8.1 Settings

Contains basic functions.

Avg/Hold Num

When **Average/Hold** is **ON**, the average/hold number of sweeps are taken at each frequency. The traces themselves are not averaged; the data resulting from each sweep is averaged when calculating the measurement result.

The Average Type is *always* **Log-Pwr Avg (Video)** (RMS).

3 Spectrum Analyzer Mode
3.11 Harmonics Measurement

Remote Command	<code>[:SENSe]:HARMonics:AVERage:COUNT <integer></code> <code>[:SENSe]:HARMonics:AVERage:COUNT?</code>
Example	<code>:HARM:AVER:COUN 20</code>
Preset	10
Min	1
Max	9999
Annotation	In the Meas Bar Auto Function
Remote Command	<code>[:SENSe]:HARMonics:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:HARMonics:AVERage[:STATe]?</code>
Preset	OFF

Averaging On/Off

Turns averaging on or off.

NOTE

In this measurement, **Average Type** is preset to the [Log-Pwr Avg \(Video\)](#) method. Other averaging methods are not available.

Remote Command	<code>[:SENSe]:HARMonics:AVERage[:STATe] OFF ON 0 1</code> <code>[:SENSe]:HARMonics:AVERage[:STATe]?</code>
Example	<code>:HARM:AVER OFF</code> <code>:HARM:AVER?</code>
Preset	ON
State Saved	Yes
Range	OFF ON

Average Mode

Selects the termination control used for the averaging function. This determines the action after the specified number of measurements (**Avg/Hold Num**) is reached.

- **EXponential** – Each successive data acquisition after the average count is reached is exponentially weighted and combined with the existing average. **Exponential** averaging weights new data more than old data, which facilitates tracking of slow-changing signals. The average is displayed at the end of each sweep

- **REPeat** – After reaching the "Avg/Hold Num" on page 1919, all previous result data is cleared, and the average count set back to 1

Remote Command	<code>[:SENSe]:HARMonics:AVERage:TCONtrol EXPonential REPeat</code> <code>[:SENSe]:HARMonics:AVERage:TCONtrol?</code>
Example	<code>:HARM:AVER:TCON EXP</code>
Preset	<code>REPeat</code>
Range	<code>EXPonential REPeat</code>

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Harmonics

Sets the number of harmonics that are measured, including the fundamental, thus, setting this to 3 measures up through the third harmonic. All measured harmonics are included in the calculation of Total Harmonic Distortion (THD).

Harmonics outside of the frequency range of the instrument are not measured. Harmonics that require a resolution bandwidth greater than the instrument's range are measured using the widest available resolution bandwidth.

Remote Command	<code>[:SENSe]:HARMonics:NUMBer <integer></code> <code>[:SENSe]:HARMonics:NUMBer?</code>
Example	<code>:HARM:NUMB 5</code>
Preset	10
Min	2
Max	10

Range Table (On/Off)

Enables override of the default harmonic measurement parameters. Allows you to set frequency, bandwidth, sweep time, etc. for each harmonic independently.

When **Range Table** is **OFF**, the data in the range table is cleared.

Remote Command	<code>[:SENSe]:HARMonics:RTABle:STATe OFF ON 0 1</code> <code>[:SENSe]:HARMonics:RTABle:STATe?</code>
Example	<code>:HARM:RTAB:STAT 1</code>

Preset	OFF
Range	OFF ON

Range Table

Accesses a dialog that allows editing of the **Range Table** to control the measurement parameters for each individual measurement.

Measure Tone

Sets whether the selected harmonic is measured (checked) or not measured (unchecked). Harmonics that are not measured do not affect Total Harmonic Distortion (THD).

When sending the Backwards Compatibility SCPI command below, send a *complete* list of 10 states. Each harmonic will be made active or inactive depending on the position. Thus, `:HARM:RANG:STAT 1,0,1,0,1,0,0,0,0,0` turns on the third and fifth harmonics. The Backwards Compatibility query returns 10 states.

Remote Command	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:STATe OFF ON 0 1</code> <code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:STATe OFF ON 0 1</code>
Example	Turn on the second tone (by default the second harmonic): <code>:HARM:TONE2:STAT ON</code>
Preset	ON
Range	OFF ON
Backwards Compatibility Command	
Example	<code>:HARM:RANG:STAT 1,0,1,0,1,0,0,0,0,0</code>
Preset	ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
Backwards Compatibility SCPI	<code>[:SENSe]:HARMonics:RANGe[:LIST]:STATe OFF ON 0 1, ...</code> <code>[:SENSe]:HARMonics:RANGe[:LIST]:STATe</code>

Frequency

Sets the frequency of the selected harmonic. This overrides the normal frequency calculation and allows non-integral harmonics to be measured.

When sending the Backwards Compatibility SCPI command below, send a complete list of 10 frequencies. Each harmonic will have its frequency set appropriately. The Backwards Compatibility query returns 10 frequencies.

Remote Command	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:FREQuency <frequency></code> <code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:FREQuency?</code>
Example	<code>:HARM:TONE2:FREQ 2 GHz</code>
Couplings	Tone frequencies are affected by "Freq Offset" on page 1908
Preset	1 GHz
Min	Instrument minimum frequency
Max	Instrument maximum frequency
Backwards Compatibility Command	
Preset	1 GHz
Backwards Compatibility SCPI	<code>[:SENSe]:HARMonics:RANGe[:LIST]:FREQuency <frequency>, <frequency>, <frequency>, <frequency>, <frequency>, <frequency>, <frequency></code> <code>[:SENSe]:HARMonics:RANGe[:LIST]:FREQuency?</code>

Res BW

Sets the pre-detection filter (RBW) bandwidth of the selected harmonic measurement. The bandwidth of a harmonic signal is greater than the bandwidth of the fundamental; the auto rules multiply the fundamental bandwidth by the harmonic number. Thus, third harmonic measurement should typically use a resolution bandwidth 3 times as wide as the fundamental resolution bandwidth.

When using a measurement without a range table, or when auto is selected, this calculation is performed automatically. If the requested resolution bandwidth is higher than the maximum available resolution bandwidth, a "*" is shown next to the result in the measurement table.

Remote Command	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:BANDwidth BWIDth[:RESolution] <frequency></code> <code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:BANDwidth BWIDth[:RESolution]?</code>
Example	<code>:HARM:TONE3:BAND 100 kHz</code> Set the resolution bandwidth for the 3 rd harmonic to 100 kHz
Couplings	In Auto mode, the tone RBW is set to the minimum available RBW that is at least as high as the fundamental RBW times the tone frequency divided by the fundamental frequency
Preset	The value used after a preset is dependent upon the input signal, as the RBW defaults to Sense
Min	1 Hz
Max	8 MHz
Auto Function	
Remote Command	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:BANDwidth BWIDth[:RESolution]:AUTO ON OFF</code> <code> 1 0</code>

	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:BANDwidth BWIDth[:RESolution]:AUTO?</code>
Preset	ON

Dwell Time

Sets the **Dwell Time** for the specified harmonic. In zero-span, the **Auto** mode strikes a balance between measurement speed and accuracy; increasing the dwell time will reduce measurement speed while increasing accuracy.

Remote Command	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:SWEEp:TIME <time></code> <code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:SWEEp:TIME?</code>
Example	<code>:HARM:TONE:SWE:TIME 100 us</code> Set the sweep time for this harmonic to 100 us
Couplings	If the Sweep Time is set to Auto , the sweep time will be 200 divided by the resolution bandwidth, to a minimum of 10 ms
Preset	The actual preset value depends upon an input signal, since Dwell Time defaults to Sense
Min	100 us
Max	4000 s

Auto Function

Remote Command	<code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:SWEEp:TIME:AUTO OFF ON 0 1</code> <code>[:SENSe]:HARMonics:TONE[1] 2 ... 10:SWEEp:TIME:AUTO?</code>
Preset	ON

Backwards Compatibility Command

Backwards Compatibility SCPI	<code>[:SENSe]:HARMonics:RANGe[:LIST]:SWEetime <time>, ...</code> <code>[:SENSe]:HARMonics:RANGe[:LIST]:SWEetime?</code>
------------------------------	---

Backwards Compatibility Auto Function

Preset	ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
--------	--

Auto-Fill

Sets up the "Range Table" on page 1912, based on the first entry in the range table. When selected, each of the entries after range 1 are set appropriately.

Remote Command	<code>[:SENSe]:HARMonics:RTABle:FILL</code>
Example	<code>:HARM:RTAB:FILL</code> fills the range table based on current fundamental measurement settings

Couplings	Changes all settings in the range table The frequency for each range is set to the integer multiples of the first entry in the range table The RBW for each range is set to integer multiples of the first RBW The Dwell Time for each range is set to integer divisors of the first dwell time
-----------	---

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 1916 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL NONE
Backwards Compatibility Notes	: COUP : NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other

3 Spectrum Analyzer Mode

3.11 Harmonics Measurement

instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time

- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Initiates the first sweep ("[Harmonic Measurement Details](#)" on page 1849). Returns Meas Local variables in the current measurement to their preset values (many of which are determined from the results of the first sweep).

Remote Command :CONFigure:HARMonics

3.11.8.2 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "[Restore Defaults](#)" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRument:COUPlE:FREQUency:CENTer ALL NONE :INSTRument:COUPlE:FREQUency:CENTer?
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQUency:CENTer[:STATe] 1 0 ON OFF :GLOBal:FREQUency:CENTer[:STATe]?

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTRument:COUPlE:EMC:STANdard ALL NONE :INSTRument:COUPlE:EMC:STANdard?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole

sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:FREQuency:BAND:EXTend 0 1 ON OFF</code> <code>:INSTrument:COUPle:FREQuency:BAND:EXTend?</code>
Example	<code>:INST:COUP:FREQ:BAND:EXT 1</code> <code>:INST:COUP:FREQ:BAND:EXT?</code>
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	<code>:INSTrument:COUPle:DEFault</code>
Example	<code>:INST:COUP:DEF</code>
Backwards Compatibility SCPI	<code>:GLOBal:DEFault</code>

Avg/Hold Num

When **Average/Hold** is **ON**, the average/hold number of sweeps are taken at each frequency. The traces themselves are not averaged; the data resulting from each sweep is averaged when calculating the measurement result.

The Average Type is *always* **Log-Pwr Avg (Video)** (RMS).

Remote Command	<code>[:SENSe]:HARMonics:AVERage:COUNT <integer></code> <code>[:SENSe]:HARMonics:AVERage:COUNT?</code>
Example	<code>:HARM:AVER:COUN 20</code>
Preset	10
Min	1
Max	9999
Annotation	In the Meas Bar Auto Function

Remote Command	<code>[:SENSe]:HARMonics:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:HARMonics:AVERage[:STATe]?</code>
Preset	OFF

3.11.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.11.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Dwell Time

Selects the length of time for which the instrument sweeps when measuring the fundamental. Additional overhead time is required by the instrument that impacts the sweep rate, but is not calculated as part of **Dwell Time**.

Reducing the sweep time increases the rate of sweeps.

Dwell Time normally changes with the resolution bandwidth, so by default the dwell time varies with each harmonic. If **Dwell Time Auto** is **OFF**, the harmonics will have the same dwell time unless "**Range Table**" on page 1912 is used.

Remote Command	<code>[:SENSe]:HARMonics:SWEEptime <time></code> <code>[:SENSe]:HARMonics:SWEEptime?</code>
Example	Set Dwell Time for the fundamental to 100 μ s: <code>:HARM:SWE 100 us</code>
Couplings	If Dwell Time is Auto , the dwell time will be 200 divided by the resolution bandwidth, to a minimum of 10 ms. If Range Table is active, the time for each harmonic is determined by that harmonic's individual dwell time setting (which includes an auto toggle)
Preset	The actual preset dwell time depends upon the results of the first sweep operation, since the sweep time is Auto , and the auto rule depends upon the detected optimal RBW
Min	100 us
Max	4000 s
	Auto Function

Remote Command	<code>[:SENSe]:HARMonics:SWEEptime:AUTO OFF ON 0 1</code> <code>[:SENSe]:HARMonics:SWEEptime:AUTO?</code> <code>[:SENSe]:HARMonics:SWEEptime:STATe OFF ON 0 1</code> <code>[:SENSe]:HARMonics:SWEEptime:STATe?</code>
Preset	<code>ON</code>

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "[More Information](#)" on page 1921

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	<code>ON</code> Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to <code>ON</code> , but <code>*RST</code> sets <code>:INIT:CONT</code> to <code>OFF</code>
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument
-----------------	---

3 Spectrum Analyzer Mode

3.11 Harmonics Measurement

keeps sweeping

See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep

The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

Single Mode

The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping

See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep

The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 2039 for details of **:INIT:IMMEDIATE**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 1923

Remote Command	<code>:INITiate[:IMMediate]</code> <code>:INITiate:REStart</code>
Example	<code>:INIT:IMM</code> <code>:INIT:REST</code>
Notes	<code>:INIT:REST</code> and <code>:INIT:IMM</code> perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The <code>STATus:OPERation</code> register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The <code>STATus:QUEStionable</code> register bit 9 (<code>INTegrity</code> sum) is cleared The <code>SWEEPING</code> bit is set The <code>MEASURING</code> bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the <code>:INIT:REST</code> command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write , but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the <code>:INIT:REST</code> command restart not only Trace Average , but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue

Event	Trace Effect
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

3.11.9.2 Sweep Config

Lets you configure the Sweep and Control functions of the instrument , such as **Sweep Rules**.

Only appears in VXT.

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command `[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1`
`[:SENSe]:SWEep:IF:DITHer?`

3 Spectrum Analyzer Mode

3.11 Harmonics Measurement

Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	OFF
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	<code>[:SENSe]:SWEep:IMAGeProt OFF ON 0 1</code> <code>[:SENSe]:SWEep:IMAGeProt?</code>
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	ON
State Saved	Saved in instrument state

3.11.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The "[Trace Control](#)" on page 1926 tab in this menu contains radio-button selections for the trace type (**Clear/Write, Max Hold**).

3.11.10.1 Trace Control

The controls on this tab allow you to set the "[Trace Type](#)" on page 1927 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display**, are

described fully in the ["View/Blank" on page 1740](#) control description. Essentially, when **Update** is **ON**, a trace is updating, and when **Update** is **OFF** it is not. When **Display** is **ON**, it is visible and when **Display** is **OFF** it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITe	:TRAC2:TYPE WRIT	See: "Clear/Write" on page 1930
Trace Average	AVERage	:TRAC2:TYPE AVER	See: "Trace Average" on page 1930
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: "Max Hold" on page 1931
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: "Min Hold" on page 1931

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the ["View/Blank" on page 1740](#) state must be set to **Active** (**Update: ON**, **Display: ON**) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: ["Trace Mode Backwards Compatibility Commands" on page 1928](#)

Remote Command	<p>For Swept SA Measurement (in SA Mode):</p> <pre>:TRACe[1] 2 ... 6:TYPE WRITe AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 ... 6:TYPE?</pre> <p>For all other measurements:</p> <pre>:TRACe[1] 2 3:<meas>:TYPE WRITe AVERage MAXHold MINHold</pre> <pre>:TRACe[1] 2 3:<meas>:TYPE?</pre> <p>where <meas> is the identifier for the current measurement</p>
Example	<pre>:TRAC:TYPE WRIT</pre> <pre>:TRAC:TYPE?</pre>
Couplings	<p>Selecting a Trace Type (by pressing any of the Trace Type selections or sending <code>:TRAC:TYPE</code>) sets the Trace to Active (Update: ON, Display: OFF), even if the same trace type was already selected</p> <p>When Detector setting is "Auto" (<code>[:SENSe] : <meas> : DETector : AUTO?</code>), Detector (<code>[:SENSe] : <meas> : DETector [:FUNction] ?</code>) switches aligning with the switch of this parameter: "NORMal" with WRITe (Clear Write), "AVERage" with AVERage, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold</p>
Preset	<p>Swept SA and Monitor Spectrum: WRITe</p> <p>All other measurements: AVERage</p>

	Following Preset , all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under **"View/Blank"** on page 1740.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The **:TRACe:MODE** command is retained for backwards compatibility, and the **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay** commands introduced for ongoing use. The old Trace Modes are selected using **:TRAC:MODE**, whose parameters are mapped into calls to **:TRACe:TYPE**, **:TRACe:UPDate** and **:TRACe:DISPlay**, and the old global Averaging command **[:SENSe]:AVERage[:STATe]** is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup, Legacy Compatibility** menu is **ON**, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart, Single** or **:INIT:IMM**, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	WRITE
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	:TRACe[1] 2 ... 6:MODE WRITE MAXHold MINHold VIEW BLANK :TRACe[1] 2 ... 6:MODE?
Backwards Compatibility Notes	The legacy :TRACe:MODE command is retained for backwards compatibility. In conjunction with the legacy :AVERage command, it works as follows: <ul style="list-style-type: none"> – :AVERage ON OFF sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the [:SENSe]:AVERage[:STATe] command description below – :TRACe:MODE WRITE sets :TRACe:TYPE WRITE (Clear/Write) unless average is true, in

which case it sets it to `:TRACe:TYPE AVerage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace

- `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANK` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANK`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	<code>OFF</code>
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	<code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> <code>[:SENSe]:AVERage[:STATe]?</code>
Backwards Compatibility Notes	<p>Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command <code>[:SENSe]:AVERage[:STATe] ON OFF 1 0</code> was used to turn Averaging on or off</p> <p>In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another</p> <p>For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command <code>[:SENSe]:AVERage[:STATe] OFF ON 0 1</code>. When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old <code>:TRAC:MODE</code> command will instead get put</p>

into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average**, **Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average**, **Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup**.

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data

- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup**.

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count *k* is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold**, clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

3 Spectrum Analyzer Mode
3.11 Harmonics Measurement

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1927 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

3.12 List Sweep Measurement (Remote Only)

List Sweep can be selected using the front panel key or the remote command. Measurement setup control is only available remotely. While in the List Sweep measurement, the screen is blanked, with a message “Executing List Sweep measurement from Remote Control port”.

To exit List Sweep you can select another measurement (press **Mode/Meas** for the Mode/Meas/View dialog) or press the **Mode Preset** key, which will return you to the Swept SA measurement.

Since List Sweep is a Remote only measurement, you may want to lock out the front panel keys to avoid having key presses interfere with the measurement. There are two ways to lock out the front panel keys. Accessing the instrument over GPIB (IEEE-488) puts it in remote operation, or you can send the **:SYSTem:KLOCK ON** command.

List Sweep Measurement Commands

Command	Action	Return Value
:INITiate:LIST	Restart the measurement (see also " Trigger Source " on page 1942 for BUS trigger info)	n/a
:CONFigure?	Query the current measurement	Name of current measurement: "LIST"
:CONFigure:LIST	Switch to the List Sweep measurement and preset List Sweep parameters. See " List Parameters " on page 1935 for preset values.	n/a
:FETCh:LIST?	Query measurement data	List of measurement data (see below)
:READ:LIST?	Measure and query measurement data	List of measurement data (see below)

Example Assume that only one detector is used for each point and the list length is 4:
READ:LIST?
-12.3, 34.5, 56.7,23.4
Note that all returned values are in the internal unit of dBm

Remote Command Notes The range of the list length is [0,10000], inclusive, unless otherwise specified, so the list can contain a maximum of 10,001 points.

If remote commands are sent containing inconsistent list lengths, an error is returned.
See also "[List Lengths of One or Zero](#)" on page 1934

Status Bits/OPC
Dependencies

The Status Operation Register bit "Waiting for Trigger" is set at the same time when a new list point measurement is initiated. It is cleared when the trigger actually occurs (i.e. after the trigger event occurs and all the applicable trigger criteria have been met).

While the Trigger bit is set/unset along with each triggering condition at each point, the Measurement bit is set once when the first point measurement is initiated. It is cleared only after all points measurement in the list are complete and results are available

3.12.1 Views and Windows

While in the List Sweep measurement, the screen is blanked, with a message "List Sweep measurement in progress. System under remote control".

View	Result
(none)	(none)

3.12.2 General Information

The List Sweep measurement is entirely based on lists of parameters sent by remote commands described in the section "[Remote Commands](#)" on page 1936. This section includes some general information about the List Sweep measurement.

3.12.2.1 List Lengths of One or Zero

List Length of One

SCPI standards call for all lists to be the same length except for lists of length one. When a list is of length 1, the particular list is treated as though it were a list of length equal to the other lists, with all values being the same.

List Length of Zero

A list of length zero is defined as being a parameter that is not modified from its current value in executing a list, that is, the value it was set to in the Swept SA measurement. This provides the programmer the flexibility to execute the measurement at a number of different Center Frequencies, for example, by setting the Center Frequency before entering the List Sweep measurement and then providing a Frequency list of length zero.

The measurement presets to lists of length zero, which is the only way to set a list of length zero. Once you have sent a command to set a particular list, the only way to set it back to zero is with a preset.

NOTE

If you query the the list values when the length is zero, the analyzer will return 9.91 E+37 for any numerical parameter, which means “not a number” and is the value usually returned for an undefined quantity. For an enumerated value, such as Trigger Source, the analyzer will return “NONE”. The user should understand that either means “List Sweep is using the current value from the Swept SA measurement”

3.12.2.2 Differences with other measurements

The following are the major differences of the “List sweep” feature from other measurements:

- “List sweep” does not support front panel data display in order to meet optimum high throughput.
- The following remote commands are not supported for the List Sweep Measurement, even though they are common SCPI commands for other measurements. They are accepted without error, but do nothing when the List Sweep Measurement is running:
 - INITiate:REStart
 - INITiate:PAUSE
 - INITiate:RESume
- The command MEASure:LIST? generates NaN.
- The command SENSE:FEED EMIXer is accepted, but all elements of an existing Frequency List will have the values clipped to the default value for the External Mixer band that is selected. The Frequency List will not be retained when changing inputs. When switching back to RF from External Mixing all elements of an existing Freq List will be clipped to the RF default frequency.

3.12.2.3 List Parameters

Non-List SCPI commands are not allowed while in List Sweep Measurement and should not be sent while in the List Sweep measurement. In general, parameters in List Sweep inherit the values they were set to in Swept SA, with a few exceptions:

- Phase noise optimization is set to Fast Tune. See "[Phase Noise Optimization](#)" on page 1940

3 Spectrum Analyzer Mode
3.12 List Sweep Measurement (Remote Only)

- Detector type is set to LAVG. See ["Detector List" on page 1941](#)
- Trigger source is set to Free Run, see ["Trigger Source" on page 1942](#)

In addition, sweep mode is set to Single (INIT:CONT OFF) regardless of its value in Swept SA. "List sweep" only allows single measurement mode (see details in the command section.) INITiate:CONTinuous ON is not supported and should not be sent.

Additionally, the list parameter settings do not affect other application or measurement settings.

Note that list parameters will hold their values on entry as long as no list command has been sent defining them, which means as long as they have a list length of zero. See ["List Lengths of One or Zero" on page 1934](#).

3.12.2.4 Output data

The results are output as a list in the order of the entered list points. The number of the output data per each list point depends on the number of the detector settings. The measurement results are output in a list of float point values separated by commas. The unit of the results is dBm, the fundamental amplitude unit.

3.12.3 Remote Commands

There is no front panel user interface for List Sweep. The following remote commands are used to build your list. Once you have constructed the list, you can start the measurement using the INITiate or READ commands described in ["List Sweep Measurement Commands" on page 1933](#)

3.12.3.1 Frequency List

The command defines a list of analyzer center frequencies at which the measurements are made.

The query form queries the analyzer for the values in the frequency list.

Remote Command	<code>[:SENSe]:LIST:FREQuency <freq>[, <freq>]</code> <code>[:SENSe]:LIST:FREQuency?</code>
Example	<code>LIST:FREQ 1GHz,1.5GHz,2GHz,2.5GHz</code> Sets a list of 4 frequencies.
Preset	Current center frequency value from Swept SA measurement
State Saved	Saved in instrument state
Range	Same as center frequency range.

Remote Command	<code>[:SENSe]:LIST:FREQuency:POINts?</code>
----------------	--

Example	<code>LIST:FREQ:POIN?</code>
---------	------------------------------

3.12.3.2 Mechanical Attenuator List

This command defines a list of analyzer mechanical attenuator settings at which the measurements are made.

NOTE

Changing the mechanical attenuator within the list should be avoided if possible, because it slows down the measurement and wears out the attenuator.

The query form queries the analyzer for the values in the mechanical attenuation list.

Remote Command	<code>[:SENSe]:LIST:ATTenuation <power>[, <power>]</code> <code>[:SENSe]:LIST:ATTenuation?</code>
----------------	--

Example	<code>LIST:ATT 10DB</code>
---------	----------------------------

Dependencies	If the requested setting is not valid, it is ignored and the previous setting is retained.
--------------	--

Preset	Current mechanical attenuation value from Swept SA measurement
--------	--

State Saved	Saved in State
-------------	----------------

Range	Same as the mechanical attenuator range.
-------	--

Remote Command	<code>[:SENSe]:LIST:ATTenuation:POINts?</code>
----------------	--

Example	<code>LIST:ATT:POIN?</code>
---------	-----------------------------

3.12.3.3 Electronic Attenuation List

This command defines a list of analyzer electronic attenuator settings at which the measurements are made.

The query form queries the analyzer for the values in the electronic attenuation list.

Remote Command	<code>[:SENSe]:LIST:EATTenuation <power>[, <power>]</code> <code>[:SENSe]:LIST:EATTenuation?</code>
----------------	--

Example	<code>LIST:EATT 10DB</code>
---------	-----------------------------

Dependencies	If the required hardware option is not present, an error message would be issued. However, the error message does not prevent list sweep from execution if all other list settings are set properly.
--------------	--

3 Spectrum Analyzer Mode
 3.12 List Sweep Measurement (Remote Only)

Preset	Current electronic attenuation value from Swept SA measurement
State Saved	Saved in instrument state
Range	Same as the electronic attenuator range.
Remote Command	<code>[:SENSe]:LIST:EATTenuation:POINts?</code>
Example	<code>LIST:EATT:POIN?</code>

3.12.3.4 RBW Type List

This command defines a list of analyzer RBW Type settings used for the measurements.

The query form queries the analyzer for the values in the RBW Type list.

Remote Command	<code>[:SENSe]:LIST:BANDwidth BWIDth:RESolution:TYPE <type>[, <type>]</code> <code>[:SENSe]:LIST:BANDwidth BWIDth:RESolution:TYPE?</code>
Example	<code>LIST:BAND:RES:TYPE GAUS</code> For this example, Types from Swept SA measurement include: GAUSSian FLATtop EMI
Preset	Current RBW Type setting from Swept SA measurement
State Saved	Saved in instrument state
Range	Same as the RBW Types available in Swept SA measurement.

Remote Command	<code>[:SENSe]:LIST:BANDwidth BWIDth:RESolution:TYPE:POINts?</code>
Example	<code>LIST:BAND:RES:TYPE:POIN?</code>

3.12.3.5 RBW List

This command defines a list of analyzer RBW settings at which the measurements are made.

The query form queries the analyzer for the values in the RBW list.

Remote Command	<code>[:SENSe]:LIST:BANDwidth BWIDth:RESolution <freq>[, <freq>]</code> <code>[:SENSe]:LIST:BANDwidth BWIDth:RESolution?</code>
Example	<code>LIST:BAND:RES 100KHZ</code>
Preset	Current RBW value from Swept SA measurement

State Saved	Saved in instrument state
Range	Same as the RBW values available in the Swept SA measurement
Remote Command	<code>[:SENSe]:LIST:BANDwidth BWIDth:RESolution:POINts?</code>
Example	<code>LIST:BAND:RES:POIN?</code>

3.12.3.6 VBW List

This command defines a list of analyzer VBW settings at which the measurements are made.

The query form queries the analyzer for the values in the VBW list.

Remote Command	<code>[:SENSe]:LIST:BANDwidth BWIDth:VIDeo <freq>[, <freq>]</code> <code>[:SENSe]:LIST:BANDwidth BWIDth:VIDeo?</code>
Example	<code>LIST:BAND:VID 10KHZ</code>
Preset	Current Video BW value from Swept SA measurement
State Saved	Saved in instrument state
Range	Same as the Video BW values available in the Swept SA measurement.

Remote Command	<code>[:SENSe]:LIST:BANDwidth BWIDth:VIDeo:POINts?</code>
Example	<code>LIST:BAND:VID:POIN?</code>

3.12.3.7 Sweep Time List

This command defines a list of analyzer sweep times at which the measurements are made. In zero span measurements, this is the time required to measure a single point given the current setting for the number of points in the sweep.

The query form queries the analyzer for the values in the sweep time list.

Remote Command	<code>[:SENSe]:LIST:SWEEp:TIME <time>[, <time>]</code> <code>[:SENSe]:LIST:SWEEp:TIME?</code>
Preset	Current Sweep Time value from Swept SA measurement
State Saved	Saved in instrument state
Range	Same as the Sweep Time range available in the Swept SA measurement.

3 Spectrum Analyzer Mode
 3.12 List Sweep Measurement (Remote Only)

Remote Command	<code>[:SENSe]:LIST:SWEep:TIME:POINts?</code>
Example	<code>LIST:SWE:TIME:POIN?</code>

3.12.3.8 Trigger Delay List

This command defines a list of analyzer trigger delay time used when making the measurements.

The query form queries the analyzer for the values in the trigger delay list.

Remote Command	<code>[:SENSe]:LIST:TRIGger:DELAy <time>[, <time>]</code> <code>[:SENSe]:LIST:TRIGger:DELAy?</code>
Example	<code>LIST:TRIG:DEL 0.01S</code>
Preset	0 seconds
State Saved	Saved in instrument state
Range	Same as the Trigger Delay range for EXTERNAL1 trigger.

Remote Command	<code>[:SENSe]:LIST:TRIGger:DELAy:POINts?</code>
Example	<code>LIST:TRIG:DEL:POIN?</code>

3.12.3.9 Phase Noise Optimization

This command defines a list of analyzer phase noise optimization settings at which the measurements are made.

Upon switching to List Sweep from another measurement, phase noise optimization is set to “Fast Tune”. The user may select whatever phase noise optimization one desires via the phase noise optimization list parameter afterwards.

Remote Command	<code>[:SENSe]:LIST:FREQuency:SYNThesis 1 2 3</code> <code>[:SENSe]:LIST:FREQuency:SYNThesis?</code> <code>[:SENSe]:LIST:FREQuency:SYNThesis:AUTO OFF ON 0 1</code> <code>[:SENSe]:LIST:FREQuency:SYNThesis:AUTO?</code>
Example	<code>LIST:FREQ:SYNT 2</code> <code>LIST:FREQ:SYNT:AUTO OFF</code> <code>LIST:FREQ:SYNT 2</code>
Preset	Fast Tuning

State Saved	Saved in instrument state
Range	Fast Tuning (3) Best Phase Noise for offsets <20kHz (2) Best Phase Noise for offsets >30kHz (1)
Min	1
Max	3

3.12.3.10 Detector List

This command defines a list of analyzer detector settings at which the measurements are made. The choice of detectors is different from the choice in other measurements.

The query form queries the analyzer for the values in the detector list.

Remote Command	<code>[:SENSe]:LIST:DETECTOR <type>[, <type>]</code> <code>[:SENSe]:LIST:DETECTOR?</code>
Example	<code>LIST:DET POS</code>
Remote Command Notes	LAVG : average detector. Average detected on the log scale. VAVG : average detector. Average detected on the voltage scale. RMS: average detector. Average detected on the power (rms) scale. NEGative: negative peak detector. POSitive: positive peak detector. SAMPlE: sample detector. PKAV: Peak-AVER detector, a newly defined term, would allow the simultaneous measurement and two-point reporting of the results of the positive peak and the average detector (voltage scale). PRMS: Peak-RMS detector, a newly defined term, would allow the simultaneous measurement and two-point reporting of the results of the positive peak and the average detector (rms scale). DAVG: DualAvg detector is similarly a newly defined term that allows two-point reporting of simultaneously made measurements. With this detector, one result (the former) is average detected on the power (rms) scale, and one is average detected on the voltage scale.
Preset	LAVG
State Saved	Saved in instrument state
Range	LAVG VAVG RMS NEGative POSitive SAMPlE PKAV PRMS DAVG
Remote Command	<code>[:SENSe]:LIST:DETECTOR:POINTs?</code>
Example	<code>LIST:DET:POIN?</code>

3.12.3.11 Trigger Source

This command sets the source for the trigger that controls the start of each new measurement point in the list. The other trigger command :TRIGger:SOURce, is used to start the list .

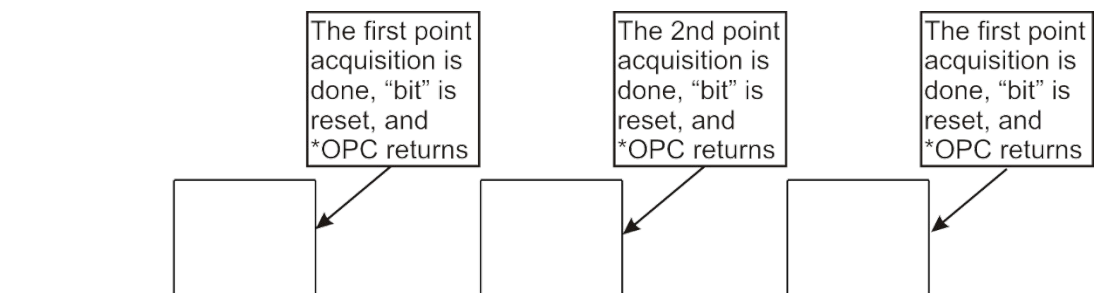

The query form queries the analyzer for the values in the trigger source of the list sweep.

When list trigger is set to BUS, the first measurement is taken immediately when the INIT command is sent, and subsequent measurements are taken when the *TRG command is sent. The measuring bit is set at the time when a new list point measurement is initiated via *TRG and cleared when the measurement result of that point is received. In other words, the measurement bit is set/reset at each point. An example is shown as following:

1. TRIG:SOUR IMM // this sets the first point trigger setting in the list sweep
2. CONF:LIST // set to list sweep measurement
3. LIST:FREQ 800e6, 810e6, 820e6 //set three point list frequency measurement
4. LIST:TRIG:SOUR BUS // set list trigger to BUS
5. INIT:IMM; *OPC? // Initiate one measurement and obtain the first point acquisition as the first point is free run (in step (2))
6. *TRG; *OPC? // trigger and obtain the 2nd point acquisition
7. *TRG; *OPC? // trigger and obtain the 3rd point acquisition
8. FETCH:LIST? // it should return the 3-point list of result

In the example above, the measuring “bit” is set at the starting of (5),(6) and (7) and cleared when *OPC returns. The diagram below illustrates the measuring “bit” status change vs. time:

Measuring “bit” status time line:

Remote Command	<code>[:SENSe]:LIST:TRIGger:SOURce EXTerna11 EXTerna12 IMMEDIATE BUS</code> <code>[:SENSe]:LIST:TRIGger:SOURce?</code>
Example	<code>LIST:TRIG:SOUR EXT2</code>
Remote Command Notes	EXTerna1 2: external sources IMMEDIATE: free run BUS: software controlled trigger The BUS trigger is only in “List Sweep”. It specifies a common trigger source which allows a source and a receiver (analyzer) to coordinate triggering without requiring the connection of the trigger in and trigger out ports on the rear panels of the instruments.
Dependencies	If the list trigger source is set to BUS for all points, you need a trigger for each list item after the first. For example, if there are three points in the list, you get the first point on the INIT and then have to send *TRG two times to execute the complete List Sweep measurement. If the list trigger source is not set to BUS, use *TRG or TRIG:IMM to start the list measurement.
Preset	IMMEDIATE
State Saved	Saved in instrument state
Status Bits/OPC Dependencies	The trigger bit is set and cleared at each measurement point. The Status Operation Register bit “Waiting for Trigger” is set at the time when a new list point measurement is initiated. It is cleared when the trigger actually occurs (i.e. after the trigger event occurs and all the applicable trigger criteria have been met). While the Trigger bit is set/unset along with each triggering condition at each point, the Measurement bit is set once when the first point measurement is initiated. It is cleared only after all points measurement in the list are complete. The only exception is when list trigger setting is BUS, see details above
Remote Command	<code>[:SENSe]:LIST:TRIGger:SOURce:POINts?</code>
Example	<code>LIST:TRIG:SOUR:POIN?</code>
Remote Command Notes	Only one trigger source selection is allowed.

3.12.3.12 Trigger Holdoff

Sets the holdoff time between triggers. When the trigger condition is satisfied, the trigger occurs, the delay begins, and the holdoff time begins. New trigger conditions are ignored until the holdoff time expires. For a free-running trigger, the holdoff value is the minimum time between triggers.

Remote Command	<code>[:SENSe]:LIST:TRIGger:HOLDoff <time></code> <code>[:SENSe]:LIST:TRIGger:HOLDoff?</code>
Example	<code>LIST:TRIG:HOLD 100MS</code>

3 Spectrum Analyzer Mode
 3.12 List Sweep Measurement (Remote Only)

Preset	0.0 s
State Saved	Saved in State
Min	0 s
Max	100 s

Remote Command	<code>[:SENSe]:LIST:TRIGger:HOLDoff:POINts?</code>
Example	<code>LIST:TRIG:HOLD:POIN?</code>
Remote Command Notes	Only one trigger holdoff selection is allowed.

3.12.3.13 Trigger Level

Sets the value at which the selected trigger input will trigger a new sweep.

Remote Command	<code>[:SENSe]:LIST:TRIGger:LEVe1 <amp;l></code> <code>[:SENSe]:LIST:TRIGger:LEVe1?</code>
Example	<code>LIST:TRIG:LEV 0.4V</code>
Preset	1.2 V
State Saved	Saved in instrument state
Min	-5 V
Max	5 V

Remote Command	<code>[:SENSe]:LIST:TRIGger:LEVe1:POINts?</code>
Example	<code>LIST:TRIG:LEV:POIN?</code>
Remote Command Notes	Only one trigger level selection is allowed.

3.12.3.14 Trigger Slope

Controls the trigger polarity. It is set positive to trigger on a rising edge and negative to trigger on a falling edge.

Remote Command	<code>[:SENSe]:LIST:TRIGger:SLOPe POSitive NEGative</code> <code>[:SENSe]:LIST:TRIGger:SLOPe?</code>
Example	<code>LIST:TRIG:SLOP NEG</code>
Preset	POSitive

State Saved	Saved in instrument state
Range	Same as the Sweep Time range available in the Swept SA measurement.
Remote Command	<code>[:SENSe] : LIST : TRIGger : SLOPe : POINts ?</code>
Example	<code>LIST : TRIG : SLOP : POIN ?</code>
Remote Command Notes	Only one trigger slope selection is allowed.

3.12.3.15 Sequencing

Defines a sequence for stepping through the list. You must use LIST:SEQ or LIST:SEQ:AUTO before performing a measurement using the READ command. When lists are not of the same length (except lengths of 0 and 1) an error "Invalid List length" would be generated at sequencing time.

Remote Command	<code>[:SENSe] : LIST : SEQuence <value> [, <value>]</code> <code>[:SENSe] : LIST : SEQuence ?</code> <code>[:SENSe] : LIST : SEQuence : AUTO ON1</code> <code>[:SENSe] : LIST : SEQuence : AUTO ?</code>
Example	<code>LIST : SEQ 1, 2, 4, 3</code>
Remote Command Notes	LIST:SEQ: defines a sequence for stepping through the list. LIST:SEQ:AUTO: when on, the sequence is set to 1 through N, where N is the longest list.
Preset	Ascending order: 1 through N
Range	Depends on the number of frequency points in your list.

Remote Command	<code>[:SENSe] : LIST : SEQuence : POINts ?</code>
Example	<code>LIST : SEQ : POIN ?</code>

3.12.3.16 Preselector Center State

This command defines a list of Preselector Center request states. When the state is set to 1 (true), a preselector center will initiate at the frequency setting before the measurement. If set to 0 (false), no preselector center will occur. A preselector center state that is set to true will override a preselector adjust offset frequency.

Remote Command	<code>[:SENSe] : LIST : PCENter <state> [, <state>]</code> <code>[:SENSe] : LIST : PCENter ?</code>
Example	<code>LIST : PCEN 0, 1, 1, 1</code>

3 Spectrum Analyzer Mode
 3.12 List Sweep Measurement (Remote Only)

	Sets a list of 4 preselector center states
Preset	Sets preselector center state to off
State Saved	Saved in instrument state
Remote Command	<code>[:SENSe]:LIST:PCENter:POINts?</code>
Example	<code>[:SENSe]:LIST:PCEN:POIN?</code>

3.12.3.17 Preselector Adjust

This command defines a list of Preselector Adjust offset frequencies. A preselector center state that is set to true will override a preselector adjust offset frequency.

Remote Command	<code>[:SENSe]:LIST:PADJust <freq>[, <freq>]</code> <code>[:SENSe]:LIST:PADJust?</code>
Example	<code>LIST:PCEN 1.0 MHz, 2.0 MHz, 3.5 MHz, 2.0 MHz</code> Sets a list of 4 preselector adjust offset frequencies
Preset	Sets the preselector center offset frequency to zero
State Saved	Saved in instrument state
Remote Command	<code>[:SENSe]:LIST:PADJust:POINts?</code>
Example	<code>[:SENSe]:LIST:PADJust:POIN?</code>

3.13 Phase and Amplitude vs Time Measurement

This measurement performs narrow band long capture; phase and amplitude variation over the capture is computed.

The steps involved in the PAVT measurement include:

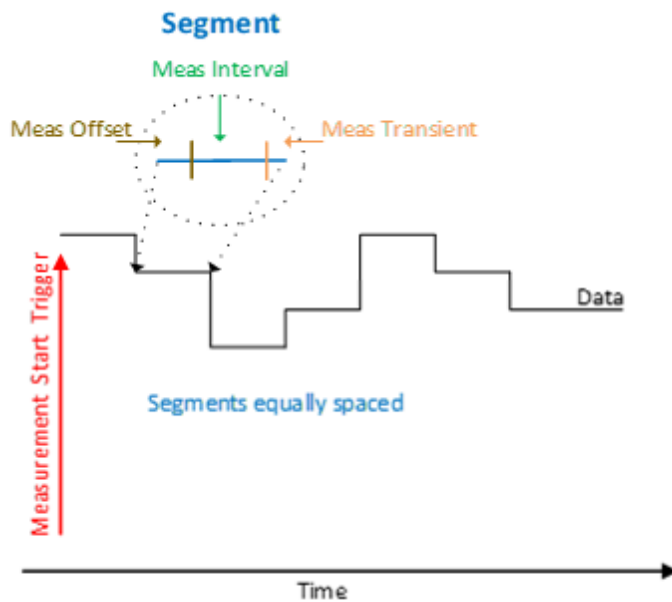

- | | | |
|---|---------------------------|--|
| 1 | Instrument Setup | You configure the measurement for Center Frequency, Triggering, and Amplitude. Adjust the Amplitude Reference level, Range, or Adjust Range for Min Clipping as appropriate for the transmitted signal. Once the amplitude settings are obtained, ensure that the transmitted signal remains within the dynamic range of the instrument for proper measurement to be performed |
| 2 | Determine Frequency Error | Provide the Frequency Error, or perform a measurement of Frequency Error. The Frequency Error measurement is at narrow band with a specific sample rate. When the measurement is run, the transmitted signal must not change in frequency |
| 3 | Actual measurement | This is a long capture of the transmitted signal as the phase and amplitude of the signal changes. The power and phase for the entire captured signal will be calculated from the measured data and Frequency Error |

Based on the Phase and Power calculated, additional manipulation on the data occurs to reduce the result to the request number of segments and to make the results relative to the first segment.

The first segment is called the Relative Baseline; the absolute values of the first segment are stored into the Relative Baseline result and then normalized to obtain 0° phase and 0 dB reference.

Measurement Operation

The 1st segment (the Relative Baseline) is initiated when the Trigger conditions are met, and all following segments are computed immediately thereafter based on the Meas Offset, Meas Interval, and Meas Transient. The measurement time of each segment is linear progression (segments are equally spaced).

Phase and Amplitude vs Time Measurement Commands

The following commands and queries can be used to configure the measurement, then retrieve the measurement results:

```
:CONFigure:PAVTime
:CONFigure:PAVTime:NDEFault
:INITiate:PAVTime
:FETCh:PAVTime[n]?
:READ:PAVTime[n]?
:MEASure:PAVTime[n]?
```

Remote Command Results for Phase and Amplitude vs Time

The following table describes the results returned by the FETCh, MEASure, and READ queries listed above, according to the index value *n*. All the return values are floating point numbers in scientific notation, they are listed in the table as integers or simple real values for readability. If no result is available, NaN (9.91E+37) is returned.

n	Results Returned
0	Returns the number of measured segments (points)
not specified or 1	Returns scalar results for the segments measured in quadruple format, Phase, Amplitude, Time and Delta Frequency Error

n	Results Returned
	<p>For example if "Segments" on page 2013 = 5, then the return result would look like: 0, 0, 0, -168E-03, -9.63E-03, 0.9212E-03, 0.999E-03, 161.455E-03, 70.976E-03, -0.612E-03, 2.000E-03, -87.325E-03, 59.676E-03, -0.347E-03, 2.999E-03, 301.646E-03, 104.21E-03, -0.318E-03, 4.000E-03, 358.402E-03</p>
2	<p>Returns scalar Phase results for the segments measured, equivalent to the Phase values from the n = 1 query For example if Segments = 5, then the return result would look like: 0,10,-10,20,-30</p>
3	<p>Returns scalar Amplitude results for the segments measured, equivalent to the Amplitude values from the n = 1 query For example if Segments = 5, then the return result would look like: 0,-.5,-1.2,1.2,2.5</p>
4	<p>Returns scalar Time results for the segments measured, equivalent to the Time values from the n = 1 query For example if Segments = 5, then the return result would look like: 0,10,20,30,40</p>
5	<p>Returns scalar Frequency Error results for the segments measured For example if Segments = 5, then the return result would look like: 0,100000,120000,-80000,90000</p>
6	<p>Returns the Relative Baseline results</p> <ol style="list-style-type: none"> <li data-bbox="358 1094 456 1121">1. Phase <li data-bbox="358 1150 505 1178">2. Amplitude <p>For example: 125, -15.25</p>

3.13.1 Views

The PAVT measurement has one view: "[Normal](#)" on page 1998.

This is a multiple-window View. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

3.13.1.1 Normal

Windows: "[Graph](#)" on page 1950, "[Results](#)" on page 1950

The PAVT measurement provides tabular result and graphical display.

3.13.2 Windows

This section describes the windows that are available in Phase and Amplitude vs Time measurements.

3.13.2.1 Graph

Corresponding Trace

Yellow: Phase vs Time

Light Blue: Amplitude vs Time

3.13.2.2 Results

Displays the Frequency Error, the Relative Baseline values, and the list of textual results of the Phase and Amplitude vs Time measurement.

Results window

Name	Corresponding Results	Example
Frequency Error [Hz]	Frequency error supplied by user, or measured by invocation of Measure Frequency Error immediate action	-125 kHz
Relative Baseline [°]	Phase of the 1 st segment before normalization	45°
Relative Baseline [dBm]	Amplitude of the 1 st segment before normalization	-15.00 dBm
Phase [°]	The phase of the particular segment relative to the 1 st segment	-45°
Amplitude [dB]	The amplitude of the particular segment relative to the 1 st segment	-1.99 dB
Time [ms]	The start time of the Meas Interval for the particular segment relative to the 1 st segment. When Meas Type = Normal the Time is equally spaced over the Total Meas Time	10 ms
Delta Freq Error [Hz]	Additional Frequency error of each segment	-1.00 MHz

3.13.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.13.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Scale

Selects the active scale for parameter adjustments of the menu.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe] AMPLitude PHASe</code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y AMPL</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y?</code>
Preset	PHASe
State Saved	Saved in instrument state
Range	Amplitude Phase

Ref Value

The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 1953.

Amplitude Scale

Sets the value for the reference position for the Amplitude Scale.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:RLEVel <rel_ amp1></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:RLEVel?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RLEV -10 dB</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RLEV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	-100/+100 dB
Annotation	Ref <value> top of graph

Phase Scale

Sets the value for the reference position for the Phase Scale. The reference line is at the top, center, or bottom of the graticule, depending on the value of **Ref Position**.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:RLEVel <real></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:RLEVel?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:RLEV 90</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:RLEV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	-1000/+1000
Annotation	Ref <value> / top of graph

Scale/Div

Sets the units per division in the graph window.

Amplitude Scale

Sets the units per division of the amplitude vertical scale in the graph window.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:PDIVision <rel_ ampl></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:PDIVision?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:PDIV 5</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:PDIV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Range	0.10 dB to 20.00 dB
Min	0.10 dB
Max	20.00 dB
Annotation	<value> dB/ left upper of graph

Phase Scale

Sets the units per division of the phase vertical scale in the graph window.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:PDIVision <real></code> <code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:PDIVision?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:PDIV 5</code>

	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:PDIV?</code>
Preset	Automatically calculated
State Saved	Saved in instrument state
Range	1 to 100
Min	1
Max	100
Annotation	<value> / left upper of graph

Ref Position

Positions the reference level at the top, center or bottom of the Y Scale display.

Amplitude Scale

Positions the Amplitude scale reference level at the top, center or bottom of the Y Scale display. Changing the reference position does not change the value of "Ref Value" on page 1951.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:RPOSition TOP CENTER BOTTom</code>
	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:AMPLitude:RPOSition?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RPOS TOP</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:AMPL:RPOS?</code>
Preset	<code>CENTER</code>
State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	> and < are displayed both side of graph to indicate Reference Position

Phase Scale

Positions the Phase Scale reference level at the top, center or bottom of the Y Scale display. Changing the reference position does not change the value of "Ref Value" on page 1951.

Remote Command	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:RPOSition TOP CENTER BOTTom</code>
	<code>:DISPlay:PAVTime:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PHASe:RPOSition?</code>
Example	<code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:RPOS TOP</code> <code>:DISP:PAVT:VIEW:WIND:TRAC:Y:PHAS:RPOS?</code>
Preset	<code>CENTER</code>

State Saved	Saved in instrument state
Range	Top Center Bottom
Annotation	> and < are displayed both side of graph to indicate Reference Position

3.13.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See ["Dual-Attenuator Configurations"](#) on page 1954
- See ["Single-Attenuator Configuration"](#) on page 1955

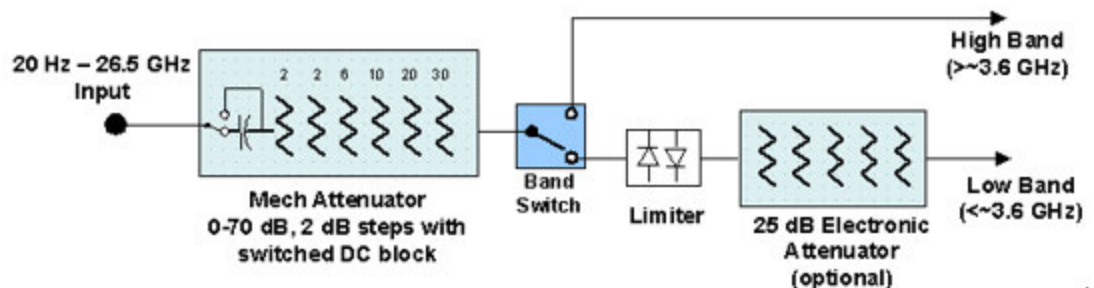

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the Range tab in that case
--------------	--

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

Configuration 2: Mechanical attenuator, no optional electronic attenuator

Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	<code>[:SENSe]:POWer[:RF]:FRATten <rel_amp1></code> <code>[:SENSe]:POWer[:RF]:FRATten?</code>
Example	<code>:POW:FRAT 14</code> <code>:POW:FRAT?</code>
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See Reference Level and " Mech Atten " on page 1957 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	<p>When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:</p> <ul style="list-style-type: none"> - If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten - If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten - If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten <p>In the Amplitude, "Y Scale" on page 1951 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:</p> <ul style="list-style-type: none"> - Attenuator summary:

-
- Total Atten below 50 GHz: 30 dB
 - Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "[Internal Preamp](#)" on page 1981 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "[Attenuator Configurations and Auto/Man](#)" on page 1959

Remote Command	<code>[:SENSe]:POWer[:RF]:ATTenuation <rel_amp></code> <code>[:SENSe]:POWer[:RF]:ATTenuation?</code>
Example	<code>:POW:ATT 20</code> Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support Auto setting of Mech Atten . In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in " Elec Atten " on page 1960 See " Attenuator Configurations and Auto/Man " on page 1959 for more information on the Auto/Man functionality
Couplings	If the RF Input Port is the RF Input: <ul style="list-style-type: none"> - If the USB Preamp is connected to USB, use 0 dB for Mech Atten - Otherwise compute the auto-selected value of Mech Atten based on Reference Level, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, μW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) - In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 1956 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto , but no changes are made to the actual

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

	<p>attenuator hardware setting until the input is changed back to the RF Input</p> <p>For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is ≤ 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB</p>	
Preset	<p>Auto</p> <p>The Auto value is 10 dB</p>	
State Saved	<p>Saved in instrument state</p>	
Min	<p>0 dB</p> <p>The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</p>	
Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
	<p>Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB</p>	
Annotation	<p>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:</p> <p><i>Atten: <total> dB (e<elec>)</i></p> <p>The e letter is in amber in Single-Attenuator configurations</p> <p>For example:</p> <p>Dual-Attenuator configuration:</p> <p><i>Atten: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB</p> <p>Single-Attenuator configuration:</p> <p><i>A: 24 dB (e14)</i></p> <p>Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)</p> <p>When in Manual, a # sign appears in front of Atten in the annotation</p>	
	<p>Auto Function</p>	
Remote Command	<pre>[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF ON 0 1 [:SENSe]:POWer[:RF]:ATTenuation:AUTO?</pre>	
Example	<p>Turn Auto Mech AttenON:</p> <pre>:POW:ATT:AUTO ON</pre>	

Dependencies	:POW:ATT:AUTO is only available in measurements that support Auto , such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "[Attenuation](#)" on page 1954, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "[Mech Atten](#)" on page 1957 (or :POW:ATT) as the "main" attenuation; and the attenuation that is set by :POW:EATT as the "soft" attenuation (:POW:EATT is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "[Elec Atten](#)" on page 1960 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see ["More Information" on page 1961](#)

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl></code> <code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
Example	<code>:POW:EATT 10</code> <code>:POW:EATT?</code>
Notes	Electronic Attenuation's specification is defined only when Mech Atten is 6 dB
Dependencies	<p>Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Attenuation control or <code>:POW:ATT</code>, and affects the total attenuation displayed on the Attenuation control and the Meas Bar</p> <p>The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If "Internal Preamp" on page 1981 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out</p> <p>If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned</p> <p>If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence</p> <p>If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and Internal Preamp is unavailable</p> <p>If "LNA" on page 1982 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the Enabled/Disabled section of the Elec Atten control will be OFF and grayed-out. This coupling works in the following modes/measurements:</p> <ul style="list-style-type: none"> - Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes - Transmit On Off Power measurement in 5GNR Mode

- Power vs. Time and Transmit Power measurement in GSM/EDGE Mode
- Burst Power measurement in Spectrum Analyzer Mode

The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in " Mechanical Attenuator Transition Rules " on page 1962
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the Mech Atten control description

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code>
Example	<code>:POW:EATT:STAT ON</code> <code>:POW:EATT:STAT?</code>
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum Low Band frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily

aid in remote operation and are negligible for front panel use. See "[Using the Electronic Attenuator: Pros and Cons](#)" on page 1963 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See "[Attenuator Configurations and Auto/Man](#)" on page 1959

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "[Pre-Adjust for Min Clipping](#)" on page 1964.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</code>
Example	<code>:POW:RANG:OPT IMM</code>
Notes	Executing Adjust Atten for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE` is executed.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLY COMBined</code> <code>[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?</code>
Example	<code>:POW:RANG:OPT:TYPE EONL</code> <code>:POW:RANG:OPT:TYPE?</code>
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	<code>COMBined</code>
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under "**Adjust Atten for Min Clipping**" on page 1963 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "**Adjustment Algorithm**" on page 1965

Selection	SCPI	Note
Off	<code>OFF</code>	This is the default setting
On	<code>ON</code>	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to <code>COMBined</code>

Selection	SCPI	Note
Elec Atten Only	ELECTRICAL	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBINED	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF ON ELECTRICAL COMBINED [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?	
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?	
Notes	The parameter option ELECTRICAL sets this function to ON in Single-Attenuator models The parameter option COMBINED is mapped to ELECTRICAL in Single-Attenuator models. If you send COMBINED , it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBINED	
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1960 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 1964 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes	
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC	
State Saved	Saved in instrument state	
Range	Dual-Attenuator models: Off Elec Atten Only Mech + Elec Atten Single-Attenuator models: Off On	

Backwards Compatibility Command

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON OFF 1 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

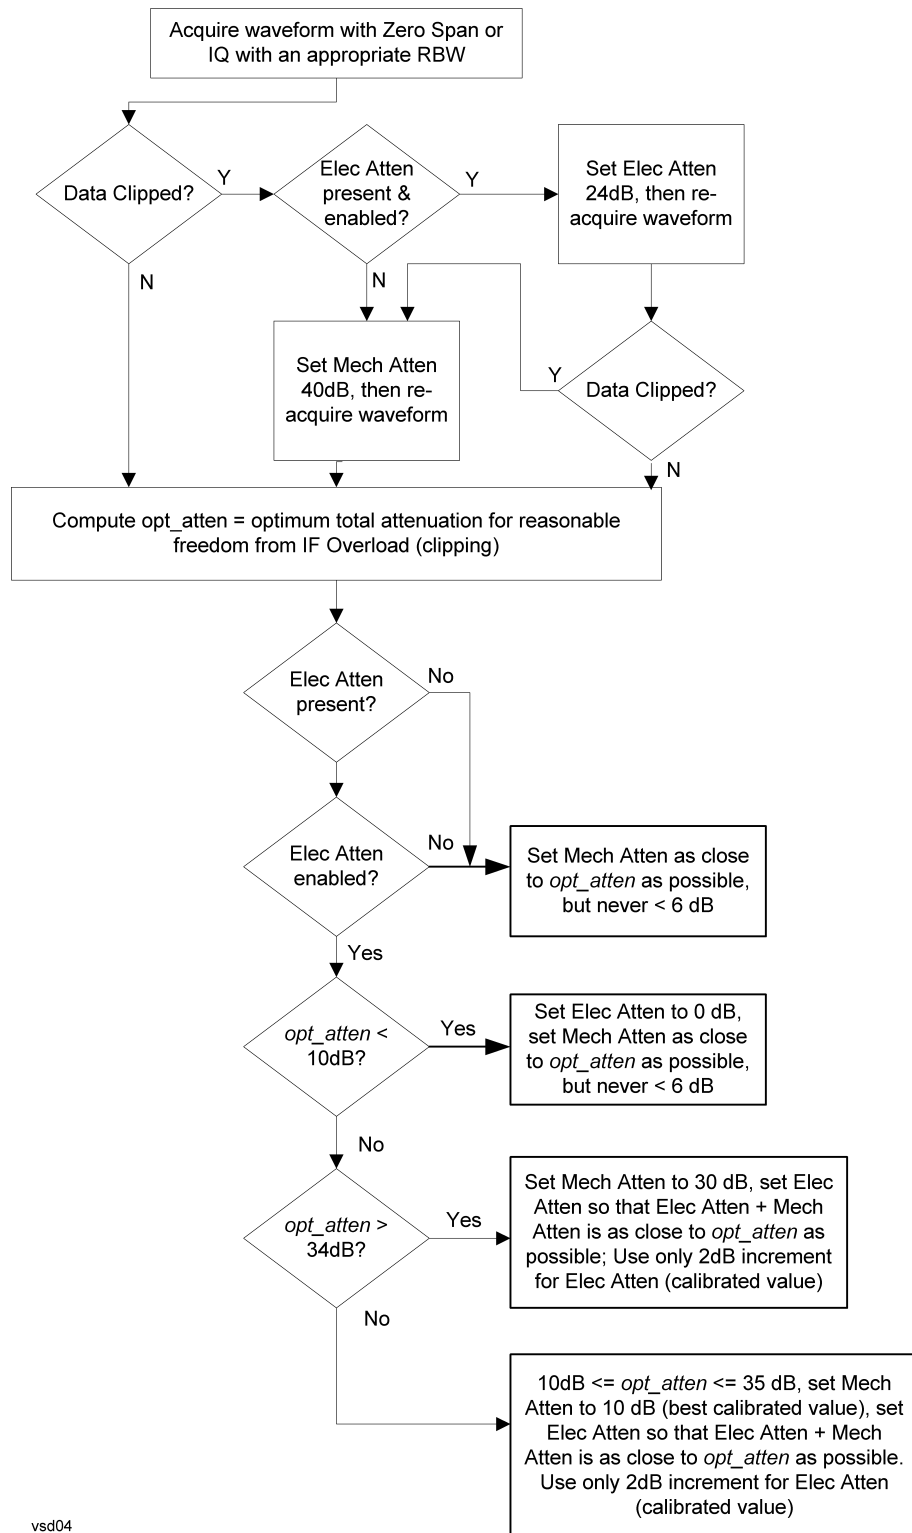

The algorithms for the adjustment are documented below:

Single-Attenuator Models

Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1963 or "Pre-Adjust for Min Clipping" on page 1964 selection is Mech + Elec Atten:

vsd04

"Pre-Adjust for Min Clipping" on page 1964 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	<code>[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?</code>
Example	<code>:POW:ATT:STEP 2</code> <code>:POW:ATT:STEP?</code>
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "[Max Mixer Lvl Rules](#)" on page 1969.

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real></code> <code>[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?</code>
Example	<code>:POW:MIX:RANG -15 dBm</code> <code>:POW:MIX:RANG?</code>
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Lets you optimize the Max Mixer Level setting for certain kinds of measurements.

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

NORMa1 The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression will be negligible

TOI Allows a range of settings of the "Max Mixer Level" on page 1969, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size

COMPression Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies

Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMa1	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	<code>[:SENSe]:POWer[:RF]:MIXer:RULEs NORMa1 TOI COMPression</code> <code>[:SENSe]:POWer[:RF]:MIXer:RULEs?</code>
Example	<code>:POW:MIX:RULE:COMP</code>
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	NORM

3.13.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and **MAN** is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	<code>[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF ON 0 1</code> <code>[:SENSe]:VOLTage:IQ:RANGe:AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:VOLT:IQ:RANG:AUTO OFF</code> <code>:VOLT:IQ:RANG:AUTO?</code>
Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto , both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: $Y_{Max} = \max(\text{abs}(\text{top}), \text{abs}(\text{bottom}))$ The I Range and Q Range are then set to Y_{Max}
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#"

This is an alternate form of the command to match the **POWer** form of the I Range and Q Range SCPI.

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

Remote Command	<code>[:SENSe] :POWer :IQ :RANGe :AUTO OFF ON 0 1</code> <code>[:SENSe] :POWer :IQ :RANGe :AUTO?</code>
Example	Put the I Range and Q Range in manual <code>:POW:IQ:RANG:AUTO OFF</code> <code>:POW:IQ:RANG:AUTO?</code>
Notes	<code>:POW:IQ:RANG:AUTO</code> is an alternate form of <code>:VOLT:IQ:RANG:AUTO</code> , to maintain consistency with I Range and Q Range, which support both the POWer and VOLTage forms of the command
Preset	ON
Range	Auto Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	<code>[:SENSe] :VOLTage :IQ [:I] :RANGe [:UPPer] <voltage></code> <code>[:SENSe] :VOLTage :IQ [:I] :RANGe [:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak <code>:VOLT:IQ:RANG 0.5 V</code> <code>:VOLT:IQ:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When "Q Same as I" on page 1974 is On, the I Range value will be copied to "Q Range" on page 1973 Changing the value also sets Range = Man
Preset	Complex SPECTrum Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50Ω) 0.25 V Peak (-2 dBm @ 50Ω) 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak This is an alternate form of the command to allow entry as a power.

Remote Command	<code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <amp1></code> <code>[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?</code>
Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω , and to 1.0 V Peak when Reference Z is 75 Ω <code>:POW:IQ:RANG 4 dBm</code> <code>:POW:IQ:RANG?</code>
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω : 10, 4, -2, -8 75 Ω : 8.2, 2.2, -3.8, -9.8 600 Ω : -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "**I Range**" on page 1972 determines both I and Q channel range settings.

Remote Command	<code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage></code> <code>[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?</code>
Example	Set the Q Range to 0.5 V Peak: <code>:VOLT:IQ:Q:RANG 0.5 V</code> <code>:VOLT:IQ:Q:RANG?</code>
Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, " I Range " on page 1972 determines both I and Q channel range settings
Couplings	When " Q Same as I " on page 1974 is On, the " I Range " on page 1972 value is copied to Q Range and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) 0.5 V Peak (4 dBm @ 50 Ω) 0.25 V Peak (-2 dBm @ 50 Ω) 0.125 V Peak (-

3 Spectrum Analyzer Mode
3.13 Phase and Amplitude vs Time Measurement

	8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	<p>The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#"</p> <p>The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples:</p> <p>"Rng: 1 V Peak" the Q Range is 1 V Peak</p> <p>"Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak</p> <p>This is an alternate form of the command to allow entry as a power.</p>
Remote Command	<pre>[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <amp;l> [:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?</pre>
Example	<p>Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω:</p> <pre>:POW:IQ:Q:RANG 4 dBm :POW:IQ:Q:RANG?</pre>
Notes	<p>The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command</p> <p>The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:</p> <p>50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9</p>
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote	<pre>[:SENSe]:VOLTage POWer:IQ:MIRRed OFF ON 0 1</pre>
--------	---

Command	<code>[:SENSe] :VOLTagE POWer : IQ : MIRRored ?</code>
Example	Turn off the mirroring of I Range to Q Range <code>:VOLT:IQ:MIRR OFF</code> <code>:POW:IQ:MIRR OFF</code>
Couplings	When ON , the "I Range" on page 1972 value is mirrored (copied) to the "Q Range" on page 1973
Preset	ON
State Saved	Saved in instrument state
Range	OFF ON

3.13.3.4 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No
-------------	----

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	<code>[:SENSe] : POWer [: RF] : RANGe <real></code> <code>[:SENSe] : POWer [: RF] : RANGe ?</code>
Example	<code>:POW:RANG 10 dBm</code> <code>:POW:RANG?</code>
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the Center Frequency The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	-/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	<code>[:SENSE]:POWER[:RF]:RANGE:OPTimize IMMEDIATE</code>
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

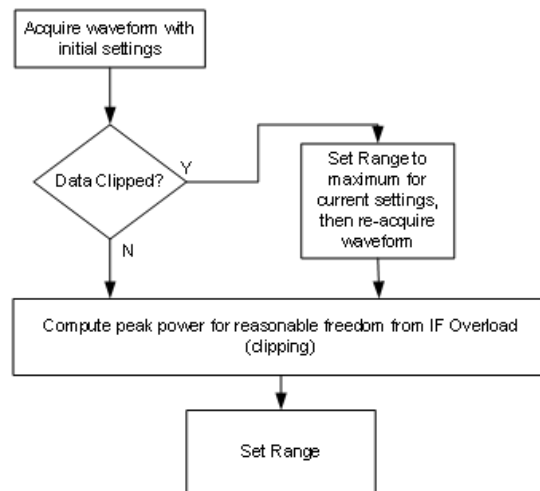

Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	<code>[:SENSE]:POWER[:RF]:RANGE:OPTimize:ATTenuation OFF ON ELECTRICAL COMBINED</code> <code>[:SENSE]:POWER[:RF]:RANGE:OPTimize:ATTenuation?</code>
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECTRICAL , COMBINED , and ON) are honored and all are mapped to ELECTRICAL , so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support Pre-Adjust for Min Clipping
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:

Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 1975 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:PARatio <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:PARatio?</code>	
Example	<code>:POW:RANG:PAR 12 dB</code>	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 1977. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	<code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real></code> <code>[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?</code>	
Example	<code>:POW:RANG:MIX:OFFS -5 dB</code>	
Preset	0 dB	

State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.13.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because ["Software Preselection" on page 1992](#) is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on ["Preselector Adjust" on page 1979](#) changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in ["Proper Preselector Operation" on page 1979](#).

Remote Command	<code>[:SENSe] :POWer [:RF] :PCENter</code>
Example	<code>:POW:PCEN</code>
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E

	<p>Grayed-out if the microwave preselector is off</p> <ul style="list-style-type: none">- If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken- Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz- Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0- Grayed-out in the Spectrogram View
Couplings	<p>The active marker position determines where the centering will be attempted</p> <p>If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed</p> <p>The offset applied to do the centering appears in "Preselector Adjust" on page 1979</p>
Status Bits/OPC dependencies	<p>When centering the preselector, *OPC does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to :READ or :MEASure queries</p> <p>The Measuring bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed</p>

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "[Presel Center](#)" on page 1978 is available.

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	<code>[:SENSe]:POWer[:RF]:PADJust <freq></code> <code>[:SENSe]:POWer[:RF]:PADJust?</code>
Example	<code>:POW:PADJ 100KHz</code> <code>:POW:PADJ?</code>
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	<ul style="list-style-type: none"> - Does not appear in CXA-m - Does not appear in VXT Models M9410A/11A/15A/16A - Does not appear in M9410E/11E/15E/16E - Grayed-out if microwave preselector is off - Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz - Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz - Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 - Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The Preselector Adjust value set by " Presel Center " on page 1978, or by manually adjusting Preselector Adjust Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	-/+500 MHz
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:MW:PADJust</code> <code>[:SENSe]:POWer[:RF]:MMW:PADJust</code> Backwards Compatibility Command
Notes	The command has no effect, and the query always returns MWAVE
Backwards Compatibility SCPI	<code>[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVE MMWave EXTERNAL</code> <code>[:SENSe]:POWer[:RF]:PADJust:PRESelector?</code>

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE

The maximum **Center Frequency for Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values ≤ 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while $40 \text{ MHz} < \text{IFBW} \leq 1 \text{ GHz}$ have a maximum of 3.3 GHz, and $1 \text{ GHz} < \text{IFBW} \leq 1.5 \text{ GHz}$ have a maximum of 3.5 GHz. IFBW values $> 1.5 \text{ GHz}$ do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command [:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL
 [:SENSe]:POWer[:RF]:GAIN:BAND?

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

Example	<code>:POW:GAIN:BAND LOW</code> <code>:POW:GAIN:BAND?</code>
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If <code>:POW:GAIN:BAND FULL</code> is sent when a low band preamp is available, the preamp band parameter is set to <code>LOW</code> instead of <code>FULL</code> , and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	<code>LOW</code>
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF ON 0 1</code> <code>[:SENSe]:POWer[:RF]:GAIN[:STATe]?</code>
Example	<code>:POW:GAIN OFF</code> <code>:POW:GAIN?</code>
Preset	<code>OFF</code>

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "**Internal Preamp**" on page 1981. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with "**Internal Preamp**" on page 1981, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "**More Information**" on page 1983

Remote Command	<code>[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF ON 0 1</code>
----------------	---

	<code>[:SENSe] :POWer [:RF] :GAIN :LNA [:STATe] ?</code>
Example	<code>:POW:GAIN:LNA ON</code>
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements LNA is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

```
Atten: 8 dB
Pre: Int on, LNA on
μW Path: LNP, On
Source: Off
```

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

```
Atten: 8 dB
Pre: Int off, LNA on
μW Path: LNP, On
Source: Off
```

μW Path Control

Options for this control include **μW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the μW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **μW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the μW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **μW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. μW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See " Low Noise Path Enable " on page 1988
μW Preselector Bypass	:POW:MW:PATH MPB	See " μW Preselector Bypass " on page 1990
Full Bypass Enable	:POW:MW:PATH FULL	See " Full Bypass Enable " on page 1990

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH STD LNPath MPBypass FULL</code> <code>[:SENSe]:POWer[:RF]:MW:PATH?</code>
Example	<code>:POW:MW:PATH LNP</code> Enables the Low Noise path <code>:POW:MW:PATH?</code>
Notes	When " Presel Center " on page 1978 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of μW Path Control The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable . In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as

	<p>though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled</p> <p>Alignment switching ignores the settings in this menu, and restores them when finished</p>

μW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **μW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	μW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	μW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypass
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass

Measurement	μ W Path Control Auto behavior
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto μ W path is standard For other cases, auto μ W path is presel bypass if presel bypass is enabled, auto μ W path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path
5G NR Mode	

Measurement	μ W Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	μ W Path Control Auto behavior
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	<code>[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON OFF 1 0</code> <code>[:SENSe]:POWer[:RF]:MW:PATH:AUTO?</code>
Example	<code>:POW:MW:PATH:AUTO ON</code> <code>:POW:MW:PATH:AUTO?</code>
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See " μW Path Control Auto " on page 1986 above
Preset	ON
Range	ON OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider

opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around -30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.

3 Spectrum Analyzer Mode

3.13 Phase and Amplitude vs Time Measurement

There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

μW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave preselector is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed

whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "**Y Scale**" on page 1951 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: <code>:POW:MW:PRES OFF</code>
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (<code>:POW:MW:PATH STD</code>) The OFF parameter sets path MPB (<code>:POW:MW:PATH MPB</code>)
Preset	ON
Backwards Compatibility SCPI	<code>[:SENSe] :POWer [:RF] :MW:PRESelector [:STATe] ON OFF 0 1</code> <code>[:SENSe] :POWer [:RF] :MW:PRESelector [:STATe] ?</code>

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is **OFF**, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

Type	ID	
	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection **ON** at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command `[:SENSe] :POWer [:RF] :SWPrese1 :STATe 0 | 1 | ON | OFF`

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

	<code>[:SENSe] :POWer [:RF] :SWPrese1 :STAT?</code>
Example	<code>:POW:SWPR:STAT 1</code> <code>:POW:SWPR:STAT?</code>
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects Sweep Time Auto Tune supports Software Preselection , so Auto Tune should be performed after setting the Software Preselection state
Preset	N9041B OFF N9042B+V3050A ON M9410A/11A ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by $2 * IF / N$. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- **NORMa1** - mathematically removes all image and multiple responses of signals present at the input
- **ADVanced** - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	<code>[:SENSe] :POWer [:RF] :SWPrese1 NORMa1 ADVanced</code> <code>[:SENSe] :POWer [:RF] :SWPrese1?</code>
Example	<code>:POW:SWPR NORM</code> <code>:POW:SWPR?</code>
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method

	Grayed-out when "Software Preselection" on page 1992 is OFF. The grayout message is "Unavailable unless SW Presel enabled"	
Preset	N9041B	ADVanced
	N9042B+V3050A	NORMa1
State Saved	Saved in instrument state	

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- **NORMa1** – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for **NARRow** (below)
- **NARRow** – a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	[:SENSe]:POWer[:RF]:SWPreSel:BW NORMa1 NARRow [:SENSe]:POWer[:RF]:SWPreSel:BW?	
Example	:POW:SWPR:BW NARR	
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1992 is OFF. The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when Software Preselection is enabled	
Preset	N9041B	NORMa1
	N9042B+V3050A	NARRow
State Saved	Saved in instrument state	

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	<code>[:SENSe]:<measurement>:PFILter[:STATe] ON OFF 1 0</code> <code>[:SENSe]:<measurement>:PFILter[:STATe]?</code>
Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode: <code>:SPEC:PFIL ON</code> Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes: <code>:WAV:PFIL ON</code> Enable High Freq Prefilter for the Swept SA Measurement in SA Mode: <code>:SAN:PFIL ON</code>
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See " Prefilter Presets " on page 1996 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

CEVM	LTEAFDD, LTEATDD	OFF

Meas	Mode	Preset
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.13.4 BW

For this measurement, bandwidth is determined by the algorithm, and is not user-adjustable.

3.13.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.13.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Display Type

Allows you to display Phase and Amplitude traces in absolute values, or values relative to the 1st sample point's phase and amplitude. The 1st sample point's phase and amplitude are different from the Relative Baseline values, which only reflect the segment averaged phase and amplitude values. Setting **Display Type** to **RELative** enables the phase and amplitude traces to start from 0 degree and 0 dB, so there is no need to adjust scale or reference between measurements.

Remote Command	<code>:DISPlay:PAVTime:TYPE ABSolute RELative</code> <code>:DISPlay:PAVTime:TYPE?</code>
Example	<code>:DISP:PAVT:TYPE REL</code> <code>:DISP:PAVT:TYPE?</code>
Preset	<code>ABSolute</code>
State Saved	Yes
Range	<code>ABSolute RELative</code>

3.13.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The PAVT measurement has one view: "Normal" on page 1998.

This is a multiple-window View. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Normal

Windows: "Graph" on page 1950, "Results" on page 1950

The PAVT measurement provides tabular result and graphical display.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:SElect <alphanumeric></code> <code>:DISPlay:VIEW:ADVanced:SElect?</code>
Example	Select Baseband as the current View <code>:DISP:VIEW:ADV:SEL "Baseband"</code>
Notes	<p>You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command</p> <p>For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <p>because "Trace Zoom" is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu</p> <p>You <i>cannot</i> use the legacy View parameter (which in this case would be <code>TZOOM</code>) with</p> <pre>:DISP:VIEW:ADV:SEL</pre> <p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:</p> <pre>:DISP:VIEW:ADV:SEL "Trace Zoom"</pre> <pre>:DISP:VIEW:ADV:SEL "TRACE ZOOM"</pre>

	<p>If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”</p> <p>If the display is disabled (via :DISP:ENAB OFF) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated</p>
Backwards Compatibility SCPI	<p>The legacy node :DISPlay:VIEW[:SElect] is retained for backwards compatibility, but it only supports predefined views</p>

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	:DISPlay:VIEW:ADVanced:NAME <alphanumeric>
Example	:DISP:VIEW:ADV:NAME “Baseband”
	Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<p><alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If <alphanumeric> name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated</p> <p>If the display is disabled (via :DISP:ENAB OFF) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated</p>

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	<code>:DISPlay:VIEW:ADVanced:REName <alphanumeric></code>
Example	<code>:DISP:VIEW:ADV:REN "Baseband"</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete</code>
Example	<code>:DISP:VIEW:ADV:DEL</code>
Notes	<p><code><alphanumeric></code> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case</p> <p>If the <code><alphanumeric></code> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated</p> <p>If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated</p>

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	<code>:DISPlay:VIEW:ADVanced:DElete:ALL</code>
----------------	--

Example	<code>:DISP:VIEW:ADV:DEL:ALL</code>
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SElect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:CAT?</code>
Notes	<p>Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for <i>all</i> the Views, including User Views, available for the current Measurement</p> <p>Example: <code>"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"</code></p> <p>No distinction is made between Predefined and User Views</p> <p>If you switch measurements with the display disabled (via <code>:DISP:ENAB OFF</code>), then query the list of available Views, the result is undefined</p>

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	<code>:DISPlay:VIEW:ADVanced:USER:CATalog?</code>
Example	<code>:DISP:VIEW:ADV:USER:CAT?</code>
Notes	<p>Returns a quoted string of the available User Views for the current measurement, separated by commas.</p> <p>Example: <code>"Baseband,myView1,yourView1"</code></p> <p>If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2004), then query the list of available Views, the result is undefined</p>

3.13.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	<code>:DISPlay:GRATicule[:STATe] OFF ON 0 1</code> <code>:DISPlay:GRATicule[:STATe]?</code>
Example	<code>:DISP:GRAT OFF</code>
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	<code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF ON 0 1</code> <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code> This command is accepted for backwards compatibility with older instruments, but the WINDow , TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	<code>:DISPlay:ANNotation:SCReen[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:SCReen[:STATe]?</code>
Example	<code>:DISP:ANN:SCR OFF</code>
Dependencies	Grayed-out and forced to OFF when System Display Settings, Annotation is OFF
Preset	ON This remains OFF through a Preset when System Display Settings, Annotation is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with

Remote Command	<code>:DISPlay:ANNotation:TRACe[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:TRACe[:STATe]?</code>
Example	<code>:DISP:ANN:TRAC OFF</code>
Preset	<code>OFF</code>
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	<code>:DISPlay:ACTivefunc[:STATe] ON OFF 1 0</code> <code>:DISPlay:ACTivefunc[:STATe]?</code>
Example	<code>:DISP:ACT OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	<code>:DISPlay:ANNotation:FREQuency[:STATe] ON OFF 1 0</code> <code>:DISPlay:ANNotation:FREQuency[:STATe]?</code>
Example	<code>:DISP:ANN:FREQ OFF</code>
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	<code>ON</code>

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	<code>:DISPlay:ANNotation:MBAR[:STATe] OFF ON 0 1</code> <code>:DISPlay:ANNotation:MBAR[:STATe]?</code>
Example	<code>:DISP:ANN:MBAR OFF</code>
Dependencies	Grayed out and forced to <code>OFF</code> when System Display Settings, Annotation is <code>OFF</code>
Preset	<code>ON</code> This remains <code>OFF</code> through a Preset when System Display Settings, Annotation is set to <code>OFF</code>
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither

***RST** nor **:SYSTem:PRESet** enable the display)

- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending **:SYSTem:DEFaults MISC** or **:DISPlay:ENABle ON** (neither ***RST** nor **:SYSTem:PRESet** enable the display)
- and you are using either the **:SYSTem:KLOCK** command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SElect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELeTe
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SElect
Delete Screen	:INSTrument:SCReen:DELeTe
Delete All But This Screen	:INSTrument:SCReen:DELeTe:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF ON 0 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON , but changing Backlight settings does <i>not</i> change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC , but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.13.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements – it does not change as you change measurements.

3.13.6.1 Settings

Contains controls that pertain to the frequency parameters of the measurement. These parameters control where the instrument is tuned, and implications to the measurement algorithm.

Center Frequency

This function sets (and queries) the **Center Frequency** for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set the value for a specific input.

Center Frequency is remembered as you go from input to input.

See:

- ["RF Center Freq" on page 2009](#)
- ["Ext Mix Center Freq" on page 2010](#)
- ["I/Q Center Freq" on page 2010](#)
- ["Center Frequency Presets" on page 2007](#)

Remote Command	<code>[:SENSe] :FREQuency :CENTer <freq></code>
	<code>[:SENSe] :FREQuency :CENTer?</code>
Example	<code>:FREQ:CENT 50 MHz</code> sets Center Frequency to 50 MHz <code>:FREQ:CENT UP</code> increments the Center Frequency by the value of CF Step <code>:FREQ:CENT?</code> returns the current value of Center Frequency

Notes	Preset and Max values are dependent on Hardware Options (5xx), port selections or other aspects of the particular instrument in use If no terminator (e.g., MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Couplings	For E7760A, if the Input Port selected is a mmWave port, and option RF4 is not present, the frequency of the instrument and source must be the same. Thus, changing this instrument frequency will also update the source frequency. If option RF4 is present, the frequency of the instrument and source are independent
Preset	Depends on instrument's maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2007 , "RF Center Freq" on page 2009, "Ext Mix Center Freq" on page 2010, and "I/Q Center Freq" on page 2010
State Saved	Saved in instrument state
Min	Depends on instrument's maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2007 , "RF Center Freq" on page 2009, "Ext Mix Center Freq" on page 2010, and "I/Q Center Freq" on page 2010
Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 2007 , "RF Center Freq" on page 2009, "Ext Mix Center Freq" on page 2010, and "I/Q Center Freq" on page 2010
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

Specifies the RF Center Frequency. This command sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:RF:CENTer <freq></code> <code>[:SENSe] :FREQuency:RF:CENTer?</code>
Example	<code>:FREQ:RF:CENT 30 MHz</code> <code>:FREQ:RF:CENT?</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on Span

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. This command sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency:EMIXer:CENTer <freq></code> <code>[:SENSe] :FREQuency:EMIXer:CENTer?</code>
Example	<code>:FREQ:EMIX:CENT 60 GHz</code> <code>:FREQ:EMIX:CENT?</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	Ext Mix Center Freq is not available in VXT Models M9410A/11A
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz. Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Specifies the I/Q Center Frequency. This command sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is

selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	<code>[:SENSe] :FREQuency :IQ :CENTer <freq></code> <code>[:SENSe] :FREQuency :IQ :CENTer?</code>
Example	<code>:FREQ:IQ:CENT 30 MHz</code>
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	I/Q Center Freq is not available in VXT Models M9410A/11A
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for "**Center Frequency**" on page 2006, and start/stop frequency functions. Once a step size has been selected and the Center Frequency function is active, the step keys (and the **UP** | **DOWN** parameters for Center Frequency from remote commands) change Center Frequency by the step-size value.

Remote Command	<code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement] <freq></code> <code>[:SENSe] :FREQuency :CENTer :STEP [:INCRement]?</code> <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO OFF ON 0 1</code> <code>[:SENSe] :FREQuency :CENTer :STEP :AUTO?</code>
Example	<code>:FREQ:CENT:STEP 500 MHz</code> <code>:FREQ:CENT UP</code> increases the current center frequency value by 500 MHz <code>:FREQ:CENT:STEP?</code> <code>:FREQ:CENT:STEP:AUTO ON</code> <code>:FREQ:CENT:STEP:AUTO?</code>
Notes	Preset and Max values are depending on Hardware Options (503, 507, 508, 513, 526)
Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning This control does not appear in 5G NR Mode
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Freq Offset

Enables you to set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a Mode Preset or set the frequency offset to 0 Hz.

See "[More Information](#)" on page 2012.

Remote Command	<code>[:SENSe] :FREQuency:OFFSet <freq></code> <code>[:SENSe] :FREQuency:OFFSet?</code>
Example	<code>:FREQ:OFFS 10 MHz</code> <code>:FREQ:OFFS?</code>
Notes	Preset and Max values are dependent on Hardware Options (503, 507, 508, 513, 526)
Preset	See " Center Frequency Presets " on page 2007
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an

offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE

If a trace is exported with a nonzero Freq Offset, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want Freq Offset to be 0, or the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.

3.13.7 Marker

There is no **Marker** functionality in the PAVT Measurement.

3.13.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.13.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Segments

Sets the number of measurement results. A Segment is comprised of a Measurement Offset, Measurement Interval, and Measurement Transient.

Remote Command	<code>[:SENSe]:PAVTime:SEGMENTS <integer></code> <code>[:SENSe]:PAVTime:SEGMENTS?</code>
Example	<code>:PAVT:SEGM 360</code> <code>:PAVT:SEGM?</code>
Preset	180
State Saved	Saved in instrument state
Min	1
Max	1000

Total Meas Time

Information only. Returns the result of (Meas Offset + Meas Interval + Meas Transient)*Segments.

Remote Command	<code>[:SENSe]:PAVTime:MTIMe?</code>
Example	<code>:PAVT:MTIM?</code>
State Saved	Saved in instrument state

Meas Interval

Sets the duration of acquisition window within the segment.

Remote Command	<code>[:SENSe]:PAVTime:SEGMENTS:INTERVAL <time></code> <code>[:SENSe]:PAVTime:SEGMENTS:INTERVAL?</code>
Example	<code>:PAVT:SEGM:INT 10 us</code> <code>:PAVT:SEGM:INT?</code>
Couplings	Meas Interval must be > 0 s and less than (Max Capture Length/Segments) - Meas Offset - Meas Transient
Preset	1 ms
State Saved	Saved in instrument state
Min	100 ns
Max	(Max Capture Length/Segments) - Meas Offset - Meas Transient

Meas Offset

Sets the offset prior to "[Meas Interval](#)" on page 2014 within the segment.

Remote Command	<code>[:SENSe]:PAVTime:SEGMENTS:OFFSet <time></code> <code>[:SENSe]:PAVTime:SEGMENTS:OFFSet?</code>
Example	<code>:PAVT:SEGM:OFFS 1 us</code> <code>:PAVT:SEGM:OFFS?</code>
Couplings	Meas Offset must be >= 0 s and less than (Max Capture Length/Segments) - Meas Interval - Meas Transient
Preset	0
State Saved	Saved in instrument state
Min	0
Max	(Max Capture Length/Segments) - Meas Interval - Meas Transient

Meas Transient

Sets the time between the end of the "Meas Interval" on page 2014 and the end of the segment.

Remote Command	<code>[:SENSe] :PAVTime :SEGMENTS :TRANSient <time></code> <code>[:SENSe] :PAVTime :SEGMENTS :TRANSient?</code>
Example	<code>:PAVT :SEGM :TRAN 1 us</code> <code>:PAVT :SEGM :TRAN?</code>
Couplings	Meas Transient must be ≥ 0 s and less than (Max Capture Length/Segments) - Meas Offset - Meas Interval
Preset	0
State Saved	Saved in instrument state
Min/Max	Min = 0 Max = (Max Capture Length/Segments) - Meas Offset - Meas Interval

Measure Frequency Error

Measures the frequency error of the input signal at the center frequency.

This is an "immediate action" function, that is, it executes once, when the control is pressed; the trigger is effectively Free Run, because the acquisition occurs immediately regardless of the instrument trigger setting.

Remote Command	<code>[:SENSe] :PAVTime :FERRor :IMMediate</code>
Example	<code>:PAVT :FERR :IMM</code>
Status Bits/OPC dependencies	Non-overlapped

Frequency Error

The offset of the input signal from the Center Frequency. The frequency error can be determined by the instrument using "Measure Frequency Error" on page 2015, or is can be supplied by the user.

Remote Command	<code>[:SENSe] :PAVTime :FERRor <freq></code> <code>[:SENSe] :PAVTime :FERRor?</code>
Example	<code>:PAVT :FERR 10 MHz</code> <code>:PAVT :FERR?</code>
Preset	0 Hz

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

State Saved	Saved in instrument state
Min	-100 MHz
Max	100 MHz
Status Bits/OPC dependencies	Non-overlapped

Frequency Error Measurement Time

Sets the acquisition time for "Measure Frequency Error" on page 2015.

Remote Command	<code>[:SENSe]:PAVTime:FERRor:TIME <time></code> <code>[:SENSe]:PAVTime:FERRor:TIME?</code>
Example	<code>:PAVT:FERR:TIME 1 us</code> <code>:PAVT:FERR:TIME?</code>
Preset	10 ms
State Saved	Saved in instrument state
Min/Max	100 ns/500 ms

Segment Frequency Error Correction

Sets the Segment Frequency Error Correction to On or Off. When **ON**, frequency error is calculated simultaneously with each sample point's IQ values. The phase results are compensated with this real time frequency error, as well as the **Frequency Error** entered by user or calculated by "Measure Frequency Error" on page 2015.

Remote Command	<code>[:SENSe]:PAVTime:FERRor:CORRection[:STATe] OFF ON 0 1</code> <code>[:SENSe]:PAVTime:FERRor:CORRection[:STATe]?</code>
Example	<code>:PAVT:FERR:CORR ON</code> <code>:PAVT:FERR:CORR?</code>
Preset	OFF
State Saved	Saved in instrument state

Sync Type (Models with Multiple Receivers only)

Sets the Sync Type when multiple receivers in one instrument need to sync at data acquisition. This setting is available when the instrument supports multiple receivers. Only one receiver can be set as Primary, and the others can only be set as Secondary.

Remote Command	<code>[:SENSe]:PAVTime:SYNC OFF PRIMary SEConDary</code> <code>[:SENSe]:PAVTime:SYNC?</code>
Example	<code>:PAVT:SYNC SEC</code> <code>:PAVT:SYNC?</code>
Notes	UXM: Only Transceiver A can be configured as Primary, and Transceiver B as Secondary. Otherwise, an error message is issued This control appears only in models with multiple receivers
Preset	<code>OFF</code>
State Saved	Yes
Range	<code>OFF Primary Secondary</code>

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "[Measurement-Specific Details](#)" on page 2018 below.

Remote Command	<code>:COUPlE ALL</code>
Example	<code>:COUP ALL</code>
Backwards Compatibility SCPI	<code>:COUPLE ALL NONE</code>
Backwards Compatibility Notes	<code>:COUP:NONE</code> puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is <i>not</i> recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

3 Spectrum Analyzer Mode

3.13 Phase and Amplitude vs Time Measurement

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple** *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency

- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	<code>:CONFigure:PAVTime</code>
Example	<code>:CONF:PAVT</code>
Couplings	Selecting Meas Preset restores all measurement parameters to their default values

3.13.8.2 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	<code>[:SENSe]:RADio:STANdard[:SElect] NONE JSTD IS95a IS97D IS98D GSM W3GPP C2000MC1 C20001X NADC PDC BLUEtooth TETRa WL802DOT11A WL802DOT11B WL802DOT11G HIPERLAN2 DVBTLSN DVBTGPN DVBTIPN FCC15 SDMBSE UWBINDOOR LTEB1M4 LTEB3M LTEB5M LTEB10M LTEB15M LTEB20M WL11N20M WL11N40M WL11AC20M WL11AC40M WL11AC80M WL11AC160M WL11AX20M WL11AX40M WL11AX80M WL11AX160M WL11BE20M WL11BE40M WL11BE80M WL11BE160M WL11BE320M WL11AD2G WL11AY2G16 WL11AY4G32 WL11AY6G48 WL11AY8G64 NR5GFR1B100M</code> <code>[:SENSe]:RADio:STANdard[:SElect]?</code>
Example	<code>:RAD:STAN NONE</code> <code>:RAD:STAN?</code>
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	<code>[:SENSe]:RADio:STANdard:DEVIce BTS MS</code> <code>[:SENSe]:RADio:STANdard:DEVIce?</code>
Example	<code>:RAD:STAN:DEV MS</code> <code>:RAD:STAN:DEV?</code>
Preset	<code>BTS</code>
State Saved	Saved in instrument state
Range	<code>BTS MS</code>

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP W-CDMA	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 1.4 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
	RBW	Auto rules
3GPP LTE 5 MHz	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
	Span	7.5 MHz
	RBW	Auto rules
3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.13 Phase and Amplitude vs Time Measurement

3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules

PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN?
		Query always returns IS97D
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	<code>[:SENSe]:RADio:STANdard:BAND:CLASs BC0 BC1</code> <code>[:SENSe]:RADio:STANdard:BAND:CLASs?</code>
Example	<code>:RAD:STAN:BAND:CLAS BC0</code> <code>:RAD:STAN:BAND:CLAS?</code>
Preset	<code>BC0</code>
State Saved	Saved in instrument state
Range	0 (800 MHz Band) 1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.13 Phase and Amplitude vs Time Measurement

WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11b	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11n 40 MHz	Command Example	:RAD:STAN WL11N40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
WLAN 802.11ac 20 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
WLAN 802.11ac 80 MHz	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz

3 Spectrum Analyzer Mode 3.13 Phase and Amplitude vs Time Measurement

WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules

3 Spectrum Analyzer Mode

3.13 Phase and Amplitude vs Time Measurement

WLAN 802.11be 80 MHz	Command Example	:RAD:STAN WL11BE80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 160 MHz	Command Example	:RAD:STAN WL11BE160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 320 MHz	Command Example	:RAD:STAN WL11BE320M
	IBW	320 MHz
	Span	480 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ad 2 GHz	Command Example	:RAD:STAN WL11AD2G
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 2.16 GHz	Command Example	:RAD:STAN WL11AY2G16
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 4.32 GHz	Command Example	:RAD:STAN WL11AY4G32
	IBW	4.32 GHz
	Span	6.48 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 6.48 GHz	Command Example	:RAD:STAN WL11AY6G48
	IBW	6.48 GHz
	Span	9.72 GHz
	RBW	1 MHz
	VBW	Auto rules

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

WLAN 802.11ay 8.64 GHz	Command Example	:RAD:STAN WL11AY8G64
	IBW	8.64 GHz
	Span	12.96 GHz
	RBW	1 MHz
	VBW	Auto rules
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
5G NR FR1 100MHz	IBW	100 MHz

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is **NONE**, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as **:CONF** allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to **NONE**.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to **NO**, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to **YES**, all measurements and standard selections are enabled, so you can select any combination.

NOTE

If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	<code>[:SENSe]:RADio:STANdard:EAMeas YES NO</code> <code>[:SENSe]:RADio:STANdard:EAMeas?</code>
Example	<code>:RAD:STAN:EAM YES</code> <code>:RAD:STAN:EAM?</code>
Preset	NO
State Saved	Saved in instrument state
Range	YES NO

3.13.8.3 Advanced

Contains controls for setting advanced functions of the instrument.

IF Gain

Sets the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	<pre>[:SENSe]:PAVTime:IF:GAIN[:STATe] ON OFF 1 0 [:SENSe]:PAVTime:IF:GAIN[:STATe]? [:SENSe]:PAVTime:IF:GAIN:AUTO[:STATe] ON OFF 1 0 [:SENSe]:PAVTime:IF:GAIN:AUTO[:STATe]?</pre>
Example	<pre>:PAVT:IF:GAIN ON :PAVT:IF:GAIN? :PAVT:IF:GAIN:AUTO ON :PAVT:IF:GAIN:AUTO?</pre>
Notes	<p>ON = high gain OFF = low gain</p>
Dependencies	<p>The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamp-lifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls</p> <p>This control is not available in VXT model M9421A, EXM, or UXM</p>
Preset	<p>OFF OFF</p>
State Saved	Saved in instrument state
Range	Low Gain High Gain

3.13.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "[Global Center Freq](#)" on page 2034) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to **ON**, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched **ON**, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is **ON**, modifies the **Global Center Freq**.

When **Global Center Freq** is switched **OFF**, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **ON**, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:FREQuency:CENTer ALL NONE
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE
Preset	OFF
Backwards Compatibility SCPI	:GLOBa1:FREQuency:CENTer[:STATe] 1 0 ON OFF :GLOBa1:FREQuency:CENTer[:STATe]?

Global EMC Std

When this control is switched **ON**, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is **ON** modifies the **Global EMC Std**.

When **Global EMC Std** is switched **OFF**, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is **ON**, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:EMC:STANdard ALL NONE</code> <code>:INSTrument:COUPle:EMC:STANdard?</code>
Example	<code>:INST:COUP:EMC:STAN ALL</code> <code>:INST:COUP:EMC:STAN?</code>
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Global Limit Lines (Freq and Amptd)

When this control is set to **ALL**, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global Settings**, while **Global Limit Lines** is **ALL**, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to **NONE**, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is **ALL**, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to **NONE** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	<code>:INSTrument:COUPle:LLINe ALL NONE</code> <code>:INSTrument:COUPle:LLINe?</code>
Example	<code>:INST:COUP:LLIN ALL NONE</code> <code>:INST:COUP:LLIN?</code>
Preset	Set to OFF on Global Settings , Restore Defaults and System, Restore Defaults, All Modes
Range	ALL NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned **ON**, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to **OFF** when "**Restore Defaults**" on page 2037 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:FREQuency:BAND:EXTend 0 1 ON OFF :INSTrument:COUPle:FREQuency:BAND:EXTend?
Example	:INST:COUP:FREQ:BAND:EXT 1 :INST:COUP:FREQ:BAND:EXT?
Preset	Set to OFF by Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	ON OFF

Restore Defaults

Resets all functions in the **Global** settings menu to **OFF**. Pressing **System, Restore Defaults, All Modes** has the same effect.

Remote Command	:INSTrument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.13.9 Sweep

Contains controls that allow you to control the sweep and measurement functions of the instrument.

3.13.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "**More Information**" on page 2038

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

Remote Command	<code>:INITiate:CONTinuous OFF ON 0 1</code> <code>:INITiate:CONTinuous?</code>
Example	Put instrument into Single measurement operation: <code>:INIT:CONT 0</code> <code>:INIT:CONT OFF</code> Put instrument into Continuous measurement operation: <code>:INIT:CONT 1</code> <code>:INIT:CONT ON</code>
Preset	ON Note that <code>:SYST:PRES</code> sets <code>:INIT:CONT</code> to ON , but <code>*RST</code> sets <code>:INIT:CONT</code> to OFF
State Saved	Saved in instrument state
Annunciation	The Single/Continuous icon in the Meas Bar changes depending on the setting: <ul style="list-style-type: none"> - A line with an arrow is Single - A loop with an arrow is Continuous
Backwards Compatibility Notes	X-Series A-models had Single and Cont hardkeys in place of the SweepSingleCont softkey. In the X-Series A-models, if in single measurement, the Cont hardkey (and <code>INIT:CONT ON</code>) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a Cont/Single toggle control instead of Single and Cont hardkeys, but it is still true that, if in single measurement, the Cont/Single toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the Average/Hold Num , the count stops incrementing, but the instrument keeps sweeping See the Trace key description under Trace Average for the averaging formula used both before and after the Average/Hold Num is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold
Single Mode	The instrument takes a single sweep when in Single mode, or if in average or Max/Min Hold, or if there is a Waterfall window displayed, it takes multiple sweeps until the average/hold count reaches the Average/Hold Num , then the count stops incrementing, and the instrument stops sweeping See the Trace key description under Trace Average for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the Trace key, with choices of Trace Average , Max Hold , or Min Hold

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until $k = N$, at which point the current sequence will stop and the instrument will go to the idle state

See "[Restart](#)" on page 2039 for details of `:INIT:IMMEDIATE`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "[More Information](#)" on page 2040

3 Spectrum Analyzer Mode
 3.13 Phase and Amplitude vs Time Measurement

Remote Command	:INITiate[:IMMEDIATE]
Example	:INIT:IMM :INIT:REST
Notes	:INIT:REST and :INIT:IMM perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The STATUS:OPERation register bits 0 through 8 are cleared , except bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The STATUS:QUESTionable register bit 9 (INTEGRity sum) is cleared The SWEEPING bit is set The MEASURING bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the Restart hardkey and the :INIT:REST command restarted trace averages (displayed average count reset to 1) for a trace in Clear Write, but did not restart Max Hold and Min Hold In X-Series, the Restart hardkey and the :INIT:REST command restart not only Trace Average, but MaxHold and MinHold traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC: AVER: TCON UP**.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k . This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K , shows the count for the sweep (data acquisition) in progress. $K = k + 1$, with a limit of N . The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** unpauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	<code>:INITiate:PAUSE</code> <code>:INITiate:RESume</code>
Example	<code>:INIT:PAUS</code> <code>:INIT:RES</code>
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	<code>:ABORt</code>
Example	<code>:ABOR</code>

Notes	<p>If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met</p> <p>If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met</p>
Dependencies	<p>For continuous measurement, :ABORT is equivalent to the Restart key</p> <p>Not all measurements support this command</p>
Status Bits/OPC dependencies	<p>The STATus:OPERation register bits 0 through 8 are cleared , <i>except</i> bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous</p> <p>The STATus:QUEStionable register bit 9 (INTEGRity sum) is cleared</p> <p>Since all the bits that feed into OPC are cleared by :ABORT, the Abort command will cause the *OPC query to return true</p>

3.13.10 Trace

Trace functionality is not supported in the Phase and Amplitude vs Time measurement.

4 System

The **System** hardkey and the “gear” icon both open the **System Settings** dialog, which allows you to access various configuration menus and dialogs. The line of tabs down the left side let you choose various pages for configuring your instrument.

Notes No remote command for this key specifically

4.1 System

Allows access to several general system functions, including three **Show** screens for viewing system parameters. Several such **Show** screens are available on this and other **System** menu pages. They can also be accessed with the SCPI command described here.

Remote Command	:SYSTem:SHOW OFF ERRor SYSTem HARDware LXI HWSTatistics ALIGNment SOFTware CAPPligation :SYSTem:SHOW?
Example	:SYST:SHOW SYST
Notes	Displays (or exits) the System information screens
Preset	OFF
State Saved	No
Range	OFF ERRor SYSTem HARDware LXI HWSTatistics ALIGNment SOFTware CAPPligation

4.1.1 Show System

This screen is divided into three groups: product descriptive information, options tied to the hardware, and software products. Swipe up and down on this screen to scroll the display.

System Settings	< System	Show System	? X
System	Keysight Technologies	Keysight UX A	Keysight UX A Signal Analyzer
I/O Config	Product Number	Serial Number	N9040B US00091133
User Interface	Instrument S/W Revision	Revision Date	A.15.00_P0053 11/17/2014 11:37:12 AM
Power On	Computer System	Computer Name	Windows 7 , Service Pack 1 A-N9040B-91133
Restore Defaults	IP Address	IPv6 Address	141.121.151.83 2002:8d79:9753::8d79:9753
Alignments	Link-Local IPv6 Address	Host ID	fe80::46e:1db5:7286:68ac%3 N9040B,US00091133
Licensing ...	mDNS Enabled	mDNS Host Name	Yes A-N9040B-91133
Security	mDNS Service Name	Keysight N9040B Signal Analyzer - US00091133	
Diagnostics	Option	Name / Description	
Service	N9040B-PC6	Intel(R) Core(TM) i7-3615QE CPU @ 2.30GHz, 16 GB	
	N9040B-SSD	INTEL SSDSC2BB080G4 ATA DEVICE	
	N9040B-W7X	Windows Embedded Standard 7, 64 bit OS	

Example `:SYST:SHOW SYST`

4.1.1.1 Show System contents (Remote Query Only)

Returns the contents of the **Show System** screen (the entire contents, not just the currently displayed page).

Remote Command `:SYSTem:CONFigure[:SYSTem]?`

Example `:SYST:CONF?`

Notes The output is an IEEE Block format of the **Show System** contents. Each line is separated by a new-line character

4.1.1.2 Computer System description (Remote Query Only)

Returns the **Computer System** description, which consists of the operating system and patch level, as reported by operating system.

Remote Command `:SYSTem:CSYStem?`

Example `:SYST:CSYS?`

Notes Returns the Computer System name and service pack level

4.1.2 Show Hardware

Displays details of the installed hardware. This information can be used to determine versions of hardware assemblies and field-programmable devices, in the advent of future upgrades or potential repair needs.

The screen is divided into two groups: product descriptive information and hardware information. The hardware information is listed in a table format.

Example `:SYST:SHOW HARD`

4.1.3 Show LXI

Displays the product number, serial number, firmware revision, computer name, IP address, Host ID, LXI Class, LXI Version, MAC Address, and the Auto-MDIX Capability.

Example `:SYST:SHOW LXI`

4.1.4 Show Support Subscriptions

Displays the software support subscription information for the licenses available on the instrument.

Shows the software license, description, software support expiration date (format is **YYYY.MMDD**), and the software support status. The **Software Version Date** (format is **YYYY.MMDD**) shown in the header indicates the date required to access the latest software enhancements included in this version of the software. If any license has a **Software Support Expiration Date** earlier than the **Software Version Date**, then enhancements may be available that the license does *not* enable.

System Settings	System		Support Subscriptions
System	Keysight PXA	Keysight PXA Signal Analyzer	
	Product Number	N9030A	
	Instrument S/W Revision	A.20.10	
	Software Version Date	2017.1221

Example `:SYST:SHOW SSINformation`

4.1.5 Show Support ID

Displays the Support ID for each license available in the instrument. Shows the **Software License**, **Description**, software support expiration date, and **Support ID** for that license.

Each license has a copy icon, which copies just the **Support ID** for that license to the Windows clipboard. This is useful to avoid typing mistakes when entering this value into another program or web site.

The **Copy all to clipboard ...** control copies all the data to the Windows clipboard, in comma-separated value (CSV) format.

System Settings	System	Support ID

Copy all to clipboard ...

Example `:SYST:SHOW SID`

4.1.6 Control Panel...

Opens the Windows Control Panel. **Control Panel** is used to configure certain elements of Windows that are not configured via the Multitouch UI System menus.

NOTE This feature is *not* available if Option SF1 is installed.

Control Panel is a separate Windows application, so to return to the Instrument Application, either:

- Exit by tapping on the red **X** in the upper right-hand corner
- Use **Alt+Tab**. Press and hold the **Alt** key and press and release the **Tab** key until the Instrument logo is showing in the window in the center of the screen, then release the **Alt** key

Notes No remote command for this key

4.1.7 Web Browser

Launches the instrument's default **Web Browser**. Usually, the default is Microsoft Edge. A mouse and external keyboard are highly desirable for using the browser. To return focus to the Instrument Application, close the browser (or use **Alt-Tab**).

NOTE

This feature is *not* available if Option SF1 is installed.

4.1.8 Application Controls

Lets you Minimize or Exit the application.

Pressing **Exit Program** displays a prompt asking if you are sure you want to close the program. If you select **OK**, the entire analyzer application will shut down, and you will lose any unsaved trace or measurement data.

Notes

No equivalent remote command for this key

4.1.9 Sounds

Lets you adjust the speaker volume using the slider, or mute/unmute the speaker, by tapping the **Speaker** icon.

Moving the slider up and down changes the speaker volume, and *also* unmutes the speaker if muted.

Icon when muted

4.2 I/O Config

Allows you to specify and change the I/O configuration for remote control. Controls in this menu allow configuration of the I/O ports used for SCPI remote control over GPIB and LAN.

The SCPI LAN parameters are set using controls in this menu, but configuration of LAN settings themselves is performed using the Windows Control Panel (DHCP, Gateway, Subnet Mask, etc.).

The USB port is also available for remote control, but requires no configuration.

4.2.1 GPIB

Allows you to configure the GPIB I/O port.

Dependencies	Not available in UXM
--------------	----------------------

4.2.1.1 GPIB Address

Select the GPIB remote address.

Remote Command	<code>:SYSTem:COMMunicate:GPIB[1][:SELF]:ADDRess <integer></code>
Example	<code>:SYST:COMM:GPIB:ADDR 17</code>
Notes	If the GPIB port address is changed, all further communication must use the <i>new</i> address
Preset	Unaffected by Preset , but set to 18 by Restore Defaults > "Misc" on page 2100
State Saved	No
Min	0
Max	30

4.2.1.2 GPIB Controller

Sets the GPIB port into Controller (**ON**) or Device (**OFF**) mode. In the normal state, **GPIB Controller** is disabled (**OFF**), which allows the instrument to be controlled by a remote computer. When **GPIB Controller** is enabled (**ON**), the instrument can run software applications that use the instrument's computer as a GPIB controller for devices connected to the GPIB port.

NOTE

When **GPIB Controller** is enabled, the analyzer application itself cannot be controlled over GPIB. In this case, it can be controlled via LAN or USB. The GPIB port cannot be a Controller and Device at the same time. Only one Controller can be active on the GPIB bus at any given time. If the instrument is the Controller, an external PC cannot also be a Controller.

To control the instrument from the software that is performing GPIB Controller operation, you can use an internal TCP/IP connection to the analyzer application. Use the following IP Address to send commands to the analyzer application:

`TCPIP0:localhost:inst0:INSTR`

Remote Command	<code>:SYSTem:COMMunicate:GPIB[1][:SELF]:CONTroller[:ENABLE] ON OFF 0 1</code> <code>:SYSTem:COMMunicate:GPIB[1][:SELF]:CONTroller[:ENABLE]?</code>
Example	Set GPIB port to Controller: <code>:SYST:COMM:GPIB:CONT ON</code> Set GPIB port to Device: <code>:SYST:COMM:GPIB:CONT OFF</code>
Notes	When the instrument becomes the Controller, Bit 0 in the Standard Event Status Register is set. When the instrument relinquishes Controller capability, bit 0 is cleared
Preset	Unaffected by Preset, but set to OFF (Disabled) by Restore Defaults > "Misc" on page 2100
State Saved	No
Range	Disabled Enabled

4.2.2 SCPI LAN

Displays a menu for identifying and changing SCPI over a LAN configuration. There are several ways to send SCPI remote commands to the instrument over LAN.

Having multiple users simultaneously accessing the instrument over the LAN may lead to communication problems. These controls can help to prevent that, by disabling the telnet, socket, and/or SICL capability.

NOTE

When multiple instances of the application are running, Telnet port 5023, socket port 5025, SICL server inst0 and HiSLIP server Device 0 will be assigned to the first instance; Telnet port 5123, socket port 5125, SICL server inst1 and HiSLIP server Device 1 will be assigned to the second instance; Telnet port 5223, socket port 5225, SICL server inst2 and HiSLIP server Device 2 will be assigned to the third instance; Telnet port 5323, socket port 5325, SICL server inst3 and HiSLIP server Device 3 will be assigned to the fourth instance.

- "SCPI Telnet" on page 2053
- "SCPI Socket" on page 2053
- "SICL Server" on page 2054
- "HiSLIP Server" on page 2055
- "Verbose SCPI On/Off" on page 2055
- "SCPI Socket Control Port (Remote Query Only)" on page 2057

4.2.2.1 SCPI Telnet

Turns SCPI LAN telnet capability On or Off, allowing you to limit SCPI access over LAN through telnet.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:TELNet:ENABle OFF ON 0 1</code> <code>:SYSTem:COMMunicate:LAN:SCPI:TELNet:ENABle?</code>
Example	<code>:SYST:COMM:LAN:SCPI:TELN:ENAB OFF</code>
Preset	Unaffected by Preset , but set to ON by Restore Defaults > "Misc" on page 2100 If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.2 SCPI Socket

Turns the capability to establish Socket LAN sessions **ON** or **OFF**, to limit SCPI access over LAN through socket sessions.

Connection String & Copy Button

In "SCPI LAN" on page 2052, the full SCPI connection string is displayed to the right of the **SCPI Socket ON/OFF** control. Pressing **Copy**, to the right of the string, copies the connection string to the Windows clipboard.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:SOCKet:ENABle OFF ON 0 1</code> <code>:SYSTem:COMMunicate:LAN:SCPI:SOCKet:ENABle?</code>
Example	<code>:SYST:COMM:LAN:SCPI:SOCK:ENAB OFF</code>
Dependencies	If the Secure Instrument Communications configuration has disabled this connection, local changes are not allowed, and an attempt to do so results in error -221, "Disabled by Secure Instrument Communications configuration"

Preset	Unaffected by Preset , but set to ON by Restore Defaults > "Misc" on page 2100 If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.3 SICL Server

Turns the **SICL Server** capability **ON** or **OFF**, to limit SCPI access over LAN through the SICL server. (SICL IEEE 488.2 protocol.)

Parameter	Description	Setting
Maximum Connections	The maximum number of connections that can be accessed simultaneously	5
Instrument Name	The name (same as the remote SICL address) of your instrument	inst0
Instrument Logical Unit	The unique integer assigned to your instrument when using SICL LAN	8
Emulated GPIB Name	The name (same as the remote SICL address) of the device used when communicating with your instrument	gpib7
Emulated GPIB Logical Unit	The unique integer assigned to your device when it is being controlled using SICL LAN	8
Emulated GPIB Address	The emulated GPIB address assigned to your transmitter tester when it is a SICL server (the same as your GPIB address)	18

Connection String & Copy Button

In "**SCPI LAN**" on page 2052, the full connection string is displayed to the right of the **SICL Server ON/OFF** control. Pressing **Copy**, to the right of the string copies the connection string to the Windows clipboard.

Remote Command	:SYSTem:COMMunicate:LAN:SCPI:SICL:ENABle OFF ON 0 1 :SYSTem:COMMunicate:LAN:SCPI:SICL:ENABle?
Example	:SYST:COMM:LAN:SCPI:SICL:ENAB OFF
Dependencies	Not available in UXM If the Secure Instrument Communications configuration has disabled this connection, local changes are not allowed, and an attempt to do so results in error -221, "Disabled by Secure Instrument Communications configuration"
Preset	Unaffected by Preset , but set to ON by Restore Defaults > "Misc" on page 2100 If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.4 HiSLIP Server

Turns the **HiSLIP Server** capability **ON** or **OFF**, to limit SCPI access over LAN through the HiSLIP server.

HiSLIP stands for High-Speed LAN Instrument Protocol, and is part of the IVI-6.1 specification.

Example of a VISA connection string used to connect to the HiSLIP Server on an X-Series Spectrum Analyzer:

`TCPIP0::a-n9030a-93016::hislip0::INSTR`

In the example above, **hislip0** is the HiSLIP device name that VISA users must include in HiSLIP VISA Address strings. Your HiSLIP device name may differ, depending on your VISA settings.

Connection String & Copy Button

In "**SCPI LAN**" on page 2052, the full connection string is displayed to the right of the **HiSLIP Server ON/OFF** control. Pressing **Copy**, to the right of the string copies the connection string to the Windows clipboard.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:HISLip:ENABle OFF ON 0 1</code>
Example	<code>:SYST:COMM:LAN:SCPI:HISL:ENAB OFF</code>
Preset	Unaffected by Preset , but set to ON by Restore Defaults > "Misc" on page 2100 If not set up or specified, the Secure Instrument Communications configuration setting: is ON
State Saved	No
Range	OFF ON

4.2.2.5 Verbose SCPI On/Off

When you turn **Verbose SCPI ON**, additional information is returned by `:SYSTem:ERRor?`. The additional information consists of the characters that stimulated the error. This can aid you in debugging your test programs, by indicating where in the parsing of a SCPI command the instrument encountered an invalid command or query.

Specifically, with **Verbose SCPI ON**, `:SYSTem:ERRor?` is expanded to show the SCPI data received, with the indicator `<Err>` at the point in the stream that the error occurred.

Verbose SCPI has no effect on the **Show Errors** screen or front-panel Message Line; and only changes the response to `:SYST:ERR?`.

See the example below, where the invalid command `:SENS:BOGUS` is sent:

Normal response to `:SYST:ERR?` (using the Telnet window):

```
SCPI> SENS:BOGUS
SCPI> SYST:ERR?
-113,"Undefined header"
```

After turning on **Verbose SCPI**:

```
SCPI> SYST:BOGUS
SCPI> SYST:ERR?
-113,"Undefined header;SYST:BOGUS<Err>"
```

Remote Command	<code>:SYSTem:ERRor:VERBose OFF ON 0 1</code> <code>:SYSTem:ERRor:VERBose?</code>
Example	<code>:SYST:ERR:VERB ON</code>
Preset	Unaffected by Preset , but set to OFF by Restore Defaults > "Misc" on page 2100
State Saved	No
Range	OFF ON

4.2.2.6 Device Clear on Disconnect

When using HiSLIP (High Speed LAN Instrument Protocol), Telnet, or Sockets, a communication session with the instrument is opened when you connect, and closed when you disconnect. This differs from other connections such as GPIB, USB and VXI-11 connections, which are never actually closed but stay open as long as the instrument is running.

When a session is closed, a Device Clear function is generated, which affects the entire instrument, not just the current connection. Thus, when using HiSLIP, Telnet, or Sockets, unexpected Device Clears may occur, which can disrupt measurements in ways that GPIB and VXI-11 "sessions" do not.

Device Clear on Disconnect enables these auto-generated Device Clears for Telnet, Socket, and HiSLIP sessions. For backwards compatibility, they are *not* generated unless you explicitly enable them.

There is no change in VXI-11, USB, or GPIB session behavior. These sessions do not close when you disconnect, have never generated Device Clear events, and still do not generate Device Clear events, regardless of the setting of this switch.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:EOSession:DCLear:ENABle 0 1 ON OFF</code> <code>:SYSTem:COMMunicate:LAN:SCPI:EOSession:DCLear:ENABle?</code>
Example	<code>:SYST:COMM:LAN:SCPI:EOS:DCL:ENAB ON</code>
Preset	Unaffected by Preset , but set to OFF by Restore Defaults > "Misc" on page 2100

State Saved	No
Range	OFF ON

4.2.2.7 SCPI Socket Control Port (Remote Query Only)

Returns the TCP/IP port number of the control socket associated with the SCPI socket session. This query lets you obtain the unique port number to open when a device clear is to be sent to the instrument. Every time a connection is made to the SCPI socket, the instrument creates a peer control socket. The port number for this socket is random. You must use this command to obtain the port number of the control socket. To force a device clear on this socket, open the port and send the string `DCL\n` to the instrument.

If this query is sent to a non-SCPI Socket interface, then 0 is returned.

Remote Command	<code>:SYSTem:COMMunicate:LAN:SCPI:SOCKet:CONTRol?</code>
Example	<code>:SYST:COMM:LAN:SCPI:SOCK:CONT?</code>
Preset	Unaffected by Preset or Restore Defaults > "Misc" on page 2100
State Saved	No
Range	0 to 65534
Min	0
Max	65534
Backwards Compatibility SCPI	<code>:SYSTem:COMMunicate:TCPIp:CONTRol?</code>

4.2.2.8 SCPI Instrument Port (Remote Query Only)

Some MIMO applications need to be able to determine the port to use to communicate with the instrument. This query returns the port number to use for communications.

Remote Command	<code>:SYSTem:COMMunicate:LAN:INSTrument:PORT?</code>
-------------------	---

4.2.3 Web Password Reset

The embedded web server contains certain capabilities that are password-protected; modifying the LAN configuration of the instrument, and access to web pages that can change the settings of the instrument. The default password from the factory is:

`measure4u`

This control lets you set the web password as desired, or to reset the password to the factory default.

Selecting **Web Password Reset** displays a control for resetting the password as desired, or to the factory default. The built-in alpha keyboard appears. You may change the password from the factory default of “**measure4u**”.

You can cancel this entry by pressing the **Cancel (ESC)** front-panel key.

Dependencies Not available in UXM

4.2.4 System IDN Response

Allows you to specify a response to ***IDN?**, return the instrument to the **FACTory** response if you have changed it, or, if your test software is expecting the ***IDN** response to indicate Agilent Technologies, configure the instrument to respond with Agilent as the manufacturer.

The current ***IDN** response is displayed at the top of the panel, followed by the **System IDN Response** and **User IDN** controls.

4.2.4.1 System IDN Response

To select the factory-set response, select **FACTory**. To specify your own response, select **USER**. You can enter your desired response using "**User IDN**" on page 2059.

If your test software expects the response to indicate Agilent Technologies as the Manufacturer, you can configure this response by selecting **AGILent**.

Remote Command	:SYSTem:IDN:CONFigure FACTory AGILent USER
	For option details, see " More Information " on page 2058 :SYSTem:IDN:CONFigure?
Example	:SYST:IDN:CONF FACT
Notes	Affects the response returned by all Modes of the instrument, unless the current Mode has <i>also</i> specified a custom response, in which case the current Mode's custom IDN response takes precedence over the System's, but only while that Mode is current Survives shutdown and restart of the software and therefore survives a power cycle
Preset	The *IDN response is reset to FACTory by Restore Defaults >"Misc" on page 2100 or Restore Defaults >"All" on page 2101 and survives subsequent running of the software

More Information

Here are details of the options available for the System ***IDN** response:

Factory

SCPI example: `:SYST:IDN:CONF FACT`

Selects the factory default configuration of ***IDN?**, which indicates the Manufacturer as Keysight Technologies. For example,

`"Keysight Technologies,N9040B,MY00012345,A.15.00"`

where the fields are Manufacturer, Model Number, Serial Number, Firmware Revision.

NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* factory System IDN response.

Agilent

SCPI example: `:SYST:IDN:CONF AGIL`

Starting with software version x.14.50, the ***IDN?** response in the Factory configuration indicates the Manufacturer as Keysight Technologies. If your test software is expecting the response to indicate Agilent Technologies, you can configure the response with this menu selection or SCPI command.

For example:

`"Agilent Technologies,N9020A,MY00012345,A.05.01"`

NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* Agilent System IDN response.

User

SCPI example: `:SYST:IDN:CONF USER`

Selects your customized configuration of ***IDN?**

Enter your desired response using **"User IDN"** on page 2059.

4.2.4.2 User IDN

Allows you to specify your own response to ***IDN?**. You may enter your desired response with the Alpha Editor or a plugin PC keyboard. Once the value is entered, select **USER** under **System IDN Response**.

When you select this control, the active function becomes the current User string and is highlighted, so typing replaces it. If instead you wish to edit the existing string, press the left or right arrow to go to the beginning or the end.

If you enter a null string (for example, by clearing the User String while editing and then pressing **Done**), the instrument automatically reverts to the **FACTory** setting.

NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* User System IDN response.

Remote Command	<code>:SYSTem:IDN <string></code> <code>:SYSTem:IDN?</code>
Notes	<p>The <code><string></code> must consist of four fields, each separated by a comma, example: <code>:SYST:IDN "XYZ Corp,Model 12,012345,A.01.01"</code></p> <p>The four fields are <code><manufacturer></code>, <code><model number></code>, <code><serial number></code>, <code><firmware revision></code>. The fields are comma-delimited, so text within a field cannot contain a comma</p> <p>This affects the response given in all Modes of the instrument, unless the current Mode has also specified a custom response, in which case the current Mode's custom IDN response takes precedence over the System's, but only while that Mode is current</p> <p>Survives shutdown and restart of the software and therefore survives a power cycle</p> <p>Null string as parameter restores the FACTory setting, example: <code>:SYST:IDN ""</code></p>
Preset	Unaffected by Preset , but set to the original FACTory setting by Restore Defaults > "Misc" on page 2100

4.2.4.3 SYSTem:PERSONa (Remote Commands Only)

The `:SYSTem:PERSONa` command set permits setting of individual fields of the `*IDN?` response.

- `"SYSTem:PERSONa:DEFault"` on page 2060
- `"SYSTem:PERSONa:MANUFACTurer"` on page 2061
- `"SYSTem:PERSONa:MANUFACTurer:DEFault"` on page 2061
- `"SYSTem:PERSONa:MODel"` on page 2061
- `"SYSTem:PERSONa:MODel:DEFault"` on page 2062

SYSTem:PERSONa:DEFault

Resets the `*IDN` response to the instrument default.

Remote Command	<code>:SYSTem:PERSONa:DEFault</code> <code>:SYSTem:PERSONa:DEFault?</code>
Notes	<code>:SYST:PERSON:DEF?</code> returns the default value of <code>*IDN?</code> even if the current setting of <code>*IDN?</code> is the

non-default value. The query return type is a `<string>`

`:SYST:PERS:DEF`

is equivalent to:

`:SYSTem:IDN ""`

`:SYSTem:IDN:CONF DEF`

SYSTem:PERSONa:MANufacturer

Sets the **MANufacturer** field of the `*IDN?` response. This is the first field of the `*IDN?` response.

Remote Command `:SYSTem:PERSONa:MANufacturer <string>`

`:SYSTem:PERSONa:MANufacturer?`

Notes

When setting the **MANufacturer** field, the current IDN response string is modified to replace the manufacturer field with the string specified by the command. If the resulting IDN response matches one of the predefined responses (`:SYST:IDN:CONF FACT | AGIL`), then the `:SYST:IDN:CONF` is set to the corresponding value. If the IDN response with the new manufacturer field is not one of the predefined values, then `:SYST:IDN:CONF` will be set to **USER** and `:SYST:IDN` will be set to the new IDN response string

The query returns the current value of the `*IDN?` Manufacturer field

SYSTem:PERSONa:MANufacturer:DEFAULT

Resets the **MANufacturer** field of the `*IDN?` response to the default value.

Remote Command `:SYSTem:PERSONa:MANufacturer:DEFAULT`

`:SYSTem:PERSONa:MANufacturer:DEFAULT?`

Notes

The query returns the default **MANufacturer** field value of `*IDN?` even if the current setting of `*IDN?` is the non-default value. The return type is a `<string>`

SYSTem:PERSONa:MODEL

Sets the **MODEL** field of the `*IDN?` response. This is the second field of the `*IDN?` response.

Remote Command `:SYSTem:PERSONa:MODEL <string>`

`:SYSTem:PERSONa:MODEL?`

Notes

When setting the **MODEL** field, the current IDN response string is modified to replace the model field with the string specified by the command. If the resulting IDN response matches one of the predefined responses (`:SYST:IDN:CONF FACT | AGIL`), then `:SYST:IDN:CONF` is set to the corresponding value. If the IDN response with the new model field is not one of the predefined values, then `:SYST:IDN:CONF` will be set to **USER** and `:SYST:IDN` will be set to the new IDN response string

The query returns the current value of the `*IDN?MODE1` field

SYSTem:PERSONa:MODEl:DEFault

Resets the `MODE1` field of the `*IDN?` response to the default value.

Remote Command	<code>:SYSTem:PERSONa:MODEl:DEFault</code> <code>:SYSTem:PERSONa:MODEl:DEFault?</code>
Notes	The query returns the default <code>MODE1</code> field value of <code>*IDN?</code> even if the current setting of <code>*IDN?</code> is the non-default value. The return type is a <code><string></code>

4.2.5 LXI

Accesses various `LXI` configuration properties.

Dependencies	Not available in UXM
--------------	----------------------

4.2.5.1 LAN Reset

Resets the LAN connection. This sets parameters as follows, and restarts the LAN operation:

DHCP	Enabled
Automatic IP Address	Enabled
ICMP Ping Responder	Enabled
Web Password	<code>keysight</code>
Dynamic DNS	Enabled
mDNS and DNS-SD	Enabled
Dynamic Link Local Addressing	Enabled
Auto Negotiation	Enabled

There is no SCPI command for this function.

4.2.5.2 Device Identification (Remote Command Only)

Enabling LXI device identification places the LXI Status Indicator in the **Identify** state. Disabling LXI device identification places the LXI Status Indicator in the **No Fault** state. The LXI Status indicator is in the upper left region of the instrument's graphical user interface.

Remote Command	<code>:LXI:IDENTify[:STATe] OFF ON 0 1</code>
----------------	---

	<code>:LXI:IDENTify[:STATe]?</code>
Example	<code>:LXI:IDEN ON</code>
Preset	Not part of Preset , but reset to OFF by Restore Defaults > "All" on page 2101
State Saved	No
Range	OFF ON

4.2.6 Restore I/O Config Defaults

Causes the group of settings associated with the **I/O Config** menu to be reset to their default values. This also happens on **Restore Misc Defaults**, which has a SCPI command.

When **Restore I/O Config Defaults** is selected, a message appears saying:

`This will reset all of the I/O Config variables to their default state, including the GPIB address and SCPI LAN settings`

`It will not affect Alignment data or settings`

`This action cannot be undone. Do you want to proceed?`

The message provides **OK** and **Cancel** buttons so you can affirm or cancel the operation.

4.2.7 Query USB Connection (Remote Query Only)

Enables you to determine the speed of the USB connection.

Remote Command	<code>:SYSTem:COMMunicate:USB:CONNectioN?</code>	
Example	<code>:SYST:COMM:USB:CONN?</code>	
Notes	NONE	Indicates no USB connection has been made
	LSpeed	Indicates a USB low speed connection (1.5 Mbps) Note that this is reserved for future use, the T+M488 protocol is not supported on low-speed connections
	HSPeed	Indicates that a USB high speed connection (480 Mbps) has been negotiated
	FSPeed	Indicates that a USB full speed connection (12 Mbps) has been negotiated
State Saved	No	
Range	NONE LSpeed HSPeed FSPeed	

4.2.8 USB Connection Status (Remote Query Only)

Lets you determine the current status of the USB connection.

Remote Command	<code>:SYSTem:COMMunicate:USB:STATus?</code>
Example	<code>:SYST:COMM:USB:STAT?</code>
Notes	<p>SUSPended – Indicates that the USB bus is currently in its suspended state. The bus is in the suspended state when:</p> <ul style="list-style-type: none"> – The bus is not connected to any controller – The controller is currently powered off – The controller has explicitly placed the USB device into the suspended state <p>When in the suspended state, no USB activity, including start of frame packets are received</p> <p>ACTive – Indicates that the USB device is in the active state. When the device is in the active state, it receives periodic frame starts, but is not necessarily receiving or transmitting data</p>
State Saved	No
Range	<code>SUSPended ACTive</code>

4.2.9 USB Packet Count (Remote Query Only)

Lets you determine the number of packets received and transmitted on the USB bus.

Remote Command	<code>:SYSTem:COMMunicate:USB:PACKets?</code>
Example	<code>:SYST:COMM:USB:PACK?</code>
Notes	<p>Two integers are returned:</p> <ol style="list-style-type: none"> 1. The number of packets received since application invocation 2. The number of packets transmitted since application invocation <p>If no packets have been received or transmitted, the response is <code>0,0</code></p> <p>The packet count is initialized to <code>0,0</code> when the instrument application is started</p>
State Saved	No

4.2.10 Lock Remote I/O Session (Remote Command only)

An instrument can support multiple remote I/O sessions at the same time. However, you cannot *simultaneously* send remote commands from multiple sessions to the same instrument. The results in such a case are undefined.

Ensure that only *one* session actively controls the instrument at a time. Other sessions must wait until the active session finishes the instrument control.

To help achieve this cooperative instrument sharing, the following remote commands are provided:

- "Lock Remote I/O Request (Remote Query only)" on page 2066
- "Unlock Remote I/O Session (Remote Command only)" on page 2067
- "Remote I/O Session Lock Name (Remote Query only)" on page 2068
- "Remote I/O Session Lock Owner (Remote Query only)" on page 2068

Example Procedure for Lock Usage

Step	Action
1	Each session tries to obtain a lock by sending <code>:SYSTem:LOCK:REQuest?</code> This query can be sent simultaneously from multiple sessions
2	Only one session will be granted. The granted session receives <code>1</code> in response to its query
3	The granted session actively controls the instrument Meanwhile, other sessions must wait, and must periodically send <code>:SYSTem:LOCK:REQuest?</code> , requesting the lock
4	When the active session finishes its task, it releases the lock by sending <code>:SYSTem:LOCK:RELease</code>
5	Now the lock has become available, so when one of the waiting sessions sends <code>:SYSTem:LOCK:REQuest?</code> , it receives <code>1</code> in response, granting the lock to that session

By repeating steps 3, 4, and 5 above, multiple sessions can share the same instrument in a cooperative fashion.

NOTE

A session can query its own unique session name by sending `:SYSTem:LOCK:NAME?`. This session name is determined by the instrument.

A session also can query the name of the currently granted session by sending `:SYSTem:LOCK:OWNer?`.

NOTE

Remote I/O interfaces are grouped in two types: single-session interface and multi-session interface. Both types of interfaces can be used for cooperative instrument sharing.

The recommended interface is LAN HiSLIP.

Interface	Single-session	Multi-Session
GPIB	ü	
USB-488	ü	
LAN VXI-11 (SICL)	ü	
LAN Socket		ü
LAN HiSLIP		ü
LAN Telnet		ü

If using a single-session interface, care must be taken to ensure only one client uses the single-session interface.

In particular, LAN VXI-11 (SICL) interface is a single-session interface, even though multiple clients could simultaneously connect to this interface. Such multiple VXI-11 clients share the same session context; the same status registers and the same error queue. Even a SCPI query response can be received by another client. Furthermore, the lock obtained by `:SYSTem:LOCK:REQuest?` is shared among all VXI-11 clients, allowing all of them to actively control the instrument.

If a LAN VXI-11 (SICL) interface must be used by multiple clients for a cooperative instrument sharing, then VISA locking *must* be used, *in addition to* Remote I/O Session Lock.

4.2.10.1 Lock Remote I/O Request (Remote Query only)

You can lock the SCPI control of the instrument to the I/O Interface and Session by sending `:SYSTem:LOCK:REQuest?`. This permits cooperative sharing of the instrument between multiple computers, or multiple sessions from the same computer.

Remote Command	<code>:SYSTem:LOCK:REQuest?</code>
Example	<code>:SYST:LOCK:REQ?</code>
Notes	Returns 1 if the lock request is granted, or 0 if the request is denied Lock requests on an individual interface and session can be nested and each request will increase an internal lock count by 1. For every granted request, send <code>:SYST:LOCK:REL</code> to decrement the internal lock count to fully relinquish the lock When the instrument is locked, Bit 0 is set in the Operation Instrument status register

Disconnecting the individual interface and session releases the lock if the lock is granted to the interface and session

A Device Clear over any interface and session releases the lock, regardless of the interface and session which obtained the lock

The following queries are permitted over any interface and session, even if an interface has the instrument locked:

- *IDN?
- *OPT?
- *STB?
- *ESR?
- :SYSTem:DATE?
- :SYSTem:TIME?
- :SYSTem:PON:TIME?
- Queries in the :STATus subsystem
- Queries in the :SYSTem:ERRor subsystem
- Queries in the :SYSTem:LKEY subsystem
- Queries in the :SYSTem:LOCK subsystem
- Queries in the :SYSTem:METRics subsystem
- Queries in the :SYSTem:MODuLe subsystem

All other commands and queries result in error: -203, "Command protected; Instrument locked by another I/O session"

State Saved	Not part of Save/Recall
-------------	-------------------------

4.2.10.2 Unlock Remote I/O Session (Remote Command only)

You can unlock the SCPI control of the current I/O Interface and Session by sending **:SYSTem:LOCK:RELease**. Lock requests on an individual interface and session can be nested, and each request increases an internal lock count by 1. For every granted request, you will need to perform a release. The lock is not relinquished until the internal lock count reaches 0.

Remote Command	:SYSTem:LOCK:RELease
----------------	-----------------------------

Example	:SYST:LOCK:REL
---------	-----------------------

Notes	When the instrument is unlocked, Bit 0 is cleared in the Operation Instrument status register
-------	---

4.2.10.3 Remote I/O Session Lock Name (Remote Query only)

Use this query to obtain the name of the current I/O Interface and Session.

Remote Command	:SYSTem:LOCK:NAME?
Example	:SYST:LOCK:NAME?
Notes	<p>The information returned is a string of the format: <code><I/O Interface>[/<IP address>/<Session ID>]</code></p> <p>Where IP address and Session ID are only provided for interfaces that provide multiple sessions</p> <p>Single Session interfaces (GPIB, USB-488, and LAN VXI-11) only list interface name</p> <p>Session ID is an internally generated identifier. It is not guaranteed to be consistent across instrument software versions (the identifier is subject to change when the software of the instrument is updated). The absolute value of Session ID is not significant, but the identifier will be consistent for a given software version, and can be relied upon for lock owner logic comparisons</p>

4.2.10.4 Remote I/O Session Lock Owner (Remote Query only)

Use this query to determine which I/O Interface and Session has the SCPI locked.

If no interface and session has the SCPI locked, then the return value is **NONE**.

Remote Command	:SYSTem:LOCK:OWNer?
Example	:SYST:LOCK:OWN?
Notes	<p>The information returned is a string of the format: <code><I/O Interface>[/<IP address>/<Session ID>]</code></p> <p>Where IP address and Session ID are only provided for interfaces that provide multiple sessions</p> <p>Single Session interfaces (GPIB, USB-488, and LAN VXI-11) only list interface name</p> <p>Session ID is an internally generated identifier. It is not guaranteed to be consistent across instrument software versions (the identifier is subject to change when the software of the instrument is updated). The absolute value of Session ID is not significant, but the identifier will be consistent for a given software version, and can be relied upon for lock owner logic comparisons</p> <p>If no interface and session has the SCPI locked, then the return value is NONE</p>

4.2.11 Multiple Network Interface Card Configuration (Remote Commands Only)

Systems that have multiple Network Interface Cards (NICs) require additional configuration information. The following keys can be added to the XApps configuration file:

- **PrimaryNICIPv4** – IP address value is a string with the exact IP V4 format. Required field in IP v4 networks.
- **PrimaryNICIPv6** – IP address value is a string with the exact IP V6 format. Required field in IP v6 networks.

These commands do not apply to instruments that have only one NIC. The commands apply to all modular deployments that have a controller with multiple NICs.

To configure and query these configuration options, the following remote commands are provided:

- "Multiple Network Adapters Enabled (Remote Query Only)" on page 2069
- "Config IPV4 Address (Remote Command Only)" on page 2070
- "Config IPV6 Address (Remote Command Only)" on page 2070
- "List All Physical Network Adapter IP Addresses (Remote Query Only)" on page 2070

4.2.11.1 Multiple Network Adapters Enabled (Remote Query Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:MULTiple:NIC:ENABled?</code>
Example	<code>:SYSTem:COMMunicate:LAN:MULTiple:NIC:ENABled?</code>
Notes	Applies to Instruments that have multiple Network Adapters. When more than one network adapter is present in the system, and they are Enabled (that is, they have a valid IP Address), this query returns: <ul style="list-style-type: none"> - 1, if more than one NIC enabled - 0, if only one or No NICs are enabled
State Saved	No

4.2.11.2 Config IPV4 Address (Remote Command Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:IPV4:CONFig <ipaddress></code> <code>:SYSTem:COMMunicate:LAN:IPV4:CONFig?</code>
Example	<code>:SYSTem:COMMunicate:LAN:IPV4:CONFig "192.168.1.146"</code> <code>:SYSTem:COMMunicate:LAN:IPV4:CONFig?</code>
Notes	<p>Applies to instruments that have multiple Network Adapters. When more than one network adapter is present in the system, you must specify in the instrument config file the IP address to use to enable Remoting channel bindings. If this is not provided, Remoting connections are likely to fail on systems where multiple NICs are enabled</p> <p>Sets the valid IPV4 address, passed in as string in the config file</p> <p>The query returns IPV4 address, as a string</p> <p>If config file is missing, "" (empty string) is returned</p> <p>Changing the IPV4 value requires a restart of the instrument software, to ensure that servers use the configured IP address</p>
State Saved	No

4.2.11.3 Config IPV6 Address (Remote Command Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:IPV6:CONFig <ipaddress></code> <code>:SYSTem:COMMunicate:LAN:IPV6:CONFig?</code>
Example	<code>:SYSTem:COMMunicate:LAN:IPV6:CONFig "2001:0db8:85a3:0000:0000:8a2e:0370:7334"</code> <code>:SYSTem:COMMunicate:LAN:IPV6:CONFig?</code>
Notes	<p>Applies to instruments that have multiple Network Adapters. When more than one network adapter is present in the system, you must specify in the instrument config file the IP address to use to enable Remoting channel bindings. If this is not provided, Remoting connections are likely to fail on systems where multiple NICs are enabled</p> <p>Sets the valid IPV6 address, passed in as string in the config file</p> <p>The query returns IPV6 address, as a string</p> <p>If config file is missing, "" (empty string) is returned</p> <p>Changing the IPV6 value requires a restart of the instrument software, to ensure servers use the configured IP address</p>
State Saved	No

4.2.11.4 List All Physical Network Adapter IP Addresses (Remote Query Only)

Remote Command	<code>:SYSTem:COMMunicate:LAN:PHYSical:IPADdress:LIST?</code>
Example	<code>:SYSTem:COMMunicate:LAN:PHYSical:IPADdress:LIST?</code>

4 System
4.2 I/O Config

: "192.168.1.146, 2001:0db8:85a3:0000:0000:8a2e:0370:7334"

Notes Returns the IP Addresses of the physical network adapters found in the PC/Instrument

State Saved No

4.3 Preload / Unload Modes

The X-Series platform supports many Modes. Each Mode that is loaded uses a portion of the total available memory. At some point, this may result in insufficient free memory. This can occur during a measurement, or when loading a new Mode. A limited number of Modes can be loaded without impacting performance.

Preload / Unload Modes allows you to select and enable Modes to be preloaded at startup, and to specify the default **Power-On Mode**.

The dialog includes the following controls:

- "Power-On Mode" on page 2072
- "Table of Modes" on page 2073
- "Preload: Select All, Preload: Deselect All" on page 2073
- "Move Up, Move Down" on page 2073
- "Unload" on page 2073

Modes that are not preloaded may be loaded at runtime as needed, resources permitting. However, note that loading more Modes increases memory consumption and may adversely impact performance.

When a memory-full situation occurs, the instrument notifies you with the following message:

Out of memory; Insufficient resources. Please save state if needed. You have following options:

1. Open System Settings > Configure Preload Modes to unload unused Modes
2. Reconfigure preloaded Modes on the above dialog, close and restart the analyzer SW
3. Close and restart the analyzer SW

Option 1 allows you to unload unused Modes and continue running the software, without having to restart it.

The command `:INSTRument:UNLoad <mode>` provides equivalent functionality; see "Unload" on page 2073.

4.3.1 Power-On Mode

Displays a list of licensed Modes. Use this control to change the factory default Power-On Mode. The instrument will execute the selected Mode after power up. Selecting the Power-On Mode here automatically enables that Mode for preloading.

4.3.2 Table of Modes

The table of Modes becomes scrollable when the number of Modes exceeds the dialog's displayable size.

Use the check boxes in the **Preload** column to enable or disable the preloading of the Modes that you want.

Use the check boxes in the **Unload** column to select the Modes that you want to unload.

The Unload check boxes are grayed-out when the Modes are used by other Modes.

Example:

5G NR & V2X Mode cannot be loaded when either Sequence Analyzer Mode or Power Amplifier Mode are already loaded, because these Modes use 5G NR & V2X Mode. To unload 5G NR & V2X Mode, both Sequence Analyzer Mode and Power Amplifier Mode must be unloaded first.

When the active Mode is unloaded, the screen becomes blank except for the message; **"No Mode is active"**. You can then select another desired Mode.

When multiple screens are open, and a Mode is unloaded, inactive screens that have that Mode as their active Modes are closed.

The active screen is never closed.

4.3.3 Preload: Select All, Preload: Deselect All

Toggles the **Preload** checkbox state for all Applications listed, except for the Power-On Application, which is always selected.

4.3.4 Move Up, Move Down

The default order in which Applications are listed in the table is the order in which they are displayed in the **Mode/Measurement/View** Selector dialog. To change the order in this list, select the desired Application row from the table, then click **Move Up** or **Move Down** to move it to the desired position.

4.3.5 Unload

Unloads the specified Mode.

Remote `:INSTRument:UNLoad <mode>`

Command	
Example	<code>:INST:UNL NR5G</code>
Notes	<p>Error message if the specified Mode is not available, -224,"Illegal parameter value;<mode> is not a valid choice"</p> <p>Error message if the specified Mode is not loaded and therefore cannot be unloaded, -221,"Settings conflict;<mode> is not loaded"</p> <p>Error message if the specified Mode is used by other Modes and therefore cannot be unloaded, -221,"Settings conflict;<mode> is used by <other modes>"</p> <p>Error message if the specified Mode does not support Unload Mode feature and therefore cannot be unloaded, -221,"Settings conflict;Feature not supported for this Mode"</p>

4.3.6 Loaded Modes (Remote Query Only)

Returns a list of loaded Modes.

Remote Command	<code>:SYSTem:APPLication:LOADed?</code>
Example	<code>:SYST:APPL:LOAD?</code>
Preset	Not affected by Preset

4.3.7 User Interface

Configures functions specific to the User Interface, such as the menu panel orientation and the display color theme.

4.3.7.1 Menu Panel Position

Allows the Menu Panel to be positioned on the **RIGHT** or **LEFT** side of the display.

Remote Command	<code>:SYSTem:DISPlay:MPPosition RIGHT LEFT</code> <code>:SYSTem:DISPlay:MPPosition?</code>
Example	<code>:SYST:DISP:MPP LEFT</code>
Preset	This is unaffected by Preset but is set to RIGHT by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.2 Menu Panel Tabs

Allows the **Menu Panel Tabs** to be positioned on the **RIGHT** or **LEFT** side of the menu panel.

Remote Command	:SYSTem:DISPlay:MPTab RIGHT LEFT :SYSTem:DISPlay:MPTab?
Example	:SYST:DISP:MPT LEFT
Preset	This is unaffected by Preset but is set to RIGHT by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.3 Annotations Local Settings/All Off

Overrides the annotation settings for all measurement in all modes and turns them all off. This provides the security based "annotation off" function of previous instruments; hence it uses the legacy SCPI command.

When this control is set to **All Off**, the **Screen Annotation**, **Meas Bar**, **Trace Annotation**, and **Control Annotation** controls under the **Display, Annotation** menu are grayed-out and forced to **OFF** for all measurements in all modes. When **Local Settings** is selected, you can set the local annotation settings on a measurement-by-measurement basis.

Remote Command	:DISPlay:WINDow[1]:ANNotation[:ALL] OFF ON 0 1 :DISPlay:WINDow[1]:ANNotation[:ALL]?
Example	:DISP:WIND:ANN OFF
Preset	This is unaffected by Preset but is set to ON by Restore Defaults > "User Interface" on page 2099, Restore Defaults > "Misc" on page 2100 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)
Backwards Compatibility Notes	The WINDow parameter and optional subopcode is included for backwards compatibility but ignored – all windows are equally affected

4.3.7.4 Display Theme

Allows you to change the **Display Theme**. This is similar to the Themes selection under Page Setup and Save Screen Image.

The two available themes are:

- **FILLED**: this is the normal theme using filled objects
- **OUTLine**: this theme uses color, but does not use fill for most areas on the display. It is ideal for images that need to be printed on inkjet printers. Although setting **Display Theme** to **OUTLine** does not affect screen image saves or prints, it does show you exactly how screen images will look when using the **OUTLine** theme under **Save Screen Image**, and how prints will look when using the **OUTLine** theme under **Page Setup**.

NOTE

Although the **OUTLine** theme eliminates most of the filled area, some objects remain filled. In particular, the selected marker remains filled with the green marker color, to distinguish it from the other markers. This is important, as it is the selected marker whose readout appears in the upper right corner of the display.

Remote Command	<code>:DISPlay:THEMe TDColor TDMonochrome FCOLOR FMONochrome FILLED OUTLine</code> <code>:DISPlay:THEMe?</code>
Example	<code>:SYST:DISP:THEM OUTL</code> sets the display style to OUTLine
Notes	To permit code compatibility with A-model X-Series Signal Analyzer instruments, the command parameters from the A-models are mapped as follows: <ul style="list-style-type: none"> – TDColor and TDMonochrome are both mapped to FILLED (exact full color representation of what is on the screen) – FCOLOR and FMONochrome are both mapped to OUTLine (uses color for traces and other items, but most filled areas are white) <p>There is no Monochrome theme in the B-model instruments, so the monochrome commands for the A-model instruments yield color themes</p> <p>The query of <code>:DISPlay:THEMe?</code> always returns FILLED or OUTLine. It never returns FCOLOR, FMONochrome, TDColor, or TDMonochrome</p>
Preset	This is unaffected by Preset but is set to FILLED by Restore Defaults > "User Interface" on page 2099 , Restore Defaults > "Misc" on page 2100 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.5 Backlight

Turns the display **Backlight** on and off. This setting may interact with settings under the Windows **Power** menu.

When the backlight is **OFF**, pressing ESC, TAB, SPACE, ENTER, UP, DOWN, LEFT, RIGHT, DEL, BKSP, CTRL, or ALT turns the backlight **ON** without affecting the

4 System
4.3 Preload / Unload Modes

application. Pressing any other key turns backlight **ON**, and could potentially perform the action as well.

Remote Command	<code>:DISPlay:BACKlight ON OFF</code> <code>:DISPlay:BACKlight?</code>
Example	Turn backlight ON : <code>:DISP:BACK ON</code> Turn backlight OFF : <code>:DISP:BACK OFF</code>
Preset	Pressing any key turns the backlight back ON , as does Restore Defaults > "User Interface" on page 2099, Restore Defaults > "Misc" on page 2100 or Restore Defaults > "All" on page 2101
State Saved	Not saved in State

4.3.7.6 Backlight Intensity

Allows the **Backlight Intensity** to be controlled from the UI settings panel.

Remote Command	<code>:SYSTem:DISPlay:BACKlight:INTensity <integer></code> <code>:SYSTem:DISPlay:BACKlight:INTensity?</code>
Example	<code>:SYST:DISP:BACK:INT 67</code>
Preset	100
State Saved	Power On Persistent (survives shutdown and restart)
Range	0-100

4.3.7.7 Hints

Hints are descriptions that provide additional information for a control. You can set **Hints** to be enabled or disabled.

Remote Command	<code>:SYSTem:DISPlay:HINTs[:STATe] OFF ON 0 1</code> <code>:SYSTem:DISPlay:HINTs?</code>
Example	<code>:SYST:DISP:HINT OFF</code>
Preset	This is unaffected by Preset but is set to ON by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.8 Numeric Entry Auto Open

Configures whether the **Numeric Entry** Panel will appear immediately when an active function control is activated (Auto Open **ON**), or be deferred until you touch it again or begin to enter a value (Auto Open **OFF**). When configured for Auto Open

OFF (the default), adjusting the value with the front panel Up/Down keys or the RPG hides the **Numeric Entry** Panel.

Remote Command	:SYSTem:DISPlay:NEPimmediate ON OFF 1 0 :SYSTem:DISPlay:NEPimmediate?
Example	:SYST:DISP:NEP OFF
Preset	This is unaffected by Preset but is set to ON by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.9 Touch On/Off

Turns the touch functionality on and off on the display. If **OFF**, you can turn it back on using the front panel **Touch On/Off** key, or by using a mouse to toggle this control.

Preset	Always starts up ON Unaffected by Preset but is turned ON by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Not saved in state, not affected by Preset , not Power On Persistent (does not survive shutdown and restart)

4.3.7.10 Control Size

Configures the size of the controls in the user interface. This can be used to make screen dumps from a large screen instrument match those from a smaller screen instrument, to make the controls more readable on a large-screen instrument, or to display more information on a smaller screen instrument.

Remote Command	:DISPlay:UINTerface:CSIZe SMALL LARGE :DISPlay:UINTerface:CSIZe?
Example	:DISP:UINT:CSIZ LARGE
Preset	This is unaffected by Preset but is set to SMALL by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.11 Quick Save Mode

When **Quick Save Mode** is **NORMAL** (the default setting), the instrument does an immediate save of a new file of the same type and to the same directory as the previous **Save** action. When **Quick Save Mode** is in the **PROMPT** state, instead of immediately performing a **Save**, the Alpha Keyboard appears with the proposed

4 System

4.3 Preload / Unload Modes

auto-filename in the entry area. You can then press **Enter** to accept the auto filename, or edit the name then press **Enter**. This allows you to easily save a file with a custom file name.

Remote Command	:MMEMory:STORe:QSAVe NORMa1 PROMpt
Example	:MMEM:STOR:QSAV PROM
Preset	This is unaffected by Preset but is set to NORMa1 by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.12 Screen Tabs Left/Right

This switch, when in the **RIGHT** position, makes the screen tabs start on the right and build across to the left, thus minimizing the finger travel over to the screen tab when there is only one screen. When tabs are added from right to left, they appear as below:

The default is **LEFT**.

Remote Command	:DISPlay:UINTERface:STAB RIGHT LEFT
	:INSTrument:SCREen:STAB?

Example	:DISP:UINt:STAB RIGH
Preset	This is unaffected by Preset but is set to LEFT by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.13 Hide Screen Tabs in Full Screen

This switch, when in the **ON** position, causes the Screen Tabs to be hidden when in Full Screen view, thus maximizing the display area available for results. By also turning off the Meas Bar (in the **Display, Annotation** menu), you can maximize the available area for results, as shown below:

Remote Command	:DISP:UINt:HTABs ON OFF 1 0 :DISP:UINt:HTABs? :DISP:UINt:STFScreen ON OFF 1 0 Implemented but with wrong sense; ON turns them off and OFF turns them on; so, don't document to customer
----------------	--

Example	:DISP:UINt:HTAB ON Hide the tabs in full screen
Preset	This is unaffected by Preset but is set to OFF by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.3.7.14 2-Screen Orientation

When you add a second Screen using the “+” control on the Screen Tabs bar, normally the screen is added to the right of the first screen. However, sometimes it is better to add the new screen below the first screen rather than to the right, as shown below.

New screen added to the right (horizontal orientation)

New screen added below (vertical orientation)

The **2-Screen Orientation** switch allows you to choose between these two orientations for 2-Screen configurations. The default is the **HORizontal** configuration, two Screens side-by-side.

Remote Command	<code>:INSTrument:SCReen:ORientation VERTical HORizontal</code>
Example	<code>:INST:SCR:ORI VERT</code> Set the 2 screens to be above/below each other
Preset	HOR This is unaffected by Preset but is set to HORizontal by Restore Defaults > "User Interface" on page 2099 or Restore Defaults > "All" on page 2101

4.3.7.15 Clock Format

Allows the **Clock Format** to be switched between 12-Hour Format (**HR12**) and 24-Hour Format (**HR24**).

Remote Command	<code>:SYSTem:DISPlay:CFORmat HR12 HR24</code> <code>:SYSTem:DISPlay:CFORmat?</code>
Example	<code>:SYST:DISP:CFOR HR12</code>
Preset	HR12
State Saved	Power On Persistent (survives shutdown and restart)
Range	12-Hour 24-Hour

4.3.7.16 Language

Accesses the selection of **Language** displayed on the menus and controls. **ENGLISH** is the default.

All Measurement Applications that share common controls will display the localized controls.

The description on the control labels is bounded by the control size. Any given language will have labels in that language that are shorter or longer than the equivalent label in English. Any localized text on the controls that does not fit the label size remains in English. Thus, for any given menu, controls may be displayed in English *and* the selected language.

- Labels that are acronyms, engineering, or technology specific terms may remain in English.
- All Application and Measurement names remain in English.
- All data in exported files remain in English.
- The Diagnostic and Service menus in the System Subsystem remain in English.
- The Windows operating system must remain in English. Changing the **Region and Language** settings in the Windows Control Panel is not supported.

External keyboards in English are supported. Localized external keyboards are not supported. When the language selected is not English, a message is displayed to explain that any external keyboard must remain in English.

Other aspects of the Graphical User Interface remain in English. The Remote User Interface (SCPI) remains in English.

Remote Command	<code>:SYSTem:DISPlay:LANGuage ENGLISH RUSSian</code>
Example	<code>:SYST:DISP:LANG ENGL</code> <code>:SYST:DISP:LANG RUSS</code> Requires Option AKT
Preset	This is unaffected by Preset but is set to ENGLISH by Restore Defaults > "User Interface" on page 2099, Restore Defaults > "Misc" on page 2100 or Restore Defaults > "All" on page 2101

4.3.7.17 Restore User Interface Defaults

Causes the group of settings associated with the **User Interface** menu to be reset to their default values. This also happens on **Restore Misc Defaults**.

When **User Interface** is selected, a message appears saying:

This will reset all of the User Interface variables to their default state, including the menu panel location, display theme, and language.

It will not affect Alignment data or settings.

This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons for you to affirm or cancel the operation.

Example :SYST:DEF UINT

4.3.7.18 User Interface Type (Remote Query Only)

Use this query to determine if the instrument is running the Multi-Touch user interface or Softkey user interface. This is an easy way to distinguish between A-models (Softkey) instruments and Touch UI (Multi-Touch) instruments.

Remote Command :DISP:UINterface:TYPE?

Example :DISP:UINT:TYPE?

Notes The query returns **MULTITOUCH** for instruments with the Multi-Touch UI or **SOFTKEY** for instruments with the Softkey UI

4.4 Power On

Lets you select how the instrument should power on.

NOTE

In products that run multiple instances of the X-Series Application, the same Power On type is shared between all the instances.

4.4.1 Power On State

Lets you select whether the instrument powers up in a default state, or some other state. The options are:

- **MODE** and Input/Output Defaults
- **USER** Preset
- **LAST** State

Remote Command	<code>:SYSTem:PON:TYPE MODE USER LAST</code> <code>:SYSTem:PON:TYPE?</code>
Example	<code>:SYST:PON:TYPE MODE</code> <code>:SYST:PON:TYPE USER</code> <code>:SYST:PON:TYPE LAST</code>
Preset	This is unaffected by Preset but is set to MODE by Restore Defaults > "All" on page 2101
State Saved	No
Backwards Compatibility SCPI	<code>:SYSTem:PON:TYPE PRESet</code> The PRESet parameter is supported for backward compatibility only, and behaves the same as MODE

Mode and Input/Output Defaults

When the instrument is powered-on in **MODE** and Input/Output Defaults, it performs "**Restore Mode Defaults**" on page 2209 for all Modes in the instrument, and performs **Restore Input/Output Defaults**.

Persistent parameters (such as Amplitude Correction tables or Limit tables) are not affected at power-on, even though they are normally cleared by **Restore Input/Output Defaults** and/or **Restore Mode Defaults**.

User Preset

Sets **Power On State** to **USER** Preset. When the instrument is powered on in User Preset, it will **User Preset** each mode and switch to the "**Power On Application**" on page 2087. **Power OnUser Preset** does not affect any settings other than those set by a normal **User Preset**.

Backwards Compatibility Note: Power On: **User Preset** causes the instrument to power up in the "**Power On Application**" on page 2087, *not* the last Mode the instrument was in prior to shutdown. Also, **Power On: User Preset** will **User Preset** all Modes. This does *not* exactly match legacy behavior.

NOTE

In products that run multiple instances of the X-Series Application, the same **User Preset** is shared between all the instances.

NOTE

An instrument can never power up for the first time in **USER** preset.

Last State

Sets **Power On State** to **LAST**. When the instrument is powered on, it will put all modes in the last state they were in prior to when the instrument was put into Power Standby, and it will start up in the mode it was last in prior to powering off the instrument. The saving of the active mode prior to shutdown happens behind the scenes when a controlled shutdown is requested, either via the front panel **Standby** key, or the remote command **:SYSTem:PDOWn**. The non-active modes are saved as they are deactivated and recalled by Power On: Last State.

Power On: Last State only works if you completed a controlled shutdown prior to powering on in **LAST**. If a controlled shutdown is not completed when in **Power On: Last State**, the instrument powers up in the last active Mode, but it may not power up in the active Mode's last state. If an invalid Mode state is detected, a **Mode Preset** occurs. To control the shutdown under remote control, use **:SYSTem:PDOWn**.

Backwards Compatibility Note: It is no longer possible to power-up the instrument in the last Mode the instrument was running with that Mode in the preset state. (ESA/PSA **SYST:PRESET:TYPE MODE** with **SYST:PON:PRESET**) You can power-on the instrument in the last Mode the instrument was running in its last state (**:SYST:PON:TYPE LAST**), or you can specify the Mode to power-up in its preset state (**:SYST:PON:MODE <mode>**).

NOTE

In products that run multiple instances of the X-Series Application, each instance has a unique **Last State**.

NOTE

An instrument can never power up for the first time in **LAST**.

If line power to the instrument is interrupted, for example by pulling the line cord plug or by switching off power to a test rack, **Power On Last State** may not work properly. For proper operation, **Power On Last State** depends on your shutting down the instrument using the **Standby** key or the `:SYSTem:PDOWn` command. This ensures the last state of each Mode is saved and can be recalled during a power-up.

4.4.2 Power On Application

Accesses a menu that lists the available Modes, and lets you select which Mode is to be the **Power On Application**. Whichever application is selected runs at power-on when the Power On Type is set to “**MODE** and Input/Output Defaults”.

NOTE

In products that run multiple instances of the X-Series Application, the same Power On Application is shared between all the instances.

Remote Command	<code>:SYSTem:PON:MODE <mode></code> where <code><mode></code> is an item from the same set that can be sent using the <code>:INSTrument[:SElect]</code> command <code>:SYSTem:PON:MODE?</code>						
Example	<code>:SYST:PON:MODE SA</code>						
Notes	The displayed list of possible Modes (and remote parameters) depends on which Modes are installed in the instrument						
Preset	Unaffected by Preset but is set by Restore Defaults > "All" on page 2101 to SA , except in the cases noted below:						
	<table border="1"> <tr> <td>N8973B, N8974B, N8975B, N8976B</td> <td>NFIG</td> </tr> <tr> <td>VXT models</td> <td>BASIC</td> </tr> <tr> <td>M9410E/11E/15E/16E</td> <td>BASIC</td> </tr> </table>	N8973B, N8974B, N8975B, N8976B	NFIG	VXT models	BASIC	M9410E/11E/15E/16E	BASIC
N8973B, N8974B, N8975B, N8976B	NFIG						
VXT models	BASIC						
M9410E/11E/15E/16E	BASIC						
State Saved	No						

4.4.3 FPGA Configuration

Lets you choose which FPGA image you want loaded into the instrument.

Depending on your hardware configuration, your instrument may contain a Field Programmable Gate Array (FPGA) which handles much of the processing for some of the mathematically intensive features, such as Time Domain Scan (Option TDS) and Enhanced Sweep Speed (Option FS2). The FPGA is not big enough to hold the

functionality for both options, so you must decide which FPGA program you want loaded.

When licenses allow for both FPGA image versions to be available, and you have not explicitly chosen an FPGA image version, then, when the firmware is updated, the Time Domain Scan version will be loaded. In the absence of all licenses, the Enhanced Sweep Speed version will be loaded. Once you have explicitly chosen an FPGA image version, using the FPGA Configuration dialog, any future firmware updates will continue to load the chosen version as long as it is licensed.

Example: loading the Time Domain Scan FPGA image, removing the TDS license, and then updating the firmware will result in the Enhanced Sweep Speed version being loaded.

When multiple capabilities are licensed, the FPGA Configuration presents a dialog that tells you that there is insufficient space to fit all the licensed capabilities, and asks you to choose one of the FPGA programs (images).

If you remove licenses, it is possible to end up with an unlicensed capability loaded in the FPGA while a licensed capability is not loaded. In this case, the dialog does not present the **Preference** group and shows a message about unlicensed/licensed capabilities. You can dismiss the dialog if the licensed capability is not currently needed, and you do not want to take the time to load the licensed FPGA image. However, this dialog will continue to appear each time the instrument is restarted.

Behavior when the Enhanced Sweep Speed FPGA Image is Loaded

When the Enhanced Sweep Speed version of the FPGA image is loaded, sweep behavior still depends on the licenses:

- Option FS2 gives full FPGA enhanced sweep speed
- Option FS1 gives software implemented enhanced sweep speed
- Neither Option FS1 nor FS2 – no enhanced sweep speed
- Both Options FS1 and FS2 – same as Option FS2, the full FPGA enhanced sweep speed

If EMI Receiver Mode and TDS option are licensed, and the Enhanced Sweep Speed FPGA image is loaded, then you will not have the proper FPGA image loaded to fully support EMI Receiver Mode. In particular, the Frequency Scan measurement cannot use Scan Type “Time Domain Scan” (this is the normally the default Scan Type for instruments with the TDS option). Instead, EMI Receiver Mode behaves as if the TDS option is not licensed.

Behavior when the Time Domain Scan FPGA Image is loaded

When the Time Domain Scan version of the FPGA image is loaded, EMI Receiver Mode works as expected with the TDS option licensed, but the Option FS2 capability

silently reverts to FS1 behavior.

Switching Between Enhanced Sweep Speed and Time Domain Scan FPGA Images

You cannot have both full TDS and FS2 images at the same time, so to switch to the other image, you must go through the process of reloading the FPGA by choosing the desired image with the Selected FPGA control, and pressing "**Load FPGA**" on [page 2091](#), or issuing the "Load FPGA" SCPI command below with the proper parameter.

Incorrect FPGA Configuration

If EMI Receiver Mode, Option TDS, or Option FS2 license is removed while the FPGA image for that license is loaded, the instrument ends up in an incorrect configuration, since the loaded FPGA image version has support for unlicensed functionality that is not accessible and does not support the currently licensed functionality. It will still function, but when the instrument recognizes this situation at startup, it automatically displays the **FPGA Configuration** dialog. The only selections available will be the licensed ones, but you can choose to dismiss the dialog and continue with the current FPGA image version if you do not want to take the time to load the correct FPGA image. The dialog will continue to be presented at each startup until the correct FPGA image is loaded.

FPGA Updates When Firmware Installs

The FPGA image and X-Series firmware are tightly coupled, so whenever the firmware is updated, the FPGA image is also checked and updated if needed. The rules for choosing between Time Domain Scan and Enhanced Sweep Speed versions of the FPGA image are:

1. Always use Time Domain Scan FPGA image for MXE
2. If neither EMC Mode nor Option TDS nor Option FS2 are licensed, the Enhanced Sweep Speed FPGA image is loaded
3. If EMC Mode and Option TDS are licensed and Option FS2 is not licensed, the Time Domain Scan FPGA image is loaded
4. If EMC Mode and Option TDS are not licensed, and Option FS2 is licensed, the Enhanced Sweep Speed FPGA image is loaded
5. If all are licensed
 - a. If "**FPGA Load Preference**" on [page 2090](#) is **Time Domain Scan**, the Time Domain Scan FPGA image is loaded

- b. If **FPGA Load Preference** is **Enhanced Sweep Speed**, the Enhanced Sweep Speed FPGA image is loaded
- c. If **FPGA Load Preference** is **Prompt at Startup**:
 - a. If the last FPGA Configuration Load was Time Domain Scan, the Time Domain Scan FPGA image is loaded
 - b. If the last FPGA Configuration Load was Enhanced Sweep Speed, the Enhanced Sweep Speed FPGA image is loaded
 - c. If no FPGA has been explicitly loaded, the Time Domain Scan FPGA image is loaded

4.4.3.1 FPGA Load Preference

Select either image from the radio buttons at the top of the dialog:

Option	SCPI	Description
Time Domain Scan	TDS	Load the Time Domain Scan version of the FPGA image
Enhanced Sweep Speed	FS2	Load the Enhanced Sweep Speed version of the FPGA image
Prompt at Startup	PROMpt	Prompt at each startup, displaying the FPGA Configuration dialog. You can choose to continue with the currently loaded FPGA image version, or load a different version

If you select the image that is already loaded, you will not be prompted again. If you select a different one, the Selected FPGA control changes to that one and you must then press "**Load FPGA**" on page 2091 to load the other image.

When installing new firmware, the **FPGA Load Preference** setting is used to load the preferred FPGA image version if more than one version is available. Selecting **Prompt at Startup** causes you to be prompted at each startup to select the desired version of the FPGA image.

Remote Command	<code>:SYSTem:PON:FPGA:PREference TDS FS2 PROMpt</code>
Example	<code>:SYST:PON:FPGA:REF TDS</code> <code>:SYST:PON:FPGA:REF?</code>
Notes	This SCPI is always available, but if the hardware does not support multiple FPGA image choices, the returned value is always: NA = Not available for this hardware Also, when not supported, any attempt to change away from NA generates error -224, "Illegal parameter value"
Dependencies	Dialogs and menus available only when EMC Mode, Option TDS and Option FS2 are all licensed

Preset	PROMpt Not affected by Mode Preset but set to PROMpt by Restore Defaults >"All" on page 2101 or Power On
--------	---

4.4.3.2 Load FPGA

Depending on the "**FPGA Load Preference**" on page 2090 selection, there may be a mismatch between the desired FPGA image, and the one that is currently loaded. In that case the **Load FPGA** control at the bottom of the dialog is not grayed-out, and you must press it to actually load the desired FPGA image. The image that is currently loaded is shown on the right:

If you have a mismatch, but do not actually load the other image, the **FPGA Load Preference** is remembered, but the image you had before remains until you return to this dialog and press **Load FPGA**, or until the next time the instrument firmware is updated.

If you press **Load FPGA**, the X-series software exits, the FPGA update program runs, and the instrument reboots. After rebooting, the new image will be loaded in the FPGA.

NOTE This can take 15 minutes or more.

CAUTION If power is lost during the FPGA load process, the FPGA can become corrupted, in which case the only solution is to return it to Keysight for servicing.

Remote Command	<code>:SYSTem:PON:FPGA:LOAD TDS FS2</code>
Example	<code>:SYST:PON:FPGA:LOAD TDS</code> For options, see Dependencies row below <code>:SYST:PON:FPGA:LOAD?</code>
Notes	If the specified FPGA image version is the one already loaded, then the command does nothing. If the FPGA image needs to change, the analyzer software exits (terminating the SCPI session), and the FPGA update utility is launched. Once the FPGA has updated, the instrument will reboot This SCPI is always available, but if the hardware does not support multiple FPGA image choices, the value returned is always: NA = Not available for this hardware Also, when not supported, any attempt to change away from NA generates error -224, "Illegal parameter value"
Dependencies	Available only when there are multiple versions of the FPGA image that could be loaded

Selection limited to licensed features:

- **TDS** selection requires EMC Mode and Option TDS
- **FS2** requires Option FS2

The UI is blanked when there is only one licensed selection, and that selection is already loaded.

Sending the SCPI for an unlicensed selection results in error:

-224, "Illegal parameter value; <option> is not licensed"

Preset

None. Not affected by **Mode Preset** nor any ["Restore Defaults" on page 2098](#)

4.4.4 Restore Power On Defaults

This selection causes the **Power On** settings to be reset to their default values.

When this button is pressed, a message appears saying:

This will reset Power On State and Power On Application to their default state.

It will not affect Alignment data or settings.

This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons for you to confirm or cancel the operation.

Example

`:SYST:DEF PON`

4.4.5 Configure Applications – Desktop application

The **Configure Applications** utility runs from the instrument's desktop. You must close the Instrument Application before running **Configure Applications**.

This utility can be used to:

- select applications (Modes) for preload
- determine how many Modes can fit in memory at one time
- specify the order of the Modes in the Mode menu.

The utility consists of a window with instructions, a set of **Select Application** checkboxes, a "fuel bar" style memory gauge, and keys that help you set up your configuration.

NOTE

In products that run multiple instances of the X-Series Application, the same **Configure Applications utility is shared between all the instances.**

For more details, see the following topics:

- "Preloading Applications" on page 2093
- "Access to Configure Applications utility" on page 2093
- "Virtual memory usage" on page 2094

Example

Display the Config Applications screen:

```
:SYST:SHOW CAPP
```

Preloading Applications

During runtime, if a Mode that is not preloaded is selected using the **Mode** menu or by sending SCPI commands, there will be a pause while the Application is loaded. During this pause, a message that says "**Loading application, please wait ...**" is displayed. Once loaded, the application stays loaded, so the next time you select it during a session, there is no delay.

Preloading lets you "preload" at startup, to eliminate the runtime delay. Preloading an application causes it to be loaded into the instrument's memory when the analyzer program starts up. If you do this, the delay will increase the time it takes to start up the analyzer program, but this may be preferable to having to wait the first time you select an application. Note that, once an application is loaded into memory, it cannot be unloaded without exiting and restarting the analyzer program.

Note that there are more applications available for X-Series than can fit into Windows Virtual Memory. By allowing you to choose which licensed applications to load at startup, the **Configure Applications** utility allows you to make optimal use of the instrument memory.

Access to Configure Applications utility

A version of the utility runs the first time you power up the instrument after purchasing it from Keysight. The utility automatically configures preloads so that as many licensed applications as possible are preloaded while keeping the total estimated virtual memory usage below the limit. This auto-configuration only takes place at the very first run, and after analyzer software upgrades.

At any time, you can manually start the **Configure Applications** utility by closing the analyzer application and double-tapping the **Configure Applications** icon on the desktop.

The utility's main dialog looks like this:

Instructions are provided below and in the utility. Use the utility to find a configuration that works best for you, and then restart the analyzer program.

- Select All** Marks all applications in the selection list. This allows you to enable all applications licensed on the instrument for pre-loading, or is a convenience for selecting all applications in one operation and then letting you deselect individual applications
- Deselect All** Clears the marks from all applications in the selection list, except the Power On application. The Power On application cannot be eliminated from the pre-load list
- Move Up** The application list is the order that applications appear in the Mode Menu. These keys let you shift the selected application up or down in the list, thus moving the selected application earlier or later in the Mode Menu
- Move Down**
- Select Power On Application** This is the same as the "Power On Application" selection on the Power On page of the System Settings dialog

Virtual memory usage

There are more applications available for X-Series than can fit into memory at any one time, so the **Configure Applications** utility includes a memory tracker that serves two purposes:

1. It will not let you preload more applications than will fit into memory at once
2. You can determine how many of your favorite applications can reside in memory at one time

The utility provides a graphical representation of the amount of memory (note that the amount of memory shown here is *virtual* memory, which is a limitation imposed by the operating system, not by the amount of physical memory you have in your instrument). You select applications to preload by checking the boxes on the left. Checked applications preload at startup. The colored fuel bar indicates the total memory required when all the checked applications are loaded (either preloaded or selected during runtime).

Here is what the fuel bar colors mean:

- RED: the applications you have selected cannot all fit into the instrument's memory. You must deselect applications until the fuel bar turns yellow
- YELLOW: the applications you have selected can all fit into the instrument's memory, but there is less than 10% of the memory left, probably not enough to load any other applications, either via preload or by selecting a Mode while the instrument is running
- GREEN: The indicator is green when <90% of the memory limit is consumed. This means the applications you have selected can all fit into the instrument's memory with room to spare. You will be able to load one or more other applications without running out of memory

If Sequence Analyzer is selected to be preloaded, all apps that are part of the Sequencer Mode (GSM/EDGE, WCDMA, CDMA2K and 1xEVDO) are preloaded (if licensed).

4.4.6 Configure Applications - Instrument boot-up

When the Instrument Application starts, a dialog box similar to the one you see when you run **Configure Applications** is displayed, allowing you to choose which licensed applications are to be loaded. This dialog is only displayed if the memory required to pre-load all the licensed applications exceeds the virtual memory available.

4.4.7 Configure Applications - Remote Commands

The following topics provide details on using remote commands to configure the list of applications you want to load into the instrument memory, or query the virtual memory utilization for your applications.

- "Configuration list (Remote Command Only)" on page 2096
- "Configuration Memory Available (Remote Query Only)" on page 2096
- "Configuration Memory Total (Remote Query Only)" on page 2096
- "Configuration Memory Used (Remote Query Only)" on page 2097
- "Configuration Application Memory (Remote Query Only)" on page 2097

4.4.7.1 Configuration list (Remote Command Only)

Used to set or query the list of applications to be loaded in-memory.

Remote Command	<code>:SYSTem:PON:APPLication:LLISt <string of INSTRument:SElect names></code> <code>:SYSTem:PON:APPLication:LLISt?</code>
Example	<code>:SYST:PON:APPL:LLIS "SA,BASIC,WCDMA"</code>
Notes	<code><string of INSTRument:SElect names></code> contains items that are valid options for the <code>:INSTRument:SElect</code> command The order of the <code><INSTRument:SElect names></code> specifies the order in which the applications are loaded into memory, and the order that they appear in the Mode menu Error message -225 "Out of Memory" is reported when more applications are listed than can reside in virtual memory. When this occurs, the existing applications load list is unchanged
Preset	Not affected by Preset
State Saved	Not saved in instrument state

4.4.7.2 Configuration Memory Available (Remote Query Only)

Returns the amount of Virtual Memory remaining.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory[:AVAIlable]?</code>
Example	<code>:SYST:PON:APPL:VMEM?</code>
Preset	Not affected by Preset

4.4.7.3 Configuration Memory Total (Remote Query Only)

Returns the limit of Virtual Memory allowed for applications.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory:TOTal?</code>
Example	<code>:SYST:PON:APPL:VMEM:TOT?</code>
Preset	Not affected by Preset

4.4.7.4 Configuration Memory Used (Remote Query Only)

Returns the amount of Virtual Memory used by all measurement applications.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory:USED?</code>
Example	<code>:SYST:PON:APPL:VMEM:USED?</code>
Preset	Not affected by Preset

4.4.7.5 Configuration Application Memory (Remote Query Only)

Returns the amount of Virtual Memory a particular application consumes.

Remote Command	<code>:SYSTem:PON:APPLication:VMEMory:USED:NAME? <INSTrument:SElect name></code>
Example	<code>:SYST:PON:APPL:VMEM:USED:NAME? CDMA2K</code>
Notes	<code><INSTrument:SElect name></code> is an item from the same set used by the <code>:INSTru-ment:SElect</code> command If the name provided is invalid, 0 (zero) is returned
Preset	Not affected by Preset

4.5 Restore Defaults

Provides initialization of system setting groups, including the option to set the entire instrument back to a factory default state.

NOTE

In products that run multiple instances of the X-Series Application, all instances have the same factory default states for **Restore Defaults**.

Remote Command	:SYSTem:DEFault [ALL] ALIGn INPut MISC MODes PON UINTerface SCReen
Example	:SYST:DEF
State Saved	No

4.5.1 Input/Output

Input/Output Preset resets the group of settings and data associated with the **Input/Output** front-panel key to their default values. These settings are not affected by a **Mode Preset** because they are associated with connections to the instrument, which you will probably not want to reset every time you press **Mode Preset**.

By using **Input/Output Preset** and "[Restore Mode Defaults](#)" on page 2209, a full preset of the current mode will be performed, with the caveat that since **Input/Output Preset** is a global function, it will affect *all* modes.

This is the same as the **Input/Output Preset** button in the **Preset** dropdown and the **Input/Output** menu.

When **Input/Output** is selected, a message appears saying:

This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to confirm or cancel the operation.

Example	:SYST:DEF INP
---------	---------------

4.5.2 I/O Config

Causes the group of settings associated with the **I/O Config** menu to be reset to their default values. This also happens on **Restore Misc Defaults**, which has a SCPI command, although **I/O Config** does not.

When **I/O Config** is selected, a message appears saying:

This will reset all of the I/O Config variables to their default state, including the GPIB address and SCPI LAN settings

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

4.5.3 User Interface

Causes the group of settings associated with the **User Interface** menu to be reset to their default values. This also happens on a **Restore Misc Defaults**.

When **User Interface** is selected, a message appears saying:

This will reset all of the User Interface variables to their default state, including the menu panel location, display theme, and language

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example :SYST:DEF UINT

4.5.4 Power On

Causes the **Power On** settings to be reset to their default values.

The Power On settings are **Power On State** and **Power On Application**.

When **Power On** is selected, a message appears saying:

This will reset Power On State and Power On Application to their default state

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example :SYST:DEF PON

4.5.5 Alignments

Causes the **Alignments** system settings to be reset to their default values. This does not affect any Alignment data stored in the system.

After performing this function, it may impact the auto-alignment time of the instrument until a new alignment baseline has been established.

When **Alignments** is selected, a message appears saying:

This will reset all of the settings for the Alignment system to their default values

No alignment data will be erased

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Example :SYST:DEF ALIG

4.5.6 Misc

Causes miscellaneous system settings to be reset to their default values.

CAUTION This function resets the GPIB address to 18.

When **Misc** is selected, a message appears saying:

This will reset miscellaneous system settings to their default values. This includes settings for I/O Config (GPIB and SCPI LAN), the User Interface, the Save/Recall system, and the Preset type

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

This Miscellaneous group contains settings that are *not* part of the other Restore Defaults groups. These include:

- All settings on the **I/O Config** page of the **System Settings** dialog
- All settings in the following table:

4 System
4.5 Restore Defaults

Miscellaneous Setting	Default Value
The SYST:PRES:TYPE	MODE
Auto File Name Number	000
Save Type	State
State Save To	Register 1
Screen Save To	SCREEN000.png
Save/Recall Shortcuts	Deleted
Display Theme	Filled
Backlight	ON
System Annotation	Local Settings
Language	English
DISP:ENABLE	ON
Full Screen	Off

Example `:SYST:DEF MISC`

4.5.7 All

Comprehensively resets **All** instrument settings to their factory default values.

Resets all **System Settings** groups, performs "[Restore Mode Defaults](#)" on page 2209 for all Modes in the instrument, and switches back to the power-on mode. Does not affect the User Preset file, or any user saved files.

When **All** is selected, a message appears:

This will reset all of the settings in the instrument to their factory default values, including the state of all Modes and Screens, the GPIB settings, the Alignment settings, and the Power On Mode

It will not affect Alignment data or settings

This action cannot be undone. We recommend canceling this operation and restoring settings individually (I/O Config, User Interface, Alignments, etc.) instead

Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to confirm or cancel the operation.

NOTE

If you are using a Keysight USB External Mixer, then you will need to perform **Refresh USB Mixer Connection** (SCPI command `:MIX:BAND USB`) after **Restore Defaults > All**.

Example	<code>:SYST:DEF ALL</code>
Couplings	All causes the currently running measurement to be aborted, and sets all modes to a consistent state, so it is unnecessary to couple any settings Backwards Compatibility SCPI
Notes	<code>:SYST:PRES:PERS</code> is the same as <code>:SYST:DEF ALL</code>
Backwards Compatibility SCPI	<code>:SYSTem:PRESet:PERsistent</code>

4.6 Alignments

Accesses the alignment system of the instrument. You can control the automatic alignments, view alignment statistics and manually perform alignments.

The current setting of the alignment system is displayed in the Meas Bar along the top of the display. For conditions that may cause specifications to be impacted, this annotation will be in amber.

4.6.1 Auto Align

Lets you configure the automatic background alignments and the alerts from the automatic alignment system.

Dependencies	Does not appear in VXT or M9410E/11E/15E/16E
--------------	--

4.6.1.1 Auto Align

Configures the method the automatic background alignment will use when it runs.

Automatic background alignments are run periodically between measurement acquisitions. The instrument's software determines when alignments are to be performed to maintain warranted operation. The recommended setting for Auto Align is Normal.

Auto Align execution *cannot* be aborted with the **Cancel (ESC)** key. To interrupt **Auto Align** execution, select **Auto Align Off**.

Remote Command	<code>:CALibration:AUTO ON LIGHT PARTial OFF</code> For details of each option, see "Auto Align Options" on page 2104 <code>:CALibration:AUTO?</code>
Example	<code>:CAL:AUTO ON</code>
Notes	While Auto Align is executing, bit 0 of Status Operation register is set
Couplings	Auto Align is set to Off if Restore Align Data is invoked
Preset	This is unaffected by Preset but is set to ON by Restore Defaults > "Alignments" on page 2100
State Saved	No
Annotation	In the Meas Bar: <ul style="list-style-type: none"> - Normal with "All But RF" off: Auto (white) - Normal with "All But RF" on: Auto/No RF (amber) - Partial: Partial (amber)

	- Off: Off (amber)
Status Bits/OPC dependencies	When Auto Align is executing, Bit 0 in the Status Operational register is set An interfering signal at the RF Input may prevent automatic alignment of the RF subsystem. If this occurs, the Error Condition message “Align RF skipped” is reported, the Status Questionable Calibration bit 11 is set, and the alignment proceeds. When a subsequent alignment of the RF subsystem succeeds, either by the next cycle of automatic alignment or from an Align Now, RF, the Error Condition and Status Questionable Calibration bit 11 are cleared
Backwards Compatibility SCPI	:CALibration:AUTO ALERT Parameter ALERT is for backwards compatibility only, and is mapped to PARTIAL

Auto Align Options

The available settings for Auto Align are as follows:

Normal

SCPI example **:CAL:AUTO ON**

Auto Align, Normal turns on the automatic alignment of all measurement systems. This selection maintains the instrument in warranted operation across varying temperature and over time.

If the condition “Align Now All required” is set, transitioning to **Auto Align, Normal** performs the required alignments, clears the “Align Now All required” condition, then continues with further alignments as required to maintain the instrument adequately aligned for warranted operation.

When **Auto Align, Normal** is selected, the **Auto Align Off** time is set to zero.

When **Auto Align, Normal** is selected, the Meas Bar indicates Align: Auto (in white) or Align: Auto/No RF (in amber). The amber color reminds you that you are responsible for maintaining the RF alignment of the instrument.

Alignment processing because of the transition to **Normal** is executed sequentially. Thus, ***OPC?** or ***WAI** following **:CAL:AUTO ON** will return when the alignment processing is complete.

Light

SCPI example **:CAL:AUTO LIGH**

Auto Align, Light turns on the automatic alignment of all measurement systems. The **Auto Align, Light** selection allows more drift in amplitude accuracy to allow much less frequent measurement interruptions to perform alignments. The temperature changes required to trigger each alignment are increased by a factor of three. Alignments also expire from time as well as temperature. In a stable thermal

4 System

4.6 Alignments

environment, the alignments occur one-ninth as often as in Normal. With these less frequent alignments, all accuracy specifications (those expressed with $\pm x$ dB tolerances) change by nominally a factor of 1.4.

If the condition “Align Now, All required” is set, transitioning to **Auto Align, Light** performs the required alignments, clears the “Align Now, All required” condition, and continues with further alignments as required to maintain the instrument adequately aligned for warranted operation.

Alignment processing because of the transition to **Light** is executed sequentially. Thus, ***OPC?** or ***WAI** following **:CAL:AUTO LIGHT** will return when the alignment processing is complete.

When **Auto Align, Light** is selected, the **Auto Align Off** time is set to zero.

When **Auto Align, Light** is selected, the Settings Panel indicates Align: Light.

Partial

SCPI example **:CAL:AUTO PART**

Auto Align, Partial disables the full automatic alignment and the maintenance of warranted operation for the benefit of improved measurement throughput. Accuracy is retained for the Resolution Bandwidth filters and the IF Passband, which is critical to FFT accuracy, demodulation, and many measurement applications. With Auto Align set to Partial, you are now responsible for maintaining warranted operation by updating the alignments when they expire. The Auto Align, Alert mechanism will notify you when alignments have expired. One solution to expired alignments is to perform the Align All, Now operation. Another is to return the Auto Align selection to Normal.

Auto Align, Partial is recommended for measurements where the throughput is so important that a few percent of improvement is more valued than an increase in the accuracy errors of a few tenths of a decibel. One good application of **Auto Align, Partial** would be an automated environment where the alignments can be called during overhead time when the device-under-test is exchanged.

When **Auto Align, Partial**, is selected the elapsed time counter begins for **Auto Align Off** time.

When **Auto Align, Partial** is selected, the Settings Panel indicates Align: Partial in an amber color. The amber color reminds you that you are responsible for maintaining the warranted operation of the instrument.

Off

SCPI example **:CAL:AUTO OFF**

Auto Align, Off disables automatic alignment and the maintenance of warranted operation, for the benefit of maximum measurement throughput. With **Auto Align**

set to **Off**, you are now responsible for maintaining warranted operation by updating the alignments when they expire. The Auto Align, Alert mechanism will notify you when alignments have expired. One solution to expired alignments is to perform the **Align All, Now** operation. Another is to return the **Auto Align** selection to **Normal**.

The **Auto Align Off** setting is rarely the best choice, because **Partial** gives almost the same improvement in throughput while maintaining the warranted performance for a much longer time. The choice is intended for unusual circumstances, such as the measurement of radar pulses where you might want the revisit time to be as consistent as possible.

When **Auto AlignOff** is selected, the **Auto Align Off** time is initialized and the elapsed time counter begins.

When **Auto AlignOff** is selected, the Settings Panel indicates Align: Off in an amber color. The amber color reminds you that you are responsible for maintaining the warranted operation of the instrument.

4.6.1.2 All but RF

Configures automatic alignment to include or exclude the RF subsystem. (Eliminating the automatic alignment of the RF subsystem prevents the input impedance from changing. The normal input impedance of 50 ohms can change to an open circuit when alignments are being used. Some devices under test do not behave acceptably under such circumstances, for example by showing instability.)

When **All but RF** is **ON**, the operator is responsible for performing an **Align Now RF** when RF-related alignments expire. The Auto Align, Alert mechanism will notify you to perform an **Align Now All** when the combination of time and temperature variation is exceeded.

When **All But RF** is **ON**, the Settings Panel indicates Align: Auto/No RF (in amber). The amber color reminds you that you are responsible for maintaining the RF alignment of the instrument.

Remote Command	:CALibration:AUTO:MODE ALL NRF
Example	:CAL:AUTO:MODE NRF
Preset	Unaffected by Preset but set to ALL by Restore Defaults > "Alignments" on page 2100
State Saved	No

4.6.1.3 Alert

The instrument signals an **Alert** when conditions exist such that you will need to perform a full alignment (for example, **Align Now All**). Alert can be configured in one

4 System
4.6 Alignments

of four settings:

Setting	Option
Time & Temperature	TTEmperture
Time & Temperature Light	LIGHT
7 days	WEEK
None	NONE

With **Auto Align** set to **Normal**, the configuration of **Alert** is not relevant, because the instrument's software maintains the instrument in warranted operation.

A confirmation is required when a selection other than **TTEmperture** is chosen. This prevents accidental deactivation of alerts. When setting **Alert** from the front panel to any value but **TTEmperture**, confirmation is required to transition into this setting of Alert. The confirmation dialog is:

This will suppress alerts from the Alignment system, which would notify you when an Alignment is required to maintain warranted operation. Without the alerts you will be responsible for performing an Align Now All at appropriate intervals to maintain warranted operation

Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

No confirmation is required when **Alert** is configured through a remote command.

For more information see "[Time & Temperature](#)" on page 2107

Remote Command	<code>:CALibration:AUTO:ALERt TTEmperture LIGHT DAY WEEK NONE</code>
Example	<code>:CAL:AUTO:ALER TTEM</code>
Preset	Unaffected by Preset but set to TTEmperture by Restore Alignment Defaults
State Saved	No
Status Bits/OPC dependencies	When an alert is generated, the condition message "Align Now All required" appears in the Status Bar, and bit 14 is set in the Status Questionable Calibration register

The settings for **Alert** are detailed below.

Time & Temperature

SCPI Example

CAL:AUTO:ALER TTEM

The instrument signals an alert when alignments expire due to the combination of the passage of time and changes in temperature. The alert is the Error Condition message "Align Now All required". If this choice for Alert is selected, the absence of an alert means that the instrument alignment is sufficiently up-to-date to maintain warranted accuracy.

Time & Temperature Light

SCPI Example

`CAL:AUTO:ALER LIGH`

This is a light version of Time & Temperature which means for this setting the time/temperature changes required to trigger an alert are increased by a factor of three and the time alerts will occur one-ninth as often as for Time and Temperature.

24 hours

SCPI Example

`CAL:AUTO:ALER DAY`

The instrument signals an alert after a time span of 24 hours since the last successful full alignment (for example, **Align Now All** or completion of a full **Auto Align**). You may want to select this option in an environment where the temperature is stable on a daily basis, at a small risk of accuracy errors in excess of the warranted specifications. The alert is the Error Condition message “Align Now All required”.

7 days

SCPI Example

`CAL:AUTO:ALER WEEK`

The instrument signals an alert after a time span of 168 hours since the last successful full alignment (for example, **Align Now All** or completion of a full **Auto Align**). You may want to select this option in an environment where the temperature is stable on a weekly basis, at a modest risk of accuracy degradations in excess of warranted performance. The alert is the Error Condition message “Align Now All required”.

None

SCPI Example

`CAL:AUTO:ALER NONE`

The instrument does not signal an alert. This is provided for rare occasions where you are making a long measurement that cannot tolerate **Auto Align** interruptions, and must have the ability to capture a screen image at the end of the measurement without an alert posted to the display. Keysight does not recommend using this selection in any other circumstances, because of the risk of accuracy performance drifting well beyond expected levels without the operator being informed.

4.6.2 Align Now

Accesses alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

Executing immediate alignments from SCPI can be problematic due to the length of time required for the alignments to complete. Alignment commands are by their

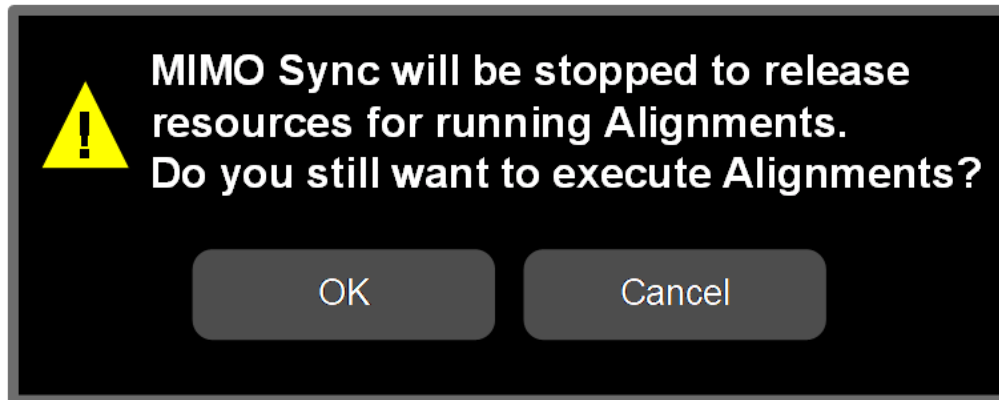

nature sequential, meaning they must complete before any other SCPI commands can be processed. In many cases the alignment itself will take longer than the typical SCPI timeout value. Furthermore, status cannot be easily queried while a sequential command is running.

For this reason, overlapped versions of the **Align Now** commands are provided. When using these No-Operation-Pending (**NPENDING**) commands, the SCPI thread will not be blocked (will be released immediately), so that you can use **:STATus:OPERation:CONDition?** to query the alignment status bit and use **:STATus:QUEStionable:CALibration:CONDition?** to check the alignment results. As an example, **:CALibration[:ALL]:NPENDING** is the overlapped replacement for **:CALibration[:ALL]**.

While the alignment is executing, the coming NOP calibration will be ignored, and **error message “Setting Conflict, Alignment is in process”** will be posted. Also, any other operations to the instrument will be pended and postponed until the alignment is completed. The operations include: Preset, Initiate a new measurement, Device clear and so on. Accordingly, changing parameters will not take effect although the UI is updated immediately. To avoid unexpected timeouts and results, these operations are not recommended during any such alignments.

NOTE

The Alignments are not performed if the MIMO Sync is running, because the MIMO and Alignments require the same hardware resource. If the instrument is in MIMO Sync and you press a button to execute Alignments, a pop-up window appears as below. Click **OK** to stop MIMO and execute Alignments.

If the instrument is in MIMO sync, and you send a SCPI command to run Alignments, the align process is not executed, and a warning is generated. To execute Alignments, you must first stop MIMO via SCPI (or manually).

Controls in this Dialog

The selection and order of controls displayed in this dialog depends on the instrument type and options. Select the control of interest from the following list:

- "Align Now All" on page 2110
- "Align Now All but RF" on page 2112
- "Align Now RF" on page 2114
- "Align Now Expired" on page 2115
- "Align Now Preselector" on page 2116
- "Align Now All but RF Preselector" on page 2117
- "Align Now RF Presel Only (20 Hz to 3.6 GHz)" on page 2117
- "Align Now External Mixer" on page 2118
- "Align Source" on page 2119
- "Align Receiver" on page 2120
- "Align Fast" on page 2120
- "Align LO Leakage" on page 2121
- "Align IF Cable" on page 2121
- "Align RRH Amplitude" on page 2121
- "Align LO Clock" on page 2122
- "Align VXT Transceiver" on page 2123
- "Align External Mixer Path" on page 2127
- "Align Low Band" on page 2128
- "Align High Band" on page 2128

4.6.2.1 Align Now All

In PXE, the key label is **Align Now All (plus RF Presel 20 Hz – 3.6 GHz)**

Immediately executes an alignment of all subsystems. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

If an interfering user signal is present at the RF Input, the alignment is performed on all subsystems except the RF. After completion, the Error Condition message "Align RF skipped" is generated. In addition, the Error Condition message "Align Now, RF

4 System

4.6 Alignments

required” is generated, and bits 11 and 12 are set in the Status Questionable Calibration register.

The query form of the remote commands (`:CALibration[:ALL]?` or `*CAL?`) invokes the alignment of all subsystems and returns a success or failure value. An interfering user signal is not grounds for failure; if the alignment was able to succeed on all portions but unable to align the RF because of an interfering signal, the resultant will be the success value.

Successful completion of **Align Now All** will clear the “Align Now All required” Error Condition, and clear bit 14 in the Status Questionable Calibration register. It will also begin the elapsed time counter for Last Align Now All Time, and capture the Last Align Now All Temperature.

If the Align RF subsystem succeeded in aligning (no interfering signal present), the elapsed time counter begins for Last Align Now, RF Time, and the temperature is captured for the Last Align Now, RF Temperature. In addition, the Error Conditions “Align RF skipped” are cleared, the Error Condition “Align Now, RF required” is cleared, and bits 11 and 12 are cleared in the Status Questionable Calibration register

Align Now All can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORt` SCPI command. When this occurs, the Error Condition message “Align Now All required” is generated, and bit 14 is set in the Status Questionable Condition register. This is because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

In many cases, you might find it more convenient to change alignments to **Normal**, instead of executing **Align Now All**. When the Auto Align process transitions to **Normal**, the instrument will immediately start to update only the alignments that have expired, thus efficiently restoring the alignment process.

Remote Command	<code>:CALibration[:ALL]</code> <code>:CALibration[:ALL]?</code>
Example	<code>:CAL</code>
Notes	<p><code>:CALibration[:ALL]?</code> returns 0 if successful, or 1 if failed</p> <p><code>:CALibration[:ALL]?</code> is the same as <code>*CAL?</code></p> <p>While Align Now All is performing the alignment, the Calibrating bit (Bit 0 in the Status Operation register) is set. Completion, or termination, will clear Bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORt</code> command</p> <p>Successful completion will clear bit 14 in the Status Questionable Calibration register</p> <p>An interfering user signal is not grounds for failure of Align Now All. However, Bits 11 and 12 are set in the Status Questionable Calibration register to indicate Align Now, RF is required</p> <p>An interfering user-supplied signal will result in the instrument requiring an Align Now, RF with the</p>

	interfering signal removed
Couplings	<p>Initializes the time for the Last Align Now All Time</p> <p>Records the temperature for the Last Align Now All Temperature</p> <p>If Align RF component succeeded, initializes the time for the Last Align Now, RF Time</p> <p>If Align RF component succeeded, records the temperature for the Last Align Now, RF Temperature</p>
Status Bits/OPC dependencies	Bits 11, 12, or 14 may be set in the Status Questionable Calibration register
	IEEE Command
Remote Command	<code>*CAL</code>
Example	<code>*CAL?</code>
Notes	<p>Returns 0 if successful, or 1 if failed</p> <p><code>:CALibration[:ALL]?</code> is exactly the same as <code>*CAL?</code>, including all conditions, status register bits, and couplings</p> <p>See additional remarks described with <code>:CALibration[:ALL]?</code></p> <p>Overlapped Command</p>
Remote Command	<code>:CALibration[:ALL]:NPending</code>
Example	<code>:CAL:NPEN</code>
Notes	<p><code>:CALibration[:ALL]:NPending</code> is the same as <code>:CALibration[:ALL]</code>, including all conditions, status register bits, except this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. <code>:CALibration:ALL:NPending</code> (Start a calibration) 2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If bit 0 is set, then the system is doing calibration, you should repeat this SCPI query until the bit is cleared) 3. <code>:STATus:QUEStionable:CALibration:CONDition?</code> (Check if there are any errors/-failures in previous calibration procedure)

4.6.2.2 Align Now All but RF

In PXE, the key label is **Align Now All but RF (not including RF Presel)**

Immediately executes an alignment of all subsystems except the RF subsystem. The instrument will stop any measurement currently underway, perform the alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key). This can be used to align portions of the instrument that are not impacted by an interfering user input signal.

4 System
4.6 Alignments

This operation might be chosen instead of **All** if you do not want the device under test to experience a large change in input impedance, such as a temporary open circuit at the instrument input.

The query form of the remote commands (**:CALibration:NRF?**) invokes the alignment and returns a success or failure value.

Successful completion of **Align Now All but RF** clears the “Align Now All required” Error Condition, and clears Bit 14 in the Status Questionable Calibration register. If “Align Now All required” was in effect prior to executing **All but RF**, the Error Condition message “Align Now RF required” is generated and Bit 12 in the Status Questionable Calibration register is set. It will also begin the elapsed time counter for Last Align Now All Time, and capture the Last Align Now All Temperature.

Align Now All but RF can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORt** SCPI command. When this occurs, the Error Condition message “Align Now All required” is generated, and Bit 14 is set in the Status Questionable Condition register. This is because new alignment data may be used for an individual subsystem, but not a full new set of data for all subsystems.

Remote Command	:CALibration:NRF :CALibration:NRF?
Example	:CAL:NRF
Notes	Returns 0 if successful, or 1 if failed While Align Now All but RF is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, will clear Bit 0 in the Status Operation register This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORt command Successful completion clears Bit 14 in the Status Questionable Calibration register and sets Bit 12 if invoked with “Align Now All required”
Couplings	Initializes the time for the Last Align Now All Time Records the temperature for the Last Align Now All Temperature
Status Bits/OPC dependencies	Bits 12 or 14 may be set in the Status Questionable Calibration register

Overlapped Command

Remote Command	:CALibration:NRF:NPENDING
Example	:CAL:NRF:NPEN
Notes	:CALibration:NRF:NPENDING is the same as :CALibration:NRF , including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not Typical usage is:

-
1. `:CALibration:NRF:NPENDING` (start the All but RF calibration)
 2. `:STATus:OPERation:CONDition?` (If bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared)
 3. `:STATus:QUESTionable:CALibration:CONDition?` (to check if there are any errors/-failures in previous calibration procedure)

4.6.2.3 Align Now RF

In PXE, the key label is **Align Now RF Only**

Immediately executes an alignment of the RF subsystem. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

This operation might be desirable if the alignments had been set to not include RF alignments, or if previous RF alignments could not complete because of interference which has since been removed.

If an interfering user signal is present at the RF Input, the alignment will terminate and generate the Error Condition message “Align RF skipped”, and Error Condition “Align Now, RF required”. In addition, bits 11 and 12 will be set in the Status Questionable Calibration register.

The query form of the remote commands (`:CALibration:RF?`) invokes the alignment of the RF subsystem and returns a success or failure value. An interfering user signal is grounds for failure.

Successful completion of **Align Now RF** begins the elapsed time counter for Last Align Now, RF Time, and capture the Last Align Now, RF Temperature.

Align Now RF can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORT` SCPI command. When this occurs, the Error Condition message “Align Now, RF required” is generated, and Bit 12 is set in the Status Questionable Condition register. None of the new alignment data is used.

Remote Command	<code>:CALibration:RF</code> <code>:CALibration:RF?</code>
----------------	---

Example	<code>:CAL:RF</code>
---------	----------------------

Notes	<p>Returns 0 if successful, or 1 if failed (including interfering user signal)</p> <p>While Align Now RF is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORT</code> command</p>
-------	---

4 System
4.6 Alignments

	<p>Successful completion clears the Error Conditions “Align RF skipped” and the Error Conditions “Align RF failed” and “Align Now, RF required”, and clears Bits 3, 11, and 12 in the Status Questionable Calibration register</p> <p>A failure encountered during alignment generates the Error Condition message “Align RF failed” and sets Bit 3 in the Status Questionable Calibration register</p> <p>An interfering user signal will result in Bits 11 and 12 being set in the Status Questionable Calibration register, to indicate Align Now, RF is required</p> <p>An interfering user supplied signal results in the instrument requiring Align Now RF with the interfering signal removed</p>
Couplings	<p>Initializes the time for the Last Align Now, RF Time</p> <p>Records the temperature for the Last Align Now, RF Temperature</p>
Status Bits/OPC dependencies	Bits 11, 12, or 14 may be set in the Status Questionable Calibration register

Overlapped Command

Remote Command	<code>:CALibration:RF:NPENding</code>
Example	<code>:CAL:RF:NPEN</code>
Notes	<p><code>:CALibration:RF:NPENding</code> is the same as <code>:CALibration:RF</code>, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. <code>:CALibration:RF:NPENding</code> (Start a RF calibration) 2. <code>:STATus:OPERation:CONDition?</code> (If Bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:CONDition?</code> (to check if there are any errors/-failures in previous calibration procedure)

4.6.2.4 Align Now Expired

Alignments can be Expired when **Auto Align** is **PARTial** or **OFF**.

This control runs the alignments that have expired. This differs from performing **Align All, Now.**, which performs an alignment of all subsystems regardless of whether they are needed or not, whereas **Execute Expired Alignments** aligns only the individual subsystems that have become due.

Remote Command	<code>:CALibration:EXPIred</code>
	<code>:CALibration:EXPIred?</code>
Example	<code>:CAL:EXP?</code>
Notes	<code>:CALibration:EXPIred?</code> returns 0 if successful, or 1 if failed

While **Align Now Expired** is performing the alignment, the Calibrating bit (Bit 0 in the Status Operation register) is set. Completion, or termination, clears Bit 0 in the Status Operation register

This command is sequential; that is, it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by **:ABORT**

Successful completion clears bit 14 in the Status Questionable Calibration register

An interfering user signal is not grounds for failure of **Align Now Expired**. However, if RF Alignment was required, Bits 11 and 12 are set in the Status Questionable Calibration register to indicate Align Now, RF is required

Status Bits/OPC dependencies Bits 11, 12, or 14 may be set in the Status Questionable Calibration register

4.6.2.5 Align Now Preselector

Normally, Preselector Alignment runs during power up, and during the twenty minutes after power up, whenever there is a 1-degree internal temperature change.

This alignment is also run when an **"Align Now All"** on page 2110 is performed. This feature is helpful during the 20-minute warm-up time to correct for preselector drift while alignments are being held off. This feature can also be used in lieu of using the Preselector Center functionality, to improve speed throughput for remote testing with minimal impact to amplitude accuracy specs. The algorithm centers the preselector at the upper and lower operating frequencies of the YTF preselector.

The **Align Now Preselector** alignment is *not* a substitute for the Characterizer Preselector Advanced Alignment, which creates the default preselector centering curves for the YTF Preselector and is typically run annually.

Remote Command **:CALibration:PRESelector**
:CALibration:PRESelector?

Example **:CAL:PRES**

Notes Returns 0 if successful, or 1 if failed (including interfering user signal)

While **Align Now Preselector** is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register

This command is sequential; that is, it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by **:ABORT**

Successful completion clears the Error Conditions "Align Preselector failed" and clears Bit 3 in the Status Questionable Calibration Failure (Extended) register

A failure encountered during alignment generates the Error Condition message "Align Preselector failed" and sets Bit 3 in the Status Questionable Calibration Failure (Extended) register

Status Bits/OPC dependencies Bit 3 may be set in the Status Questionable Calibration Failure (Extended) register

4.6.2.6 Align Now All but RF Preselector

Only available in models with the RF Preselector, such as the N9048B. It is identical to the "Align Now All" on page 2110 (plus RF Presel) function, except that the RF Preselector is only partially aligned. Only the System Gain, Mechanical attenuator and Electronic attenuator alignments on the RF Preselector path are aligned. The purpose of these alignments is to improve the RF Preselector path amplitude variation compared to the bypass path.

Remote Command	<code>:CALibration:NRFPreselector</code> <code>:CALibration:NRFPreselector?</code>
Example	<code>:CAL:NRFPre</code>
Dependencies	Only appears in N9048B. Sending the SCPI command or query in other models generates an error
Status Bits/OPC dependencies	Bits 12 or 14 may be set in the Status Questionable Calibration register

4.6.2.7 Align Now RF Presel Only (20 Hz to 3.6 GHz)

Only available in models with the RF Preselector, such as the N9048B. It executes an alignment of the RF Preselector section. The receiver will stop any measurement currently underway, perform the alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key). *Only* the RF Preselector is aligned; no Align Now All function is performed first.

The query (`:CALibration:RFPreselector:ONLY?`) invokes the alignment of the RF Preselector on both Conducted and Radiated Band, and returns a success or failure value. Successful completion clears the "Align 20 Hz to 3.6 GHz required" Error Condition, and clears Bit 1 and Bit 2 in the Status Questionable Calibration Extended Needed register.

The elapsed time counter will begin for Last Align Now, Conducted Time and Last Align Now Radiated Time and the temperature is captured for Last Align Now, Conducted Temperature and Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key or remotely with Device Clear followed by the `:ABORT` SCPI command. When this occurs, the Error Condition "Align 20 Hz to 3.6 GHz required" is set because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The "Align 20 Hz to 3.6 GHz required" Error Condition will appear when this alignment has expired. The user is now responsible to perform the Align Now, 20 Hz to 3.6 GHz in order to keep the receiver in warranted operation. This alignment can only be performed by the user, as it is not part of the Auto Align process.

Remote Command	<code>:CALibration:RFPreselector:ONLY</code>
----------------	--

	<code>:CALibration:RFPSelector:ONLY?</code>
Example	<code>:CAL:RFPS:ONLY</code>
Notes	<p>Query returns 0 if successful, or 1 if failed</p> <p>When Align 20 Hz to 3.6 GHz is performing the alignment, bit 0 in the Status Operation register is set. Completion, or termination, will clear bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORT</code> command. Successful completion clears Bits 1 and 2 in the Status Questionable Calibration Extended Needed register and Bits 0 and 1 in Status Questionable Calibration Extended Failure register</p> <p>A failure encountered during alignment sets the Error Condition “20 Hz to 3.6 GHz Alignment Failure”, sets Bits 1 and 2 in the Status Questionable Calibration Extended Needed register, and Bit 9 in Status Questionable Calibration register</p>
Dependencies	<p>Only appears in N9048B. Sending the SCPI command or query in other models generates an error</p> <p>This key is grayed-out if the instrument is displaying an “Align Now All required” message. If you press the key while it is grayed-out, you will see the informational message, “Align Now All required first”</p>
Couplings	<p>Initializes the time for the Last Align Conducted Now, Conducted Time</p> <p>Initializes the time for the Last Align Radiated Now, Radiated Time</p> <p>Records the temperature for the Last Align Conducted Now, Conducted Temperature</p> <p>Records the temperature for the Last Align Radiated Now, Radiated Temperature</p>
Status Bits/OPC dependencies	<p>Bit 8 or 9 may be set in the Status Questionable Calibration register</p> <p>Bit 1 and 2 may be set in the Status Questionable Calibration Extended Needed register</p> <p>Bit 0 and 1 may be set in the Status Questionable Calibration Extended Failure register</p>

4.6.2.8 Align Now External Mixer

Immediately executes an alignment of the External Mixer that is plugged into the USB port. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key). As this alignment calibrates the LO power to the mixer, this is considered an LO alignment; and failure is classified as an LO alignment failure.

The query (`:CALibration:EMIXer?`) invokes the alignment of the External Mixer and returns a success or failure value.

Remote Command	<code>:CALibration:EMIXer</code> <code>:CALibration:EMIXer?</code>
Example	<code>:CAL:EMIX</code>
Notes	<p>Returns 0 if successful, or 1 if failed</p> <p>While Align Now External Mixer is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed.</p>

	<p>Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the :ABORT command</p> <p>A failure encountered during alignment generate the Error Condition message “Align LO failed” and sets Bit 5 in the Status Questionable Calibration register. Successful completion clears the “Align LO failed” message and Bit 5 in the Status Questionable Calibration register</p>
Dependencies	This control does not appear unless option EXM is present and is grayed-out, unless a USB mixer is plugged in to the USB
Status Bits/OPC dependencies	Bit3 may be set in the Status Questionable Calibration Extended Failure register

4.6.2.9 Align Source

Accesses source alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

The instrument stops any sequence of the source, performs the alignment, then restarts the sequence from the beginning.

Note: This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, it is required to perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert available for the source alignment. Operators are responsible for checking temperature shift since the last **Align Now Source** to determine whether the source alignment needs to be executed.

Remote Command	:CALibration:INTernal:SOURce[:ALL] :CALibration:INTernal:SOURce[:ALL]?
Example	:CAL:INT:SOUR
Notes	:CAL:INT:SOUR? Initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9410A/11A
Couplings	Initializes the time for the Last Align Source Now, All Time Records the temperature for the Last Align Source Now, All Temperature

Overlapped Command

Remote Command	:CALibration:INTernal:SOURce[:ALL]:NPending
Example	:CAL:INT:SOUR:NPEN
Notes	:CALibration:INTernal:SOURce[:ALL]:NPending is the same as :CALibration:INTernal:SOURce[:ALL] , including all conditions and status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not Typical usage is:

	<ol style="list-style-type: none"> 1. <code>:CALibration:INTernal:SOURce:NPending</code> (start an internal source calibration) 2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If Bit 0 is set, then the system is doing calibration. Repeat this query until the bit is cleared) 3. <code>:STATus:QUEStionable:CALibration:EXTended:FAILure:CONDition?</code> (Check if Bit 14 is set or not. If this bit is set, that means there are some errors in previous internal source calibration)
Dependencies	Only appears in VXT models M9410A/11A

4.6.2.10 Align Receiver

Accesses receiver alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, it is required to perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert available for the receiver alignment. Operators are responsible for checking temperature shift since the last Align Now, Align Receiver, to determine whether the receiver alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:RECeiver[:ALL]</code> <code>:CALibration:INTernal:RECeiver[:ALL]?</code>
Example	<code>:CAL:INT:REC</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9410A/11A
Couplings	Initializes the time for the Last Align Receiver Now, All Time Records the temperature for the Last Align Receiver Now, All Temperature

4.6.2.11 Align Fast

Accesses fast alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This aligns the subsystem that is most sensitive to temperature and time and includes:

- compensating the DC offset, gain imbalance and quadrature phase imbalance of IQ Modulator and/or Demodulator
- compensating the gain offset of RF path

4 System

4.6 Alignments

It is suggested to perform Fast Alignment every 8 hours or when temperature has changed more than 5°C from the previous Fast Alignment.

Remote Command	<code>:CALibration:INTernal:FAST[:ALL]</code> <code>:CALibration:INTernal:FAST[:ALL]?</code>
Example	<code>:CAL:INT:FAST</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9410A/11A /15A/16A

4.6.2.12 Align LO Leakage

Accesses LO Leakage alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This alignment reduce the LO Leakage of the instrument.

Remote Command	<code>:CALibration:INTernal:LOLeakage</code> <code>:CALibration:INTernal:LOLeakage?</code>
Example	<code>:CAL:INT:LOL</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9410A/11A /15A/16A

4.6.2.13 Align IF Cable

Accesses IF Cable alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This alignment aligns the IF cabling to the remote heads.

Remote Command	<code>:CALibration:INTernal:RRHead:IFCable</code> <code>:CALibration:INTernal:RRHead:IFCable?</code>
Example	<code>:CAL:INT:RRH:IFC</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT based solutions with M1740A/41A/42A/49A/49B RRH
Backwards Compatibility SCPI	<code>:CALibration:INTernal:IFCable</code> <code>:CALibration:INTernal:IFCable?</code>

4.6.2.14 Align RRH Amplitude

This is an immediate action operation, which runs until complete.

Aligns the Amplitude of Remote Radio Head. This operation could take quite a long time to run.

CAUTION

For M1741A/49A/49B RRH, make sure to connect 50-ohm terminations to Head Tx/Rx 1 and 2 ports.

Remote Command	<code>:CALibration:INTernal:RRHead:AMPLitude</code> <code>:CALibration:INTernal:RRHead:AMPLitude?</code>
Example	<code>:CAL:INT:RRH:AMPL?</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT based solutions with M1741A/42A/49A/49B RRH
Backwards	<code>:CALibration:INTernal:RRHAmp</code>
Compatibility SCPI	<code>:CALibration:INTernal:RRHAmp?</code>

4.6.2.15 Align Fast RRH Amplitude

This is an immediate action operation, which runs until complete.

Compare to Align RRH Amplitude, it aligns the amplitude of Remote Radio Head with a wider frequency interval. This operation takes about one minute.

Remote Command	<code>:CALibration:INTernal:RRHead:AMPLitude:FAST</code> <code>:CALibration:INTernal:RRHead:AMPLitude:FAST?</code>
Example	<code>:CAL:INT:RRH:AMPL:FAST?</code>
Notes	The query initiates an alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT based solutions with M1742A RRH

4.6.2.16 Align RRH LO Power

This is an immediate action operation, which runs until complete.

Aligns the LO Power of Remote Radio Head.

Remote Command	<code>:CALibration:INTernal:RRHead:LOPower</code> <code>:CALibration:INTernal:RRHead:LOPower?</code>
Example	<code>:CAL:INT:RRH:LOP</code>
Notes	The query initiates an alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT based solutions with M1741A/49A/49B RRH

4.6.2.17 Align LO Clock

This is an immediate action operation, which runs until complete.

Synchronizes RRH LO Clocks.

Remote Command	<code>:CALibration:INTernal:RRHead:LOSync</code> <code>:CALibration:INTernal:RRHead:LOSync?</code>
Example	<code>:CAL:INT:RRH:LOS?</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT based solutions with M1741A/42A/49A/49B RRH
Backwards	<code>:CALibration:INTernal:LOSync</code>
Compatibility SCPI	<code>:CALibration:INTernal:LOSync?</code>

4.6.2.18 Align VXT Transceiver

In M941xE(M941xA+M9471A) system, accesses alignment processes in VXT Transceiver(M9410A/11A/15A/16A), which are immediate action operations and perform complete operations, running until they are complete.

The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

There is no alert available for the VXT Transceiver alignment. Operators are responsible for checking temperature shift since the last **Align VXT Transceiver** to determine whether the VXT Transceiver alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:VXT:TRANSceiver</code> <code>:CALibration:INTernal:VXT:TRANSceiver?</code>
Example	<code>:CAL:INT:VXT:TRAN</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears on M9410E/11E/15E/16E

4.6.2.19 Align up down converter

In M941xE(M941xA+M9471A) system, accesses alignment processes in up down converter (M9471A), which are immediate action operations and perform complete operations, running until they are complete.

The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

There is no alert available for the up down converter alignment. Operators are responsible for checking temperature shift since the last **Align up down converter** to determine whether the up down converter alignment needs to be executed.

Remote Command	<code>:CALibration:UPDown:CONVerter</code> <code>:CALibration:UPDown:CONVerter?</code>
Example	<code>:CAL:UPD:CONV</code>
Notes	The query initiates an Alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears on M9410E/11E/15E/16E

4.6.2.20 Align Selected Freq Ranges

VXT models M9410A/11A provide five alignments: **Align Now All**, **Align Source**, **Align Receiver**, **Align Fast** and **Align LO Leakage**. Every time you execute one of these alignments, the system performs a full span alignment. To save time, it is possible to limit the range of alignment frequency settings. **Align Selected Freq Ranges** allows you to set the start and stop frequency of an alignment.

The example below shows the steps for processing Align Receiver on VXT model M9410A, specifying a frequency range from 1.3 GHz to 1.8 GHz, and 2.5 GHz to 3.9 GHz.

- First row: set the Start and Stop Frequency to 1.3 GHz and 1.8 GHz. Enable the first row
- Second row: set the Start and Stop Frequency to 2.5 GHz and 3.9 GHz. Enable the second row
- Click **Align Receiver**. A message appears: “Aligning Selected Freq Ranges 1 of 7”

The equivalent SCPI command sequence is:

```
:CAL:INT:ASFR ON
:CAL:INT:ASFR:FRAN 1.3 GHz, 1.8 GHz, 2.5 GHz, 3.9 GHz
:CAL:INT:REC
```

Remote Command	<code>:CALibration:INTernal:ASFRanges[:STATe] ON OFF 1 0</code> <code>:CALibration:INTernal:ASFRanges?</code>
Example	<code>:CAL:INT:ASFR ON</code> <code>:CAL:INT:ASFR?</code>
Notes	When Align Selected Freq Ranges is ON , the table is displayed for setting up the frequency ranges to be aligned
Dependencies	Only available in: <ul style="list-style-type: none"> – VXT models M9410A/11A – VXT models M9410A/11A with RRH and/or CIU – M9410E/11E

Only functional for the following alignments:

- Align Now All of VXT models M9410A/11A and M9410E/11E
- Align Source
- Align Receiver
- Align Fast
- Align LO Leakage
- Align VXT Transceiver of M910E/11E
- Align Up Down Converter of M9410E/11E

Align Selected Freq Ranges only guarantees the hardware performance within the frequency range

Preset **OFF**

Enable Extended Freq Range

Allows you to set frequency ranges for VXT models M9410A/11A/15A with Remote Head and/or CIU. When Enable Extended Freq Range is not active, the frequency range is limited by VXT models only.

Remote Command **:CALibration:INTernal:ASFRanges:EXTend[:STATE] ON | OFF | 1 | 0**
:CALibration:INTernal:ASFRanges:EXTend[:STATE]?

Example **:CAL:INT:ASFR:EXT ON**
:CAL:INT:ASFR:EXT?

Dependencies Only available in VXT models M9410A/11A/15A/16A with Remote Head and/or CIU
Only available when **Align Specified Freq Ranges** is **ON**

Preset **OFF**

Frequency Range

Allows you to set the alignment frequency range.

Remote Command **:CALibration:INTernal:ASFRanges:FRANges <startFreq>,<stopFreq>[,<startFreq>,<stopFreq>][,<startFreq>,<stopFreq>][,<startFreq>,<stopFreq>][,<startFreq>,<stopFreq>]**

Example **:CAL:INT:ASFR:FRAN 1.3 GHz,1.8 GHz,2.5 GHz,3.9 GHz**
:CAL:INT:ASFR:FRAN?

Notes **<startFreq>**: Start frequency of an alignment
<stopFreq>: Stop frequency of an alignment
To process alignment for a single frequency point, set **<startFreq> = <stopFreq>**

Dependencies	<p>Only appears when "Align VXT Transceiver" on page 2123 is ON</p> <p>Error message "Invalid alignment frequency range" is reported if start and stop frequencies are invalid, such as:</p> <ol style="list-style-type: none"> 1. Stop frequency - Start frequency < 0 2. the count of start and stop frequency is not even 3. the frequency is out of range. See "More Information" on page 2126 4. more than 5 pairs of start and stop frequency are listed
Preset	1.0 GHz, 2.0 GHz

More Information

When **"Enable Extended Freq Range" on page 2125** is not active, the frequency range depends on the VXT models. The table below lists the Start and Stop Frequency Ranges for VXT models M9410A/11A/15A:

Hardware	Options	Min Frequency	Max Frequency
M9410A/11A	F06	330 MHz	6.08 GHz
M9410A/11A	F06 & EP6	330 MHz	6.6 GHz
M9410A/11A	F06 & LFE & EP6	6.5 kHz	6.6 GHz
M9415A/16A	F06	330 MHz	6.6 GHz
M9415A/16A	F08	330 MHz	8.6 GHz
M9415A/16A	F12	330 MHz	12.9 GHz

When **Enable Extended Freq Range** is active, the frequency range depends on the extensions connected to VXT models. The table below lists the Start and Stop Frequency Range of VXT models with Radio Heads/CIU:

Connected with Radio Heads/CIU	Min frequency	Max frequency	IF Frequency range
VXT + CIU	5.9 GHz	12 GHz	1.4 GHz ~ 4.6 GHz
VXT + CIU + RRH	24.25 GHz	43.5 GHz	2.5 GHz ~ 4.5 GHz
VXT + M1742A	10 GHz	32 GHz	3.0 GHz ~ 5.5 GHz

NOTE

The Min frequency and Max frequency are also the preset frequencies. It is recommended to keep the preset frequency range for VXT models with extensions. An alignment with the full IF Frequency range will be executed ignoring the specific ranges.

The table below lists the Frequency Range of M941xE(VXT Models with M9471A)

4 System
4.6 Alignments

Products with M9471A	Preset	Receiver minimum settable frequency	Source minimum settable (center)frequency	Minimum center frequency with Spec	Receiver maximum settable(center) frequency	Source maximum settable (center) frequency
M941xE without LFE option	1 GHz	330.000005 MHz	330 MHz	380MHz	26.499999995 GHz	26.5GHz
M941xE with LFE option (LFE option in M9411A or M9471A)	1 GHz	750.005 kHz	750 kHz	1MHz	26.499999995 GHz	26.5GHz

NOTE

The minimum spec frequency is 380 MHz, but the receiver minimum settable center frequency is 330.000005 MHz, the source minimum settable center frequency is 330 MHz.

With Option LFE in M9411A or in M9471A, the receiver minimum settable frequency is 750.005 kHz, the source minimum settable frequency is 750 kHz, but Spec to customer only ensure down to 1 MHz.

Enable

Enables or disables the selected frequency ranges.

Preset **Row 1: ON**
Other rows: OFF

4.6.2.21 Align External Mixer Path

Immediately executes an alignment of the External Mixer Path inside the VXT models M9415A/16A. External Mixer Path is used when the RF Port is connected to an external Remote Radio Head (RRH). It provides a better performance compared to the normal path. External Mixer Path Alignment covers frequencies from 2.4 GHz to 3.4 GHz of the external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the External Mixer Path alignment. You are responsible for checking the temperature shift since the last **Align Now, External Mixer Path**, to determine whether the external mixer path alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:EMPath</code> <code>:CALibration:INTernal:EMPath?</code>
Example	<code>:CAL:INT:EMP</code>
Notes	The query initiates an alignment and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9415A/16A when Option MXP is installed
Couplings	Initializes the time for the Last Align External Mixer Path Now, All Time Records the temperature for the Last Align External Mixer Path Now, All Temperature

4.6.2.22 Align Low Band

Accesses Low Band alignment processes that are immediate action operations. They perform complete operations and run until they are complete. Low Band Alignment covers frequencies from 380 MHz to 4.3 GHz of the non-external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the Low Band alignment. You are responsible for checking the temperature shift since the last **Align Now, Align Low Band**, to determine whether the Low Band alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:LBAND[:ALL]</code> <code>:CALibration:INTernal:LBAND[:ALL]?</code>
Example	<code>:CAL:INT:LBAN</code>
Notes	The query initiates an Alignment, and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9415A/16A
Couplings	Initializes the time for the Last Align Low Band Now, All Time Records the temperature for the Last Align Low Band Now, All Temperature

4.6.2.23 Align High Band

Accesses High Band alignment processes that are immediate action operations. They perform complete operations and run until they are complete. High Band Alignment covers frequencies from 4.3 GHz to 12 GHz of the non-external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the High Band alignment. You are responsible for checking the temperature shift since last **Align Now, Align High Band**, to determine whether the High Band alignment needs to be executed.

Remote Command	<code>:CALibration:INTernal:HBAND[:ALL]</code> <code>:CALibration:INTernal:HBAND[:ALL]?</code>
Example	<code>:CAL:INT:HBAN</code>
Notes	The query initiates an Alignment, and returns 0 if successful, or 1 if failed
Dependencies	Only appears in VXT models M9415A/16A
Couplings	Initializes the external time for the Last Align High Band Now, All Time Records the temperature for the Last Align High Band Now, All Temperature

4.6.3 Path Delay Calibration

Path Delay Calibration is used to remove the time delay differences between multiple power channels of a module.

Dependencies	Only available in VXT modules M9410A/11A Only for modules with matched Digital board hardware version, which means the modules are in same FPGA version The matched hardware version information is in below table
--------------	--

	Digital board Hardware version	Matched module
M9410A	2,3,4,6,10,11	Yes
M9410A	12, 13	Yes
M9411A	18	Yes
M9411A	20,21	Yes
M9411A	12,13	Yes
M9411A	0,1,2,3,4,6,10,11	Yes

4.6.3.1 Source Path Delay Calibration

Accesses the Source Path Delay Calibration processes, which are immediate-action operations and perform complete operations, running until they are complete.

NOTE Connect the RF In of the primary module to the OUT port (COMMON, PORT 1) of the combiner.

NOTE Before performing Path Delay Calibration of Sources, please confirm that:

NOTE Each of the RF Out ports is connected to the RF In port of the Primary channel, using an RF combiner.

NOTE The cables between the combiner and the Source output ports are of the same length.

NOTE A pop-up window appears (as shown below); press OK to continue calibration.

NOTE If the is in MIMO sync, and you send a SCPI command to run Calibration, the calibration process is not executed and instrument a warning is generated (“-221,Setting Conflict; Calibrations are not available while MIMO Sync is On”). To execute Calibration, you must first stop MIMO, manually or via SCPI.

Remote Command :CALibration:PDElay:SOURce
 :CALibration:PDElay:SOURce?

Example :CAL:PDEL:SOUR

Notes The query initiates an Alignment and returns 0 if successful, or 1 if failed
 If the calibration process detected a faulty state, an error will be generated: “Misc/System Alignment Failure”. Calibration will be aborted. Please see event log for more information:

1. Cables are not connected
2. Power control failure
3. Hardware failure
4. M9300A 10MHz reference open failure

Dependencies Only appears in VXT models M9410A/11A
 Only for modules with matched Digital board hardware version, which means the modules are in same FPGA version

4.6.3.2 Path Delay Correction On/Off(Remote Command only)

On/Off the path delay correction to enable the calibration data on the source of the module.

Remote Command	<code>:CALibration:PDElay:CORRection ON OFF</code> <code>:CALibration:PDElay:CORRection?</code>
Example	<code>:CAL:PDEL:CORR ON</code>
Notes	If the Path Delay Calibration has never been performed and there is no calibration correction data in the controller, an alert is generated
Preset	<code>OFF</code>
Range	<code>ON OFF</code>

4.6.4 Show Alignment Statistics

Shows alignment information you can use to ensure that the instrument is operating in a specific manner. The **Show Alignment Statistics** screen is where you can view time and temperature information.

Values displayed are only updated when the **Show Alignment Statistics** screen is invoked. They are not updated while the **Show Alignment Statistics** screen is being displayed. The remote commands that access this information obtain current values.

Note that some of these statistics only display if your instrument supports them; for example, Last Source Align Now All Time only shows up in instruments which contain a source which supports auto alignments.

An example of the **Show Alignment Statistics** screen would be similar to:

Std Header	Product Number: N9020A Serial Number: US46340924 Firmware Revision: A.01.01		
Instrument Info	Time since start-up:	300 hrs	
	Current Temperature:	+28 degC	
Auto Align Info	Time while Auto Align off:	90 min	
Std Align Now	Time since last Align Now All:	12.5 hrs	Times & Temperature delta. Shown as "---" if none since start-up.
	Temperature since last Align Now All:	-1.3 degC	
	Time since last Align Now RF:	5 min	
	Temperature since last Align Now RF:	+0.1 degC	
If TG Option (Not Zorro1)	Time since last Align TG:	2.5 hrs	Time & Temperature 'stamp'
	Temperature since last Align TG:	+0.2 degC	
Opts 508,513 526	Last Characterize Preselector:	Jun 1, 2006 15:00:00	
	Last Characterize Preselector Temperature:	+32.1 degC	

“Time while Auto Align off” is not available in VXT models M9410A/11A.

A successful **Align Now, RF** sets the Last Align RF temperature to the current temperature, and resets the Last Align RF time. A successful **Align Now All** or **Align Now All but RF** sets the Last Align Now All temperature to the current temperature, and resets the Last Align Now All time. A successful **Align Now All** also resets the Last Align RF items if the RF portion of the **Align Now** succeeded.

Example `:SYST:SHOW ALIGN`

Notes The values displayed on the screen are only updated upon entry to the screen, and not updated while the screen is being displayed

The following data-specific queries are available:

Query Time since Startup

Remote Command `:SYSTem:PON:TIME?`

Example `:SYST:PON:TIME?`

Notes Value is the time since the most recent start-up in seconds

State Saved No

Query Current Temperature

Remote Command `:CALibration:TEMPerature:CURRent?`

Example `:CAL:TEMP:CURR?`

Notes Value is in degrees Centigrade

State Saved No

Query Current Temperature at Remote Radio Head

Remote Command	<code>:CALibration:TEMPerature:CURRent:RRHead?</code>
Example	<code>:CAL:TEMP:CURR:RRH?</code>
Notes	Value is in degrees Centigrade
Dependencies	Only appears when Align RRH Amplitude is available
State Saved	No

Query Current Temperature at Remote Radio Head LO

Remote Command	<code>:CALibration:TEMPerature:CURRent:RRHead:LO?</code>
Example	<code>:CAL:TEMP:CURR:RRH:LO?</code>
Notes	Value is in degrees Centigrade
Dependencies	Only appears when Align RRH LO Power is available
State Saved	No

Query Time since Last Align Now All

Remote Command	<code>:CALibration:TIME:LALL?</code>
Example	<code>:CAL:TIME:LALL?</code>
Notes	Value is the elapsed time, in seconds, since the last successful Align Now All or Align Now All but RF was executed
State Saved	No

Query Temperature of Last Align Now All

Remote Command	<code>:CALibration:TEMPerature:LALL?</code>
Example	<code>:CAL:TEMP:LALL?</code>
Notes	Value is in degrees Centigrade at which the last successful Align Now All or Align Now All but RF was executed
State Saved	No

Query Time since Last Align Now Receiver

Remote Command	<code>:CALibration:TIME:INTernal:RECeiver?</code>
Example	<code>:CAL:TIME:INT:REC?</code>
Notes	Value in hours since the last successful Align Now Receiver
Dependencies	Only appears in VXT models M9410A/11A
State Saved	No

Query Temperature of Last Align Now Receiver

Remote Command	<code>:CALibration:TEMPerature:INTernal:RECeiver?</code>
Example	<code>:CAL:TEMP:INT:REC?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Receiver was executed
Dependencies	Only appears in VXT models M9410A/11A
State Saved	No

Query Time since Last Align Now Source

Remote Command	<code>:CALibration:TIME:INTernal:SOURce?</code>
Example	<code>:CAL:TIME:INT:SOUR?</code>
Notes	Value in hours since the last successful Align Now Source
Dependencies	Only appears in VXT models M9410A/11A
State Saved	No

Query Temperature of Last Align Now Source

Remote Command	<code>:CALibration:TEMPerature:INTernal:SOURce?</code>
Example	<code>:CAL:TEMP:INT:SOUR?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Source was executed
Dependencies	Only appears in VXT models M9410A/11A
State Saved	No

Query Time since Last Align Now Fast

Remote Command	<code>:CALibration:TIME:INTernal:FAST?</code>
Example	<code>:CAL:TIME:INT:FAST?</code>
Notes	Value in hours since the last successful Align Now Fast
Dependencies	Only appears in VXT models M9410A/11A/15A/16A
State Saved	No

Query Temperature of Last Align Now Fast

Remote Command	<code>:CALibration:TEMPerature:INTernal:FAST?</code>
Example	<code>:CAL:TEMP:INT:FAST?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Fast was executed
Dependencies	Only appears in VXT models M9410A/11A/15A/16A
State Saved	No

Query Time since Last Align Now LO Leakage

Remote Command	<code>:CALibration:TIME:INTernal:LOLeakage?</code>
Example	<code>:CAL:TIME:INT:LOL?</code>
Notes	Value in hours since the last successful Align Now LO Leakage
Dependencies	Only appears in VXT models M9410A/11A/15A/16A
State Saved	No

Query Temperature of Last Align Now LO Leakage

Remote Command	<code>:CALibration:TEMPerature:INTernal:LOLeakage?</code>
Example	<code>:CAL:TEMP:INT:LOL?</code>
Notes	Value in degrees Centigrade when the last successful Align Now LO Leakage was executed
Dependencies	Only appears in VXT models M9410A/11A/15A/16A
State Saved	No

Query Time since Last Align Now IF Cable

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:IFCable?</code>
Example	<code>:CAL:TIME:INT:RRH:IFC?</code>
Notes	Value in hours since the last successful Align Now IF Cable
Dependencies	Only appears in VXT based solutions with M1740A/41A/42A/49A/49B RRH
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TIME:INTernal:IFCable?</code>

Query Temperature of Last Align Now IF Cable

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:IFCable?</code>
Example	<code>:CAL:TEMP:INT:RRH:IFC?</code>
Notes	Value in degrees Centigrade when the last successful Align Now IF Cable was executed
Dependencies	Only appears in VXT based solutions with M1740A/41A/42A/49A/49B RRH
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TEMPerature:INTernal:IFCable?</code>

Query Time since Last Align LO Clock

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:LOSync?</code>
----------------	--

Example	<code>:CAL:TIME:INT:RRH:LOS?</code>
Notes	Value in hours since the last successful Align LO Clock
Dependencies	Only appears in VXT based solutions with M1741A/42A/49A/49B RRH
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TIME:INTernal:LOSync?</code>

Query Temperature of Last Align LO Clock

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:LOSync?</code>
Example	<code>:CAL:TEMP:INT:RRH:LOS?</code>
Notes	Value in degrees Centigrade when the last successful Align LO Clock was executed
Dependencies	Only appears in VXT based solutions with M1741A/42A/49A/49B RRH
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TEMPerature:INTernal:LOSync?</code>

Query Time since Last Align RRH Amplitude

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:AMPLitude?</code>
Example	<code>:CAL:TIME:INT:RRH:AMPL?</code>
Notes	Value in hours since the last successful Align RRH Amplitude
Dependencies	Only appears in VXT based solutions with M1741A/42A/49A/49B RRH
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TIME:INTernal:RRHAmp?</code>

Query Temperature of Last Align RRH Amplitude

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:AMPLitude?</code>
Example	<code>:CAL:TEMP:INT:RRH:AMPL?</code>
Notes	Value in degrees Centigrade when the last successful Align RRH Amplitude was executed
Dependencies	Only appears in VXT based solutions with M1741A/42A/49A/49B RRH
State Saved	No
Backwards Compatibility SCPI	<code>:CALibration:TEMPerature:INTernal:RRHAmp?</code>

Query Time since Last Align Fast RRH Amplitude

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:AMPLitude:FAST?</code>
Example	<code>:CAL:TIME:INT:RRH:AMPL:FAST?</code>
Notes	Value in hours since the last successful Align Fast RRH Amplitude
Dependencies	Only appears in VXT based solutions with M1742A RRH
State Saved	No

Query Temperature of Last Align Fast RRH Amplitude

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:AMPLitude:FAST?</code>
Example	<code>:CAL:TEMP:INT:RRH:AMPL:FAST?</code>
Notes	Value in degrees Centigrade when the last successful Align Fast RRH Amplitude was executed
Dependencies	Only appears in VXT based solutions with M1742A RRH
State Saved	No

Query Time since Last Align RRH LO Power

Remote Command	<code>:CALibration:TIME:INTernal:RRHead:LOPower?</code>
Example	<code>:CAL:TIME:INT:RRH:LOP?</code>
Notes	Value in hours since the last successful Align RRH LO Power
Dependencies	Only appears in VXT based solutions with M1741A/49A/49B RRH
State Saved	No

Query Temperature of Last Align RRH LO Power

Remote Command	<code>:CALibration:TEMPerature:INTernal:RRHead:LOPower?</code>
Example	<code>:CAL:TEMP:INT:RRH:LOP?</code>
Notes	Value in degrees Centigrade when the last successful Align RRH LO Power was executed
Dependencies	Only appears in VXT based solutions with M1741A/49A/49B RRH
State Saved	No

Query Time since Last Align Now RF

Remote Command	<code>:CALibration:TIME:LRF?</code>
Example	<code>:CAL:TIME:LRF?</code>
Notes	Value is the elapsed time, in seconds, since the last successful Align Now, RF was executed, either individually or as a component of Align Now All
State Saved	No

Query Temperature of Last Align Now RF

Remote Command	:CALibration:TEMPerature:LRF?
Example	:CAL:TEMP:LRF?
Notes	Value is in degrees Centigrade at which the last successful Align Now RF was executed, either individually or as a component of Align Now All
State Saved	No

Query Time since Last Align IF

Remote Command	:CALibration:TIME:LIF?
Example	:CAL:TIME:LIF?
Notes	Value is the elapsed time, in seconds, since the last successful Align IF was executed
State Saved	No

Query Temperature of Last Align IF

Remote Command	:CALibration:TEMPerature:LIF?
Example	:CAL:TEMP:LIF?
Notes	Value is in degrees Centigrade at which the last successful Align IF was executed
State Saved	No

Query Time since Last Characterize Preselector

Remote Command	:CALibration:TIME:LPreselector?
Example	:CAL:TIME:LPR?
Notes	Value is the date and time the last successful Characterize Preselector was executed. The date is separated from the time by a space character Returns "" if no Characterize Preselector has ever been performed on the instrument
Dependencies	In models that do not include preselectors, this command is not enabled and any attempt to set or query yields an error
State Saved	No

Query Temperature of Last Characterize Preselector

Remote Command	:CALibration:TEMPerature:LPreselector?
Example	:CAL:TEMP:LPR?
Notes	Value is in degrees Centigrade at which the last successful Characterize Preselector was executed

4 System
4.6 Alignments

Dependencies	In models that do not include preselectors, this command is not enabled and any attempt to set or query yields an error
--------------	---

State Saved	No
-------------	----

Query Time since Auto Align Off

Remote Command	<code>:CALibration:AUTO:TIME:OFF?</code>
----------------	--

Example	<code>:CAL:AUTO:TIME:OFF?</code>
---------	----------------------------------

Notes	Value is the elapsed time, in seconds, since Auto Align has been set to Off or Off with Alert . The value is 0 if Auto Align is ALL or NORF
-------	---

State Saved	No
-------------	----

Query Time since Last Align Now 20 Hz - 30 MHz

Remote Command	<code>:CALibration:TIME:RFPSelector:LCONducted?</code>
----------------	--

Example	<code>:CAL:TIME:RFPS:LCON?</code>
---------	-----------------------------------

Notes	Values are the date and time the last successful Align Now, 20 Hz - 30 MHz was executed. The date is separated from the time by a semi-colon character
-------	---

State Saved	No
-------------	----

Query Temperature of Last Align Now 20 Hz - 30 MHz

Remote Command	<code>:CALibration:TEMPerature:RFPSelector:LCONducted?</code>
----------------	---

Example	<code>:CAL:TEMP:RFPS:LCON?</code>
---------	-----------------------------------

Notes	Value is in degrees Centigrade at which the last successful Align Now, 20 Hz - 30 MHz was executed
-------	---

State Saved	No
-------------	----

Query Time since Last Align Now 30 MHz - 3.6 GHz

Remote Command	<code>:CALibration:TIME:RFPSelector:LRADiated?</code>
----------------	---

Example	<code>:CAL:TIME:RFPS:LRAD?</code>
---------	-----------------------------------

Notes	Value is the date and time the last successful Align Now, 30 MHz - 3.6 GHz was executed. The date is separated from the time by a semi-colon character
-------	---

State Saved	No
-------------	----

Query Temperature of Last Align Now 30 MHz – 3.6 MHz

Remote Command	:CALibration:TEMPerature:RFPSelector:LRADiated?
Example	:CAL:TEMP:RFPS:LRAD?
Notes	Value is in degrees Centigrade at which the last successful Align Now, 30 MHz – 3.6 GHz was executed
State Saved	No

Query Next Scheduled Alignment Time

Remote Command	:CALibration:RFPSelector:SCHeduler:TIME:NEXT? Returns data using the following format: YYYY/MM/DD; HH:MM:SS
Example	:CAL:RFPS:SCH:TIME:NEXT?
Notes	The next run time will be updated based on the start date/time and recurrence set by the user “date” is representation of the date the task will run in the form: YYYY/MM/DD where: <ul style="list-style-type: none"> – YYYY is the four-digit representation of year. (for example, 2009) – MM is the two-digit representation of month. (for example, 01 to 12) – DD is the two-digit representation of the day. (for example, 01 to 28, 29, 30 or 31 depending on the month and year) “time” is a representation of the time of day the task will run in the form: HH:MM:SS where: <ul style="list-style-type: none"> – HH is the two-digit representation of the hour in 24-hour format – MM is the two-digit representation of minute – SS is the two-digit representation of seconds
State Saved	No

Query Time since Last Align Now External Mixer Path

Remote Command	:CALibration:TIME:INTernal:EMPath?
Example	:CAL:TIME:INT:EMP?
Notes	Value in hours since the last successful Align Now External Mixer Path
Dependencies	Only appears option MXP is installed
State Saved	No

Query Temperature of Last Align Now External Mixer Path

Remote Command	<code>:CALibration:TEMPerature:INTernal:EMPath?</code>
Example	<code>:CAL:TEMP:INT:EMP?</code>
Notes	Value in degrees Centigrade when the last successful Align Now External Mixer Path was executed
Dependencies	Only appears option MXP is installed
State Saved	No

Query Time since Last Align Now Low Band

Remote Command	<code>:CALibration:TIME:INTernal:LBANd?</code>
Example	<code>:CAL:TIME:INT:LBAN?</code>
Notes	Value in hours since the last successful Align Now Low Band
Dependencies	Only appears in VXT models M9415A/16A
State Saved	No

Query Temperature of Last Align Now Low Band

Remote Command	<code>:CALibration:TEMPerature:INTernal:LBANd?</code>
Example	<code>:CAL:TEMP:INT:LBAN?</code>
Notes	Value in degrees Centigrade when the last successful Align Now Low Band was executed
Dependencies	Only appears in VXT models M9415A/16A
State Saved	No

Query Time since Last Align Now High Band

Remote Command	<code>:CALibration:TIME:INTernal:HBAN?</code>
Example	<code>:CAL:TIME:INT:HBAN?</code>
Notes	Value in hours since the last successful Align Now High Band
Dependencies	Only appears in VXT models M9415A/16A
State Saved	No

Query Temperature of Last Align Now High Band

Remote Command	<code>:CALibration:TEMPerature:INTernal:HBANd?</code>
Example	<code>:CAL:TEMP:INT:HBAN?</code>
Notes	Value in degrees Centigrade when the last successful Align Now High Band was executed
Dependencies	Only appears in VXT models M9415A/16A
State Saved	No

Query Time since Last Align VXT Transceiver

Remote Command	:CALibration:TIME:INTernal:VXT:TRANsceiver?
Example	:CAL:TIME:INT:VXT:TRAN?
Notes	Value in hours since the last successful Align VXT Transceiver Returns NaN if Align VXT Transceiver has never been performed on the instrument
Dependencies	Only appears in M9410E/11E/15E/16E
State Saved	No

Query Temperature of Last Align VXT Transceiver

Remote Command	:CALibration:TEMPerature:INTernal:VXT:TRANsceiver?
Example	:CAL:TEMP:INT:VXT:TRAN?
Notes	Value in degrees Centigrade when the last successful Align VXT Transceiver was executed Returns 9.91E+37(NaN) if Align VXT Transceiver has never been performed on the instrument
Dependencies	Only appears in M9410E/11E/15E/16E
State Saved	No

Query Time since Last Align Up Down Converter

Remote Command	:CALibration:TIME:UPDown:CONVerter?
Example	:CAL:TIME:UPD:CONV?
Notes	Value in hours since the last successful Align Up Down Converter Returns NaN if Align Up Down Converter has never been performed on the instrument
Dependencies	Only appears in M9410E/11E/15E/16E
State Saved	No

Query Temperature of Last Align Up Down Converter

Remote Command	:CALibration:TEMPerature:UPDown:CONVerter?
Example	:CAL:TEMP:UPD:CONV?
Notes	Value in degrees Centigrade when the last successful Align Up Down Converter was executed Returns 9.91E+37(NaN) if Align Up Down Converter has never been performed on the instrument
Dependencies	Only appears in VXT models M9410A/11A and M9410E/11E
State Saved	No

Query Time since Last Path Delay Calibration

Remote Command	:CALibration:TIME:PDElay:SOURce?
----------------	----------------------------------

Example	<code>:CAL:TIME:PDEL:SOUR?</code>
Notes	The value is the elapsed time in hours since the last successful Path Delay Calibration has been performed Returns NaN if the Path Delay Calibration has never been performed
State Saved	No

Query Temperature of Last Path Delay Calibration

Remote Command	<code>:CALibration:TEMPerature:PDElay:SOURce?</code>
Example	<code>:CAL:TEMP:PDEL:SOUR?</code>
Notes	The value is in degrees Centigrade at which the last successful Path Delay Calibration has been performed Returns 9.91E+37(NaN) if the Path Delay Calibration has never been performed
State Saved	No

4.6.5 Timebase DAC

Lets you change the setting of the **Timebase DAC** from a factory calibrated setting to your own desired setting.

The display shows the current **Timebase DAC** setting at the top, and gives you a choice of **CALibrated** or **USER** setting. There is also a field for you to enter your desired setting.

Dependencies	Does not appear in VXT and M941xE
--------------	-----------------------------------

4.6.5.1 Timebase DAC

Allows control of the internal 10 MHz reference oscillator timebase. This may be used to adjust for minor frequency alignment between your signal's reference and the internal frequency reference. This adjustment has no effect if the instrument is operating with an External Frequency Reference.

If the value of the **Timebase DAC** changes (by switching to **CALibrated** from **USER** with **User Value** set to a different value, or in **USER** with a new value entered) an alignment may be necessary. The alignment system will take appropriate action; which will either invoke an alignment or cause an **Alert**.

The **CALibrated** setting sets the **Timebase DAC** to the value established during factory or field calibration. In this case the value displayed at the top of the screen is the calibrated value.

The **USER** setting sets the **Timebase DAC** to the value set on the **User Value** control. In this case the value displayed at the top of the screen is the user value.

Remote Command	<code>:CALibration:FREquency:REFerence:MODE CALibrated USER</code> <code>:CALibration:FREquency:REFerence:MODE?</code>
Example	<code>:CAL:FREQ:REF:MODE CAL</code>
Notes	If the value of the timebase is changed the alignment system automatically performs an alignment or alerts that an alignment is due
Dependencies	Not available in UXM
Preset	Unaffected by Preset , but set to CALibrated by Restore Defaults >"Alignments" on page 2100
State Saved	No

4.6.5.2 User Value

Lets you set the **Timebase DAC** to a value other than the value established during the factory or field calibration. The current value of the DAC is displayed at the top of the screen. This will be the Calibrated value if **Timebase DAC** is set to **CALibrated**.

Remote Command	<code>:CALibration:FREquency:REFerence:FINE <integer></code> <code>:CALibration:FREquency:REFerence:FINE?</code>
Example	<code>:CAL:FREQ:REF:FINE 8191</code>
Notes	If the value of the timebase is changed the alignment system automatically performs an alignment or alerts that an alignment is due
Couplings	Setting <code>:CAL:FREQ:REF:FINE</code> sets <code>:CAL:FREQ:REF:MODE USER</code>
Preset	Unaffected by Preset , but set to the factory setting by Restore Defaults >"Alignments" on page 2100
State Saved	No
Min	0
Max	16383
Backwards Compatibility SCPI	<code>:CALibration:FREquency:REFerence:COARse</code> ESA hardware contained two DAC controls for the Timebase. In X-Series the command <code>:CALibration:FREquency:REFerence:FINE</code> is the method for adjusting the timebase. The COARse option is provided as an alias to FINE
	Backwards Compatibility Command
Remote Command	<code>:CALibration:FREquency:REFerence:COARse <integer></code> <code>:CALibration:FREquency:REFerence:COARse?</code>
Example	<code>:CAL:FREQ:REF:COAR 8191</code>
Notes	This is an alias for <code>:CAL:FREQ:REF:FINE</code> . Any change to COARse is reflected in FINE and <i>vice-versa</i> . See <code>:CAL:FREQ:REF:FINE</code> for description of functionality
Couplings	Setting <code>:CAL:FREQ:REF:COAR</code> sets <code>:CAL:FREQ:REF:MODE USER</code>

4.6.6 Advanced

Accesses alignment processes that are immediate action operations that perform operations that run until complete. **Advanced** alignments are performed on an irregular basis, or require additional operator interaction.

Dependencies	Not available in UXM
--------------	----------------------

4.6.6.1 Characterize Preselector

The Preselector tuning curve drifts over temperature and time. Recognize that the Amplitude, Presel Center function adjusts the preselector for accurate amplitude measurements at an individual frequency. Characterize Preselector improves the amplitude accuracy by ensuring the Preselector is approximately centered at all frequencies without the use of the Amplitude, Presel Center function. Characterize Preselector can be useful in situations where absolute amplitude accuracy is not of utmost importance, and the throughput savings or convenience of not performing a Presel Center is desired. Presel Center is required prior to any measurement for best (and warranted) amplitude accuracy.

Keysight recommends that the Characterize Preselector operation be performed yearly as part of any calibration, but performing this operation every three months can be worthwhile.

Characterize Preselector immediately executes a characterization of the Preselector, which is a YIG-tuned filter (YTF). The instrument stops any measurement currently underway, performs the characterization, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

The query (**:CALibration:YTF?**) invokes the alignment of the YTF subsystem, and returns a success or failure value.

A failure encountered during alignment generates the Error Condition message "Characterize Preselector failure" and sets Bit 3 in the **STATus:QUESTIONable:CALibration:EXTended:FAILure** status register. Successful completion of **Characterize Preselector** clears this Condition. It also begins the elapsed time counter for Last Characterize Preselector Time, and captures the Last Characterize Preselector Temperature.

The last Characterize Preselector Time and Temperature survives across the power cycle, as this operation is performed infrequently.

NOTE

The Characterize Preselector function can be interrupted, by pressing the Cancel (ESC) front-panel key, or remotely with Device Clear followed by the :ABORT SCPI command. None of the new characterization data is then used.

However, since the old characterization data is purged at the beginning of the characterization, you now have an uncharacterized preselector. You should re-execute this function and allow it to finish before making any further preselected measurements.

Remote Command	<code>:CALibration:YTF</code> <code>:CALibration:YTF?</code>
Example	<code>:CAL:YTF</code>
Notes	<p><code>:CALibration:YTF?</code> returns 0 if successful, or 1 if failed (including interfering user signal)</p> <p>While Advanced, Characterize Preselector is performing the alignment, Bit 0 in the Status Operation register is set. Completion, or termination, clears Bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORt</code> command</p> <p>Successful completion clears Bit 9 in the Status Questionable Calibration register</p> <p>A failure encountered during alignment generates the Error Condition message “Characterize Preselector failed” and sets Bit 9 in the Status Questionable Calibration register</p> <p>For Options that support frequencies > 3.6 GHz only</p>
Dependencies	This control does not appear in models that do not contain preselectors. In these models the SCPI command is accepted without error, but no action is taken
Couplings	<p>Initializes the time for the Last Characterize Preselector Time</p> <p>Records the temperature for the Last Characterize Preselector Temperature</p> <p>Overlapped Command</p>
Remote Command	<code>:CALibration:YTF:NPENding</code>
Example	<code>:CAL:YTF:NPEN</code>
Notes	<p><code>:CALibration:YTF:NPENding</code> is the same as <code>:CALibration:YTF</code>, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query if the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> 1. <code>:CALibration:YTF:NPENding</code> (Start a YTF calibration) 2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If Bit 0 is set, then the system is doing calibration, and you should repeat this query until the bit is cleared) 3. <code>:STATus:QUESTionable:CALibration:EXTended:FAILure:CONDition?</code> (Check whether Bit 2 is set. If this bit is set, that means there are some errors in previous internal source calibration)

4.6.6.2 Characterize Reference Clock

Calibrates the Reference Input Phase with the External Reference Output. This feature is only available when either option DP2 or B40 is present. It requires connecting the 10 MHz OUT to the EXT REF IN port with a BNC cable before running the characterization.

See ["Front panel guided calibration sequence" on page 2148](#)

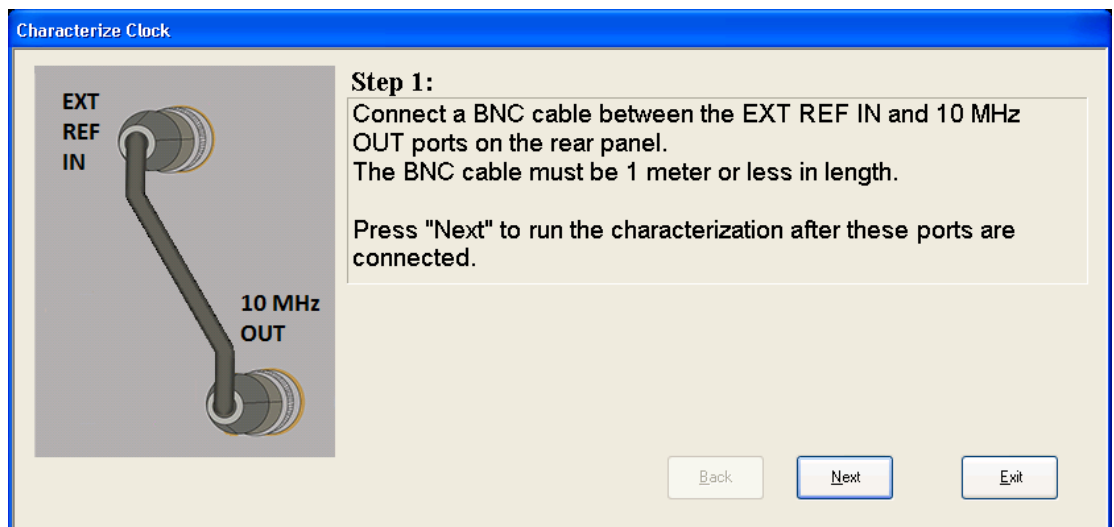

Remote Command	<code>:CALibration:REference:CLOCK?</code>
Example	<code>:CAL:REF:CLOC:INIT?</code> connect cable <code>:CAL:REF:CLOC?</code> disconnect cable <code>:CAL:REF:CLOC:END?</code>
Notes	<code>:CALibration:REference:CLOCK?</code> returns 0 if successful, or 1 if failed
Dependencies	Option DP2 or B40
Couplings	Initializes the time for the Last Characterize Reference Clock Time Records the temperature for the Last Characterize Reference Clock Temperature. Expected to be run after <code>:CAL:REF:CLOC:INIT</code> , and before <code>:CAL:REF:CLOC:END</code>
Remote Command	<code>:CALibration:REference:CLOCK:INITialize?</code>
Example	<code>:CAL:REF:CLOC:INIT?</code>
Notes	Returns 0 if successful, or 1 if failed
Dependencies	Option DP2 or B40
Couplings	Expected to be run before sending <code>:CAL:REF:CLOC?</code> . This will stop the current measurement when it has completed (does not abort the current data acquisition), and prepare the instrument for the expected cabling
Remote Command	<code>:CALibration:REference:CLOCK:END?</code>
Example	<code>:CAL:REF:CLOC:END?</code>
Notes	Returns 0 if successful, or 1 if failed
Dependencies	Option DP2 or B40
Couplings	Expected to be run after sending <code>:CAL:REF:CLOC?</code> , and after removing the cable used in that Characterize Reference Clock step. This will resume any queued measurements, and concludes the reference clock characterization
Remote Command	<code>:CALibration:TIME:REference:CLOCK?</code>
Example	<code>:CAL:TIME:REference:CLOCK?</code>

Notes	Value is the date and time the last successful Characterize Reference Clock was executed. The date is separated from the time by a space character. Returns "" if Characterize Reference Clock has never been performed on the instrument
Dependencies	Option DP2 or B40
State Saved	No

Front panel guided calibration sequence

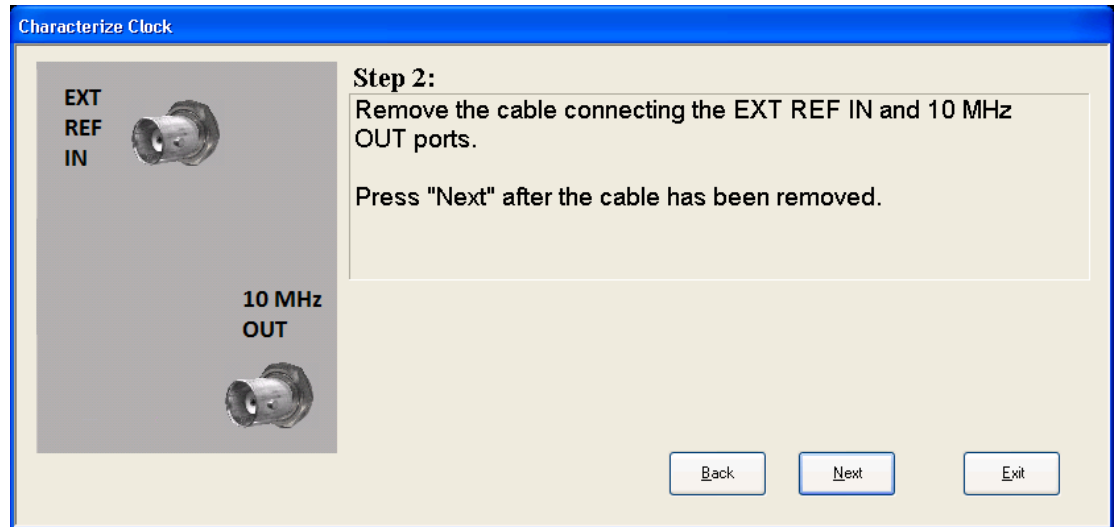

When selecting **Characterize Reference Clock** via the front panel, the following form is displayed.

Step 1 of the guided calibration sequence:

The screenshot shows a software dialog box titled "Characterize Clock". On the left, there is a diagram of a BNC cable connecting two ports: "EXT REF IN" at the top and "10 MHz OUT" at the bottom. On the right, the text reads: "Step 1: Connect a BNC cable between the EXT REF IN and 10 MHz OUT ports on the rear panel. The BNC cable must be 1 meter or less in length. Press 'Next' to run the characterization after these ports are connected." At the bottom right, there are three buttons: "Back", "Next" (which is highlighted with a blue border), and "Exit".

Step 2 of the guided calibration sequence:

Step 3 of the guided calibration sequence:

4.6.6.3 Characterize Noise Floor

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. To do this, press **Characterize Noise Floor**. When you press this control, the instrument stops any measurement currently underway, and a dialog appears with an **OK** and **Cancel** button that says:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel

When you press **Enter** or **OK**, the characterization proceeds. After the characterization, the instrument restarts the measurement from the beginning

(similar to pressing the **Restart** key). The characterization takes many minutes to run.

The noise floor model used by Noise Floor Extensions includes an estimation of the temperature behavior of the noise floor, but this is only an estimation. The noise floor changes little with the age of the components. However, even small changes in the estimated level of the noise floor can make large changes in the effective noise floor, because the effective noise floor is the error in the estimation of the noise floor. Keysight recommends that the **Characterize Noise Floor** operation be performed when the instrument is operating at an ambient temperature that is significantly different than the ambient temperature at which this alignment was last run. In addition, Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year.

The noise floor model from the last operation of **Characterize Noise Floor** survives across the power cycle.

NOTE

The **Characterize Noise Floor** function can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORt SCPI` command. None of the new characterization data is then used. However, since the old characterization data is purged at the beginning of the characterization, you now have an uncharacterized noise floor. You should re-execute this function and allow it to finish before making any further measurements with NFE. Until you do, the instrument will display a “Characterize Noise Floor required” message and set bit 12 in the Status Questionable Calibration register (`STATus:QUEStionable:CALibration:EXTended:NEEDed`).

Remote Command	<code>:CALibration:NFLoor</code> <code>:CALibration:NFLoor?</code>
Example	<code>:CAL:NFL</code>
Notes	<code>:CALibration:NFLoor?</code> returns 0 if successful, or 1 if failed (including interfering user signal) This command is sequential; it must complete before further commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORt</code> command
Dependencies	This control does not appear in models that do not contain NF2. In these models the command is accepted without error, but no action is taken
Couplings	Successful completion of Characterize Noise Floor begin the elapsed time counter or the Last Characterize Noise Floor Time
Remote Command	<code>:CALibration:TIME:NFLoor?</code>
Example	<code>:CAL:TIME:NFL?</code>
Notes	Value is the date and time the last successful Characterize Noise Floor was executed. The date is separated from the time by a space character Returns “” if no Characterize Noise Floor has ever been performed on the instrument

4 System
4.6 Alignments

Dependencies	In models that do not include NF2, this command is not enabled and any attempt to set or query yields an error
State Saved	No
Remote Command	<code>:CALibration:TEMPerature:NFLoor?</code>
Example	<code>:CAL:TEMP:NFL?</code>
Notes	Value is the temperature of the last successful Characterize Noise Floor was executed Returns "" if no Characterize Noise Floor has ever been performed on the instrument
Dependencies	In models that do not include NF2, this command is not enabled and any attempt to set or query yields an error
State Saved	No
Remote Command	<code>:CALibration:TIME:ELAPsed:NFLoor?</code>
Example	<code>:CAL:TIME:ELAP:NFL?</code>
Notes	Value is the elapsed time the instrument was powered-on since the last successful Characterize Noise Floor was executed Returns "" if no Characterize Noise Floor has ever been performed on the instrument
Dependencies	In models that do not include NF2, this command is not enabled and any attempt to set or query yields an error
State Saved	No

4.6.6.4 Calibration Temperature History

The following queries let you retrieve various statistics regarding the Calibration Temperature history.

Minimum Temperature Within Last Number of Seconds

Lets you query the minimum temperature within the last number of seconds. If no data exists for the requested time, the returned value is 9.91e+37.

Remote Command	<code>:CALibration:TEMPerature:MINimum? <seconds></code>
Example	<code>:CAL:TEMP:MIN? 60</code>

Maximum Temperature Within Last Number of Seconds

Lets you query the maximum temperature within the last number of seconds. If no data exists for the requested time, the returned value is 9.91e+37.

Remote Command	<code>:CALibration:TEMPerature:MAXimum? <seconds></code>
Example	<code>:CAL:TEMP:MAX? 60</code>

Temperature Seconds Ago

Lets you query temperature X seconds ago. If no data exists for the requested time, the returned value is 9.91e+37.

Remote Command	<code>:CALibration:TEMPerature:AGO? <seconds></code>
----------------	--

Example	<code>:CAL:TEMP:AGO? 75</code>
---------	--------------------------------

Oldest Temperature Value

Lets you query the oldest recorded temperature value.

Remote Command	<code>:CALibration:TEMPerature:OLDest[:TEMPerature]?</code>
----------------	---

Example	<code>:CAL:TEMP:OLD?</code>
---------	-----------------------------

Oldest Temperature Time

Lets you query how long ago the oldest temperature value was recorded.

Remote Command	<code>:CALibration:TEMPerature:OLDest:SECONDS?</code>
----------------	---

Example	<code>:CAL:TEMP:OLD:SEC?</code>
---------	---------------------------------

4.6.6.5 TDS Alignment

Only appears in N9038B (MXE-B) when Option TDS is installed and licensed.

The TDS alignment includes [AlignNowAll](#) and [RFPrese1](#) alignment. Immediately executes an alignment of the TDS subsystem. The instrument stops any measurement currently underway, performs the alignment, and then restarts the measurement from the beginning (similar to pressing the **Restart** key).

Align TDS can be interrupted by pressing the **Cancel (ESC)** front-panel key or from remote with Device Clear followed by `:ABORT`. When this occurs, no new TDS alignment data will be employed.

Remote Command	<code>:CALibration:TDS</code> Params missing? What does the query return? <code>:CALibration:TDS?</code>
----------------	--

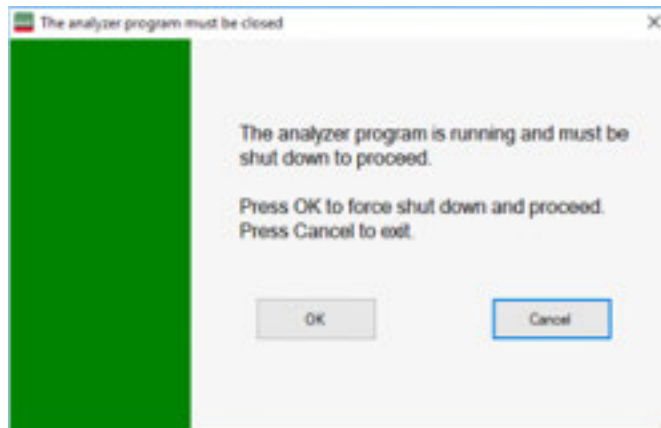

Example	<code>:CAL:TDS</code>
---------	-----------------------

Notes	This command is sequential; it must complete before further commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORT</code> command
-------	---

Dependencies	Only appears in N9038B (MXE-B) models with Option TDS installed and licensed
--------------	--

4.6.6.6 Backup or Restore Align Data...

Opens the utility for backing-up or restoring alignment data. Since this utility cannot be run while the instrument software is running, a prompt tells you to shut down the instrument first:

Press **OK** and the instrument will shut down and open the backup utility.

Alignment data for the instrument resides on the hard drive in a database. Keysight uses high quality hard drives; however, it is highly recommended the alignment data be backed-up to storage outside of the instrument. Additionally, for customers who use multiple CPU Assemblies or multiple disk drives, the alignment that pertains to the instrument must be transferred to the resident hard drive after a CPU or hard drive is replaced. This utility facilitates backing-up and restoring the alignment data.

NOTE

This utility allows you to navigate to any location of the Windows file system. If you are backing up alignment data to storage outside of the instrument, then it is assumed that you will use a USB memory device, or Mapped Network Drive.

Processor Assembly types PC6 and PC7 contain a removable SD memory card. When one of these CPUs is installed, the Backup and Restore Alignment Data wizard defaults to the SD card as the backup location. At every power-on, the software will check to determine if the calibration data on the SD memory card (the backup) is newer than the data in use on the disk. In such situations, before the application is loaded, you are given the opportunity to restore the data from the backup. If you respond **Yes**, the Backup and Restore Alignment Data wizard (see ["Alignment Data Wizard \(without Flash\)" on page 2154](#)) will be invoked to perform the restore.

Processor Assembly types PC6S and PC7S contain an internal flash EEPROM, as well as a removable SD card. When one of these CPUs is installed, the Backup and Restore Alignment Data wizard defaults to the internal flash as the backup location.

As with the PC6 and PC7, at every power-on, the software compares the timestamp of the backup on the flash and the timestamp of the alignment data in use on the disk. If the backup on the flash has newer data, you are given the opportunity to restore the data from the backup before the application is loaded. If you respond **Yes**, the Backup and Restore Alignment Data wizard (see "[Alignment Data Wizard \(with Flash\)](#)" on page 2164) will be invoked and will prompt you to restore that backup.

For purposes of these instructions, "alignment data" and "calibration data" are used interchangeably.

Dependencies	Not available in UXM
Remote Command	<code>:CALibration:DATA:DEFault</code>
Example	<code>:CAL:DATA:DEF</code>
Notes	Restores the alignment data files to their default state
Couplings	Sets Auto Align to OFF . Sets Bit 14 in the Status Questionable Calibration register. The Error Condition message "Align Now All required" is generated

Alignment Data Wizard (without Flash)

Guides you through the operation of backing-up or restoring the alignment data.

4 System
4.6 Alignments

The default backup location for instruments *without* internal flash will be the first drive identified as an external drive (USB or LAN) if such is available; or, if not, the internal D: partition.

The default file name is `<model number>_<serial number>_<date in YYYYMMDDHHMMSS>.bkz`.

The default file extension for legacy backup files was `.bak`. The Backup and Restore operations support both the `.bak` (legacy format) and `.bkz` formats.

If a USB drive is present, it will be selected by default. The path defaults to the `AlignmentBackups` folder, and a filename is automatically created, in the form: `<model>_<serial number>_<date><time>.bkz`

If you wish to enter a customer filename, you can do so with an external keyboard, or by opening the onscreen Alpha keyboard, by pressing the **Keyboard** hardkey on the front panel:

When the **Next >** button is pressed, you will be prompted to create a new folder if the chosen path does not yet exist.

4 System
4.6 Alignments

The restore operation checks the validity of the restore file using the database's built-in file validation. If the restore file is corrupt, the existing alignment data will remain in use.

If the serial number information in the backup file being restored is different from that of the instrument, the following message appears (the serial numbers shown are examples):

4 System
4.6 Alignments

The default restore location for instruments *without* internal flash will be the first drive identified as an external drive (USB or LAN) if such is available; or, if not, the internal D: partition. The default restore file will be the most recent file that matches the default backup file name format: `<model number>_<serial number>_<date>.bkz`

Changing the drive letter also modifies the path displayed in the box below. When this step is first loaded, the drive drop-down menu is populated with connected drives, which provide you with read access.

The path defaults to the **AlignBackups** folder. The most recent backup (*.bkz or *.bak) file in the folder will also be selected by default.

4 System
4.6 Alignments

When restoring data in the legacy **.bak** format, Administrator privileges are required. You will be prompted when you attempt a restore (indicated by the UAC Shield on the **Restore** button below).

4 System
4.6 Alignments

Perform Backup (without Flash) (Remote Command Only)

Invokes an alignment data backup operation to the provided location.

NOTE

Keysight recommends that the specified location should be external to the instrument (USB or Mapped Network Drive).

Remote Command `:CALibration:DATA:BACKup <filename>`

Example `:CAL:DATA:BACK "F:\AlignDataBackup_N9020A_US00000001_2008140100.bkz"`

Perform Restore (without Flash) (Remote Command Only)

Invokes an alignment data restore operation from the provided filename.

Remote Command `:CALibration:DATA:RESTore <filename>`

Example `:CAL:DATA:REST "F:\ AlignDataBackup_N9020A_US00000001_2008140100.bkz"`

Alignment Data Wizard (with Flash)

If your instrument has Processor Assembly type PC6S or PC7S (see ["Show System" on page 2045](#)) the instrument has an internal flash EEPROM that can store a backup of the alignment data. In this case, the interface to the Alignment Data Wizard is enhanced to accommodate this internal storage. This section details the use of this internal flash. For details on using external storage, see the previous section (["Alignment Data Wizard \(without Flash\)" on page 2154](#)).

The Alignment Data Wizard guides you through the operations of backing up or restoring alignment data.

4 System
4.6 Alignments

Having selected **Backup** or **Restore**, you then select the source or destination for the alignment data. As shown below, you can select either:

- Internal flash EEPROM, or,
- External Removable Drive (which includes the SD card described in "[Backup or Restore Align Data...](#)" on page 2153)

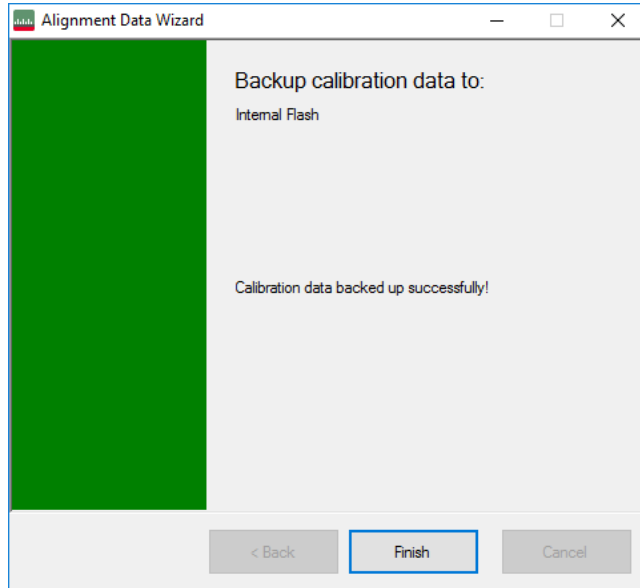

The final page of the wizard asks you to confirm the choices made in the previous pages. When the operation is complete, an indication is displayed on the same page, as below.

Backup

4 System
4.6 Alignments

Restore

When restoring alignment data, if the serial number information in the backup file being restored is different from that of the instrument, the following message appears (the serial numbers shown are examples):

Immediately before the actual restoration, a final confirmation message is displayed detailing what is being restored and the current database that will be overwritten on the disk (the dates and versions are examples):

4 System

4.6 Alignments

When backing up alignment data to the flash, if there is already an existing backup on the flash, a final confirmation message is displayed detailing what is being backed up and what will be overwritten on the flash (again, the dates and versions are examples):

Perform Backup (with Flash) (Remote Command Only)

Invokes an alignment data backup operation to the internal flash EEPROM.

Remote Command `:CALibration:DATA:INTernal:BACKup`

Example `:CAL:DATA:INT:BACK`

Perform Restore (With Flash) (Remote Command Only)

Invokes an alignment data restore operation from the internal flash EEPROM.

Remote Command `:CALibration:DATA:INTernal:RESTore`

Example `:CAL:DATA:INT:REST`

Restore Alignment Defaults

Causes the Alignment system settings to be reset to their default values. This does not affect any Alignment data stored in the system.

After performing this function, it may impact the auto-alignment time of the instrument until a new alignment baseline has been established.

When **Alignments** is selected, a message appears saying:

`This will reset all of the settings for the Alignment system to their default values`

`No alignment data will be erased`

`This action cannot be undone. Do you want to proceed?`

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

Align Now All must be executed if the value of the Timebase DAC results in a change.

Example	<code>:SYST:DEF ALIG</code>												
Notes	<p>Alignment processing that results as the transition to Auto Align Normal will be executed sequentially; thus <code>*OPC?</code> or <code>*WAI</code> will wait until the alignment processing is complete</p> <p>The parameters affected are:</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Setting</th> </tr> </thead> <tbody> <tr> <td>Timebase DAC</td> <td>Calibrated</td> </tr> <tr> <td>Timebase DAC setting</td> <td>Calibrated value</td> </tr> <tr> <td>Auto Align State</td> <td>Normal (if the instrument is not operating with default alignment data, Off otherwise)</td> </tr> <tr> <td>Auto Align All but RF</td> <td>Off</td> </tr> <tr> <td>Auto Align Alert</td> <td>Time & Temperature</td> </tr> </tbody> </table>	Parameter	Setting	Timebase DAC	Calibrated	Timebase DAC setting	Calibrated value	Auto Align State	Normal (if the instrument is not operating with default alignment data, Off otherwise)	Auto Align All but RF	Off	Auto Align Alert	Time & Temperature
Parameter	Setting												
Timebase DAC	Calibrated												
Timebase DAC setting	Calibrated value												
Auto Align State	Normal (if the instrument is not operating with default alignment data, Off otherwise)												
Auto Align All but RF	Off												
Auto Align Alert	Time & Temperature												

4.6.6.7 oGRF Preselector

This menu and all its submenus are only available in models with the RF Preselector, such as N9038B, or N9048B.

Dependencies	Only available in RF Preselector models
--------------	---

Align Now, 20 Hz to 30 MHz

Immediately executes an alignment of the receiver subsystem. The receiver will stop any measurement currently underway, perform an Align Now All, then perform the RF Preselector alignment, and then restart the measurement from the beginning (similar to pressing the Restart key).

The query `:CALibration:RFPSelector:CONDUCTed?` invokes the alignment of the RF Preselector on Conducted Band and returns a success or failure value. Successful completion clears the “Align 20 Hz to 30 MHz required” Error Condition, and clears bit 1 in the Status Questionable Calibration Extended Needed register. The elapsed time counter will begin for Last Align Now, Conducted Time, and the temperature is captured for the Last Align Now, Conducted Temperature. The alignment can be interrupted by pressing the Cancel (ESC) front-panel key or remotely with Device Clear followed by the `:ABORt` SCPI command. When this occurs, the Error Condition “Align 20 Hz to 30 MHz required” is set because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

4 System
4.6 Alignments

The “Align 20 Hz to 30 MHz required” Error Condition will appear when this alignment has expired. User is now responsible to perform the Align Now, 20 Hz to 30 MHz to keep the receiver in warranted operation. This alignment can only be performed by user as it is not part of the Auto Align process.

Remote Command	<code>:CALibration:RFPSelector:CONDUCTed</code> <code>:CALibration:RFPSelector:CONDUCTed?</code>
Example	<code>:CAL:RFPs:COND</code>
Notes	<p>The query returns 0 if successful, or 1 if failed</p> <p>When Align 20 Hz to 30 MHz is performing the alignment, bit 0 in the Status Operation register is set. Completion, or termination, will clear bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <code>:ABORt</code> command. Successful completion will clear bit 1 in the Status Questionable Calibration Extended Needed register and bit 0 in Status Questionable Calibration Extended Failure register</p> <p>A failure encountered during alignment will set the Error Condition “20 Hz to 30 MHz Alignment Failure” and set both bit 1 in the Status Questionable Calibration Extended Needed register and bit 9 in Status Questionable Calibration register</p>
Dependencies	Does not appear in non-RF Preselector models, setting or querying the SCPI will generate an error
Couplings	<p>Initializes the time for the Last Align Conducted Now, Conducted Time</p> <p>Records the temperature for the Last Align Conducted Now, Conducted Temperature</p>
State Saved	No
Status Bits/OPC dependencies	<p>Bit 8 or 9 may be set in the Status Questionable Calibration register</p> <p>Bit 1 may be set in the Status Questionable Calibration Extended Needed register</p> <p>Bit 0 may be set in the Status Questionable Calibration Extended Failure register</p>

Align Now, 30 MHz to 3.6 GHz

Immediately executes an alignment of the receiver subsystem. The receiver will stop any measurement currently underway, perform an Align Now All, then perform the RF Preselector alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key).

The query (`:CALibration:RFPSelector:RADiated?`) invokes the alignment of the RF Preselector on Radiated Band and returns a success or failure value. Successful completion clears the “Align 30 MHz to 3.6 GHz required” Error Condition, and clears bit 2 in the Status Questionable Calibration Extended Needed register. The elapsed time counter begins for Last Align Now, Radiated Time, and the temperature is captured for the Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by `:ABORt`. When this occurs, the Error Condition “Align 30 MHz to 3.6 GHz required” is set, because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The “Align 30 MHz to 3.6 GHz required” Error Condition appears when this alignment has expired. You must now perform **Align Now, 30 MHz to 3.6 GHz** to keep the receiver in warranted operation.

Remote Command	<code>:CALibration:RFPSelector:RADiated</code> <code>:CALibration:RFPSelector:RADiated?</code>
Example	<code>:CAL:RFPS:RAD</code>
Notes	<p>The query returns 0 if successful, or 1 if failed</p> <p>When Align 30 MHz to 3.6 GHz is performed, alignment, bit 0 in the Status Operation register is set. Completion, or termination, clears bit 0 in the Status Operation register</p> <p>This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by <code>:ABORT</code>. Successful completion clears bit 2 in the Status Questionable Calibration Extended Needed register and bit 1 in Status Questionable Calibration Extended Failure register</p> <p>A failure encountered during alignment sets the Error Condition “30 MHz to 3.6 GHz Alignment Failure” and sets both bit 2 in the Status Questionable Calibration Extended Needed register and bit 9 in Status Questionable Calibration register</p>
Dependencies	Does not appear in non-RF Preselector models, setting or querying the SCPI will generate an error
Couplings	Initializes the time for the Last Align Radiated Now, Radiated Time Records the temperature for the Last Align Radiated Now, Radiated Temperature
State Saved	No
Status Bits/OPC dependencies	May set Bit 8 or 9 in the Status Questionable Calibration register May set Bit 2 in the Status Questionable Calibration Extended Needed register May set Bit 1 in the Status Questionable Calibration Extended Failure register

Align Now, 20 Hz to 3.6 GHz

Immediately executes an alignment of the receiver subsystem. The receiver will stop any measurement currently underway, perform an Align Now All, then perform the RF Preselector alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key).

The query (`:CALibration:RFPSelector:FULL?`) invokes the alignment of the RF Preselector on both Conducted and Radiated Band and return a success or failure value. Successful completion clears the “Align 20 Hz to 3.6 GHz required” Error Condition, and clears bit 1 and bit 2 in the Status Questionable Calibration Extended Needed register. The elapsed time counter begins for Last Align Now, Conducted Time and Last Align Now Radiated Time and the temperature is captured for Last Align Now, Conducted Temperature and Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key or remotely with Device Clear, followed by `:ABORT`. When this occurs, the Error Condition “Align 20 Hz to 3.6 GHz required” is set, because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

4 System
4.6 Alignments

The “Align 20 Hz to 3.6 GHz required” Error Condition appears when this alignment has expired. You must now perform the Align Now, 20 Hz to 3.6 GHz to keep the receiver in warranted operation.

Remote Command	<code>:CALibration:RFPSelector:FULL</code> <code>:CALibration:RFPSelector:FULL?</code>
Example	<code>:CAL:RFPS:FULL</code>
Notes	The query returns 0 if successful, or 1 if failed When Align 20 Hz to 3.6 GHz is performed, alignment, bit 0 in the Status Operation register is set. Completion, or termination, clears bit 0 in the Status Operation register This command is sequential; it must complete before further SCPI commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear, followed by <code>:ABORT</code> . Successful completion clears bit 1, bit 2 in the Status Questionable Calibration Extended Needed register and bit 0, bit 1 in Status Questionable Calibration Extended Failure register A failure encountered during alignment sets the Error Condition “20 Hz to 3.6 GHz Alignment Failure” and sets bit 1, bit 2 in the Status Questionable Calibration Extended Needed register and bit 9 in Status Questionable Calibration register
Dependencies	Does not appear in non-RF Preselector models, setting or querying the SCPI generates an error
Couplings	Initializes the time for the Last Align Conducted Now, Conducted Time Initializes the time for the Last Align Radiated Now, Radiated Time Records the temperature for the Last Align Conducted Now, Conducted Temperature Records the temperature for the Last Align Radiated Now, Radiated Temperature
State Saved	No
Status Bits/OPC dependencies	May set Bit 8 or 9 in the Status Questionable Calibration register May set Bit 1 and 2 in the Status Questionable Calibration Extended Needed register May set Bit 0 and 1 in the Status Questionable Calibration Extended Failure register

Alert

Enables or disables the display of RF Preselector alignment required message on the status line. The instrument powers up with Alert **ON**.

Remote Command	<code>:CALibration:RFPSelector:ALERT ON OFF 0 1</code> <code>:CALibration:RFPSelector:ALERT?</code>
Example	<code>:CAL:RFPS:ALER OFF</code>
Notes	Error Condition is generated when alert is ON and any of the RF Preselector alignments has expired
Preset	Unaffected by Preset, but set to ON by Restore Defaults > "Alignments" on page 2100
State Saved	No
Range	OFF ON

4.6.6.8 Scheduler

Setting the Scheduler to **ON** triggers execution of the scheduled task based on the recurrence and time set in the scheduler since the last successful of the specific alignment. A warning condition of “RF Preselector alignment scheduler is ON” appears when the scheduler is set to **ON**. **OFF** prevents the Scheduler from running any scheduled task.

Remote Command	:CALibration:RFPSelector:SCHeuler:STATe ON OFF 0 1
Example	:CAL:RFPS:SCH:STAT OFF
Preset	Unaffected by Preset, but set to ON by Restore Defaults > "Alignments" on page 2100
State Saved	No
Range	OFF ON

Schedule Setup

Lets you schedule a task to run automatically at the background based on the recurrence and time set in the scheduler. Make sure that the instrument’s local time is accurate, because the Scheduler relies on this information to execute the task.

This dialog contains the following controls:

- "Task" on page 2174
- "Date/Time" on page 2175
- "Hour" on page 2176
- "Minute" on page 2176
- "Recurrence" on page 2176
- "Number of Weeks" on page 2176
- "Day" on page 2177

Task

There are 3 tasks that can be selected for the scheduler to run.

- Task 1 is the 20 Hz to 30 MHz alignment
- Task 2 is the 30 MHz to 3.6 GHz alignment

4 System
4.6 Alignments

- Task 3 is the 20 Hz to 3.6 GHz alignment

Remote Command	<code>:CALibration:RFPSelector:SCHeduler:TASK T1 T2 T3</code>
Example	<code>:CAL:RFPS:SCH:TASK T1</code>
Notes	Changing the task does not reset the Scheduler time, and the alignment is based on the current scheduled configuration to occur
Preset	Unaffected by Preset but set to T3 by Restore Defaults > "Alignments" on page 2100
State Saved	No
Range	Task 1 Task 2 Task 3

Date/Time

Lets you configure the scheduler to run a task starting from this date and time. The date and time rely on the instrument's local time to execute a scheduled task. The date format is "YYYY/MM/DD" and the time is 24-hour clock.

Remote Command	<code>:CALibration:RFPSelector:SCHeduler:TIME:START "date", "time"</code>
	<code>:CALibration:RFPSelector:SCHeduler:TIME:START?</code>
	This query returns data using the format "YYYY/MM/DD; HH:MM:SS"
Example	<code>:CAL:RFPS:SCH:TIME:STAR "2009/8/20", "12:00:00"</code>
Notes	<p>"date" is the date the task will run, in the form YYYY/MM/DD where:</p> <ul style="list-style-type: none"> - YYYY is the four-digit representation of year (for example, 2009) - MM is the two-digit representation of month (for example, 01 to 12) - DD is the two-digit representation of the day (for example, 01 to 28, 29, 30 or 31 depending on the month and year) <p>"time" is the time of day the task will run, in the form HH:MM:SS where:</p> <ul style="list-style-type: none"> - HH is the two-digit representation of the hour in 24-hour format - MM is the two-digit representation of minute - SS is the two-digit representation of seconds
Preset	Unaffected by Preset but set to Current date and 00:00:00 by Restore Defaults > "Alignments" on page 2100
State Saved	No

Hour

Lets you configure the hour for the scheduled task. The command to configure the date and time parameters of the scheduler is the same; but they each have their own front panel-control.

Notes	See "Date/Time" on page 2175
Preset	Unaffected by Preset but set to Current hour and 00 by Restore Defaults > "Alignments" on page 2100
State Saved	No

Minute

Lets you configure the minute for the scheduled task. The command to configure the date and time parameters of the scheduler is the same; but they each have their own front panel-control.

Notes	See "Date/Time" on page 2175
Preset	Unaffected by Preset but set to Current minute and 00 by Restore Defaults > "Alignments" on page 2100
State Saved	No

Recurrence

Lets you configure the scheduler to run the task recurrently on a scheduled date and time. You can schedule it to run daily, weekly, or alternate weeks.

Remote Command	<code>:CALibration:RFPSelector:Scheduler:REcurrence DAY WEEK OFF</code>
Example	<code>:CAL:RFPS:SCH:REC DAY</code>
Preset	Unaffected by Preset but set to OFF by Restore Defaults > "Alignments" on page 2100
State Saved	No
Range	<code>DAY WEEK OFF</code>

Number of Weeks

Lets you set the number of weeks that the scheduler will wait to trigger a task.

Remote Command	<code>:CALibration:RFPSelector:Scheduler:REcurrence:WEEK <integer></code>
Command	<code>:CALibration:RFPSelector:Scheduler:REcurrence:WEEK?</code>

4 System
4.6 Alignments

Example	<code>:CAL:RFPS:SCH:REC:WEEK 2</code>
Notes	New scheduled date to run the alignment task is updated when this parameter is changed
State Saved	No
Range	1-52
Min	1
Max	52

Day

Lets you set the Day of the Week the scheduler will run a scheduled task.

Remote Command	<code>:CALibration:RFPSelector:SCHeduler:RECurrence:DAY SUN MON TUE WED THU FRI SAT</code> <code>:CALibration:RFPSelector:SCHeduler:RECurrence:DAY?</code>
Example	<code>:CAL:RFPS:SCH:REC:DAY SUN</code>
State Saved	No
Range	Sunday Monday Tuesday Wednesday Thursday Friday Saturday

4.7 Licensing

Accesses capabilities for configuring the licenses in your instrument.

4.7.1 License Manager

Opens the License Explorer for Fixed and Transportable licenses.

NOTE

This feature is not available if Option SF1 is installed.

For help on licensing, select **Help** in the menu bar at the top of the License Explorer window.

There are also several remote commands available for licensing. See:

- ["Install License \(Remote Command Only\)" on page 2186](#)
- ["Remove License \(Remote Command Only\)" on page 2186](#)
- ["List Licenses \(Remote Query Only\)" on page 2187](#)
- ["Validate License \(Remote Query Only\)" on page 2188](#)
- ["Host ID Query \(Remote Query Only\)" on page 2188](#)
- ["List Borrowed Licenses \(Remote Query Only\)" on page 2183](#)
- ["Return a Borrowed License \(Remote Command Only\)" on page 2184](#)

Notes

No equivalent remote command for this control

4.7.2 System Software Version Date

The date of the newest features introduced in this release of the firmware. This is *not* necessarily the same as the build date of the firmware, because the version date only changes when new features are added. For example, if A.18.06 has only defect fixes and no new features compared to A.18.05, then both A.18.05 and A.18.06 would have the same software version date.

For any feature to be enabled, the SW Support Expiration Date of the enabling license must be greater than or equal to the software version date when that feature was first introduced. See the Keysight web site for features related to a specific software application and their required support date.

The SCPI response is 3 integer values: `<year>`, `<month>`, `<day>`.

Remote Command :SYSTem:SOFTware:VERSion:DATE?

Example :SYST:SOFT:VERS:DATE?

4.7.3 Software Support Expiration Date

This date is encoded in each software license's Version field in the **YYYY.MMDD** format. It specifies the end date of the support contract associated with this license. When a support contract is renewed, a new license is issued with an updated Version corresponding to the new contract's end date. The functionality available for a license is determined by the features available before the expiration date. For example, if feature X is introduced in a release with System Software Version Date of **2017.0831**, then a license with a Software Support Expiration Date of **2017.0831** or greater would enable feature X, but **2017.0830** or earlier would not enable feature X.

The SCPI response is 3 integer values: **<year>, <month>, <day>**.

Remote Command :SYSTem:LKEY:SOFTware:SUPPort:EXPIration:DATE? <feature>

Example :SYST:LKEY:SOFT:SUPP:EXP:DATE? "N9084EM0E-1FP"

Dependencies When **<feature>** is not a valid license, one of the following errors will be issued:

- -224, "IllegalParameterValue;License is not installed"
- -224, "IllegalParameterValue;Unknown license feature"
- -224, "IllegalParameterValue;Support contract not offered for this license"

4.7.4 Network Licenses

Network Licenses are available over the customer's network from a server the customer configures. The server has a count for each license and will only allow instruments to "check-out" a license up to that count. Once the count is reached for a specific license, further check-outs fail until one of the licenses is checked back in to the server. What this means is that it is possible for an instrument to have different features available to it based on what licenses are still available on the server when it tries to get licenses.

Setting up network licenses is done via the [Keysight Floating License Manager](#) (available on external Keysight web) and it has an Installation Guide that can be downloaded from that web page.

4.7.4.1 Application Licenses

Application Licenses (like N9077EM0E-1NP) are automatically checked out when entering the Mode that uses them, and they are automatically checked-in when leaving that Mode. Because the server may have already checked out the last license for the application to another instrument, there is now the possibility that a mode switch will fail because a required license could not be checked out from the server. If the server has a limited number of licenses compared to the number of users desiring to use that license, this may mean that switching from Mode A to Mode B then back to Mode A may fail when returning to Mode A because another instrument checked out the last available license while the user was in Mode B. Also, for Modes with multiple licenses for different features (like Multi-Standard Radio), the features available may also change when switching out of the Mode and back into it.

So, when using network licenses, it is necessary to check `:SYST:ERR?` after every Mode switch, to verify that it successfully switched. If the Mode's required licenses were not successfully checked out, the instrument posts the error:

```
-310,"System error; feature not licensed"
```

There is also a potential performance issue when using network licenses, because the instrument must communicate with the server on each license check-out and check-in. This operation is usually fast (a few milliseconds), but it depends on the network communication lag between the instrument and server. For remote servers on slow or congested networks, this could be significantly slower than that.

4.7.4.2 Instrument Software Options

Instrument software licenses are those that are reported via `*OPT?` the same as HW options. For example, N9040RT1B-1NP is an instrument software option, and is reported via `*OPT?` as `RT1`. Note that the license is composed of the model number (in this case `N9040B`) combined with the option code (`RT1`).

When instrument software options are available from a network server, the instrument automatically checks them out at start-up, and only checks them in when shutting down.

4.7.4.3 License Checked Out Query (Remote Query Only)

Shows whether the specified license is checked out from a server. Since network served licenses may not always be available when there are limited licenses available compared to the desired number of users, the features available on an instrument can vary. Use this query to see whether the feature is currently checked-out to the instrument. The return value is boolean (0 or 1), returning 1 if the feature

exists and is checked out from a server. Note that querying a license that is local to the instrument (-xFP or -xTP) also returns 0, even though the license exists and is valid, because it does not require a check-out. Also, querying a license that does not exist returns 0.

Remote Command	<code>:SYSTem:LKEY:COU? <feature></code>
Example	<code>:SYST:LKEY:COU? "N9080EM0E"</code> 1
Notes	<code><"OptionInfo"></code> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one Return Value: 0 if not checked out, 1 if checked out

4.7.4.4 List Licenses Checked Out (Remote Query Only)

Lists the licenses checked out from a server. Since network served licenses may not always be available when there are limited licenses available compared to the desired number of users, the features available on an instrument can vary. Use this query to see which features are currently checked-out to the instrument.

Remote Command	<code>:SYSTem:LKEY:COU:LIST?</code>
Example	<code>:SYST:LKEY:COU:LIST?</code> #284 N9073EM0E,2018.0831 N9077EM0E,2018.0831 N9080EM0E,2018.0831 N9081EM0E,2018.0831

4.7.4.5 Borrowed Network Licenses

Network licenses can be borrowed from the network license server for a time. The maximum amount of time a license can be borrowed is specified in the license installed on the server and is set at the time the license is generated by Keysight. As part of the borrow operation, you specify how long to borrow the license. This borrow period is in hours and can be any time up to the maximum allowed by the license. Once borrowed, the license appears as a local license and can be used even when not connected to the network, and the instrument software treats them the same as other time-based licenses that are installed on the instrument. This means the licenses are validated when the instrument is started and then are used without the overhead of checking them out and back in when switching Modes. At the time of the borrow, a time is specified for how long the license will be borrowed. When that time expires, the license is automatically returned to the network license server

even if the instrument is not connected to the network. If you are done with the license before it automatically returns to the network server, the license can be explicitly returned earlier.

4.7.4.6 Borrow a License

Licenses are borrowed by using the Keysight License Manager 6 application. This can be launched from the **System Licensing** screen.

Graphic

The corresponding remote command is:

Remote Command	<code>:SYSTem:LKEY:BORRow "<feature>[,<version>]",<return date></code> <code>:SYSTem:LKEY:BORRow? "<feature>[,<version>]"</code>
Example	<code>:SYST:LKEY:BORR "N9080EM0E", "20-Aug-2018"</code> <code>:SYST:LKEY:BORR? "N9080EM0E"</code> <code>: "20-Aug-2018"</code>
Notes	If <code><version></code> is not specified, the highest available version will be borrowed The <code><return date></code> is the day when the borrow will automatically be returned to the server
Dependencies	For the command, when <code><feature></code> is not a valid license, or when a license is not currently available for borrowing, one of the following errors is issued: <ul style="list-style-type: none"> - -224, "IllegalParameterValue;License is not installed" - -224, "IllegalParameterValue;Unknown license feature"

-
- -224, "IllegalParameterValue;License not available for borrowing"

Additionally, the return date is evaluated. If it is not a valid date, the following error is issued:

- -224, "IllegalParameterValue;Invalid return date"
- -200, "Execution error; No Available Borrow Licenses For Feature: <feature>"

The return date may be clipped to the maximum borrow allowed by the license. When this happens, the following warning is issued:

- -221, "Return date clipped to maximum of <max date>"

For the query, the return is the borrow return date (as a string in **dd-mmm-yyyy** format) if the license is borrowed. In all other cases, (not borrowed, not installed, etc.) the return is an empty string

4.7.4.7 Listing Borrowed Licenses and Return a Borrowed License

The Keysight License Manager 6 can also be used to see the currently borrowed licenses or return a license before the automatic return time.

Graphic

List Borrowed Licenses (Remote Query Only)

Remote Command :SYSTem:LKEY:BORRow:LIST?

Example :SYST:LKEY:BORR:LIST?
 #266

N9073EM0E, 2018.0831, 20-Aug-2018

N9077EM0E, 2018.0831, 20-Aug-2018

Return a Borrowed License (Remote Command Only)

Remote Command	<code>:SYSTem:LKEY:BORRow:RETurn "<feature>"</code>
Example	<code>:SYST:LKEY:BORR:RET "N9080EM0E"</code>
Dependencies	When <code><feature></code> is not a valid license or when a license is not borrowed, one of the following errors is issued: <ul style="list-style-type: none"> - -224, "IllegalParameterValue;License is not installed" - -224, "IllegalParameterValue;Unknown license feature" - -224, "IllegalParameterValue;License not borrowed"

4.7.4.8 Enabling Network Checkouts While Borrowed

The default for borrowed license use is that you will be explicitly borrowing all desired network licenses, and that all other available network licenses should be ignored. This allows you to intentionally limit the functionality available to the instrument to what is explicitly borrowed.

For example, the RT1/RT2 options that enable the RTSA Mode are automatically checked out when the instrument is started, because the hardware must be configured for them at startup time. If you do not intend to use RTSA, then by borrowing only the licenses you want to use and disabling other network checkouts, the RT1/RT2 licenses will not be checked out at startup. This leave more RTSA licenses available for others to use. Note that the instrument must be restarted after the borrowing has been done to ensure the release of any network licenses already acquired.

If your intent in borrowing is to ensure access to a particular feature or application, but you still want to opportunistically use other features or applications, the default behavior can be changed to enable network license checkouts even when licenses have been borrowed.

Remote Command	<code>:SYSTem:LKEY:BORRow:NETWork:COU:ENABle</code>
Example	<code>:SYST:LKEY:BORR:NETW:COU:ENAB 0</code> <code>:SYST:LKEY:BORR:NETW:COU:ENAB?</code>
Dependencies	Only visible when licensing is configured to use a network server. SCPI is always available
Preset	Unaffected by Preset but set to 0 by Restore Defaults > "Misc" on page 2100 or Restore Defaults > "All" on page 2101
State Saved	Power On Persistent (survives shutdown and restart)

4.7.5 USB Portable Licenses

The USB Portable license is implemented with a physical dongle that is a USB device, like a USB thumb drive. It has a Host ID fixed in the dongle HW. It does not contain any writable data and so is acceptable to high security A/D customers. Transporting licenses from one instrument to another just requires moving the dongle and license files to the desired instrument. The license files can be installed on many instruments, but they will only be valid the one instrument that has the dongle. The use of USB portable licenses requires that the Keysight Floating License Manager is installed on the instrument. The licenses can then be added to the instrument's server.

USB Portable licenses are checked out and in like Network licenses. Because the licenses are local, there will be no network latency involved in the check-out/check-in, but there can still be a slight performance degradation compared to Fixed and Transportable licenses. If the instrument allows multiple concurrent instances of the X-Series software (as is the case for modular products), there may also be availability issues if all licenses are already checked out to other X-Series instances. Plugging/un-plugging the dongle is equivalent to transporting a license to/from the instrument, however, the software must be restarted whenever the dongle is plugged in.

4.7.6 Configuring Network and USB Portable Licenses

The Keysight Floating License Manager must be used to configure the Network or USB Portable licenses before the licenses can be used. Currently, an instrument can only be configured for Network or USB Portable licenses or both.

- To set up USB Portable licenses, in the Keysight Floating License Manager select “Start a floating license server with a license file” and add files containing the USB Portable licenses desired
- To set up Network licenses, in the Keysight Floating License Manager select “Connect to a floating license server” and enter the network server's name preceded by the “@” character (example: “@myserver”)
- To set up both Network and USB Portable license, first configure the USB Portable license, then configure the Network licenses, but append “;@localhost” to the server name (example: “@myserver;@localhost”). Whenever the configuration is changed, the X-Series software must be restarted

4.7.7 Floating License Manager

Opens the License Explorer for Network and USB Portable licenses.

NOTE This feature is not available if Option SF1 is installed.

For help on licensing, select **Help** in the menu bar at the top of the License Explorer window.

4.7.8 Install License (Remote Command Only)

Used to add a license to the instrument.

An example of such a command would be as below. The parameter is a unique 120-character code for each license.

```
SYST:LKEY "N9073A-1FP", "027253AD27F83CDA5673A9BA5F427FDA5E4F25AEB1017638211AC9F60D9C639FE539735909C551DE0A91"
```

Another example using one of the optional clauses.

```
SYST:LKEY "N9063EM0E-1FP,2019.0330", "02220210867E187713C9AFD4C90EA0DE2B674615DD0255798EE5B237A146A0D4E411E0ABFE04D3CAFDFFA", "ISSUED=30-Mar-2018"
```

NOTE This command does not work for Transportable, Network or USB Portable licenses.

Remote Command	<code>:SYSTem:LKEY <"OptionInfo">, <"LicenseInfo">, <"Optional1">, <"Optional2">, <"Optional3">, <"Optional4">, <"Optional5"></code>
Notes	<p><code><"OptionInfo"></code> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one, since the system knows which version is supported for each feature</p> <p><code><"LicenseInfo"></code> contains the signature, the expiration date, and serial number for transport if transportable. You must specify the signature, but you can omit the other information. If you omit the expiration date, the system regards it as permanent. If you omit the serial number, the system regards it as non-transportable. As a result, this supports reverse compatibility</p> <p><code><"Optional#"></code> are optional parameters that may be needed to match the information in the original license</p>

4.7.9 Remove License (Remote Command Only)

Removes a particular license.

An example of such a command would be as below. The parameter is a unique 120-character code for each license.

```
SYST:LKEY:DEL "N9073A-
```

1FP”, ”027253AD27F83CDA5673A9BA5F427FDA5E4F25AEB1017638211AC9F60D9C639FE53973590
9C551DE0A91”

NOTE

This command does not work for Transportable, Network or USB Portable licenses.

Remote Command	:SYSTem:LKEY:DELeTe <"OptionInfo">,<"LicenseInfo">
----------------	--

Notes	<"OptionInfo"> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one, if more than one version is installed <"LicenseInfo"> contains the signature, the expiration date, and whether be transportable. You must specify the signature, but you can omit the other information. If you omit the expiration date, the system regards it as permanent. If you omit the transportability, the system regards it as non-transportable. As a result, this supports reverse compatibility
-------	---

4.7.10 List Licenses (Remote Query Only)

Returns a list of installed licenses.

Remote Command	:SYSTem:LKEY:LIST?
----------------	--------------------

Notes	Return Value: An <arbitrary block data> of all the installed instrument licenses The format of each license is as follows <Feature>,<Version>,<Signature>,<Expiration Date>,<Serial Number for Transport>,... Return Value Example: #3136 N9073A-1FP,1.000,B043920A51CA N9060A-2FP,1.000,4D1D1164BE64 N9020A-508,1.000,389BC042F920 N9073A-1F1,1.000,5D71E9BA814C,13-aug-2005 <arbitrary block data> is: #NMMM<data> Where: N is the number of digits that describes the number of MMM characters. For example, if the data was 55 bytes, N would be 2 MMM would be the ASCII representation of the number of bytes. In the previous example, N would be 55 <data> ASCII contents of the data Additional fields may appear depending on the type of license (Fixed, Transportable, Network, USB Portable)
-------	---

4.7.11 Validate License (Remote Query Only)

Lets you query whether a particular license is currently valid.

Remote Command	<code>:SYSTem:LKEY? <"OptionInfo"></code>
Example	<code>:SYST:LKEY? "N9073A-1FP"</code>
Notes	<p><code><"OptionInfo"></code> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one</p> <p>Return Value: <code><"LicenseInfo"></code> if the license is valid, null otherwise <code><"LicenseInfo"></code> contains the signature, the expiration date, and serial number if transportable</p> <p>Return Value Example: <code>"B043920A51CA"</code></p>

4.7.12 Host ID Query (Remote Query Only)

Returns the Host ID as a string.

Remote Command	<code>:SYSTem:HID?</code>
----------------	---------------------------

4.8 Security

Accesses capabilities for operating the instrument in a security-controlled environment.

The **Security** page of the **System** menu has two controls: **USB Read/Write** and **Restore Security Defaults**.

Dependencies	Not available in UXM
--------------	----------------------

4.8.1 USB Write Protect

The Windows operating system can be configured to disable write access to the USB ports for users who are in a secure environment where transferring data from the instrument is prohibited. The **USB Write Protect** control is a convenient way for you to disable write access to USB.

NOTE

This control is only available to users with Administrator privileges.

Remote Command	<code>:SYSTem:SECurity:USB:WPRotect[:ENABle] ON OFF 0 1</code> <code>:SYSTem:SECurity:USB:WPRotect[:ENABle]?</code>
Example	Set USB ports to Read-only: <code>:SYST:SEC:USB:WPR ON</code> Set USB ports to Read-Write: <code>:SYST:SEC:USB:WPR OFF</code>
Notes	When the USB ports are in Read-only mode, then no data can be stored to USB, including the internal USB memory used for a back-up location for the calibration data
Dependencies	Grayed-out unless the current user has Administrator privileges
Preset	Unaffected by Preset or any "Restore Defaults" on page 2098. A Keysight Recovery sets the USB to write protect OFF
State Saved	No
Range	Read-Write Read only

4.8.2 Restore Security Defaults

Sets USB Read/Write to Enable.

NOTE

This control is only available to users with Administrator privileges.

4.9 Diagnostics

Displays a slider that allows you to view Hardware Statistics.

Dependencies	Not available in UXM
--------------	----------------------

4.9.1 Show Hardware Statistics

Provides a display of various hardware statistics. The statistics include the following:

- Mechanical relay cycles (on models with mechanical relays)
- High and Low temperature extremes
- Elapsed time that the instrument has been powered-on (odometer)

Modular instruments display only time and temperature information.

Example	<code>:SYST:SHOW HWST</code>
---------	------------------------------

Notes	The values displayed on the screen are only updated upon entry to the screen and not updated while the screen is being displayed
-------	--

4.9.2 Pathwave Calibration Advisor...

This is a separate application that helps maintain your instrument at peak performance. You can set the cal interval, configure cal due reminders, check the cal status, view cal certificates and test reports, and contact Keysight for a cal service.

The embedded help documentation can be accessed in the instrument at: <C:\Program Files\Keysight\Calibration Advisor\PCA.chm>, or via the ? button at the top right of the **PathWave Calibration Advisor** window.

4.9.3 Query the Mechanical Relay Cycle Count (Remote Query Only)

Returns the count of mechanical relay cycles.

Remote Command	<code>:SYSTem:MRELAY:COUNT?</code>
----------------	------------------------------------

Example	<code>:SYST:MREL:COUN?</code>
---------	-------------------------------

Notes	Query Only
-------	------------

The return value is a comma-separated list of the individual counts for each mechanical relay
The position of the relays in the list is:

“<Cal Signal>, <AC/DC>, <2dB #1 Atten>, <2dB #2 Atten>, <6dB Atten>, <10dB Atten>, <20dB Atten>, <30dB Atten>, <Fixed Atten>, <Low Noise Path Switch>, <PreSel Bypass>”

Items in the list not pertaining to your hardware configuration return as **-999** for those items

Dependencies *Not supported by E6607C*

4.9.4 Query the Operating Temperature Extremes (Remote Query Only)

Returns the low operating temperature extreme value. The value survives a power-cycle and is the temperature extreme encountered since the value was reset by the factory or service center.

Remote Command `:SYSTem:TEMPerature:LEXTreme?`

Example `:SYST:TEMP:LEXT?`

Notes Value is in degrees Celsius at which the lowest operating temperature has been recorded since 1st power-up

State Saved No

Returns the high operating temperature extreme value. The value survives a power-cycle and is the temperature extreme encountered since the value was reset by the factory or service center.

Remote Command `:SYSTem:TEMPerature:HEXTreme?`

Example `:SYST:TEMP:HEXT?`

Notes Value is in degrees Celsius at which the highest operating temperature has been recorded since 1st power-up

State Saved No

4.9.5 Query the Elapsed Time since 1st power on (Remote Query Only)

Returns the elapsed on-time in minutes since 1st power-on.

Remote Command `:SYSTem:PON:ETIMe?`

Example `:SYST:PON:ETIM?`

Notes Query Only

4.10 Service

Accesses capabilities performed in the factory or under instructions from repair procedures. This key is only visible when the logged-in user is “**advanceduser**” or “**saservice**”. The first access to the **Service** menu after invoking the instrument application will require an authentication Service Code.

Dependencies	Not available in UXM
--------------	----------------------

4.11 SCPI Recorder

Allows you to view active recording content, and edit the content. Right-click or touch and hold on any UI control to display a menu allowing you to record the SCPI associated with the control.

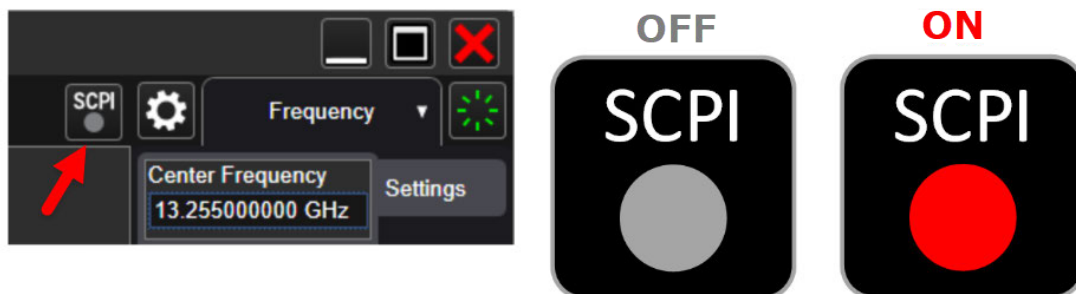

Selecting this tab displays the **Recorder** dialog on the right. The dialog displays the recorder table with the data in chronological order of recording. The Function Label column shows the feature name, for example, Center Frequency, and the SCPI column shows the full mnemonic corresponding to the feature.

4.11.1 Continuous SCPI Recording

Toggles the state of continuous recording.

When enabled (**ON**), *all* user interaction with settings that are Immediate Actions, and that have associated SCPI commands or queries, are added as recording entries in chronological order. Not every User Interface action has a corresponding SCPI command/query, for example, navigation actions between dialogs and menus in the User Interface do not have corresponding SCPI commands. All settings or a measurement that are accessible via menus have SCPI commands, so modifying those settings will create entries in the Recorder.

As a convenience, this feature can also be toggled (without visiting the SCPI Recording menu) by clicking the SCPI icon which has been added to the left of the “gear” icon (as illustrated below):

NOTE

When recording is turned on, some entries are automatically created and added to the recording. These are: `:INST:CONF:<mode>:<meas>` (see ["Mode" on page 89](#)) and `*OPC?` (see ["*OPC? - Operation Complete" on page 2747](#)). These commands set the current Mode and Measurement, perform a **Mode Preset**, then cause the instrument to wait for the completion of any previous commands. When **Continuous SCPI Recording** fills the recording container to the limit, a warning message is displayed to notify you that the recording container is full

and recording will be stopped, unless the recording limit is increased.

NOTE

To maintain the integrity of recording, stop recording *before* sending remote commands to the instrument. Changes made to the instrument via remote SCPI are *not* recorded.

4.11.2 Recording Limit

When "[Continuous SCPI Recording](#)" on page 2193 is enabled, every change you make is recorded into the recording system, which can lead to extremely large recordings.

This value limits how much content can be saved into the recording table. You may change this number to suit your needs, but the value cannot be less than 0 or greater than 500. When the recording length reaches the limit, a warning is displayed to indicate that the recording size has reached the limit and recording will be stopped.

The default limit is 250. If the limit is reduced after recording entries are added, the reduced count cannot be less than the current number of entries in the recording. If the newly-entered limit is smaller than the existing number of entries, then the actual new limit is set to the current number of entries. Increasing the limit will increase memory consumption.

4.11.3 Play All

Clicking this control causes each of the entries in the SCPI Recorder table to be executed.

If execution results in any errors, then a message box showing the SCPI command, and its corresponding error are displayed after play has completed.

4.11.4 Play Selected

You can select a row in the SCPI recording table, then click **Play Selected** to play that entry. **Play Selected** is disabled if the recording table is empty, or when no row is selected. You can then select another row and play the selection, but, if you want to play back in a particular order, you must execute the plays in the desired sequence.

After playing the selected entry, the selected row is moved down by one entry.

4.11.5 Copy

Copies the SCPI column data to the system clipboard, to make it available for Paste operations.

4.11.6 Insert *OPC? Below

Certain queries and commands must be sent during instrument programming, but there is no corresponding user-interface control for these commands. This control allows you to insert one such query: *OPC? below the selected row.

4.11.7 Move Up

Moves the selected / highlighted row up by 1 slot. Note that moving a mode or measurement switch entry in the table may impact context for subsequent entries in the table.

4.11.8 Move Down

Moves the selected / highlighted row down by 1 slot. Note that moving a mode or measurement switch entry in the table may impact context for subsequent entries in the table.

4.11.9 Delete Row

Deletes the selected entry from the recording table. Note that some entries may have subsequent entries related to the row that you delete, for example, *OPC?, which may be added automatically after a mode or measurement switch.

4.11.10 Delete All

Deletes all entries from the recording table. A warning message is displayed: "All recording data will be deleted".

To confirm that you want to delete the entire recording content, click **OK**, or click **Cancel** to avoid deleting it.

4.12 System Remote Commands (Remote Commands Only)

These commands have no front-panel key equivalent.

- "List installed Options (Remote Query Only)" on page 2196
- "Lock the Front-panel keys (Remote Command Only)" on page 2197
- "Lock Workstation (Remote Command Only)" on page 2197
- "List SCPI Commands (Remote Query Only)" on page 2199
- "Front Panel activity history (Remote Query only)" on page 2199
- "SCPI activity history (Remote Query only)" on page 2200
- "Instrument start time (Remote Query only)" on page 2200
- "SCPI Version Query (Remote Query Only)" on page 2201
- "Date (Remote Command Only)" on page 2201
- "Time (Remote Command Only)" on page 2201
- "Input Overload Enable (Remote Command Only)" on page 2202
- "Power Up (Remote Query Only)" on page 2202

4.12.1 List installed Options (Remote Query Only)

Lists the installed options that pertain to the instrument (signal analyzer).

Remote Command	<code>:SYSTem:OPTions?</code>
Example	<code>:SYST:OPT?</code>
Notes	The return string is a comma-separated list of the installed options. For example: <code>"503,P03,PFR"</code> <code>:SYSTem:OPTions?</code> and <code>*OPT?</code> are the same
State Saved	No

4.12.2 Lock the Front-panel keys (Remote Command Only)

Disables the instrument keyboard to prevent local input when the instrument is controlled remotely. Annunciation showing a “K” for **KLOCK** (keyboard lock) alerts the local user that the keyboard is locked. **KLOCK** is similar to the GPIB Local Lockout function; namely that no front-panel keys are active except for the **Power Standby** key. (The instrument is allowed to be turned-off if **KLOCK** is **ON**.) The **KLOCK** command is used in remote control situations where Local Lockout cannot be used.

Although primary intent of **KLOCK** is to lock-out the front panel, it will lock-out externally connected keyboards through USB. **KLOCK** has no effect on externally connected pointing devices (mice).

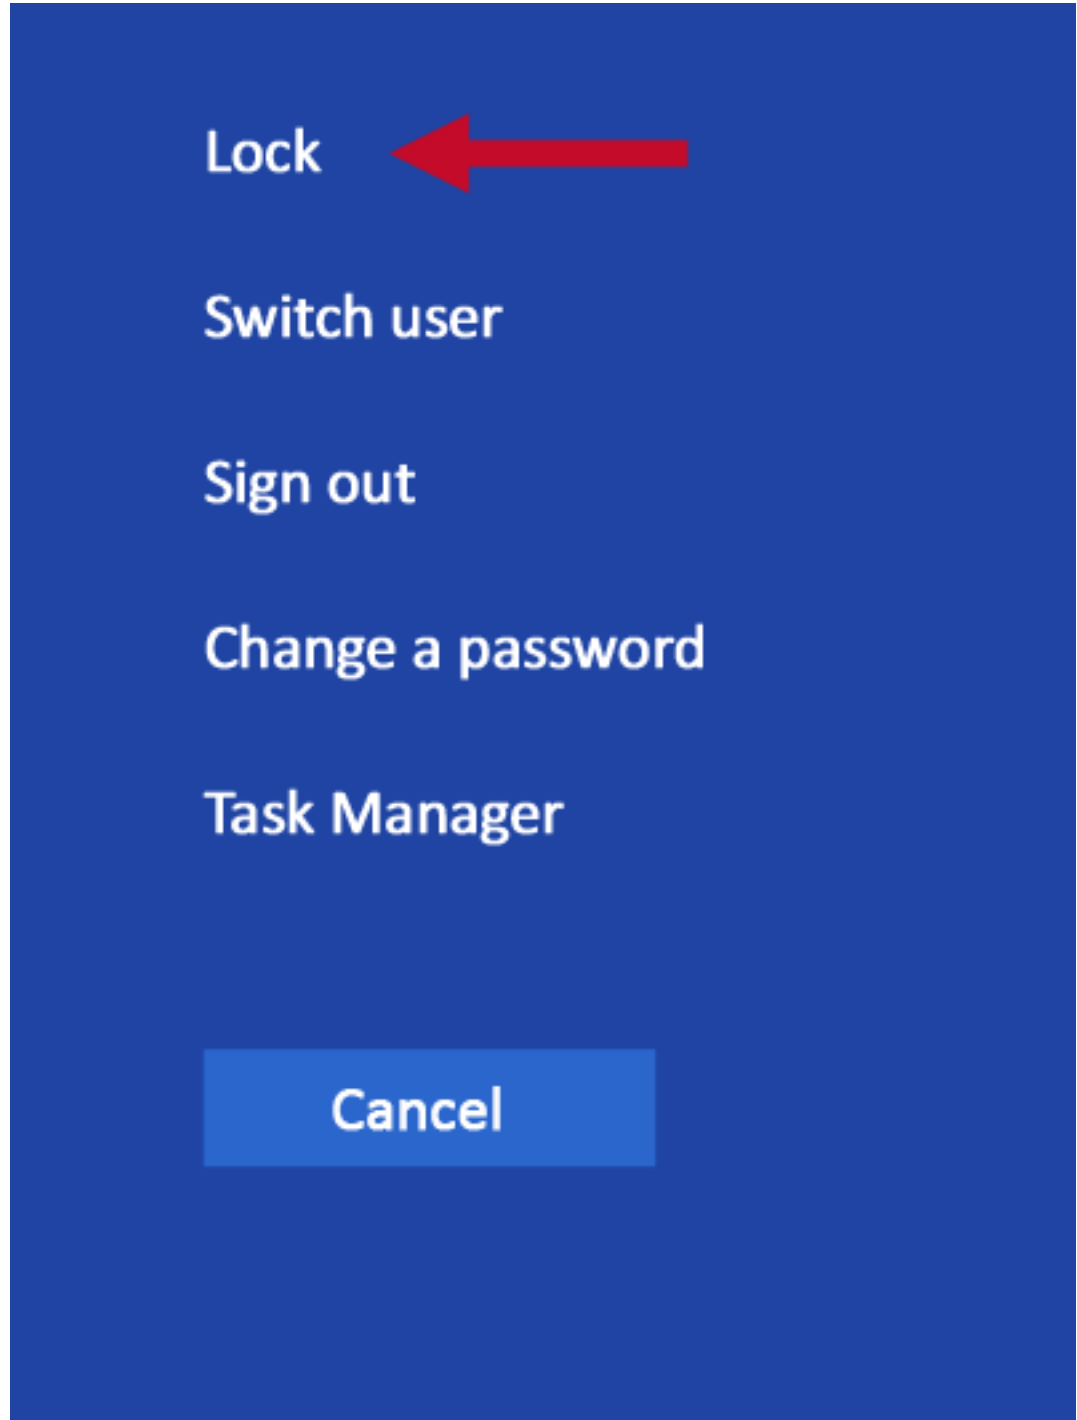

The front panel ‘**Local**’ key (**Cancel/Esc**) has no effect if **KLOCK** is **ON**.

See also "[Local Button](#)" on page 136.

Remote Command	<code>:SYSTem:KLOCK OFF ON 0 1</code> <code>:SYSTem:KLOCK?</code>
Example	<code>:SYST:KLOC ON</code>
Notes	Keyboard lock remains in effect until turned-off, or until the instrument is power-cycled
Preset	Initialized to OFF at startup, unaffected by Preset
State Saved	No

4.12.3 Lock Workstation (Remote Command Only)

Performs the same functionality as the **Win+L** function or the “Lock” function on the **CTL-ALT-DEL** screen in Windows.

As soon as you do this, the computer is locked. The initial login screen appears; no one can access the computer at that point unless they have an account and know the account's password.

Failure to initiate adds an error to the Windows event log for SA;

4 System
4.12 System Remote Commands (Remote Commands Only)

"LockWorkStation - Failed to initiate function"

See also "Local Button" on page 136.

Remote Command	:SYSTem:LWSTation
Example	:SYST:LWST
Notes	The lock remains in effect until a user logs in
State Saved	No

4.12.4 List SCPI Commands (Remote Query Only)

Outputs a list of the valid SCPI commands for the currently selected Mode.

Remote Command	:SYSTem:HELP:HEADers?
Example	:SYST:HELP:HEAD?
Notes	The output is an IEEE Block format, with each command separated with the New-Line character (0x0A)

4.12.5 Front Panel activity history (Remote Query only)

Instrument front panel usage can be monitored using :SYSTem:METRics:FPANel?. The monitoring occurs for front panel hardkey or softkey operation (including mouse or touch operation on instruments with Multi-Touch User Interface). The information of the usage pertains to the activity since the instrument application was started; the information does not persist after the application is terminated, or the instrument has been rebooted.

To prevent the front panel from being placed into Remote the monitoring must occur via an I/O protocol such as LAN Socket, or the remote program performing the monitoring must explicitly place the instrument into Local after the query has been performed.

Remote Command	:SYSTem:METRics:FPANel?
Example	:SYST:METR:FPAN?
Notes	The return value is a string with the format "YYYY-MM-DD<space>HH:MM:SS", in instrument local time If no front panel activity has occurred since the instrument was booted (instrument application started), the return value will be the time the instrument application started. The instrument application start time can be obtained with the query :SYSTem:METRics:STIME?

4.12.6 SCPI activity history (Remote Query only)

Instrument remote operation usage via SCPI can be monitored using `:SYSTem:METRics:SCPI?`. The monitoring occurs for SCPI control from any I/O channel (GPIB, USB, or LAN). The information of the usage pertains to the activity since the instrument application was started; the information does not persist after the application is terminated, or the instrument has been rebooted.

Remote Command	<code>:SYSTem:METRics:SCPI?</code>
Example	<code>:SYST:METR:SCPI?</code>
Notes	<p>The return value is a string with the format “YYYY-MM-DD<space>HH:MM:SS”, in instrument local time</p> <p>The following commands are excluded from the history accounting:</p> <ul style="list-style-type: none"> - <code>*IDN?</code> - <code>*OPT?</code> - <code>:SYSTem:DATE?</code> - <code>:SYSTem:TIME?</code> - <code>:SYSTem:PON:TIME?</code> - Queries in the <code>:SYSTem:ERRor</code> subsystem - Queries in the <code>:SYSTem:LKEY</code> subsystem - Queries in the <code>:SYSTem:METRics</code> subsystem - Queries in the <code>:SYSTem:MODUle</code> subsystem <p>If no SCPI activity has occurred since the instrument was booted (instrument application started), the return value will be the time the instrument application started. The instrument application start time can be obtained with <code>:SYSTem:METRics:STIME?</code></p>

4.12.7 Instrument start time (Remote Query only)

To determine if instrument activity has occurred, `:SYSTem:METRics:STIME?` can be used to determine the instrument application start time.

Remote Command	<code>:SYSTem:METRics:STIME?</code>
Example	<code>:SYST:METR:STIM?</code>
Notes	<p>The return value is a string with the format “YYYY-MM-DD<space>HH:MM:SS”, in instrument local time</p>

4.12.8 SCPI Version Query (Remote Query Only)

Returns the SCPI version number with which the instrument complies. The SCPI industry standard changes regularly. This command indicates the version used when the instrument SCPI commands were defined.

Remote Command	<code>:SYSTem:VERSion?</code>
Example	<code>:SYST:VERS?</code>

4.12.9 Date (Remote Command Only)

The recommended access to the Date, Time, and Time zone of the instrument is through the Windows native control (Control Panel, or accessing the Task Bar). You may also access this information remotely, as shown in here and in "[Time \(Remote Command Only\)](#)" on page 2201.

Sets or queries the date in the instrument.

Remote Command	<code>:SYSTem:DATE "<year>,<month>,<day>"</code> <code>:SYSTem:DATE?</code>
Example	<code>:SYST:DATE "2006,05,26"</code>
Notes	<code><year></code> is the four-digit representation of year (for example, 2006) <code><month></code> is the two-digit representation of year (01 to 12) <code><day></code> is the two-digit representation of day (01 to 28, 29, 30, or 31, depending on the month and year) Unless the current account has Power User or Administrator privileges, sending this command generates an error, and no action is taken

4.12.10 Time (Remote Command Only)

Sets or queries the time in the instrument.

Remote Command	<code>:SYSTem:TIME "<hour>,<minute>,<second>"</code> <code>:SYSTem:TIME?</code>
Example	<code>:SYST:TIME "13,05,26"</code>
Notes	<code><hour></code> is the two-digit representation of the hour in 24-hour format <code><minute></code> is the two-digit representation of minute <code><second></code> is the two-digit representation of second Unless the current account has Power User or Administrator privileges, sending this command generates an error, and no action is taken

4.12.11 Input Overload Enable (Remote Command Only)

Input Overload errors are reported using the Input Overload status bit (bit 12 in the Measurement Integrity Status Register). Input Overloads (for example, ADC Overload errors) can come and go with great frequency, generating many error events (for example, for signals just on the verge of overload), and so are not put into the SCPI error queue by default. Normally the status bit is the only way for detecting these errors remotely.

Use this command to enable or disable Input Overload reporting to the SCPI queue. By default, reporting is disabled. Send `:SYSTem:ERRor:OVERload ON` to enable, or `:SYSTem:ERRor:OVERload OFF` to disable. In either case, Input Overloads *always* set the status bit.

NOTE

For versions of firmware before A.10.01, Input Overload was only a Warning and so was never available in the SCPI queue, although it did set the status bit. For A.10.01 and later, Input Overload is an error, which can be enabled to the SCPI queue using this command.

Remote Command	<code>:SYSTem:ERRor:OVERload[:STATe] 0 1 OFF ON</code>
Example	Enable overload errors: <code>:SYST:ERR:OVER 1</code>
Preset	Set to OFF by Restore Misc Defaults (no Overload errors go to SCPI)
State Saved	Saved in instrument state

4.12.12 Power Up (Remote Query Only)

Returns a list of errors encountered during the application boot-up, such as: mismatch FW-FPGA, missing Calibration data, missing hardware, and construction errors.

Remote Command	<code>:SYSTem:ERRor:PUP?</code>
Notes	If no error occurs, the return value is: "No Power Up Errors" Return Value: <code><List of error strings></code> in <code><IEEE488 Block></code> format Return Value Example: "Power up errors, see details in Windows Event Log" "Unmatched FPGA Version(s), See details in Windows Event Log"

5 Preset

The Preset functions can be accessed in two ways:

- By pressing the **Mode Preset** or **User Preset** front panel keys:

- From the menu "**Preset Dropdown**" on page 2206, which appears when you press the green **Preset** icon (in the upper right corner of the display):

Types of Preset

The table below shows all possible presets, their corresponding SCPI commands and front-panel access methods.

Instrument settings are tiered in scope from those local to the current measurement to those global to all measurements and Modes. There are presets tailored to each scope. The table identifies the scope of each preset type.

NOTE

To get a Mode back to a fully predefined state, you should execute "**Restore Mode Defaults**" on page 2209 and "**Input/Output Preset**" on page 2210, but since **Input/Output Preset** is a global function, it affects *all* Modes.

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
"Auto Couple" on page 2017	:COUPle ALL	Local to the current measurement, only affects Auto/Man variables	Meas Setup menu
Meas Preset	:CONFigure:<meas>	Local to the current measurement Does not preset the RF Source	Meas Setup menu
"Mode Preset" on page 2207	:SYSTem:PRESet	Local to the current Mode, global to all measurements in the Mode, affects most but not all parameters in the Mode Does not affect Input/Output or System variables Presets the RF Source	Mode Preset key " Preset Dropdown " on page 2206
"Restore Mode	:INSTrument:DEFault	Local to the current Mode, global to	" Preset "

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
Defaults" on page 2209		all measurements in the Mode, affects all parameters in the Mode, but does not affect Input/Output or System variables Does not preset the RF Source.	Dropdown" on page 2206
"Restore Defaults All Modes" on page 2216	:SYSTem:DEFault MODEs	Affects all parameters in <i>all</i> Modes, but does not affect Input/Output or System variables Presets the RF Source	"Preset Dropdown" on page 2206
"Restore Screen Defaults" on page 2219	:SYSTem:DEFault SCReen	Deletes all Screens but one, restores that screen to its default mode and performs Mode Preset for that mode Does not affect Input/Output or System variables Presets the RF Source	"Preset Dropdown" on page 2206
"User Preset" on page 2212	:SYSTem:PRESet:USER	Local to the current Mode, global to all measurements in the Mode, affects all parameters in the Mode, as well as Input/Output variables Does not affect System variables	User Preset key "Preset Dropdown" on page 2206
"User Preset All Modes" on page 2215	:SYSTem:PRESet:USER:ALL	Same as User Preset , but affects all Modes in the current Screen	"Preset Dropdown" on page 2206
"User Preset All Screens" on page 2217		Affects the entire Screen Configuration; global to all Modes and Screens	"Preset Dropdown" on page 2206
*RST	*RST	Same as Mode Preset . Additionally always sets Single/Cont to Single	Not available from front panel
"Input/Output Preset" on page 2210	:SYSTem:DEFault INPut	Affects all Input/Output variables Does not preset the RF Source	Input/Output menu "Preset Dropdown" on page 2206 System > Restore Defaults
"Full Mode Preset" on page 2211	:SYSTem:PRESet:FULL	Same as Mode Preset + Restore Mode Defaults + Input/Output Preset . Essentially a factory preset of the current Mode Presets the RF Source	"Preset Dropdown" on page 2206
"Restore User	:SYSTem:DEFault UINTErface	Affects all variables in the "User	System > Restore

Type Of Preset	SCPI Command	Scope of Preset	Front Panel Access
Interface Defaults" on page 2083		Interface" group Does not preset the RF Source	Defaults User Interface tabs
"Restore Power On Defaults" on page 2092	:SYSTem:DEFault PON	Affects all variables in the "Power On" group Presets the RF Source	System > Restore Defaults Power On tabs
"Restore Alignment Defaults" on page 2169	:SYSTem:DEFault ALIGn	Affects all variables in the "Alignments" group Presets the RF Source	System > Restore Defaults Alignments tabs
"Restore Defaults" on page 2098 (Misc)	:SYSTem:DEFault MISC	Affects various variables not reset by other commands Presets the RF Source	System > Restore Defaults
"Restore Defaults" on page 2098 (All)	:SYSTem:DEFault [ALL] :SYSTem:PRESet:PERSistent	Affects all variables Presets the RF Source	System > Restore Defaults

5.1 Preset Dropdown

The Preset dropdown contains the following controls. In the image below, click a control for details of that control.

5.2 Mode Preset

Returns the current Mode to a known state. **Mode Preset** only presets the current Screen; it does not affect any other Screens.

Mode Preset also presets the RF Source. In this sense, it is equivalent to pressing **Source Preset** on the **Input/Output, RF Source** menu panel.

Mode Preset can be executed from the "**Preset Dropdown**" on page 2206, or by pressing the **Mode Preset** front panel key:

It does the following for the currently active Mode:

- Aborts the currently running measurement
- Switches to the default measurement and displays the default menu for that measurement
- Sets most parameters for the Mode and all its Measurements to a preset state
- Clears the input and output buffers
- Sets Status Byte to 0

Mode Preset does *not* cause a Mode switch, nor affect any **Input/Output** or **System** settings (those set in the **System Settings** dialog).

Furthermore, some Mode settings are unaffected by **Mode Preset** (for example, Noise Floor Extensions, Limit Line data, reference marker numbers, etc.) These are only reset by "**Restore Mode Defaults**" on page 2209. In each parameter's definition table there is a note that indicates whether it is reset by **Mode Preset** or by **Restore Mode Defaults**.

See "**Preset**" on page 2203 for more details.

Remote Command	<code>:SYSTem:PRESet</code>
Example	<code>:SYST:PRES</code>
Notes	*RST is preferred over <code>:SYST:PRES</code> for remote operation. *RST performs Mode Preset , as done by the <code>:SYST:PRES</code> command, and sets the measurement mode to Single measurement rather than Continuous , for optimal remote control throughput See also " *RST - Reset " on page 2748
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0

5 Preset

5.2 Mode Preset

Backwards Compatibility Notes

In X-Series, the legacy “Factory Preset” has been replaced by **Mode Preset**, which only presets the currently active Mode, not the entire instrument. In X-Series, you preset the entire instrument by using **System, Restore System Defaults All**, which behaves essentially the same way as restore System Defaults did in ESA and PSA

There is also no “Preset Type” as there was in PSA. The green **Mode Preset** front-panel key does a Mode Preset, and the **User Preset** front-panel key does a User Preset. The old **PRESet:TYPE** command is ignored (without generating an error), and **SYST:PRES** without a parameter does **Mode Preset**

The settings and correction data under the **Input/Output** front-panel key (examples: Input Z Corr, Ext Amp Gain, etc.) are no longer part of any Mode, so they are not preset by **Mode Preset**. They are preset by **Restore Input/Output Defaults, Restore System Defaults All**. Note that because “**User Preset**” on [page 2212](#) performs Recall State, and all these settings are saved in State, they *are* recalled when using **User Preset**

5.3 Restore Mode Defaults

Most settings within a Mode are affected by "[Mode Preset](#)" on page 2207, but some Mode settings are unaffected (for example, Noise Floor Extensions, Limit Line data, reference marker numbers, etc.) **Restore Mode Defaults** resets all these additional settings, as well as all the **Mode Preset** settings, *except* the RF Source.

In each parameter's definition table, there is a note that indicates whether that parameter is reset by **Mode Preset** or by **Restore Mode Defaults**.

Note that a Recall State affects all a Mode's settings, both the **Mode Preset** settings and the ones additionally affected by **Restore Mode Defaults**.

Restore Mode Defaults can be executed from the "[Preset Dropdown](#)" on page 2206.

When **Restore Mode Defaults** is selected, a message appears saying

*This will reset all of the current Mode's variables to their default state.
This action cannot be undone. Do you want to proceed?*

The message provides **OK** and **Cancel** buttons, to let you confirm or cancel the reset operation.

Remote Command	<code>:INSTRUMENT:DEFAULT</code>
Example	<code>:INST:DEF</code>
Notes	Clears all pending OPC bits. The Status Byte is set to 0
Couplings	Causes the currently running measurement to be aborted, and causes the default measurement to be active. Sets the Mode to a consistent state, with all default couplings set

5.4 Input/Output Preset

Resets the group of settings and data associated with the **Input/Output** front-panel key to their default values. These settings are not affected by "**Mode Preset**" on page 2207, because they are generally associated with connections to the instrument, which generally should remain unaltered.

All the variables set under the **Input/Output** front panel key are reset by **Input/Output Preset**, including Amplitude Corrections and Data (described in the **Corrections** section), with the exception of **RF Source** settings, which are unaffected.

By using **Input/Output Preset** and "**Restore Mode Defaults**" on page 2209, a full preset of the current Mode can be performed, with the caveat that, since **Input/Output Preset** is a global function, it affects *all* Modes.

Input/Output Preset can be executed from the **Input/Output** menu, from the "**Preset Dropdown**" on page 2206, or from the **Restore Defaults** menu under the **System** key.

When **Input/Output Preset** is selected, a message appears saying:

"This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings.

It will not affect Alignment data or settings.

It will not affect RF Source settings.

This action cannot be undone. Do you want to proceed?"

The message provides **OK** and **Cancel** buttons, to let you confirm or cancel the operation.

Example

```
:SYST:DEF INP
```

Presets all **Input/Output** variables to their factory default values

5.5 Full Mode Preset

Same as performing "Mode Preset" on page 2207, "Restore Mode Defaults" on page 2209, and "Input/Output Preset" on page 2210. Essentially a factory preset of the current Mode.

When **Full Mode Preset** is selected, a message appears saying:

This will reset all of the current Mode's variables and all of the Input/Output variables to their default state, including Input and Output selection and settings, Amplitude Correction, Frequency Reference and RF Source settings.

It will not affect Alignment data or settings.

This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons, to let you confirm or cancel the operation.

Remote Command	:SYSTem:PRESet:FULL
Example	:SYST:PRES:FULL
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0

5.6 User Preset

Recalls a state previously saved using ["Save User Preset" on page 2214](#). You can save a **User Preset** state for each Mode, allowing you to define your own favorite state for each Mode and recall it at the touch of a single button.

User Preset can be executed by pressing the **User Preset** front panel key, or from the ["Preset Dropdown" on page 2206](#).

Because **User Preset** is actually a Recall State, rather than a predefined Preset, it works a little differently from ["Mode Preset" on page 2207](#), in that it affects all the variables that normally only reset on ["Restore Mode Defaults" on page 2209](#), and it affects the **Input/Output** variables, because both of these are included in State files.

A default **User Preset** file is provided for each Mode, which simply matches the current Mode's state after **Restore Mode Defaults** and ["Input/Output Preset" on page 2210](#) has been performed.

NOTE

In products that run multiple instances of the X-Series Application, all instances use the same location to save User Preset state. So, saving User Preset of one instance will overwrite the Save User Preset of another instance.

Remote Command	<code>:SYSTem:PRESet:USER</code>
Example	<p>Save the User Preset: <code>:SYST:PRES:USER:SAVE</code></p> <p>Recall the User Preset: <code>:SYST:PRES:USER</code></p>
Notes	<p><code>:SYST:PRES:USER:SAVE</code> is used to save the current state as the user preset state</p> <p>If loading a User Preset file from a different instrument, some settings may be limited and/or coupled differently, since the capabilities of the mode may have changed from when the User Preset file was saved</p>
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0
Backwards Compatibility Notes	<p>In X-Series A-models, the User Preset key opened a menu that let you select from User Preset, Save User Preset, or User Preset All Modes. In B-models, the User Preset key immediately performs a User Preset, and the menu items are found under the Preset dropdown</p> <p>User Preset actually loads a state, and in legacy analyzers, it was possible to load a state without affecting the trace data, limit lines or correction data. Similarly, it was possible to do a User Preset without affecting the trace data, limit lines or correction data</p>

In X-Series, “state” always includes all of this data; so whenever state is loaded, or **User Preset** is executed, all the traces, limit lines and corrections are affected

In ESA and PSA, **User Preset** affected the entire instrument’s state. In X-Series, **User Preset** only recalls the state for the active Mode. There is a User Preset file for each Mode. **User Preset** can never cause a Mode switch as it could in legacy analyzers. If you want to recall all Modes to their user preset file state, perform User Preset *after* switching into each Mode

User Preset recalls Mode state, which can now include data, such as traces, whereas in ESA and PSA, User Preset did not affect data

5.7 Save User Preset

Saves the state of the currently active Mode in a unique location, for recall by the key "User Preset" on page 2212. Each Mode has one such location, so, for each Mode, one User Preset can be defined.

Save User Preset can be executed from the "Preset Dropdown" on page 2206.

All the Mode variables are saved, including those reset by "Mode Preset" on page 2207, those only reset by "Restore Mode Defaults" on page 2209, and all **Input/Output** variables, so when you subsequently press **User Preset**, the instrument returns to the exact same setup that existed when you pressed **Save User Preset**. Thus, **User Preset** has wider scope than **Mode Preset**.

Remote Command	:SYSTem:PRESet:USER:SAVE
Example	:SYST:PRES:USER:SAVE
Notes	:SYST:PRES:SAVE creates the same file as if you requested *SAV or :MMEM:STOR:STAT, except that Save User Preset does not allow you to specify the file name or location

5.8 User Preset All Modes

Recalls all the User Preset files for each Mode, switches to the Power-on Mode, and activates the saved measurement from the Power-on Mode **User Preset** file.

User Preset All Modes can be executed from the "[Preset Dropdown](#)" on page 2206

See also "[User Preset](#)" on page 2212.

Remote Command	<code>:SYSTem:PRESet:USER:ALL</code>
Example	<code>:SYST:PRES:USER:SAVE</code> <code>:SYST:PRES:USER:ALL</code>
Notes	<code>:SYST:PRES:USER:SAVE</code> is used to save the current state as the user preset state
Status Bits/OPC dependencies	Clears all pending OPC bits. The Status Byte is set to 0

5.9 Restore Defaults All Modes

Resets all Modes in the current Screen back to their default states, just as **Restore Mode Defaults** does, switches the current Screen to the Power-on Mode, and causes the default measurement for the **Power On Mode** to be active in the current Screen. Only the current Screen is affected.

Restore Defaults All Modes can be executed from the "Preset Dropdown" on page 2206.

When **Restore Defaults All Modes** is selected, a message appears saying:

This will reset all of the variables for all of the Modes in the current Screen to their default state. This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons.

Example	<code>:SYST:DEF MOD</code>
Couplings	Causes the currently running measurement to be aborted, a switch to the Power-on Mode, and activates the default measurement for the Power-on Mode

5.10 User Preset All Screens

Recalls a screen configuration previously saved using "[Save User Preset All Screens](#)" on page 2218. The complete configuration of all Screens is loaded, including the state of each Screen.

Because **User Preset All Screens** performs a Recall State as part of its function, it affects all variables that are normally only reset by "[Restore Mode Defaults](#)" on page 2209, and affects **Input/Output** variables, because both are included in State files.

Note that recalling a screen configuration in this manner wipes out your current screen configuration, and all states of all Screens.

Notes	<p>"Save User Preset All Screens" on page 2218 is used to save the current screen configuration as the "user preset all screens" configuration</p> <p>If loading a User Preset All Screens file from a different instrument, some settings may be limited and/or coupled differently, since the capabilities of the Mode may have changed from when the User Preset All Screens file was saved</p>
Status Bits/OPC dependencies	<p>Clears all pending OPC bits</p> <p>The Status Byte is set to 0</p>

5.11 Save User Preset All Screens

Saves the current Screen Configuration in a unique location, for recall by "[User Preset All Screens](#)" on page 2217.

Save User Preset All Screens can be executed from the "[Preset Dropdown](#)" on page 2206.

Besides the screen configuration, *all* Mode variables of all Screens are saved, including those reset by "[Mode Preset](#)" on page 2207, and those only reset by "[Restore Mode Defaults](#)" on page 2209, as well as all **Input/Output** variables, so when you subsequently press **User Preset All Screens**, the instrument returns to the exact Screen setup that existed when you pressed **Save User Preset All Screens**.

Notes	Creates the same file as if you requested Screen Config + State save, except that Save User Preset All Screens does not allow you to specify the file name or location
-------	--

5.12 Restore Screen Defaults

Resets the Screen configuration to the factory default; deleting all screens, all screen names, all screen states, and setting "Multiscreen" on page 176 to Off. A single screen will remain, set to the Power-on Mode, in a preset state with the default screen name.

Restore Screen Defaults can be executed from the "Preset Dropdown" on page 2206.

When **Restore Screen Defaults** is selected, a message appears saying:

This function will delete all defined screens and their settings. This action cannot be undone.

Do you want to proceed?

The message provides **OK** and **Cancel** buttons.

Example `:SYST:DEF SCReen`

5.13 Preset Type (Remote Command Only)

Remote Command	<code>:SYSTem:PRESet:TYPE FACTory MODE USER</code> <code>:SYSTem:PRESet:TYPE?</code>
Example	<code>:SYST:PRES:TYPE FACT</code>
Notes	Supported for backwards compatibility only. It is a no-op, which does not change the behavior of any preset operation
Preset	Unaffected by Preset, but set to MODE by Restore System Defaults->All
State Saved	No

5.14 Restart Instrument (Shutdown)

Shuts down the instrument, then reboots it.

Remote Command	:SYSTem:PUP
Example	:SYST:PUP

5.15 Restart Application (Application Shutdown)

Restarts the instrument application without rebooting the instrument. Before you send this command, make sure you have saved any trace or measurement data that you want to preserve.

Remote Command	<code>:SYSTem:PUP:PROcess</code>
Example	<code>:SYST:PUP:PROC</code> After sending this command, you must wait for the instrument software to restart
Notes	You cannot use <code>*WAI</code> or <code>*OPC?</code> to synchronize operation after a restart. This command stops and restarts the instrument application, so the SCPI operation is terminated and restarted A remote program must wait a fixed time before resuming sending commands to the instrument. The appropriate wait time depends on which applications are pre-loaded

5.16 System Log Off (Remote Command Only)

Provides a means to terminate all open Windows applications, and log off the current user. This is equivalent to performing the Windows command:

```
shutdown -l -f -t0
```

Remote Command	:SYSTem:LOFF
Example	:SYST:LOFF
Notes	Initiates an immediate log off of the current user. Exits the instrument application, so any unsaved measurement results will be lost. You cannot use *WAI or *OPC? to synchronize operation. In addition to the instrument application, all other Windows programs will be terminated, without the opportunity to save any work in progress. To perform a subsequent login, and regain instrument operation, human intervention will be required

5.17 Power Standby (Instrument Shutdown)

Pressing the power switch powers down the instrument. You are warned that shutting down will cause the application to lose unsaved data, and the instrument lets you respond to this warning before shutting down.

The command below has the same effect, except that you can specify Normal mode (**NORMa1**) or Forced mode(**FORCe**):

- In **NORMa1** mode, the system waits until you respond to the warning prompt
- In **FORCe** mode, the system shuts down after 20 seconds, and all data will be lost

If the instrument is not properly shut down prior to removal of line power, the system will validate the Journaling File System and the Power-On Last State (if the instrument is in Power-On Last State) during the following power-on. If a problem is detected, a message appears indicating that the system 'recovered' from an inappropriate shutdown. This is only an issue if **Power-On Type** is Last State. If the Last State is not valid, the instrument will power up in the last active Mode, but will perform "**Mode Preset**" on page 2207.

Remote Command	:SYSTem:PDOWn [NORMa1 FORCe]
Example	:SYST:PDOW Executes a normal shutdown
Notes	If no parameter is sent, NORMa1 is assumed

6 Input/Output

Accesses menus that let you control the Input/Output parameters of the instrument. In general, these are functions associated with external connections to the instrument, either to the inputs or the outputs.

Input/output connections tend to be based on situation-specific hardware set up. For that reason, input/output settings do *not*, in general, change when you perform a Mode Preset. You can revert to the default values in one of three ways:

- Use **Restore Input/Output Defaults**, in the **Input/Output** menu
- Use **System->Restore System Defaults->Input/Output Settings**
- Use **System -> Restore System Defaults->All**

The settings survive a Preset and a Power cycle.

A few Input/Output settings *do* respond to Mode Preset. For example, if the Calibrator is on, **Preset** turns it off, and if DC coupling is in effect, **Preset** switches it to AC. These exceptions are noted in the SCPI tables for the excepted functions.

Input/Output features are common across multiple Modes and Measurements. In general, they do not change when you change Mode or Measurement, although some controls appear only in certain measurements.

6.1 RF Source

Lets you control and configure the internal RF Source. This tab only appears in models that support a built-in independent RF Source, which include E7760B, and modular products such as EXM and VXT.

External Source Control and built-in Tracking Sources are controlled using the **Source** tab in **Meas Setup**.

Dependencies Only appears in models that support a built-in independent RF Source, such as E7760B, EXM and VXT

6.1.1 RF Output

Sets the source RF power output state.

Remote Command	<code>:OUTPut[:EXTernal][:STATe] ON OFF 1 0</code> <code>:OUTPut[:EXTernal][:STATe]?</code>
Example	<code>:OUTP OFF</code> <code>:OUTP?</code>
Notes	This setting is for the independent mode and has no effect on the " List Sequencer " on page 2236. If Sequencer is ON , the List Sequencer controls the source output, and this key is grayed-out When Sequencer is OFF , makes source leave List Sequencer and this setting is blanked out, taking effect immediately
Dependencies	For E7760B, the RF Output cannot be set to ON if the RF Output port is set to NONE . If you attempt to set RF Output to ON in this situation, the error message -221, "Settings conflict; Source Output is not available while Output Port is None" is displayed <code>:OUTPut:EXTernal[:STATe]</code> is supported only when Option ESC is installed. Otherwise, only <code>:OUTPut[:STATe]</code> is supported
Preset	OFF
Range	ON OFF

6.1.2 RF Output Port

Specifies the RF Output Port used by the internal source.

Switching from the RF Output port to one of the RFIO ports changes the transmitter performance of the instrument.

The **NONE** selection is available to allow setting a half-duplex port to an Input, if it was previously assigned as an Output. Set the Output to **NONE** first, then any port can be assigned as an Input.

When using VXT M9410A/11A/15A/16A with Remote Radio Heads (such as the Keysight M1740A mmWave Transceiver for 5G), the choices in the dropdown menu appear as:

Head h RFHD p

For example, if you have two Radio Heads (numbered 1 and 2), each of which have two RF half-duplex ports, the choices for these ports will appear as below:

Head and Port	Choice in dropdown	SCPI parameter
Head 1, port RF Tx/Rx 1	Head 1 RFHD 1	RRH1RFHD1
Head 1, port RF Tx/Rx 2	Head 1 RFHD 2	RRH1RFHD2
Head 2, port RF Tx/Rx 1	Head 2 RFHD 1	RRH2RFHD1
Head 2, port RF Tx/Rx 2	Head 2 RFHD 2	RRH2RFHD2

When using the E7770A Common Interface Unit, outputs may come from the DUT IF OUT ports on the rear of the CIU or the half-duplex ports on the front of the CIU labeled DUT IF In/Out. You would select GUI parameter IF Out n or SCPI parameter IFOutn for the DUT IF OUT ports or GUI parameter IFHD n or SCPI parameter IFHDn for the DUT IF In/Out ports. See ["RF Input Port" on page 2340](#) "Parameters for VXT M9410A/11A/15A/16A and EXM when used with Radio Heads/CIU" for more details.

Remote Command `[:SENSe]:FEED:RF:PORT:OUTPut RFOut | RFIO1 | RFIO2 | RFIO3 | RFIO4 | RFHD | RFFD | A1 | A2 | A3 | B1 | B2 | B3 | IFIO1 | IFIO2 | GEN | TR | RRHhRFHDp | IFOutn | IFHDn | NONE`

For details of each option, see ["Port Options" on page 2228](#)

`[:SENSe]:FEED:RF:PORT:OUTPut?`

Example

Set output to RF Output:

`:FEED:RF:PORT:OUTP RFO`

Set output to Radio Head 1, RF Tx/Rx Port 2:

`:FEED:RF:PORT:OUTP RRH1RFHD2`

Dependencies

Only appears in models that support multiple output ports. If the SCPI command is sent with unsupported parameters in any other model, an error is generated, -221, "Settings conflict; option not installed"

RFHD and **RFFD** are only available on VXT. Option HDX is required to enable RFHD port. Option FDX is required to enable RFFD port

For E7760B: Ports IFIO1 and IFIO2 are available if Option RF2 is installed. Ports A1, A2, A3, B1, B2, B3 are available if Option RF3 is installed. Attempting to select a port for which the option is not present generates the error, -241, "Hardware missing; Output not available"

A port cannot be selected as an Output while it is occupied as an Input. If the SCPI command is sent while the port is occupied, an error is generated, -221, "Settings conflict; Output Port is not available while occupied by Input"

Additionally, the mmWave ports are divided into two banks: the A Bank and the B Bank. A port cannot be selected as an Output if any port on the *same* bank is occupied as an Input. If the SCPI command is sent for this situation, an error is generated, -221 "Settings conflict; Output Port is not available while

6 Input/Output
6.1 RF Source

	port bank is occupied by Input” Lastly, if RF3 is present, and RF4 is absent, a mmWave port cannot be selected as an Output if the Input Port is occupied by wwWave Transceiver with a different frequency range. If the SCPI command is sent for this situation an error is generated, -221 “Settings conflict; Output Port is not available while occupied by Input of incompatible frequency” Ports GEN and TR are only available in modular analyzers, and only when the M9470A module is installed, such as in M8920A. Option HDX is required to enable the T/R port When any output is selected in a measurement that does not support it, the "No result; Meas invalid with this output" error condition occurs, and the measurement returns invalid data when queried
Preset	Unaffected by Mode Preset , but set to default by Source Preset or Restore System Defaults -> All
State Saved	Saved in State
Backwards Compatibility SCPI	:FEED:RF:PORT:OUTPut IFIO1 IFIO1 is treated as IF01 and sets the IF output to be the port labeled DUT IF Out on the CIU rear panel. This is for compatibility with earlier implementations on EXM and VXT when using the E7770A Common Interface Unit

Port Options

Value	Notes
RF Output RFOut	On EXM with hardware M9430A, if RF Output is selected as RF Output Port, use the settings in the Half Duplex Config menu to determine which port (RFIO3 or RFIO4) will be used On EXM with hardware M9431A, this setting is not supported. If the SCPI command is sent with this setting, an error is generated, -221, “Settings conflict; option not installed”
RFHD	RFHD port is exclusive for RF Input and RF Output. If HD Port is chosen as RF Input port, pressing this key, or sending SCPI to set it, generates error message: “-221, Settings conflict; RFHD is being used as RF Input Port” Option HDX is required to enable RFHD port
RFFD	Option FDX is required to enable RFFD port
GEN	Selects the Gen port on M8920A/20B
T/R TR	Selects the T/R port on M8920A/20B
RRHhRFHDp	Used to select a port on a Radio Head (such as the Keysight M1740A mmWave Transceiver) as an output RRHhRFHDp corresponds to Head h , port RF Tx/Rx p . For example, RRH1RFHD2 = the port labeled RF Tx/Rx 2 on Head 1

6.1.3 Half Duplex Output Port

Specifies whether **RFIO3** or **RFIO4** is the Half Duplex Output port.

Remote Command	[:SENSE]:HDUPlex:PORT:OUTPut RFIO3 RFIO4
----------------	--

Example	<code>:HDUPlex:PORT:OUTPut RFI03</code> <code>:HDUPlex:PORT:OUTPut?</code>
Dependencies	Only appears in EXM If RFI03 is selected as “Half Duplex Input Port”, then “Half Duplex Output Port” will be set to RFI04 automatically If RFI04 is selected as “Half Duplex Input Port”, then “Half Duplex Output Port” will be set to RFI03 automatically
Preset	RFI04
State Saved	Saved in State

6.1.4 RF Power

Lets you control the amplitude of the Source output. Same as "RF Power" on page 2229 in **Amplitude Setup**.

Example	<code>:SOUR:POW -100 dBm</code>
---------	---------------------------------

6.1.5 T/R Port High Power Attenuator

Controls whether additional attenuation is added at the T/R Port. The T/R port has two output paths, one that provides a 16 dB attenuator, another that bypasses this attenuator. When this control is **ON**, the path includes the 16 dB attenuator, so the maximum output level for this path is 0 dBm. When this control is **OFF**, the 16 dB attenuator is bypassed, so the maximum output level for this path is +5 dBm.

Example	<code>:FEED:RF:PORT:TR:HPOW:ATT ON</code>
---------	---

6.1.6 Amplitude Setup

Lets you access the **Amplitude Setup** panel.

Notes	This menu under this control is for independent mode, and has no effect on "List Sequencer" on page 2236. If "Sequencer" on page 2237 is ON , the List Sequencer controls the source output, and this control is grayed-out on the front panel, to indicate out-of-scope. When you set "Sequencer" on page 2237 to OFF , makes source leave List Sequencer and this control is blanked out
-------	--

6.1.6.1 RF Power

Lets you adjust the power level of the source using the numeric keypad, step keys, or RPG. Pressing any digit, 0 through 9 on the numeric keypad displays the unit terminator.

6 Input/Output
6.1 RF Source

Please refer to the "RF Power Range" on page 2230 table below for the valid ranges.

Remote Command	<code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude] <ampl></code> <code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]?</code>
Example	<code>:SOUR:POW -100 dBm</code>
Notes	<p>Amplitude corrections can be specified for use with the source. In the event of amplitude corrections being applied, the valid ranges for the RF power do not change dependent on the current amplitude correction setting. If the combination of RF power + amplitude correction is higher or lower than the source output range, the Source Unleveled bit is set, and the "Source Unleveled" indicator will appear on status panel to indicate that the source cannot maintain the output power that has been requested</p> <p>When signal generator is unable to maintain the requested output level, the "Source Unleveled" indicator will appear on status panel. When the source output setting is restored to the normal range, the "Source Unleveled" is removed from status panel</p> <p>Internal source has list sequence mode, which comprises of several steps which contain separate output power, frequency and waveform etc. When the source list sequence playing is complete, the last step keeps playing, and user can use this command to change the list sequence last step's output power</p> <p>For EXT, The multiport adapter RFIO TX ports and GPS ports cannot ensure power accuracy when power setting is lower than -130dBm, this power setting value is defined by the sum of RF Power setting and related amplitude correction value. But user settable value could be lower than this limit. When application detected there exists power setting lower than -130dBm on MPA RFIO TX ports, then popup warning message . When application detected there exists power setting lower than -130dBm on MPA GPS ports, then popup warning message . This is only warning message, and check is performed when RF is ON</p>
Dependencies	The RF power is dependent on the RF output port and frequency, such that the current frequency and selected output port determine the valid range of power values
Couplings	For if AWGN State is ON and ARB State is ON , this setting is adjusted to the value to maintain the AWGN power relationship defined by Power Control Mode and other noise settings
Preset	-100 dBm
Min	The range of values depends on the current frequency and selected RF output port. See "RF Power Range" on page 2230 below for the valid ranges
Max	The range of values depends on the current frequency and selected RF output port. Refer to "RF Power Range" on page 2230 below for the valid ranges

RF Power Range

RF Output Port	Frequency Range	Min Output Power	Max Output Power
High Power RF Out	10 MHz ≤ f ≤ 6 GHz	-150 dBm	20 dBm
RFIO 1 & RFIO 2	10 MHz ≤ f ≤ 6 GHz	-150 dBm	0 dBm

Note: This is the UI power range, which is larger than the actual specification.

VXT model M9420A

RF Output Port	Frequency Range	Min Output Power	Max Output Power without Option "1EA"	Max Output Power with Option "1EA"
RF Output	60 MHz \leq f \leq 6 GHz	-150 dBm	10 dBm	25 dBm
RFHD	60 MHz \leq f \leq 6 GHz	-150 dBm	10 dBm	15 dBm
RFFD	60 MHz \leq f \leq 6 GHz	-150 dBm	0 dBm	0 dBm

Note 1: This is the UI power range, which is larger than the actual specification.

Note 2: Max output power with Option 1EA can be set to 25 dBm, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when output power set higher than 20 dBm.

VXT models M9410A/11A

Ports	Option LFE	Frequency Range	Min Output Power	Max Output Power without option "1EA"	Max Output Power with "1EA"
RF Output	With Option LFE	1 MHz \leq f \leq 60 MHz	-150 dBm	5 dBm	5 dBm
		60 MHz \leq f \leq 380MHz	-150 dBm	5 dBm	25 dBm
	Without Option LFE	380 MHz \leq f \leq 6 GHz	-150 dBm	5 dBm	25 dBm
RFHD		1 MHz \leq f \leq 6 GHz	-150 dBm	5 dBm	5 dBm

Note 1: Min Output Power is the UI power range, which is smaller than the actual specification.

Note 2: Max output power with Option 1EA can be set to 25 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 20 dBm.

Note 3: Option LFE provides Low Frequency Extension, which covers frequency from 1 MHz to 380 MHz.

VXT models M9415A/16A

RF Output Port	Frequency Range	Min Output Power	Max Output Power without Option "1EA"	Max Output Power with Option "1EA"
RF Output	$380 \text{ MHz} \leq f \leq 12.3 \text{ GHz}$	-150 dBm	5 dBm	25 dBm
RFHD	$380 \text{ MHz} \leq f \leq 12.3 \text{ GHz}$	-150 dBm	5 dBm	18 dBm

Note 1: For RF output port, the Max output power with Option 1EA can be set to 25 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 20 dBm.

Note 2: For RFHD port, the Max output power with Option 1EA can be set to 18 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 15 dBm.

M9410E/11E/15E/16E

Ports	Option LFE	Frequency Range	Min Output Power	Max Output Power
RF Output	With Option LFE	$1 \text{ MHz} \leq f \leq 380 \text{ MHz}$	-150 dBm	13 dBm
		$380 \text{ MHz} \leq f \leq 25.9 \text{ GHz}$	-150 dBm	25 dBm
	Without Option LFE	$380 \text{ MHz} \leq f \leq 25.9 \text{ GHz}$	-150 dBm	25 dBm
RFHD		$1 \text{ MHz} \leq f \leq 25.9 \text{ GHz}$	-150 dBm	5 dBm

VXT Models with Remote Radio Heads/CIU

RRH	Port	Frequency Range	Min Output Power	Max Output Power
M1742A	Head h RFHD p	$10 \text{ GHz} \leq f \leq 32 \text{ GHz}$	-150 dBm	10 dBm

M8920A/20B

RF Output Port	Frequency Range	Min Output Power	Max Output Power
Gen	100 kHz ≤ f ≤ 6 GHz	-150 dBm	without option 1EA: 3 dBm with option 1EA: 15 dBm
T/R	100 kHz ≤ f ≤ 6 GHz	-150 dBm	T/R port high power attenuator On: -15 dBm T/R port high power attenuator Off: 3 dBm

Note: This is the UI power range, which is larger than the actual specification.

6.1.6.2 Set Reference Power

Turns the power reference state to **ON**, sets the reference power value to the current RF output power, maintains this power at the RF output, and sets the displayed power to 0.00 dB. All subsequent RF power values entered under **Source**, **Amplitude**, **RF Power** are interpreted as being relative to this reference power.

When you use a power reference, the signal generator outputs an RF power that is set relative to the reference power by the value entered under **Source**, **Amplitude**, **RF Power** as follows:

Output power = reference power – entered power

Where:

- reference power equals the original RF Power entered under **Source>Amplitude>RF Power** and set as the reference power
- entered power equals a new value entered under **Source>Amplitude>Amptd Offset**

In addition, the displayed power value is the same as a new value entered under **Source**, **Amplitude**, **RF Power**.

NOTE

If Power Ref is **ON** with a reference value set, entering a value under **Source**, **Amplitude**, **RF Power** and pressing **Set Reference Power** adds that value to the existing Power Ref value.

If you wish to change the reference power value to a new value entered under **Source**, **Amplitude**, **RF Power**, first set Power Ref to **OFF**, then press **Set Reference Power**.

Dependencies Unavailable, and grayed-out, when "List Sequencer" on page 2236 is **ON**

6.1.6.3 Power Ref

Lets you toggle the state of the power reference. When you use a power reference, the signal generator outputs an RF power that is set relative to the reference power by the value entered under **Source>Amplitude>RF Power** as follows:

Output power = reference power + entered power

Where:

- reference power equals the original RF Power entered under **Source>Amplitude>RF Power** and set as the reference power
- entered power equals a new value entered under **Source>Amplitude>Amptd Offset**

For more information on Reference Frequency, see ["Set Reference Power" on page 2233](#).

Remote Command	<code>:SOURce:POWer:REFerence <ampl></code> <code>:SOURce:POWer:REFerence?</code>
Example	<code>:SOUR:POW:REF 0.00 dBm</code>
Dependencies	Unavailable and grayed-out when "List Sequencer" on page 2236 is ON
Couplings	Coupled to "Set Reference Power" on page 2233 , such that pressing Set Reference Power updates the reference power with the current output power
Preset	0.00 dBm
Min	-125.00 dBm
Max	10.00 dBm
Auto Function	

Remote Command	<code>:SOURce:POWer:REFerence:STATe OFF ON 0 1</code> <code>:SOURce:POWer:REFerence:STATe?</code>
Example	<code>:SOUR:POW:REF:STATE ON</code>
Preset	OFF

6.1.6.4 Power Unit

Modifies the units for RF Power and Power Ref. The change is immediate and does not force a restart.

Remote Command	<code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]:UNIT DBM W V DBUV</code> <code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]:UNIT?</code>
Example	Set the RF Power units to volts:

	<code>:SOUR:POW:UNIT V</code>
Couplings	RF Power and Power Ref units are modified by Power Unit
Preset	dBm
State Saved	Saved in Instrument State

6.1.6.5 Amptd Offset

Lets you specify the RF output power offset value.

When the amplitude offset is set to zero (0) and you set a new offset value (positive or negative), the displayed amplitude value changes as follows, and the RF output power does not change:

Displayed value = output power + offset value

Where:

- output power equals the original RF Power entered under **Source, Amplitude, RF Power**
- offset value equals the value entered under **Source, Amplitude, Amptd Offset**

When the amplitude offset is set to a value other than zero (0) and you enter a new RF power value under **Source, Amplitude, RF Power**, the displayed power will be the same as the value entered and the RF output power will be equal to the value entered minus the offset value as follows:

Output power = entered power – offset power

Displayed Power = output power + offset power

Displayed power = entered power

Where:

- entered power equals the amplitude entered under **Source, Amplitude, RF Power**
- offset power equals the value previously entered and set under **Source, Amplitude, Amptd Offset**

Remote Command	<code>:SOURce:POWer[:LEVel][:IMMEDIATE]:OFFSet <rel_amp1></code> <code>:SOURce:POWer[:LEVel][:IMMEDIATE]:OFFSet?</code>
Example	<code>:SOUR:POW:OFFS 0.00 dB</code>
Notes	The amplitude Offset unit follows the units set in Power Unit
Dependencies	Unavailable, and grayed-out, when List Sequencer is ON
Preset	0.00 dB

6 Input/Output

6.1 RF Source

Min	-200.00 dB
Max	200.00 dB

6.1.6.6 Amplitude Increment

Changes the step size for the RF Power function. Once an increment size has been selected and the RF Amplitude function is active, the step keys (and the **UP | DOWN** parameters for RF Power from remote commands) change the RF Power by the set value. This feature exists in EXG and MXG.

Remote Command	<code>:SOURce:POWer:STEP[:INCRement] <amp1></code> <code>:SOURce:POWer:STEP[:INCRement]?</code>
Example	<code>:SOUR:POW:STEP 1</code>
Notes	The Amplitude Increment unit follows the units set in Power Unit
Couplings	Coupled to the Step size of the RF Power function
Preset	1 dB
Min	0.1 dB
Max	10 dB

6.1.7 Frequency

Lets you control the frequency of the Source. Same as ["Frequency" on page 2261](#) under ["Frequency Setup" on page 2261](#).

Example	<code>:SOUR:FREQ 1.00 GHz</code>
---------	----------------------------------

6.1.8 List Sequencer

Accesses sub-menus for configuring the **List Sequencer**.

List sequences allow you to enter frequencies and amplitudes at unequal intervals in nonlinear ascending, descending or random order. Each step within the list can also include its own waveform file for playback, step duration, trigger event and trigger output.

The complexities involved in configuring the **List Sequencer** do not lend themselves to manual configuration; hence the manual configuration for this feature is limited. For easier configuration of the List Sequencer, it is recommended that you use either SCPI, or load a tab-delimited file containing the setup parameters in a tabular form. The details of the SCPI for configuring the List Sequencer can be found in ["Step Configuration \(Remote Command Only\)" on page 2252](#).

Once the **List Sequencer** has been configured using the front panel, SCPI, or by loading a tab-delimited file, the sequence must be initiated using the front panel **Initiate Sequence** key, or the corresponding SCPI command.

Dependencies	Not available in E7760B
--------------	-------------------------

6.1.8.1 Sequencer

Sets the state of "[List Sequencer](#)" on page 2236

- When **List Sequencer** is **ON**, the source outputs the sequence defined by the sequencer
- When **List Sequencer** is **OFF**, the source outputs a single waveform segment or sequence (independent mode) at a single frequency and amplitude

Remote Command	<code>:SOURce:LIST[:STATe] ON OFF 1 0</code> <code>:SOURce:LIST[:STATe]?</code>
----------------	--

Example	<code>:SOUR:LIST OFF</code>
---------	-----------------------------

Notes	When the sequencer is ON , the List Sequencer controls the output of the source
-------	--

Dependencies	Not available in E7760B
--------------	-------------------------

Couplings	When in Sequence Analyzer Mode, and the List Sequencer state is OFF , Include Source is forced to NO , and the Include Source key is grayed-out When in Sequence Analyzer Mode, and the List Sequencer state is ON , Include Source is available to set, and an ARB memory related operation such as load or delete will be rejected
-----------	---

Preset	OFF
--------	------------

Range	ON OFF
-------	------------------------

6.1.8.2 Initiate Sequence

Arms the sequence for single execution. Once the sequence is armed, the source begins the sequence as soon as the trigger is received. If trigger is set to **Free Run**, the sequence starts immediately.

Remote Command	<code>:SOURce:LIST:TRIGger[:IMMediate]</code>
----------------	---

Example	<code>:SOUR:LIST:TRIG</code>
---------	------------------------------

Notes	When in Sequence Analyzer Mode, and Include Source is ON , the Initiate List Sequencer operation is rejected, and the key is grayed-out if the file needed by the sequencer is not already in ARB memory, the sequence cannot be initiated, and an error is generated There is a blocking SCPI query that can be used to check whether source list sequence was initiated successfully (see " Remote Software Trigger (Remote command Only) " on page 2261)
-------	--

Dependencies	In Sequence Analyzer Mode, if Meas Setup , Include Source is set to YES , Source , List Sequencer , Initiate Sequence is disabled Not available in E7760B
--------------	--

6.1.8.3 Repetition

Accesses a sub-menu to select the repetition type for the List Sequencer globally. It cannot be changed between different sequence steps.

In **Single**, the Source list plays one time after initiation. In **Continuous**, the Source list plays continuously after initiation.

This setting is available on EXM.

Remote Command	<code>:SOURce:LIST:REPetition:TYPE SINGle CONTInuous</code>
Example	<code>:SOUR:LIST:REP:TYPE SING</code> <code>:SOUR:LIST:REP:TYPE?</code>
Dependencies	Available on EXM Not available in E7760B
Preset	<code>SINGle</code>
Range	<code>SINGle CONTInuous</code>

6.1.8.4 Trig Out Type

Accesses a sub-menu to select the output trigger type for the List Sequencer globally. It cannot be changed between different sequence steps. It sets the output trigger type for the whole source sequence.

Remote Command	<code>:SOURce:LIST:TRIGger:OUTPut:TYPE STEP MARKer</code> <code>:SOURce:LIST:TRIGger:OUTPut:TYPE?</code>
Notes	<code>STEP</code> = Start of Step <code>MARKer</code> = Data Marker
Dependencies	Available on EXM Not available in E7760B
Preset	<code>STEP</code>
Backwards Compatibility SCPI	<code>:SOURce:LIST:TRIGgerout:TYPe BEGInningofstep DATamarker</code>

6.1.8.5 Select Data Marker

When "**Trig Out Type**" on page 2238 is set to Data **MARKer**, specifies which marker to route.

Remote Command	<code>:SOURce:LIST:TRIGger:OUTPut:TYPE:MARKer M1 ... M4</code> <code>:SOURce:LIST:TRIGger:OUTPut:TYPE:MARKer?</code>
----------------	---

Backwards Compatibility :SOURce:LIST:TRIGgerout:TYPE:Marker
SCPI

6.1.8.6 Manual Trigger Now

Provides a software trigger event to the List Sequencer. During execution of a sequence, if the sequencer is halted on any step that has been configured with a “Manual” step trigger, then this keypress causes the sequencer to continue and execute the step.

Notes No remote command, front panel only

6.1.8.7 List Sequencer Setup

Accesses the List Sequencer setup menus.

Number of Steps

Lets you specify the number of steps within the list sequence.

Remote Command :SOURce:LIST:NUMBer:STEPs <integer>
:SOURce:LIST:NUMBer:STEPs?

Example :SOUR:LIST:NUMB:STEP 1

Notes Increasing the number of steps creates additional steps at the end of the list, with all the settings within the steps set to their default values
Decreasing the number of steps removes steps from the end of the list. The settings within the removed steps are not reset. This means that increasing the number of steps again would allow you to retrieve these steps

Dependencies The Step Count parameter is increased or decreased when you insert or delete a point from within the GUI interface to the sequencer
Not available in E7760B

Preset 1

Min 1

Max 1000

Go To Step

Lets you select the step number you wish to view or edit.

Preset 1

Min	1
Max	Step Count

Insert Step Before

Inserts a new step, with default values, before the currently selected step. Inserting a step automatically increases the Step Count parameter by 1. If a sequence has already reached the upper limit of 1000 steps, then this operation is rejected, and error -221, "Setting Conflict; Cannot insert more steps, maximum number of steps reached" is displayed.

Notes	If the list already contains the maximum limit (1000 steps), pressing this control has no effect
-------	--

Delete Step

Deletes the current step. Deleting a step automatically decreases the Step Count parameter by 1. If the sequence only has one step left, then this operation is rejected, and error -221, "Setting conflict; Cannot delete current step, minimum number of steps reached" is displayed

Notes	If the list already contains the minimum limit of 1 step, pressing this control has no effect
-------	---

Clear List

Clears the list. Clearing the list sets the number of steps to the default value (1) and sets the parameters for the only step to their default values.

Step Trigger

Lets you select the trigger input for the current step.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:INPut:TRIGger IMMEDIATE INTERNAL EXTERNAL2 KEY BUS EXTERNAL4</code> For details of options, see " More Information " on page 2241 <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:INPut:TRIGger?</code>
Example	<code>:SOUR:LIST:STEP2:SET:INP:TRIG BUS</code> <code>:SOUR:LIST:STEP2:SET:INP:TRIG?</code>
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B
Preset	<code>IMMEDIATE</code>
Range	<code>IMMEDIATE INTERNAL EXTERNAL2 KEY BUS EXTERNAL4</code>

More Information

Parameter	SCPI	Notes
Free Run	IMM	Sets the trigger input for the current step to Free Run
Internal	INT	Sets the trigger input for the current step to Internal
Manual (Trigger Key)	KEY	Sets the trigger input for the current step to Manual (Trigger Key). Any step in the sequence set to Manual will cause the sequence execution to stop until the manual trigger key is pressed. Sending the Bus Trigger SCPI command will have no effect. At any point in the sequence where the List Sequencer is paused waiting for a software trigger, a pop-up dialog is displayed until the trigger event occurs
Bus	BUS	Sets the trigger input for the current step to Bus. Any step in the sequence set to Bus will cause the sequence execution to stop until the Bus Trigger command is sent. Pressing the manual trigger key has no effect. At any point in the sequence where the List Sequencer is paused waiting for a software trigger, a pop-up dialog is displayed until the trigger event occurs
External 2	EXT2	Sets the trigger input for the current step to External 2 Note: When on EXM, trigger 2 is a bi-directional trigger port. So, when trigger 2 has been configured as OUTPUT type, choosing External 2 as the input trigger for the current step will generate error

Transition Time

Lets you specify the transition time for the current step.

The following table lists recommended values for appropriate settling times to allow for changes within the source.

Value Changed	Recommended Transition Time
Frequency	500 μ s
Amplitude	100 μ s to within 0.1 dB 20 μ s to within 1.0 dB

If the Transition Time value is shorter than the time necessary for the hardware to settle and a List Sequence is initiated, a **warning** is generated. If the Transition Time value is longer than the Step Duration, an error is generated when initiating a source list sequence. For source list sequence, transition time is included in the step duration length. If the Transition Time value is longer than the Step Duration Time, the real step duration length is extended to equal the transition time and cause a timing shift.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:TRANSition:TIME <time></code> <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:TRANSition:TIME?</code>
Example	<code>:SOUR:LIST:STEP2:SET:TRAN:TIME 1ms</code>

6 Input/Output
6.1 RF Source

	<code>:SOUR:LIST:STEP2:SET:TRAN:TIME?</code>
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B
Preset	1.0 ms
Min	0.0 ms
Max	4.0 ks

Band

Lets you select the radio band for use in the current step.

Remote Command	<code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:RADio:BAND <band></code>
	<p>where <band> is one of:</p> <p>NONE PGSM EGSM RGSM DCS1800 PCS1900 GSM450 GSM480 GSM700 GSM850 TGSM810 USCELL USPCS JAPAN KOREAN NMT IMT2K UPPER SECOND PAMR400 PAMR800 IMTEXT PCS1DOT9G AWS US2DOT5G PUBLIC LOWER BANDI BANDII BANDIII BANDIV BANDV BANDVI BANDVII BANDVIII BANDIX BANDX BANDXI BANDXII BANDXIII BANDXIV BANDXIX BAND1 BAND2 BAND3 BAND4 BAND5 BAND6 BAND7 BAND8 BAND9 BAND10 BAND11 BAND12 BAND13 BAND14 BAND17 BAND18 BAND19 BAND20 BAND21 BAND24 BAND25 BAND26 BAND27 BAND28 BAND29 BAND30 BAND31 BAND65 BAND66 BAND67 BAND68 BAND71 BAND252 BAND255 BAND33 BAND34 BAND35 BAND36 BAND37 BAND38 BAND39 BAND40 BAND41 BAND42 BAND43 BAND44 BAND45 BAND46 BANDA BANDB BANDC BANDD BANDE BANDF N1 N2 N3 N5 N7 N8 N12 N20 N25 N28 N34 N38 N39 N40 N41 N50 N51 N66 N70 N71 N74 N75 N76 N77 N78 N79 N80 N81 N82 N83 N84 N86 N257 N258 N260 N261</p> <p><code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:RADio:BAND?</code></p>
Example	<p><code>:SOUR:LIST:STEP2:SET:RAD:BAND PGSM</code></p> <p><code>:SOUR:LIST:STEP2:SET:RAD:BAND?</code></p>
Notes	SCPI is supported after A.09.40
Dependencies	Not available in E7760B

Here are the Radio Standards for each Band, and a SCPI example for each (Step 2 is assumed):

Band	Standard	SCPI Example
None	None	<code>:SOUR:LIST:STEP2:SET:RAD:BAND NONE</code>

N 261	5G NR	:SOUR:LIST:STEP2:SET:RAD:BAND N261

Device

Lets you specify the radio band link direction for the steps within the list sequence. The link is used in conjunction with the channel band and channel number to determine the output frequency.

Setting	Option	Description
Uplink	UP	The source calculates the uplink frequency according to an uplink formula together with selected channel band and channel number
Downlink	DOWN	The source calculates the downlink frequency according to a downlink formula together with selected channel band and channel number

Remote Command	:SOURce:LIST:STEP[1] 2 ... 1000:SETup:RADio:BAND:LINK DOWN UP :SOURce:LIST:STEP[1] 2 ... 1000:SETup:RADio:BAND:LINK?
Example	:SOUR:LIST:STEP2:SET:RAD:BAND:LINK UP :SOUR:LIST:STEP2:SET:RAD:BAND:LINK?
Notes	SCPI is supported after A.09.40

Dependencies	Not available in E7760B
Preset	DOWN
Range	DOWN UP

Freq/Chan

Lets you select the frequency or channel value for the current step. If the Band selection for the current row is **NONE**, you enter a frequency. Otherwise, enter a channel, which causes the frequency to be automatically selected, based on the Band selection.

Entering a Frequency

If the Band selection for the current row is **NONE**, enter a Frequency. This field in the table allows you to select the frequency value for the current step.

Remote Command	:SOURce:LIST:STEP[1] 2 ... 1000:SETup:CNFRrequency <double> :SOURce:LIST:STEP[1] 2 ... 1000:SETup:CNFRrequency?
